Criticism. — The Leibnizian standpoint is here completely deserted. Instead of proceeding to demonstrate the direct opposite of the thesis, Kant in this argument deals with the extended bodies of empirical intuition. The proof given ultimately reduces to an argument from the continuous nature of space to the continuous nature of the matter which occupies it. But as the thesis and the antithesis thus refer to different realities, the former to things in themselves conceived by pure understanding, and the latter to the sensuous, no antinomy has been shown to subsist. Antinomy presupposes that both the opposing assertions have the same reference. Kant, as already noted, argues in the *Observation* to this antithesis that all attempts "made by the monadists" to refute the mathematical proof of the infinite divisibility of matter are quite futile, and are due to their forgetting that in this discussion we are concerned only with appearances.

"The monadists have, indeed, been sufficiently acute to seek to avoid this difficulty by not treating space as a condition of the possibility of the objects of outer intuition (bodies), but by taking these and the

dynamical relation of substances as the condition of the possibility of space. But we have a concept of bodies only as appearances, and as such they necessarily presuppose space as the condition of the possibility of all outer appearance."

How Kant, after writing these words, should still have left standing the proof which he has given of the thesis may be partially explained as due to the continuing influence of his earlier view, according to which antinomy represents not a conflict between opposing views of the world of ordinary consciousness, but between the demands of pure thought and the forms of sensuous existence. That older view of antinomy here gains the upper hand, notwithstanding its lack of agreement with the general scheme of the *Dialectic*.

There is a further inconsistency in Kant's procedure which may perhaps be taken as indicating the early origin of this portion of the *Critique*. He presents the mathematical proof of the continuity of matter as conclusive. Yet in the *Metaphysical First Principles of Natural Science* (1786) he most emphatically states that "the infinite divisibility of matter is very far from being proved through proof of the infinite divisibility of space."

Russell, in discussing the thesis and antithesis on their merits, from the point of view of certain present-day mathematical theories, makes the following criticism of Kant's procedure.

"Here, again, the argument applies to things in space and time, and to all collections, whether existent or not.... And with this extension the proof of the proposition must, I think, be admitted; only that *terms* or *concepts* should be substituted for *substances*, and that, instead of the argument that relations between substances are accidental (*zufällig*), we should content ourselves with saying that relations imply terms and complexity implies relations."

Russell further argues that Kant's assumption in the antithesis, that "space does not consist of simple parts, but of spaces," cannot be granted. It

"...involves a covert use of the axiom of finitude, *i.e.* the axiom that, if a space does consist of points, it must consist of some finite number of points. When once this is denied, we may admit that no finite number of divisions of a space will lead to points, while yet holding every space to be composed of points. A finite space is a whole consisting of simple parts, but not of any finite number of simple parts. Exactly the same thing is true of the stretch between 1 and 2. Thus the antinomy is not specially spatial, and any answer which is applicable in Arithmetic is applicable here also. The thesis, which is an essential postulate of Logic, should be accepted, while the antithesis should be rejected."

But, as above observed, those mathematicians who adopt this view so alter the meaning of the term point that it would perhaps be equally true to say that the thesis, as thus interpreted by Russell, coincides with what Kant believes himself to be asserting in the antithesis.

THIRD ANTINOMY

Thesis. — Causality according to the laws of nature is not the only causality from which the appearances of the world can be deduced. There is also required for their explanation another, that of freedom.

Proof. — Let us assume the opposite. In that case everything that happens presupposes a previous state upon which it follows according to a rule. That previous state is itself caused in similar fashion, and so on *in infinitum*. But if everything thus happens according to the mere laws of nature, there can never be a first beginning, and therefore no completeness of the series on the side of the derivative causes. But the law of nature is that nothing happens without a cause *sufficiently* determined *a priori*. If, therefore, all causality is possible only according to the laws of nature, the principle contradicts itself when taken in unlimited universality. Such causality cannot therefore be the sole causality possible. We must admit an absolute spontaneity, whereby a series of appearances, that proceed according to laws of nature, begins by itself.

Criticism. — The vital point of this argument lies in the assertion that the principle of causality calls for a *sufficient* cause for each event, and that such sufficiency is not to be found in natural causes which are themselves derivative or conditioned. As the antecedent series of causes for an event can never be traced back to a first cause, it can never be completed, and can never, therefore, be sufficient to account for the event under consideration. Either, therefore, the principle of causality contradicts itself, or some form of free self-originative causality must be postulated. This argument cannot be accepted as valid. Each natural cause is sufficient to account for its effect. That is to say, the causation is sufficient *at each stage*. That the series of antecedent causes cannot be completed is due to its actual infinitude, not to any insufficiency in the causality which it embodies. To prove his point, Kant would have to show that the conception of the actual infinite is inherently self-contradictory; and that, as we have already noted, he does not mean to assert. His argument here lies open to the same criticism as we have already passed upon his argument in proof of the thesis of the first antinomy.

Antithesis. — There is no freedom; everything in the world proceeds solely in accordance with laws of nature.

Proof. — Let us assume the opposite. Free causality, *i.e.* the power of absolute origination, presupposes the possibility of a state of the cause which has no causal connection with its preceding state, and which does not follow from it. But this is opposed to the law of causality, and would render unity of experience impossible. Freedom is therefore an empty thought-entity (*Gedankending*), and is not to be met with in any experience.

Criticism. — We may first observe the strange relation in which the proof of the thesis stands to that of the antithesis. According to the former, freedom must be postulated because otherwise the principle of causality would contradict itself. According to the latter, freedom is impossible, and for the same reason. Now, as Erhardt has pointed out, a principle cannot be reconciled with itself through the making of an assumption which contradicts it. That would only be the institution of a second contradiction, not the removal of the previous conflict. If the proof of the thesis be correct, that of the antithesis must be false; if the proof of the antithesis be correct, that of the thesis must be invalid. For though the thesis and the antithesis may themselves contradict one another, such conflict must not exist between the grounds upon which they establish themselves. If the reasons cited in their support are contradictory of one another, the total argument is rendered null and void. The supporting proofs being contradictory of one another, nothing whatsoever has been established. There will remain as a pressing and immediate problem the task of distinguishing the truth from among the competing alternatives; and until this has been done, the argument cannot proceed. The assumption of freedom either does or does not contradict the principle of causality. Antinomy is not the simple assertion that both A and not-A are true, but that A and not-A, though contradictory of one another, can both be established by arguments in which such contradiction does not occur.

The proof given of the thesis would seem, as already noted, to be untenable. The principle of natural causality is not self-contradictory. What now is to be said regarding the proof of the antithesis? If the principle of natural causality be formulated as asserting that every event has an *antecedent* cause determining it to exist, then certainly free, spontaneous, or self-originating causality is excluded. Here, as in Kant’s proof of the antithesis of the first antinomy, everything depends upon definition of the terms employed. It must be borne in mind that the antinomies are asserted to exist only on the dogmatic level. Critical considerations must not, therefore, be allowed to intervene. Now for ordinary consciousness the concept of causality has a very indefinite meaning, and a very wide application. Causation may be spontaneous as well as mechanical, spiritual as well as material. All possibilities lie open, and no mere reference to the concept of causal dependence suffices to decide between them. Free causality, so far as *dogmatic* analysis of the causal postulate can show to the contrary, may or may not be possible. Kant has failed to establish the antithesis save by the surreptitious introduction of conclusions which presuppose

the truth of his Critical teaching. This is especially shown in the emphasis laid upon 'unity of experience.' The further statement that freedom means lawlessness is only true if Kant's teaching is mutilated by reduction merely to its assertion of the objective validity of the mechanistic principles of natural science. Kant is both running with the hare and hunting with the hounds.

Though this antinomy is chiefly concerned with the problem of freedom, *i.e.* of spontaneous origination *within* the world, the proof of the thesis refers only to the cosmological problem of a first cause. The reasons of this oscillation we shall have occasion to consider in dealing with the fourth antinomy. The terms world and nature play the same ambiguous part as in the antithesis of the first antinomy; they tend to be employed in the narrower, mechanistic sense of Kant's own Critical teaching.

FOURTH ANTINOMY

As the proofs of the thesis and antithesis proceed on lines identical with those of the third antinomy, I shall omit detailed statement of them. Kant again argues from the fact that every change has a condition which precedes it in time. There is no difference in the proofs themselves, but only in the nature of the inference which they are made to support. In the third antinomy they lead to the assertion and denial of free causality; in the fourth antinomy they lead to the assertion and denial of an absolutely necessary being. The assertion is required in order to save the principle of causality from self-contradiction; the denial is also necessary, and for the same reason. The illegitimacy of this procedure has already been pointed out. Though the thesis and the antithesis will, if antinomy be assumed to represent an actual conflict, contradict one another, no such conflict is allowable in the grounds which profess to establish them. We must not assert, as *argument*, that both A and not-A are true.

In the *Observation* on the antithesis Kant has himself taken notice of this "strange" situation.

"From the same ground on which, in the thesis, the existence of an original being was inferred, its non-existence is inferred, and that with equal stringency."

A necessary being is inferred to exist, because the past series of events cannot contain all the conditions of an event, unless the unconditioned is to be found among them. A necessary being is denied to exist, because the series of merely conditioned events contains all the conditions that there are. Kant's defence of this procedure is as follows:

"Nevertheless, the method of argument in both cases is entirely in conformity even with ordinary human reason, which frequently falls into conflict with itself from considering its object from two different points of view. M. de Mairan regarded the controversy between two famous astronomers, which arose from a similar difficulty in regard to choice of standpoint, as a sufficiently remarkable phenomenon to justify his writing a special treatise upon it. The one had argued that *the moon revolves on its own axis*, because it always turns the same side towards the earth. The other drew the opposite conclusion that *the moon does not revolve on its own axis*, because it always turns the same side towards the earth. Both inferences were correct, according to the point of view which each chose in observing the moon's motion."

This example is not really relevant. In spite of Kant's assertion to the contrary, the point of view is one and the same in thesis and in antithesis. In both cases the absolutely necessary being is viewed as the first of the changes in the world of sense. To maintain that when thus viewed it both is and is not demanded by the law of causality, is as impossible as to assert that in one and the same meaning of our terms the moon both does and does not revolve on its own axis.

That the proofs of the fourth antinomy are identical with those of the third is due to the fact that Kant, under the stress of his architectonic, is striving to construct four antinomies while only three are really distinguishable. The third and fourth antinomies coincide as formulations of the problem whether or not the conditioned implies, and originates in, the unconditioned. The precise determination of this unconditioned, whether as free causality or as a necessary being, or in any other way, is a further problem, and does not properly fall within the scope of the *cosmological* inquiries, which are alone in

place in this division of the *Critique*.

The manner in which Kant, in treating of freedom, makes the transition from the cosmological (or theological) unconditioned to the psychological is significant. The cosmological unconditioned is proved to exist by the argument of the thesis, and its existence is at once interpreted as establishing at least in this one case the actuality of free spontaneous causality. Kant remarks that this

"...transcendental Idea of freedom does not by any means constitute the entire content of the psychological concept of that name, which is mainly empirical, but only that of absolute spontaneity of action.... The necessity of a first beginning, due to freedom, of a series of appearances we have demonstrated only in so far as it is required for the conceivability of an origin of the world.... But as, after all, the power of spontaneously originating a series in time has thus been proved (though not understood), it is now permissible for us to admit within the course of the world different series as capable in their causality of beginning of themselves, and so to attribute to their substances a power of acting from freedom."

That each such successive series in the world can only have a relatively primary beginning, and must always be preceded by some other state of things, is no sufficient objection to such causality.

"For we are here speaking of an absolutely first beginning not in time, but in causality. If, for instance, I at this moment arise from my chair in complete freedom, without being necessarily determined thereto by the influence of natural causes, a new series, with all its natural consequences *in infinitum*, has its absolute beginning in this event, although the event itself is only, with regard to time, the continuation of a preceding series."

Thus Kant's proof of freedom in the thesis of the third antinomy is merely a corollary from his proof of the existence of a cosmological or theological unconditioned; and further, this freedom is not, like the cosmological unconditioned, proved to exist, but only to be "admissible" as a possibility. Similarly in the antithesis, the only disproof of freedom is the disproof of unconditioned causality *in general*. The antinomy deals with the general opposition and relation between the contingent and the unconditioned.

It is this same opposition exactly which constitutes the subject-matter of the fourth antinomy. The terms used are different, but their meanings are one and the same. For though Kant substitutes 'absolutely necessary being' for 'unconditioned causality,' the former is still conceived as belonging to the world of sense, as the unconditioned origin of its changes. And as Kant is careful to add, only the causal, cosmological argument can be employed to establish the existence of an absolutely necessary being; nothing can legitimately be inferred from the mere Idea. The verbal change is consequently verbal only; the argument of the fourth antinomy coincides in result no less than in method of proof with the argument of the third. It is impossible to define the unconditioned in any more specific fashion save by an enquiry which entirely transcends the scope of the argument that Kant is here presenting. Kant's procedure also lies open to the further objection that the conception of an absolutely necessary being, which he here introduces without preliminary analysis or explanation, is later shown by him to be devoid of significance. He employs it, but precludes himself from either investigating it or from drawing any serviceable consequences from it. The situation is not without the elements of comedy. In order to seem to mark a real distinction between the fourth and the third antinomies, Kant has perforce to trespass upon the domain of theology; but as he is aware that the trespass is forbidden, he seeks to mitigate the offence by returning from the foray empty-handed. To such unhappy straits is he again reduced by his over-fond devotion to architectonic.

SECTION III

THE INTEREST OF REASON IN THIS SELF-CONFLICT

This section, though extremely important, requires no lengthy comment. It is lucid and straightforward. It may be summarised as follows. The theses and the antitheses rest upon diverse and conflicting interests. The theses, though expressed in dry formulas, divested of the empirical features through which alone their true grandeur can be displayed, represent the proud pretensions of dogmatic Reason. The antitheses give expression to principles of pure empiricism. The former are supported by interests of a practical and popular character: upon them morals and religion are based. The latter, while conflicting with our spiritual interests, far exceed the theses in their intellectual advantages. This explains

"...the zelotic passion of the one party, and the calm assurance of the other, and why the world hails the one with eager approval, and is implacably prejudiced against the other."

No legitimate objection could be raised against the principles of the empirical philosopher, if he sought only to rebuke the rashness and presumption of Reason when it boasts of *knowledge*, and when it represents as *speculative insight* that which is grounded only in *faith*.

"But when empiricism itself, as frequently happens, becomes dogmatic ..., and confidently denies whatever lies beyond the sphere of its intuitive knowledge, it betrays the same lack of modesty; and that is all the more reprehensible owing to the irreparable injury which is thereby caused to the practical interests of Reason."

Each party asserts more than it knows. The one allows our practical interests to delude Reason as to its inherent powers; the other would so extend empirical knowledge as to destroy the validity of our moral principles. Kant regards the opposition as being historically typified by the contrasted systems of Platonism and Epicureanism. It befits us, as self-reflecting beings, to free ourselves, at least provisionally, from the partiality of those divergent interests, and by application of "the sceptical method," unconcerned about consequences, to penetrate to the primary sources of this perennial conflict. As Kant states in the next section, the conflict is of such a character as to be genuinely resolvable.

This section must have been written, or at least first sketched, at the time when Kant still intended to bring his whole criticism of the metaphysical sciences within the scope of his doctrine of antinomy.

SECTION IV

OF THE TRANSCENDENTAL PROBLEMS OF PURE REASON, IN SO FAR AS THEY ABSOLUTELY MUST BE CAPABLE OF SOLUTION

There are sciences the very nature of which requires that every question which can occur in them must be completely answerable from what can be presumed to be known. This is true of the science of ethics. When I ask to what course of action I am committed in moral duty, the question must be answerable in terms of the considerations which have led to its being propounded. For there can be no moral obligation in regard to that of which we cannot have knowledge. We must not plead that the problem is unanswerable; a solution must be found. Kant proceeds to argue that this is no less true of transcendental philosophy.

"...it is unique among speculative sciences in that no question which concerns an object given to pure Reason is insoluble for this same human Reason, and that no excuse of an unavoidable ignorance, or of the unfathomable depth of the problem, can release us from the obligation to answer it thoroughly and completely. That very concept which enables us to ask the question must also qualify us to answer it, since, as in the case of right and wrong, the object is not to be met with outside the concept."

The third and fourth paragraphs would seem to be later interpolations. The section, like Section III., must have been written at the time when Kant still regarded the doctrine of antinomy as covering the entire

field of metaphysics. Transcendental philosophy is identified with cosmology, as dealt with in the antinomies. But in the third paragraph the former is taken as a wider term. Also, in the first two paragraphs the problems of pure Reason are regarded as soluble because their objects are not to be met with outside the concepts of them; whereas in the third paragraph they are viewed as soluble because their object is given empirically. Again, in the second paragraph transcendental philosophy has been taken as unique among speculative [*i.e.* theoretical] sciences; in the fourth paragraph mathematics is placed alongside it.

Examination of this section as a whole (and the same is true of the immediately following section) justifies the conclusion that at the time when it was written Kant regarded the Ideas of Reason as having a purely and exclusively regulative function, and consequently as exhausting their inherent meaning in their empirical reference. He regards them as entirely lacking in metaphysical significance. They are invented by Reason for Reason's own satisfaction, and must therefore yield in their internal content the explanation of their existence, and must also supply a complete and thorough answer to all problems which are traceable to them. A dogmatic (*i.e.* ontological) solution of the antinomies is, as we have already found, impossible; the Critical solution considers the question subjectively,

"...in accordance with the foundation of the knowledge upon which it is based." "For your object is only in your brain, and cannot be given outside it; so that you have only to take care to be at one with yourself, and to avoid the amphiboly which transforms your Idea into a supposed representation of an object which is empirically given and therefore to be known according to the laws of experience."

Kant's argument in proof of this purely subjective interpretation of the Ideas consists in showing that they are not presented in any given appearances, and are not even necessary to explain appearances. The unconditioned, whether of quantity, of division, or of origination, has nothing to do with any experience, whether actual or possible.

"You would not, for instance, in any wise be able to explain the appearances of a body better, or even differently, if you assumed that it consists either of simple or of inexhaustibly composite parts; for neither a simple appearance nor an infinite composition can ever come before you. Appearances demand explanation only in so far as the conditions of their explanation are given in perception, [and the unconditioned can never be so given]."

This standpoint, at once sceptical and empirical, is further developed in the next section.

SECTION V

SCEPTICAL REPRESENTATION OF THE COSMOLOGICAL QUESTIONS

Applying the "sceptical method," Kant argues that even supposing one or other party could conclusively establish itself through final refutation of the other, no advantage of any kind would accrue. The victory would be a fruitless one, and the outcome "mere nonsense." The sole validity of the Ideas lies in their empirical reference; and yet that reference is one which proves them to be, when objectively interpreted, entirely meaningless. The cosmological Idea is always either too large or too small for any concept of the understanding. No matter what view is taken, the only possible object (viz. that yielded by experience) will not fit into it. If the world has no beginning, or is infinitely divisible, or has no first cause, the regress transcends all empirical concepts; while if the world has a beginning, is composed of simple parts, and has a first cause, it is too small for the concepts through which alone it can be experienced. In other words, the cosmological Ideas are always either too large or too small for the empirical regress, and therefore stand condemned by sense-experience, which can alone impart relation to an object, *i.e.* truth and meaning to any concept. For, as Kant explicitly states, *we must not reverse this*

relation and condemn empirical concepts, as being in the one case too small, and in the other case too large for the Idea. Experience, not Ideas, is the criterion alike of reality and of truth.

"The possible empirical concept is, therefore, the standard by which we must judge whether the Idea is mere Idea and thought-entity (*Gedankending*), or whether it finds its object in the world."

When two things are compared, that for the sake of which the other exists is the sole proper standard. We do not say "that a man is too long for his coat, but that the coat is too short for the man." We are thus confirmed in the view that the antinomies rest upon a false view of the manner in which the object of the cosmological Ideas can be given; and are set upon the track, followed out in the next section, of the illusion to which they are due.

This reduction of the Ideas to mere thought-entities is one of the two alternative views which, as we have already stated, compete with one another throughout the entire *Dialectic*. We may, for instance, compare the above explanation of the conflict between the Ideas and experience with that given in A 422 = B 450. In the latter passage the antinomies are traced to a conflict between Reason and understanding. If the unity is adequate to the demands of Reason, it is too great for the understanding; if it is adequate to the understanding, it is too small for Reason. Kant does not here allow that the claims of Reason are *ipso facto* condemned through the incapacity of experience to fulfil them. On the contrary, he implies that it is through the Ideas that we come to realise the merely phenomenal character of everything experienced.

Our task, in this Commentary, is only to distinguish the passages in which those two conflicting tendencies appear, and to trace the consequences which follow from Kant's alternation between them. Discussion of their significance had best be deferred to the close of the *Dialectic*, where Kant dwells upon the regulative function of Reason. At present we need merely note that the main content of the above sections, in which the sceptical view is expounded, is of early date, prior to the working out of the *Paralogisms* and of the *Ideal*.

SECTION VI

TRANSCENDENTAL IDEALISM AS THE KEY TO THE SOLUTION OF THE COSMOLOGICAL DIALECTIC

In this section subjectivism is dominant. The type of transcendental idealism expounded is that earlier and less developed form which connects with the doctrine of the transcendental object. It shows no trace of Kant's maturer teaching. No distinction is drawn between representation and the objects represented. To the transcendental object, the "purely intelligible cause" of appearances in general, and to it alone, Kant ascribes "the whole extent and connection of our possible perceptions." Appearances exist only in the degree to which they are constructed in experience. As they are mere representations, they cannot exist outside the mind. Independently of such construction, they may indeed be said to be given in the transcendental object, but they only become objects to us on the supposition that they can be reached through extension of the series of our actual perceptions. It is in this form alone, as conceived in a regressive series of possible perceptions, and not as having existed in itself, that even the immemorial past course of the world can be represented as real;

"...so that all events which have taken place in the immense periods that have preceded my own existence mean really nothing but the possibility of extending the chain of experience from the present perception back to the conditions which determine it in time."

A similar interpretation has to be given to all propositions which assert the present reality of that which has never been actually experienced.

"In outcome it is a matter of indifference whether I say that in the empirical progress in space I can

meet with stars a hundred times farther removed than the outermost now perceptible to me, or whether I say that they are perhaps to be met with in cosmical space even though no human being has ever perceived or ever will perceive them. For even if they were given as things in themselves, without relation to possible experience, they are still nothing for me, and therefore are not objects, save in so far as they are contained in the series of the empirical regress."

The distinction between appearances and things in themselves must always, Kant observes, be borne in mind when we are interpreting the meaning of our empirical concepts; and this is especially necessary when those concepts are brought into connection with the cosmological Idea of an unconditioned. The antinomies are due to a failure to appreciate this fundamental distinction, and the key to their solution lies in its recognition.

"It would be an injustice to ascribe to us that long-decried empirical idealism which, while it admits the genuine actuality of space, denies the existence of the extended beings in it...."

This is in line with the passages from the *Prolegomena* commented upon above.

SECTION VII

CRITICAL DECISION OF THE COSMOLOGICAL CONFLICT OF REASON WITH ITSELF

Kant's argument is as follows. The antinomies rest upon the principle that if the conditioned be given, the entire series of all its conditions is likewise given. If the objects of the senses were independently real, there would be no escape from this assumption, and the dialectical conflict would consequently be irresolvable. Transcendental idealism, as above stated, reveals a way out of the dilemma. As appearances are merely representations, their antecedent conditions do not exist *as appearances*, save in the degree in which they are mentally constructed. Though the appearances are given, their *empirical* conditions are not thereby given. The most that we can say is that a regress to the conditions, *i.e.* a continued empirical synthesis in that direction, is *commanded* or *required*. The cosmological argument can thus be shown to be logically invalid. The syllogism, which it involves, is as follows:

If the conditioned be given, the entire series of all its conditions is likewise given.

The objects of the senses are given.

Therefore the entire series of all their conditions is likewise given.

In the major premiss the concept of the conditioned is employed transcendently (Kant says transcendentally), in the minor empirically. But though the inference thus commits the logical fallacy of *sophisma figurae dictionis*, the ground of its occurrence, and the reason why it is not at once detected, lie in a natural and inevitable illusion which leads us to accept the sensible world in space as being independently real. Only through Critical investigation can the deceptive power of this illusion be overcome. Owing to its influence, the above fallacy has been committed by dogmatists and empiricists alike. It can be shown that in refuting each other

... "they are really quarrelling about nothing, and that a certain transcendental illusion has caused them to see a reality where none is to be found."

The existence of antinomy, Kant further argues, presupposes that theses and antitheses are contradictory opposites, *i.e.* that no third alternative is possible. When opposed assertions are not contradictories but contraries, the opposition, to use Kant's terms, is not analytical but dialectical. Both may be false; for the one does not merely contradict the other, but makes, in addition, a further statement on its own account. Now examination of the illusion above described enables us to perceive that the opposites, in reference to which antinomy occurs, are of this dialectical character. *Theses and antitheses are alike false.* Since the world does not exist as a thing in itself, it exists neither as an infinite whole nor as a finite whole, but only

in the degree in which it is constructed in an empirical regress. We must not apply “*the Idea of absolute totality, which is valid only as a condition of things in themselves*,” to appearances. (The words which I have italicised mark the emergence of Kant’s non-sceptical, non-empirical view of the nature and function of the Ideas of Reason.) Thus antinomy, rightly understood, does not favour scepticism, but only the “sceptical method,” and indeed yields an indirect proof of the correctness of Critical teaching. This proof may be presented in the form of a dilemma. If the world is a whole existing in itself, it is either finite or infinite. But the former alternative is refuted by the proofs given of the antitheses, and the latter alternative by the proofs of the theses. Therefore the world cannot be a whole existing in itself. From this it follows that appearances are nothing outside our representations; and that is what is asserted in the doctrine of transcendental idealism.

In A 499 = B 527 Kant uses ambiguous language, which can be interpreted as asserting that in the regress there can be no lack of given conditions. Such a statement would presuppose positive knowledge regarding the unknown transcendental object. The opposite, more correct, view is given in A 514-15 = B 542-3 and A 517 ff. = B 545 ff., though in the latter passage with a reversion to the above position.

The earlier manuscripts, which Kant has so far been employing, probably terminate either, as Adickes suggests, at the end of this section, or at the close of Section VIII., which is of doubtful date. Section IX. is certainly from a later period; it represents a more complex standpoint, in which Reason is no longer viewed as possessing a merely empirical function, and in which consequently the theses and antitheses are no longer indiscriminately denounced as being alike false. Under the influence of his later, more Idealistic preoccupations, Kant so far modifies the above solution as to assert *that in the ease of the last two antinomies both theses and antitheses are true, when properly interpreted*.

SECTION VIII

THE REGULATIVE PRINCIPLE OF PURE REASON IN REGARD TO THE COSMOLOGICAL IDEAS

The principle of pure Reason, correctly formulated, is that when the conditioned is given a regress upon the totality of its conditions is *set as a problem*. As such it is valid,

“...not indeed as an *axiom* ... but as a *problem* for the understanding ..., leading it to undertake and to continue, according to the completeness in the Idea, the regress in the series of conditions of any given conditioned.”

It does not anticipate, prior to the regress, what actually exists as object, but only postulates, in the form of a rule, how the understanding ought to proceed. It does not tell us whether or how the unconditioned exists, but how the empirical regress is to be carried out under the guidance of a mere Idea. Such a rule can be regulative only, and the Idea of totality which it contains must never be invested with objective reality. As the absolutely unconditioned can never be met with in experience, we know, indeed, beforehand that in the process of the regress the unconditioned will never be reached. But the duty of seeking it by way of such regress is none the less prescribed.

Kant proceeds to give a somewhat bewildering account of the familiar distinction between *progressus in infinitum* and *progressus in indefinitum*, and to draw a very doubtful distinction between the series in division of a given whole and the series in extension of it. The illustration from the series of human generations is an unfortunate one; the discovery that it began at some one point in the past would not necessarily violate any demand of Reason. Such a series is not comparable with those of space, time, and causality. The only important result of this digression is the conclusion that whatever demand be made, whether of regress *in infinitum* or of regress *in indefinitum*, in neither case can the series of conditions be regarded as being given as infinite in the object.

“The question, therefore, is no longer how great this series of conditions may be in itself, whether finite or infinite, for it is nothing in itself; but how we are to carry out the empirical regress, and how far we should continue it.”

We have already noted Kant’s ambiguous suggestion in A 499 = B 527, that in the empirical regress there can be no lack of given conditions. The statement, thus interpreted, is illegitimate. The most that he can claim is that, were further sensations not forthcoming, we should still have to conceive those last obtained as being preceded by empty space and time, and as lacking in any experienced cause. Under such circumstances we should experience neither finitude nor unconditionedness, but only incapacity to find a content suitable to the inexhaustible character of the spatial and temporal conditions of experience, or in satisfaction of our demand for causal antecedents. In A 514-15 = B 542-3 Kant shows consciousness of this difficulty, but in dealing with it adopts a half-way position which still lies open to objection. He recognises that, since no member of a series can be empirically given as absolutely unconditioned, a higher member is always *possible*, and that the search for it is therefore prescribed; none the less he asserts that in regard to *given wholes* we are justified in taking up a very different position, namely, that the regress in the series of their internal conditions does not proceed, as in the above case, *in indefinitum*, but *in infinitum*, *i.e.* that in this case more members *exist and are empirically given* than we can reach through the regress. In given wholes we are commanded to *find* more members; in serial extension we are justified only in *inquiring* for more. This half-way position is a makeshift, and is in no respect tenable. The evidence for the infinite extensibility of space and time is as conclusive as for their infinite divisibility. And when we consider sensuous existence under these forms, it is just as possible that the transcendental object may, beyond a certain point, fail to supply material for further division, as that it may fail to yield data for further expansion. What Kant asserts of the latter, that further advance must always remain as a possibility, and for that Reason must always call for the open mind of further inquiry, without any attempted anticipatory assertion either *pro* or *contra*, alone represents the true Critical standpoint. The cessation of data may really, however, be due to an increase in the subtlety of the conditioning processes that incapacitates them from acting upon our senses; by indirect means this disability may be overcome. Reason, in its conception of an unconditioned, prescribes to us a task that is inexhaustible in its demands. We have no right to lay down our intellectual arms before any barrier however baffling, or to despair before any chasm however empty and abrupt.

SECTION IX

THE EMPIRICAL EMPLOYMENT OF THE REGULATIVE PRINCIPLE OF REASON IN REGARD TO ALL COSMOLOGICAL IDEAS

SOLUTION OF THE FIRST AND SECOND ANTINOMIES

Statement. — The fundamental fact upon which, as Kant has already stated, the regulative principle of Reason is based, is that it is impossible to experience an absolute limit. It is always *possible* that a still higher member of the series may be found; and that being so, it is our duty to search for it. But as we are here dealing with possibilities only, the regress is *in indefinitum*, not *in infinitum*.

“...we must seek the concept of the quantity of the world only according to the rule which determines the empirical regress in it. This rule says no more than that however far we may have attained in the series of empirical conditions, we should never assume an absolute limit, but should subordinate every appearance, as conditioned, to another as its condition, and that we must then advance to this condition. This is the *regressus in indefinitum*, which, as it determines no quantity in the object, is clearly enough

distinguishable from the *regressus in infinitum*."

We are acquainted only with the rule, and not with the whole object. Any assertion, therefore, which we can make, must be dictated solely by the rule, and be an expression of it. Neither the thesis nor the antithesis of the first antinomy is valid; there is a third alternative. The sensible world is neither finite nor infinite in extent; it is infinitely extensible, in terms of the rule.

Unfortunately Kant is not content to leave his conclusion in this form. He complicates his argument, and bewilders the reader, by maintaining that this is a virtual acceptance of the antithesis, in that we assert negatively, that an absolute limit in either time or space is empirically impossible; and affirmatively, that the regress goes on *in indefinitum*, and consequently has no absolute quantity.

Kant also repeats the argument of the preceding section in regard to given wholes. When the problem is that of subdivision, the regress starts from a given whole, and therefore from a whole whose conditions (the parts) are given with it. The division is, therefore, *in infinitum*, and not merely *in indefinitum*. This does not, however, he argues, mean that the given whole consists of infinitely many parts. For though the parts are contained in the intuition of the whole, yet the whole division arises only through the regress that generates it. It is a *quantum continuum*, not a *quantum discretum*. This argument has been criticised above. Kant here ignores the possibility that the parts of matter, though extended, may be physically indivisible, or that they may be centres of force which control, but do not occupy, a determinate space.

REMARKS ON THE DISTINCTION BETWEEN THE MATHEMATICAL-TRANSCENDENTAL AND THE DYNAMICAL-TRANSCENDENTAL IDEAS

Statement. — Kant again introduces the distinction between the mathematical and the dynamical. The mathematical Ideas synthesise the homogeneous, the dynamical may connect the heterogeneous. In employing the former we must therefore remain within the phenomenal; through the latter we may be able to transcend it. The way is thus opened for propounding, in regard to the third and fourth antinomies, a solution in which the pretensions of Reason no less than those of understanding may find satisfaction. Whereas both the theses and the antitheses of the first and second antinomies have to be declared false, those of the third and fourth antinomies *may both be true* — the theses applying to the intelligible realm, and the antitheses to the world of sense.

Comment. — When the distinction between the mathematical and the dynamical is thus extended from the categories to the Ideas, its validity becomes highly doubtful. Space and time are certainly themselves homogeneous, and the categories of quality and quantity, in so far as they are mathematically employed, may perhaps be similarly described. But when the term is still further extended, to cover the pairs of correlative opposites with which the first two antinomies deal, those, namely, between the limited and the unlimited, the simple and the infinitely divisible, Kant would seem to be making a highly artificial distinction. The first two antinomies deal not with space and time as such, but with the sensible world in space and time; and within this sensible world, even in its quantitative aspects, qualitative differences have to be reckoned with. Common sense does, indeed, tend to assume that the unlimited and the simple must, like that which they condition, be in space and time, and so form with the conditioned a homogeneous series. But this assumption ordinary consciousness is equally disposed to make in regard to a first cause and to the unconditionally necessary.

Kant further attempts to distinguish between the mathematical and the dynamical by asserting that the dynamical antinomies are not concerned with the quantity of their object, but only with its *existence*. He admits, however, that in all four cases a series arises which is either too large or too small for the understanding; and that being so, in each case the problem arises as to the *existence* of an unconditioned.

The artificiality of Kant's distinction becomes clear when we recognise that the opposed solutions, which he gives of the two sets of antinomies, can be mutually interchanged. As the sensible world rests

upon intelligible grounds, both the theses and the antitheses of the first two antinomies may be true, the former in the intelligible realm and the latter in the sensuous. Similarly, both the theses and antitheses of the third and fourth antinomies may be false. In the sensible world, about which alone anything can be determined, the series of dynamical conditions forms neither a finite nor an infinite series. There is a third alternative, akin to that of the antitheses, but distinct in character from it, namely, that the series is infinitely extensible. Kant's differential treatment of the two sets of antinomies is arbitrary, and would seem to be due to his having attempted to superimpose, with the least possible modification, a later solution of the antinomies upon one previously developed. In the earlier view, as we have already had occasion to observe, Reason has a merely empirical application. Its Ideas are taken as existing "only in the brain." Only their empirical reference can substantiate them, or indeed give them the least significance. And as they are by their very nature incapable of empirical embodiment, all assertions which involve them must necessarily be false. Later, Kant came to regard Reason as having its own independent rights. Encouraged by his successful establishment of the objective validity of the categories, progressively more and more convinced of the importance of the distinction, which that proof reinforced, between appearances and things in themselves, and preoccupied with the problems of the spiritual life, his old-time faith in the absolute claims of pure thought reasserted itself. Through Reason we realise our kinship with noumenal realities, and through its demands the nature of the unconditioned is foreshadowed to the mind. The theses and antitheses, which throughout the entire history of philosophy have competed with one another, may both be true. Their perennial conflict demonstrates the need for some more catholic standpoint from which the two great authorities by which human life is controlled and directed, the intellectual and the moral, may be reconciled. Neither can be made to yield to the other; each is supreme in its own field. The distinction between appearances and things in themselves, recognition of which is the first step towards an adequate theory of knowledge, and without which the nature of the intellectual life remains self-contradictory and incomprehensible, itself affords the means of such a reconciliation. The understanding is the sole key to the world of appearance, the moral imperative to the realm of things in themselves. Reason with its demand for the unconditioned mediates between them, and enables us to realise our dual vocation.

This radical alteration of standpoint was bound to make the employment of manuscript representing the earlier and more sceptical attitude altogether unsatisfactory; and only Kant's constitutional unwillingness to sacrifice what he had once committed to paper can account for his retention of the older expositions. He allows his previous treatment of the first two antinomies to remain in its sceptical form, and, by means of the distinction between the mathematical and the dynamical, develops his newer, more Idealist view exclusively in reference to the third and fourth antinomies. That it is no less applicable to the others, we have already seen.

Though the Idealist view, *as here expounded*, may be thus described, relatively to the sceptical view of Reason, as later, that is not to be taken as meaning that it represents the latest stage in the development of Kant's Critical teaching. It seems to belong to the period prior to that in which the central sections of the *Analytic* were composed. The evidence for this consists chiefly in its subjectivist references to the nature of appearances. It would seem to be contemporary with Kant's doctrine of the transcendental object.

SOLUTION OF THE THIRD ANTINOMY

Statement. — As appearances are representations only, they must have a ground which is not itself an appearance; and though the effects of such an intelligible cause appear, and accordingly are determined through other appearances, its causality is not itself similarly conditioned. Both it and its causality lie outside the empirical series; only the effects fall within the realm of experience. And that causality, not being subject to time, does not require to stand under another cause as its effect. In this way Kant derives

from his transcendental idealism an explanation of the possibility of an action being at once free and causally determined. This explanation he takes as applying either to a first cause of the whole realm of natural phenomena or to a finite being regarded as a free agent. The proof of the possibility of this metaphysical, or, as Kant entitles it, "transcendental freedom," removes what has always been the real difficulty that lay in the way of "practical freedom." The conception of freedom is a transcendental Idea which can neither be derived from experience nor verified by it. It is created by Reason for itself; and reveals the *possibility* that in this third antinomy both thesis and antithesis may be true. The alternatives— "every effect must arise from nature," and "every effect must arise from freedom" — are not exclusive of one another. They may be true of one and the same event in different relations. The event may be free in reference to its intelligible cause, determined as an existence in space and time. Were appearances things in themselves, freedom and causality would necessarily conflict: by means of the above ontological distinction freedom can be asserted without any diminution in the scope allowed to the causal principle. All events, without a single possible exception, are subject to the law of natural determination; and yet every event may *at the same time* proceed from a free cause.

POSSIBILITY OF HARMONISING CAUSALITY THROUGH FREEDOM WITH THE UNIVERSAL LAW OF NATURAL NECESSITY

Statement. — The above conclusion is so seemingly paradoxical that Kant devotes this and the following section to its further elucidation. How can events be both free and determined? The answer lies in recognition of the two-sided character of every natural existence. It is, in one aspect, mere appearance; in another, it has at its foundation a transcendental object. It is an appearance of the latter, and for its complete comprehension this latter must be taken into account. Now there is nothing to *prevent* us from attributing to the transcendental object a causality which is not phenomenal. Such causality may make the appearance just that appearance which it is. In the world of sense every efficient cause must have a specific empirical character, since only so can it determine one effect rather than another according to the universal and invariable law expressive of its nature. We must similarly allow to the transcendental object an intelligible character, and trace to it all those appearances which as members of the empirical series stand to one another in unbroken causal connection. This transcendental object, owing to its intelligible character, is not in time. Its act does not either arise or perish, and is not, therefore, subject to the law of empirical determination which applies only to the changeable, *i.e.* to events subsequent upon previous states. Such supersensuous causality can find no place in the series of empirical conditions, and though it can be conceived only in terms of the empirical character which is its outcome, the difference between it and natural causality may be as complete as that which subsists between the transcendental and the empirical objects of knowledge. In its empirical character the action is a part of nature, and enters into a causal nexus which conforms to universal laws. All its effects are inevitably determined by antecedent natural conditions. In its intelligible character, however, this same active subject must be considered free from all influence of sensibility and from all determination through natural events. In so far as it is a noumenon, there can be no change in it, and therefore nothing which is capable of explanation in terms of natural causes. Even its empirical effects are not traceable to it as events in time. For as events these effects are always the results of antecedent empirical causes. What is alone due to noumenal causality is that empirical character in virtue of which appearances are what they are, and owing to which they stand in specific and necessary causal relations to one another.

"...the empirical character is *permanent*, while its effects, according to variation in the concomitant, and in part limiting conditions, appear in changeable forms."

Empirical causality is itself in its specific nature conditioned by an intelligible cause.

Statement. — No single appearance can be exempted from the law of natural causality. For it would then be placed outside all possible experience, and would be for us a fiction of the brain, or rather could not be conceived at all. Nothing, therefore, *in nature* can act freely or spontaneously. But while thus recognising that all *events* without exception are empirically conditioned, we may, as already pointed out, regard empirical causality as itself an effect of a non-empirical and intelligible power. In events there may be nothing but nature, and yet nature itself, or perhaps even some of the existences composing it, may rest upon powers of a noumenal order. Kant proceeds to show that such an hypothesis is not only allowable, but is indispensable for understanding the distinguishing features of human life in its practical aspect.

Man is a natural existence, and his activities are subject to empirical laws. Like all other objects of nature, he has an empirical character, and in virtue of it takes his place as an integral part of the system of nature. But man is unique among all natural existences in that he not only knows himself as a sensible existence, but also, through pure apperception, becomes aware of himself as possessing faculties of a strictly intelligible character. Such are the faculties of understanding and Reason, especially the latter in its practical employment. The "ought" of the moral imperative expresses a kind of necessity and a form of causation which we nowhere find in the world of nature. The understanding can know in nature only what actually is, has been, or will be. Nothing natural can be other than it is in the particular relations in which it is found. Moral action transcends the natural in that it finds its cause, not in an appearance or set of appearances, but in an Ideal of pure Reason. Such action must indeed be possible under natural conditions, but such conditions do not determine its rightness, and consequently cannot determine its causality.

"Reason ... does not here follow the order of things as they present themselves in appearance, but frames to itself with perfect spontaneity an order of its own according to Ideas, to which it adapts the empirical conditions, and according to which it declares actions to be necessary even although they have never yet taken place, and perhaps never will take place. And at the same time it also presupposes that Reason can have causality in regard to all these actions, since otherwise no empirical effects could be expected from its Ideas."

If such action of pure Reason be admitted to be possible, it will have to be viewed, purely intelligible though it be, as also possessing an empirical character, i.e. as conforming to the system of nature. Its empirical consequences will be the effects of antecedent appearances, and will empirically determine by natural necessity all subsequent acts. In this empirical character, therefore, there can be no freedom. Were our knowledge of the circumstances sufficiently extensive, every human action, so far as it is appearance, could be predicted and shown to be necessary. How, then, can we talk of actions as free, when from the point of view of appearances they must in all cases be regarded as inevitable? The solution is that which has already been given of the broader issue. The *entire* empirical character, the whole system of nature, is determined by the intelligible character. And the former results from the latter, not empirically, and therefore not according to any temporal, causal law. It does not arise or begin at a certain time. The intelligible character conditions the empirical series *as a series*, and not as if it were a first member of it.

"Thus what we have missed in all empirical series is disclosed as possible, namely, that the condition of a successive series of events may itself be empirically unconditioned."

The intelligible character lies *outside* the series of appearances. "Reason is the *abiding* (*beharrliche*) condition of all free actions...." Freedom ought not, therefore, to be conceived only negatively as independence of empirical conditions, but also positively as the power of originating a series of events. The empirical series is in time. Reason, which is its unconditioned condition, admits of nothing antecedent to itself; it knows neither before nor after. The series is the immediate effect of a non-temporal

reality.

In illustration of his meaning, not, as he is careful to add, with the profession of thereby confirming its truth, Kant points out that moral judgment upon a vicious action is not determined in view of the inheritance, circumstances and past life of the offender, but is passed just as if he might in each action be supposed to begin, quite by himself, a new series of effects. This, in Kant's view, shows that practical Reason is regarded as a cause completely capable, independently of all empirical conditions, of determining the act, and that it is present in all the actions of men under all conditions, and is always the same. To explain why the intelligible character should in any specific case produce just this particular empirical character, good or bad,

"...transcends all the powers of our Reason, indeed all its rights of questioning, just as if we were to ask why the transcendental object of our outer sense-intuition yields intuition in *space* only and no other."

In conclusion Kant states that his intention has not been to establish the reality of freedom, not even to prove its possibility. Freedom has been dealt with only as a transcendental Idea; and the only point established is that freedom is, so to speak, a *possible possibility*, in that it is *not contradicted* either by experience or by anything that can be proved to be a presupposition of experience.

Comment. — Adequate comment upon this section is difficult for many reasons. The section is full of archaic expressions from the earlier stages of Kant's Critical teaching. Secondly, the section anticipates a problem which is first adequately dealt with in the second *Critique*. And lastly, but not least, the discussion of freedom in connection with a cosmological antinomy leads Kant to treat it in the same manner as the general antinomy, and in so doing to ignore the chief difficulty to which human freedom, as an independent problem with its own peculiar difficulties, lies open. For it is comparatively easy to reconcile the universality of the causal principle with the unconditionedness of the transcendental ground upon which nature *as a whole* is made to rest. It is a very different matter to reconcile the spontaneous origination of *particular* causal series, or the freedom of *particular* existences, such as human beings, with the singleness and uniformity of a natural system in which every part is determined by every other. Self-consciousness, with the capacity which it confers of constructing rational ideals, certainly, as Kant rightly contends, creates a situation to which mechanical categories are by no means adequate. But the mere reference to the conceivability of distinct causal series, having each a pure conception as their intelligible ground, does not suffice to meet the fundamental difficulty that, on Kant's own admission, each such separate series must form an integral part of the unitary system of natural law. In only one passage does Kant even touch upon this difficulty. Speaking of Reason's power of originating a series of events, he adds that while nothing *begins* in Reason itself (as it admits of no conditions antecedent to itself in time), the new series must none the less have a beginning in the natural world. But the proviso, which he at once makes, indicates that he is aware that this statement is untenable. For he adds the qualification that though a beginning of the series, it is never an absolutely first beginning. In other words, it is not a beginning in any real sense of the term. As the argument of his next paragraph shows, it is the entire system of nature, and not any one series within it, which can alone account, in empirical terms, for any one action.

It is open to Kant to argue, as he has already done, that the transcendental object conditions each separate appearance as well as all appearances in their totality, and that the specific empirical character of each causal series is therefore no less noumenally conditioned than is nature as a whole. But this does not suffice to meet the difficulty — how, if all natural phenomena constitute a single closed system in which everything is determined by everything else, a moral agent, acting spontaneously, can be free to originate a genuinely new series of natural events. We seem constrained to conclude that Kant has failed to sustain his position. A solution is rendered impossible by the very terms in which he formulates the problem. If the spiritual and the natural be opposed to one another as the timeless and the temporal, and if

the natural be further viewed as a unitary system, individual moral freedom is no longer defensible. Only the "transcendental freedom" of the *cosmological* argument can be reckoned as among the open possibilities.

As regards the character of the Critical doctrine which underlies this section, we need only note that the statement in A 546-7 = B 574-5, that man knows himself through pure apperception as "a purely intelligible object," does not conform to Kant's final teaching. The section can be dated through its unwavering adherence to the subjectivist doctrine of the transcendental object.

SOLUTION OF THE FOURTH ANTINOMY

Statement. — The above solution is adopted. Both thesis and antithesis may be true, the latter of the world of sense and the former of its non-empirical ground. All things sensible are contingent, but the contingent series in its entirety may nevertheless rest upon an unconditionally necessary being. The unconditioned, since it is outside the series, does not require that any one link in the series should be itself unconditioned. "Reason follows its own course in the empirical, and again a peculiar course in its transcendental use," *i.e.* it limits itself by the law of causality in dealing with appearances, lest in losing the thread of the empirical conditions it should fall into idle and empty speculations; while, on the other hand, it limits that law to appearances, lest it should wrongly declare that what is useless for the explanation of appearances is therefore impossible in itself. This does not prove that an absolutely necessary being is really possible, but only that its impossibility must not be concluded from the necessary contingency of all things sensuous.

Comment. — Kant's method of distinguishing this conclusion from that of the preceding antinomy is again artificial. "Necessary being" is not in conception more *extramundanum* than "unconditioned cause." If Kant's distinction were valid, the argument of the fourth antinomy would no longer be cosmological; it would coincide with the problem of the *Ideal of Pure Reason*.

CONCLUDING NOTE ON THE WHOLE ANTINOMY OF PURE REASON

Statement. — When we seek the unconditioned entirely beyond experience, our Ideas cease to be cosmological; they become transcendent. They separate themselves off from all empirical use of the understanding, and create to themselves an object, the material of which is not taken from experience, and which is therefore a mere thing of the mind (*blosses Gedankending*). None the less the cosmological Idea of the fourth antinomy impels us to take this step. When sensuous appearances, as merely contingent, require us to look for something altogether distinct in nature from them, our only available instruments, in so doing, are those pure concepts of things in general which contingent experience involves. We use them as instruments in such manner as may enable us to form, through analogy, some kind of notion of intelligible things. Taken in abstraction from the forms of sense, they yield that notion of an absolutely necessary Being which is equivalent to the concept of the theological Ideal.

CONCLUDING COMMENT ON KANT'S DOCTRINE OF THE ANTINOMIES

We may now, in conclusion, briefly summarise the results obtained in this chapter. Kant fails to justify the assertion that on the dogmatic level there exist antinomies in which both the contradictory alternatives allow of cogent demonstration. His proofs are in every instance invalid. The real nature of antinomy must, as he himself occasionally intimates, be defined in a very different manner, namely, as a conflict between the demand of Reason for unity and system, and the specific nature of the conditions, especially of the spatial and temporal conditions, under which the sensuous exists. In this wider form it constitutes a genuine problem, which demands for its solution the fundamental Critical distinction between

appearances and things-in-themselves, and also a more thoroughgoing discussion than has yet been attempted of the nature of Reason and of the function of its Ideas. It is to these connected questions that Kant devotes his main attention in the remaining portions of the *Dialectic*, so that in passing to the *Ideal of Pure Reason* he is not proceeding to the treatment of a new set of problems, but to the restatement and to the more adequate solution of the fundamental conflict between understanding and Reason.

The observations which closed our comment upon the *Paralogisms* are thus again in order. The teaching of the sections on the *Antinomies*, no less than that of those on the *Paralogisms*, is incomplete, and if taken by itself is bound to mislead. The Ideas of an unconditioned self and of an unconditioned ground of nature have thus far been taken as at least conceptually possible, and as signifying what may perhaps be real existences. These Ideas are in certain of the remaining sections of the *Dialectic* called in question. They are there declared to be without inherent meaning. They are useful fictions — *heuristische Fiktionen* — and in their psychological nature are simply *schemata* of regulative principles. Their theoretical significance consists merely in their regulative and limitative functions. They must not be regarded, even hypothetically, as representing real existences. In the practical (*i.e.* ethical) sphere they do indeed acquire a very different standing. But with that the *Critique of Pure Reason* is not directly concerned. The reader may therefore be warned not to omit the chapter on the *Ideal of Pure Reason*, on the supposition that it embodies only a criticism of the Cartesian and teleological proofs of God's existence. It is an integral part of Critical teaching, and carries Kant's entire argument forward to its final conclusions. Only in view of the new and deeper considerations, which it brings to light, can his treatment even of the *Antinomies* be properly understood. Its main opening section (Section II.) is, indeed, among the most scholastically rationalistic in the entire *Critique*; but in the later sections it unfolds, with a boldness and consistency to which we find no parallel in the treatment of the *Paralogisms* and of the *Antinomies*, the full consequences of the more sceptical of Kant's alternating standpoints. It disintegrates the concepts of the unconditioned, which have hitherto been employed without analysis and without question; and upon their elimination from among the legitimate instruments of Reason, the situation undergoes entire transformation, the two points of view appearing for the first time in the full extent of their divergence and conflict. For Kant's Idealist view of Reason and of its Ideas still continues to find occasional statement, showing that he has not been able decisively to commit himself to this more sceptical interpretation of the function of Reason; that he is conscious that the Idealist view alone gives adequate expression to certain fundamental considerations which have to be reckoned with; and that unless the two views can in some manner be reconciled with one another, a really definitive and satisfactory solution of the problem has not been reached. When, therefore, we speak of Kant's final conclusions, we must be taken as referring to the twofold tendencies, sceptical and Idealist, which to the very last persist in competition with one another. The greater adequacy of Kant's argument in the chapter on the *Ideal of Pure Reason* and in the important *Appendix* attached to the *Dialectic* consists in its forcible and considered exposition of both attitudes. Most of the sections on the *Antinomies* must, as we have seen, be dated as among the earliest parts of the *Critique*. Their teaching is correspondingly immature. The chapter on the *Ideal* and the *Appendix*, on the other hand, were among the latest to be written, and contain, together with the central portions of the *Analytic*, our most authoritative exposition of Kant's Critical principles.

CHAPTER III

THE IDEAL OF PURE REASON

SECTIONS I and II

THE TRANSCENDENTAL IDEAL

THE statements of the first section cannot profitably be commented upon at this stage; they are of a merely general character. I pass at once to Section II., which, as above stated, is quite the most archaic piece of rationalistic argument in the entire *Critique*. It is not merely Leibnizian, but Wolffian in character. For Kant the Wolffian logic had an old-time flavour and familiarity that rendered it by no means distasteful; and he is here, as it were, recalling, not altogether without sympathy, the lessons of his student years. They enable him to render definite, by way of contrast, the outcome of his own Critical teaching.

As Kant here restates the Wolffian notion of the *Ens realissimum* in such fashion as is required to make it conform to his deduction of the theological Idea from the disjunctive syllogism, a preliminary statement of the more orthodox formulation will help to set Wolff's doctrine in a clearer light. In so doing, I shall follow Baumgarten, whose *Metaphysica* Kant used as a class text-book. Briefly summarised Baumgarten's statement is as follows. The *Ens perfectissimum* is that Being which possesses as many predicates, *i.e.* perfections, as can possibly exist together in a single thing, and in which every one of its perfections is as great as is anywhere possible. This most perfect Being must be a real Being, and its reality must be the greatest possible. It is that in which the most and the greatest realities are. But all realities are affirmative determinations, and no denial is a reality. Accordingly no reality can contradict another reality, and all realities can exist together in the same thing. The *Ens perfectissimum*, in possessing all the realities that can exist together, must therefore possess all realities without exception, and every one of them in the highest degree. The notion of an individual existence that is at once *perfectissimum* and also *realissimum* is thus determinable by pure Reason from its internal resources. It is the ground and condition of all other existences; all of them arise through limitation of its purely positive nature.

Kant seeks to justify his metaphysical deduction of the *Ideal* from the disjunctive syllogism, by recasting the above argument in the following manner. Since everything which exists is completely determined, it is subject to the principle of complete determination, according to which one of each of the possible pairs of contradictory predicates must be applicable to it. To be completely determined the thing must be compared with the sum total of all possible predicates. Although this idea of the sum total of all possible predicates, through reference to which alone any concept can be completely determined, seems itself indeterminate, we find nevertheless on closer examination that it individualises itself *a priori*, transforming itself into the concept of an individual existence that is completely determined by the mere Idea, and which may therefore be called an Ideal of pure Reason. That is proved as follows. No one can definitely think a negation unless he founds it on the opposite affirmation. A man completely blind cannot frame the smallest conception of darkness, because he has none of light. All negations are therefore derivative; it is the realities which contain the material by which a complete determination of anything becomes possible. The source, from which all possible predicates may be derived, can be nothing but the sum total of reality. And this concept of the *omnitudo realitatis* is the Idea of a Being that is single and

individual. As all finite beings derive the material of their possibility from it, they presuppose it, and cannot, therefore, constitute it. They are imperfect copies (*ectypa*), of which it is the sole Ideal. The Idea is also individual. Out of each possible pair of contradictory predicates, that one which expresses reality belongs to it. By these infinitely numerous positive predicates it is determined to absolute concreteness; and as it therefore possesses all that has reality, not only in nature but in man, it must be conceived as a personal and intelligent Primordial Being. The logical Ideal, thus determining itself completely by its own concept, appears not only as ideal but also as real, not only as logical but also as divine.

Kant so far anticipates his criticism of the ontological argument as to give, in the remaining paragraphs of this second section, a preliminary criticism of this procedure. For the purpose for which the Ideal is postulated, namely, the determination of all finite and therefore limited existences, Reason does not require to presuppose an existence corresponding to it. Its mere Idea will suffice.

"All manifoldness of things is only a correspondingly varied mode of limiting the concept of the highest reality which forms their common substratum, just as all figures are only possible as so many different modes of limiting infinite space."

This relation is not, however, that of a real existence to other things but of an Idea to concepts. The Idea is a mere fiction, necessary for comprehending the limited, not a reality that can be asserted, even hypothetically, as given along with the limited. None the less, owing to a natural transcendental illusion, the mind inevitably tends to hypostatise it, and so generates the object of rational theology.

Comment. — The explanation of this illusion, which Kant proceeds to give in the two concluding paragraphs, is peculiarly confusing. Though the concept of an all-comprehensive reality may, he argues, be required for the definition of sensible objects, such a concept must not for that reason be taken as representing a real existence. The teaching of the section on *Amphiboly* is here entirely ignored; and the reader is bewildered by the assumption, which Kant apparently makes, that something analogous to the Leibnizian Ideal is a prerequisite of possible experience.

These last remarks indicate the kind of criticism to which the argument of this section lays itself open. In expounding the teaching of the Leibnizian science of rational theology, Kant strives to represent its Ideal as being an inevitable Idea of human Reason; and in order to make this argument at all convincing he is constrained to treat as valid the presupposed ontology, though that has already been shown in the discussion of *Amphiboly* to be altogether untenable. Limitation is not merely negative; genuine realities may negate one another. Though the objects of sense presuppose the entire system to which they belong, the form of this presupposition is in no respect analogous to that which Wolff would represent as holding between finite existences and the *Ens realissimum*. The passage in the *Analytic* in which Kant directly controverts the above teaching is as follows:

"The principle, that realities (as pure assertions) never logically contradict each other ... has not the least meaning either in regard to nature or in regard to any thing-in-itself.... Although Herr von Leibniz did not, indeed, announce this proposition with all the pomp of a new principle, he yet made use of it for new assertions, and his followers expressly incorporated it in their Leibnizian-Wolffian system. According to this principle all evils, for instance, are merely consequences of the limitations of created beings, *i.e.* negations, because negations alone conflict with reality.... Similarly his disciples consider it not only possible, but even natural, to combine all reality, without fear of any conflict, in one being, because the only conflict which they recognise is that of contradiction, whereby the concept of a thing is itself removed. They do not admit the conflict of reciprocal injury in which each of two real grounds destroys the effect of the other — a process which we can represent to ourselves only in terms of conditions presented to us in sensibility."

Thus the Ideal which Kant here declares to be a necessary Idea of Reason is denounced in the *Analytic* as based on false principles peculiar to the Leibnizian philosophy, and as "without the least meaning in regard either to nature or to any thing in itself." The teaching of the *Analytic* will no more combine with

this scholastic rationalism than oil with water. The reader may safely absolve himself from the thankless task of attempting to render Kant's argumentation in these paragraphs consistent with itself. Fortunately, in the next section, Kant returns to the standpoint proper to the doctrine he is expounding, and lays bare, with remarkable subtlety and in a very convincing manner, the concealed dialectic by which the conclusions of this metaphysical science are really determined.

SECTION III

THE SPECULATIVE ARGUMENTS IN PROOF OF THE EXISTENCE OF A SUPREME BEING

Statement. — Though the Ideal is not arbitrary, but is presupposed in every attempt to define completely a finite concept, Reason would feel hesitation in thus transforming what is merely a logical concept into a Divine Existence, were it not that it is impelled from another direction to derive reality from such a source. All existences known in experience are contingent, and so lead us (owing to the constitution of our Reason) to assume an absolutely necessary Being as their ground and cause. Now when we examine our various concepts, to ascertain which will cover this notion of necessary existence, we find that there is one that possesses outstanding claims, namely, that Idea which contains a therefore for every wherefore, which is in no respect defective, and which does not permit us to postulate any condition. The concepts of the Ideal and of the necessary alone represent the unconditioned; and as they agree in this fundamental respect, they must, we therefore argue, be identical. And to this conclusion we are the more inclined, in that, by thus idealising reality, we are at the same time enabled to realise our Ideal.

This line of argument, which starts from the contingent, is as little valid as that which proceeds directly from the Ideal. But since these arguments express certain tendencies inherent in the human mind, they have a vitality which survives any merely forensic refutation. Though the conclusions to which they lead are false, they are none the less inevitably drawn. Our acceptance of them is due to a transcendental illusion which may be detected as such, but which, like the ingrained illusions of sense-experience, must none the less persist.

The opening paragraph of Section V is the natural completion of the above analysis. The ontological argument, in *starting* from the concept of the *Ens realissimum*, inverts the natural procedure. It is "a merely scholastic innovation," and would never have been attempted save for the need of finding some necessary Being, to which we may ascend from contingent existence. It maintains that this necessary Being must be unconditioned and *a priori* certain, and accordingly looks for a concept capable of fulfilling this requirement. Such a concept is supposed to exist in the Idea of an *Ens realissimum*, and this Idea is therefore used to gain more definite knowledge of that which has been previously and independently recognised, namely, the necessary Being,

"This natural procedure of Reason was concealed from view, and instead of ending with this concept, the attempt was made to begin with it, and so to deduce from it that necessity of existence which it was only fitted to complete. Thus arose the unfortunate ontological proof, which yields satisfaction neither to the natural and healthy understanding nor to the more academic demands of strict proof."

To return to Section III.: Kant breaks the continuity of his argument, and anticipates his discussion of the cosmological proof, by stopping to point out the illegitimacy of the assumption which underlies the first step in the above argument, namely, that a limited being cannot be absolutely necessary. Though the concept of a limited being does not contain the unconditioned, that does not prove that its existence is conditioned. Indeed each and every limited being may, for all their concepts show to the contrary, be

unconditionally necessary. The above argument is consequently inconclusive, and cannot be relied on to give us any concept whatever of the qualities of a necessary Being. But this is a merely logical defect, and, as already noted, it is not really upon logical cogency that the persuasive force of the argument depends.

In conclusion Kant points out that there are only three possible kinds of speculative (*i.e.* theoretical) proofs of the existence of God: (1) from definite experience and the specific nature of the world of sense as revealed in experience; (2) from indefinite experience, *i.e.* from the fact that any existence at all is empirically given; (3) the non-empirical *a priori* proof from mere concepts. The first is the *physico-theological* or *teleological* argument, the second is the *cosmological*, and the third is the *ontological*. Kant finds it advisable to reverse the order of the proofs, and to begin by consideration of the ontological argument. This would seem to indicate that the ‘scholastic innovation’ to which he traces the origin of the ontological proof has more justification than his remarks appear to allow.

SECTION IV

THE IMPOSSIBILITY OF AN ONTOLOGICAL PROOF

Statement. — Hitherto Kant has employed the concept of an absolutely necessary Being without question. He now recognises that the problem, from which we ought to start, is not whether the existence of an absolutely necessary Being can be demonstrated, but whether, and how, such a Being can even be conceived. And upon analysis he discovers that the assumed notion of an absolutely necessary, *i.e. unconditioned* Being is entirely lacking in intelligible content. For in eliminating all conditioning causes — through which alone the understanding can conceive necessity of existence — we also remove this particular kind of necessity. A verbal definition may, indeed, be given of the Idea, as when we say that it represents something the non-existence of which is impossible. But this yields no insight into the reasons which make its non-existence inconceivable, and such insight is required if anything at all is to be thought in the Idea.

“The expedient of removing all those conditions which the understanding indispensably requires in order to regard something as necessary, simply through the introduction of the word *unconditioned*, is very far from sufficing to show whether I am still thinking anything, or not rather perhaps nothing at all, in the concept of the unconditionally necessary.”

The untenableness of the concept has been in large part concealed through a confusion between logical and ontological necessity, that is, between necessity of judgment and necessity of existence. The fact that every proposition of geometry must be regarded as absolutely necessary was supposed to justify this identification. It was not observed that logical necessity refers only to *judgments*, not to *things* and their relations, and that the absolute necessity of the judgment holds only upon the assumption that the conditioned necessity of the thing referred to has previously been granted. If there be any such thing as a triangle, the assertion that it has three angles will follow with absolute necessity; but the existence of a triangle or even of space in general is contingent. In other words, the asserted necessity is only a form of logical sequence, not the unconditioned necessity of existence which is supposed to be disclosed in the Idea of Reason. All judgments, so far as they refer to existence, as distinct from mere possibility, are hypothetical, and serve to define a reality that is only contingently given. In adopting this position, Kant is in entire agreement with Hume. The contradictory of a matter of fact is always thinkable. There has, Kant claims, been no more fruitful source of illusion throughout the whole history of philosophy than the belief in an absolute necessity that is purely logical. In the ontological argument we have the most striking instance of such rationalistic exaggeration of the powers of thought.

Comment. — Had this criticism of the Idea of unconditioned necessity been introduced at an earlier stage in Kant's argument, much confusion would have been avoided. It involves the thorough revisal of his criticism of the third and fourth antinomies, as well as of the whole account hitherto given of the function of Reason and of its metaphysical dialectic. The principle, that if the conditioned be given, the whole series of conditions up to the unconditioned is likewise given, must no longer be accepted as a basis for argument. Indeed the very terms in which Reason has so far been defined, as the faculty of the unconditioned, become subject to question. In that definition the term unconditioned has tacitly been taken as equivalent to the unconditionally necessary, and on elimination of the element of necessity, it will reduce merely to the concept of totality, which is a pure form of the understanding. Those parts of the *Dialectic*, which embody the view that Reason is simply the understanding transcendently employed, will thus be confirmed; the alternative view of Reason as a separate faculty will have to be eliminated. But these are questions which Kant himself proceeds to raise and discuss. Meantime he applies the above results in criticism of the ontological argument.

Statement. — In an identical judgment it is contradictory to reject the predicate while retaining the subject. But there is no contradiction if we reject subject and predicate alike, for nothing is then left that can be contradicted. If we assume that there is a triangle, we are bound to recognise that it has three angles, but there is no contradiction in rejecting the triangle together with its three angles. The same holds true of an absolutely necessary Being. 'God is omnipotent' is an identical and therefore necessary judgment. But if we say, 'There is no God,' neither the omnipotence nor any other attribute remains; and there is therefore not the least contradiction in saying that God does not exist. The only way of evading this conclusion is to argue that there are subjects which cannot be removed out of existence. That, however, would only be another way of asserting that there exist absolutely necessary subjects, and that is the very assertion which is now in question, and which the ontological argument undertakes to prove. Our sole test of what cannot be removed is the contradiction which would thereby result; and the only possible instance which can be cited is the concept of the *Ens realissimum*. It remains, therefore, to establish the above criticism for this specific case.

At the start Kant points out that absence of internal contradiction, even if granted, proves only that the *Ens realissimum* is a *logically* possible concept (as distinguished from the *nihil negativum*); it does not suffice to establish the possibility of the object of the concept. But for the sake of argument Kant allows this initial assumption to pass. The argument to be disproved is that as reality comprehends existence, existence is contained in the concept of *Ens realissimum*, and cannot therefore be denied of it without removing its internal possibility. The really fundamental assumption of this argument is that existence is capable of being included in the concept of a *possible* being. If that were so, the assertion of its existence would be an analytic proposition, and the proof could not be challenged. (The assumption is partly concealed by alternation of the terms reality and existence: in their actual employment they are completely synonymous.) As the above assumption thus decides the entire issue, Kant sets himself to establish, in direct opposition to it, the thesis, that every proposition which predicates existence is synthetic, and that in consequence its denial can never involve a logical contradiction. Existence can never form part of the content of a conception, and therefore must not be regarded as a possible predicate. What logically corresponds to it in a judgment is a purely formal factor, namely, the copula. The proposition, 'God is omnipotent,' contains two concepts, each of which has its object — God and omnipotence. The word 'is' adds no new predicate, but only serves to posit the predicate in its relation to the subject. Similarly, when we take the subject together with all its predicates (including that of omnipotence), and say, 'God is' or 'there is a God,' we attach no new predicate to the concept of God, but only posit the subject in itself with all its predicates as being an object that stands in relation to our concept. In order that the proposition be true, the *content* of the object and of the concept must be one and the same. If the object contained more than the concept, the concept would not express the object, and the proposition would assert a relation

that does not hold. Or to state the same point in another way, the real must not contain more content than the possible. Otherwise it would not be the possible, but something different from the possible, which would then be taken as existing. A hundred real thalers do not contain the least coin more than a hundred possible thalers. Though my financial position is very differently affected by a hundred real thalers than by the thought of them only, a conceived hundred thalers are not in the least increased through acquiring existence outside my concept.

Kant presents his argument in still another form. If we think in a thing every kind of reality except one, the missing reality is not supplied by my saying that this defective thing exists. On the contrary, it exists with the same defect with which I have thought it. When, therefore, I think a Being as the highest reality, without any defect, the question still remains whether it exists or not. For though, in my concept, nothing may be lacking of the possible real *content* of a thing in general, something is still lacking in its relation to my whole state of thinking, namely, knowledge of its existence; and such knowledge can never be obtained save in an *a posteriori* manner. That is owing to the limitations imposed by the conditions of our sense-experience. We never confound the existence of a sensible object with its mere concept. The concept represents something that may or may not exist: to determine existence we must refer to actual experience. As Kant has already stated, the actual is always for us the accidental, and its assertion is therefore synthetic. A possible idea and the idea of a possible thing are quite distinct. A thing is known to be possible only when presented in some concrete experience, or when, though not actually experienced, it has been proved to be bound up, according to empirical laws, with given perceptions. It is not, therefore, surprising that if we try, as is done in the ontological argument, to think existence through the pure category, we cannot mention a single mark distinguishing it from a merely logical possibility. The concept of a Supreme Being is, in many respects, a valuable Idea, but just because it is an Idea of pure Reason, *i.e.* a mere Idea, we can no more extend our knowledge of real existence by means of it, than a merchant can better his position by adding a few noughts to his cash account.

There are many points of connection between this section and the first edition *Introduction*; and in view of these points of contact Adickes has suggested that the considerations which arose in the examination of the ontological argument may have been what brought Kant to realise that the various problems of the *Critique* can all be traced to the central problem of *a priori* synthesis.

SECTION V

THE IMPOSSIBILITY OF A COSMOLOGICAL PROOF OF THE EXISTENCE OF GOD

Statement. — Kant, as already noted, views the ontological proof as ‘a mere innovation of scholastic wisdom’ which restates, in a quite unnatural form, a line of thought much more adequately expressed in the cosmological proof. To discover the natural dialectic of Reason we must therefore look to this latter form of argument. It is composed of two distinct stages. In the first stage it makes no use of specific experience: if *anything* is given us as existing, *e.g.* the self, there must exist an absolutely necessary Being as its cause. Then, in the second stage, it is argued that as such a Being must be altogether outside experience, Reason must leave experience entirely aside, and discover from among pure concepts what properties an absolutely necessary Being ought to possess, *i.e.* which among all possible things contains in itself the conditions of absolute necessity. The requisite enlightenment is believed by Reason to be derivable only from the concept of an *Ens realissimum*, and Reason therefore at once concludes that this concept must represent the absolutely necessary Being.

Now in that final conclusion the truth of the ontological argument is assumed. If the concept of a Being of the highest reality is so completely adequate to the concept of necessary existence that they can be

regarded as identical, the latter must be capable of being derived from the former, and that is all that is maintained in the ontological proof. To make this point clearer, Kant states it in scholastic form. If the proposition be true, that every absolutely necessary Being is at the same time the most real Being (and this is the *nervus probandi* of the cosmological proof in so far as it is also theological), it must, like all affirmative propositions, be capable of conversion, at least *per accidens*. This gives us the proposition that some *Entia realissima* are at the same time absolutely necessary Beings. One *Ens realissimum*, however, does not differ from another, and what applies to one applies to all. In this case, therefore, we must employ simple conversion, and say that every *Ens realissimum* is a necessary Being. Thus the cosmological proof is not only as illusory as the ontological, but also less honest. While pretending to lead us by a new road to a sound conclusion, it brings us back, after a short circuit, into the old path. If the ontological argument is correct, the cosmological is superfluous; and if the ontological is false, the cosmological cannot possibly be true.

But the first stage of the cosmological argument, that by which it is distinguished from the ontological, is itself fallacious. A whole nest of dialectical assumptions lies hidden in its apparently simple and legitimate inference from the contingent to the necessary. To advance from the contingent to the necessary, from the relative to the absolute, from the given to the transcendent, is just as illegitimate as the opposite process of passing from Idea to existence. The necessity of thought, which is in both cases the sole ground of the inference, is found on examination to be of merely subjective character. No less than three false assumptions are involved in this inference. In the first place, the principle that everything must have a cause, which can be proved to be valid only within the world of sense, is here applied to the sensible world as a whole; and is therefore employed in the wider form which coincides with the fundamental principle of the higher faculty of Reason. We assume, that if the conditioned be given, the totality of its conditions *up to the unconditioned* is given likewise. No such principle can be granted. As it is synthetic, it could be established only as a condition of the possibility of experience. But no such proof is offered: the principle is based upon a purely intellectual concept. Secondly, the inference to a first cause rests on the kindred assumption that an infinite series of empirical causes is impossible. That conclusion can never be drawn, even within the realm of experience. How, then, can we rely upon it in advancing beyond experience? Certainly, no one can prove that the empirical series is infinite, but just as little can we establish the opposite. In discussing the third and fourth antinomies Kant has shown that the existence of a first cause or of an absolutely necessary Being, though possible (or rather, possibly possible), is never demonstrable. Thirdly — as has been shown in A 592-3 = B 620-1 — in inferring to an unconditioned cause, it is blindly assumed that the removal of all conditions does not at the same time remove the very concept of necessity. Our only notion of necessity is derived from experience, and therefore depends on those finite conditions which the argument would deny to us. The concept of unconditioned necessity is entirely null and void.

The fourth defect, which Kant enumerates, refers to the second stage of the cosmological argument, and has already been considered. He ought also to have mentioned a still further assumption underlying its first stage, namely, that a concept which represents a limited being, as, for instance, that of matter, cannot represent necessary existence. This also is an assumption which it cannot justify. This objection Kant has himself stated in A 586 = B 614 and A 588 = B 616.

Comment. — We are apt to overlook the wider sweep which Kant's criticism takes in this section, owing to his omission to notify the reader that he is here calling in question a principle which he has hitherto been taking for granted, namely, the principle in terms of which he has in the opening sections of the *Dialectic* defined the faculty of Reason, that if the conditioned be given the totality of conditions up to the unconditioned is given likewise. The first step in his rejection of this principle occurs as merely incidental to his criticism of the ontological argument. It is there shown that the concept of the unconditionally necessary is without meaning. Now, in this present section, he calls in question the

principle itself. It must be rejected not only, as stated in the third of the above objections, because the concept of the unconditioned, which tacitly implies the factor of absolute necessity, is without real significance, but also for two further reasons — those above cited in the first and second objections. How very differently the problems of the *Dialectic* appear, and how very differently the Ideas of Reason have to be regarded, when this principle, and also the concept of the unconditioned of which it is the application, are thus called in question, will be shown in the sequel.

DISCOVERY AND EXPLANATION OF THE TRANSCENDENTAL ILLUSION IN ALL TRANSCENDENTAL PROOFS OF THE EXISTENCE OF A NECESSARY BEING

Statement. — We do not properly fulfil the task prescribed by Critical teaching in merely disproving the cosmological argument. We must also explain its hold upon the mind. If it is, as Kant insists, more natural to the mind than the ontological, and yet, as we have just seen, is more fallacious; if it has not been invented by philosophers, but is the instinctive reasoning of the natural man, it must rest, like all dialectical illusion, upon a misunderstanding of the legitimate demands of pure Reason. *Reason demands the unconditioned, and yet cannot think it*.

"Unconditioned necessity, which we so indispensably require as the last bearer of all things, is for human Reason the veritable abyss.... We can neither help thinking, nor can we bear the thought, that a Being — even if it be the one which we represent to ourselves as supreme amongst all Beings — should, as it were, say to itself: 'I am from eternity to eternity, and outside me there is nothing save what is through my will; *but whence am I*?' All support here fails us; and *supreme* perfection, no less than the *least* perfection, is unsubstantial and baseless for the merely speculative Reason...."

We are obliged to think something as necessary for all existence, and yet at the same time are unable to think anything as in itself necessary — God as little as anything else.

The explanation of this strange fact must be that which follows as a corollary from the limitation of our knowledge to sense-experience, namely, that our concepts of necessity and contingency do not concern things in themselves, and cannot therefore be applied to them in accordance with either of the two possible alternatives. Each alternative must express a subjective principle of Reason; and the two together (that something exists by necessity, and that everything is only contingent) must form complementary rules for the guidance of the understanding. These rules will then be purely heuristic and regulative, relating only to the formal interests of Reason, and may well stand side by side. For the one tells us that we ought to philosophise as if there were a necessary first ground for everything that exists, *i.e.* that we ought to be always dissatisfied with relativity and contingency, and to seek always for what is unconditionally necessary. The other warns us against regarding any single determination in things (such, for instance, as impenetrability or gravity) as absolutely necessary, and so bids us keep the way always open for further derivation. In other words, Reason guides the understanding by a twofold command. The understanding must derive phenomena and their existence from other phenomena, just as if there were no necessary Being at all; while at the same time it must always strive towards the completeness of that derivation, just as if such a necessary Being were presupposed. It is owing to a transcendental illusion or subreption that we view the latter principle as constitutive, and so think its unity as hypostatised in the form of an *Ens realissimum*. The falsity of this substitution becomes evident as soon as we consider *that unconditioned necessity, as a thing in itself, cannot even be conceived, and that the "Idea" of it cannot, therefore, be ascribed to Reason save as a merely formal principle, regulative of the understanding in its interpretation of given experience*.

Comment. — The reader may observe that, when Kant is developing this sceptical view of the Ideal of Reason, the explanation of dialectical illusion in terms of transcendental idealism falls into the background. The illusion is no longer traced to a confusion between appearances and things in

themselves, but to the false interpretation of regulative principles as being constitutive. When it is the cosmological problem with which we are dealing, the two illusions do, indeed, coincide. If we view the objects of sense-experience as things in themselves, we are bound to regard the Ideal completion of the natural sciences as an adequate representation of ultimate reality. But in Rational Theology, which is professedly directed towards the definition of a Being distinct from nature and conditioning all finite existence, it is not failure to distinguish between appearance and things in themselves, but the mistaking of a merely formal Ideal for a representation of reality, that is alone responsible for the conclusions drawn.

In A 617-18 = B 645-6 Kant makes statements which conflict with the teaching of A 586 = B 614 and A 588 = B 616. In the latter passages he has argued that the concept of a limited being may not without specific proof be taken as contradictory of absolute necessity. He now categorically declares that the philosophers of antiquity are in error in regarding matter as primitive and necessary; and the reason which he gives is that the regulative principle of Reason forbids us to view extension and impenetrability, “which together constitute the concept of matter,” as ultimate principles of experience. But obviously Kant is here going further than his regulative principle will justify. It demands only that we should always look for still higher principles of unity, and so keep open the way for possible further derivation; it does not enable us to assert that such will actually be found to exist. Notwithstanding the Ideal demands of the regulative principle, matter may be primordial and necessary, and its properties of extension and impenetrability may not be derivable from anything more ultimate.

In this connection we may raise the more general question, how far the Ideal demand for necessity and unity in knowledge and existence can be concretely pictured. Kant gives a varying answer. Sometimes — when he is emphasising the limitation of our theoretical knowledge to sense-experience — he reduces the speculative Idea of Divine Existence to a purely abstract maxim for the regulation of natural science. When the Ideal occupies the mind on its own account, and so attracts our attention away from our sense-knowledge, it is an unreality, and perverts the understanding; it yields genuine light and leading only as a quite general maxim within the sphere of natural science. From this point of view necessary Being, even as an Ideal, can by no means be identified with a personal God. It signifies only the highest possible system and unity of the endlessly varied natural phenomena in space and time, and can be approximately realised in the most various ways. Its significance is entirely cosmological. It is an Ideal of positive science, and signifies only systematic unity in the object known. In being transformed from a scientific ideal into a subject of theological enquiry, it has inevitably given rise to dialectical illusion. At other times, — when he is concerned to defend the concept of Divine Existence as at least possible, and so to prepare the way for its postulation as implied in the moral law, or when he is seeking, as in the *Critique of Judgment*, to render comprehensible the complete adaptation of phenomenal nature in its material aspect to the needs of our understanding — Kant insists that we are ultimately compelled, by the nature of our faculties, to conceive the Ideal of Reason as a personal God, as an Intelligence working according to purposes. Only by such a personal God, he maintains, can the demands of Reason be genuinely satisfied.

These two interpretations of the Ideal of Reason are in conflict with one another; and so far as the *Critique of Pure Reason* is concerned, a very insufficient attempt is made to justify the frequent assertion that the Idea of God is *the* Ideal of Reason, and not merely one possible, and highly problematic, interpretation of it. If the Idea of God is a necessary Idea, it cannot be adequately expressed through any merely regulative maxim. It demands not only system in knowledge but also perfection in the nature of the known. It is not a merely logical Ideal such as might be satisfied by any rational system, but an Ideal which concerns matter as well as form, man as well as nature, our moral needs as well as our intellectual demands. If Kant is to maintain that the only genuine function of theoretical Reason is to guide the understanding in its scientific application, he is debarred from asserting that a concrete interpretation of its regulative principles is unavoidable. And he is also precluded by his own limitation of all knowledge to sense-experience from seeking to define by any positive predicate the transcendent nature of the thing in

itself.

Such justification as Kant can offer in support of his assertion that the Idea of God, of Intelligent Perfection, is an indispensable Idea of human Reason, is chiefly based upon the teleological aspect of nature which is dealt with in the physico-theological proof. Mechanical science implies only the cosmological Idea: teleological unity presupposes the theological Ideal. Further enquiry, then, into the necessity of the Idea of God as a regulative principle, and its dangers as a source of dialectical illusion, we must defer until we have examined the one remaining argument.

SECTION VI

THE IMPOSSIBILITY OF THE PHYSICO-THEOLOGICAL PROOF

Statement. — The teleological proof starts from our definite knowledge of the order and constitution of the sensible world. The actual world presents such immeasurable order, variety, fitness, and beauty, that we are led to believe that here at least is sufficient proof of the existence of God. Kant's attitude towards this argument is at once extremely critical and extremely sympathetic. Though he represents it as the oldest, the clearest, and the most convincing, he is none the less prepared to show that it contains every one of the fallacies involved in the other two proofs, as well as some false assumptions peculiar to itself. It possesses overpowering persuasive force, not because of any inherent logical cogency, but because it so successfully appeals to feeling as to silence the intellect. It would, Kant declares, be not only comfortless, but utterly vain to attempt to diminish its influence.

"[The mind is] aroused from the indecision of all melancholy reflection, as from a dream, by one glance at the wonders of nature and the majesty of the universe...."

Meantime, however, we are concerned with its merely logical force. We have to decide whether, as theoretical proof, it can claim assent on its own merits, requiring no favour, and no help from any other quarter. On the basis of empirical facts the argument makes the following assertions. (1) There are everywhere in the world clear indications of adaptation to a definite end. (2) As this adaptation cannot be due to the working of blind, mechanical laws, and accordingly cannot be explained as originating in things themselves, it must have been imposed upon them from without; and there must therefore exist, apart from the sensible world, an intelligent Being who has arranged it according to ideas antecedently formed. (3) As there is unity in the reciprocal relations of the parts of the universe as portions of a single edifice, and as the universe is infinite in extent and inexhaustible in variety, its intelligent cause must be single, all-powerful, all-wise, i.e. God.

Now, even granting for the sake of argument the admissibility of these assertions, they enable us to infer only an intelligent author of the purposive form of nature, not of its matter, only an architect who is very much hampered by the inadaptability of the material in which he has to work, not a Creator to whose will everything is due. To prove the contingency of matter itself, we should have to establish the truth of the cosmological proof.

But the assumptions implied even in the demonstration that God exists as a *formative* power, are by no means beyond dispute. Why may not nature be regarded as giving form to itself by its blindly working forces? Can it really be proved that nature is a work of art that demands an artificer as certainly as does a house, or a ship, or a clock? Kant's argument is at this point extremely brief, and I shall so far digress from the statement of it, which he here gives, as to supplement it from his other writings. Even so-called dead matter is not merely inert. By its inherent powers of gravity and chemical attraction it spontaneously gives rise to the most wonderful forms. When Clarke and Voltaire, in their first enthusiasm over Newton's

great discovery, asserted that the planetary system must have been divinely created, each planet being launched in the tangent of its orbit by the finger of God, just as a wheel must be fixed into its place by the hand of the mechanician, they under-estimated the organising power of blind inanimate nature. As Kant argued in his early treatise, the planetary system can quite well have arisen, and, as it would seem, actually has come into existence, through the action of blindly working laws. The mechanical principles which account for its present maintenance will also account for its origin and development. But it is when we turn to animate nature, which is the chief source from which arguments for design are derived, that the insufficiency of the teleological argument becomes most manifest. As Kant points out in the *Critique of Judgment*, the differentia distinguishing the living from the lifeless, is not so much that it is organised as that it is self-organising. When, therefore, we treat an organism as an analogon of art we completely misrepresent its essential nature. In regarding it as put together by an external agent we are ignoring its internal self-developing power. As Hume had previously maintained in his *Dialogues on Natural Religion*, the facts of the organic world not only agree with the facts of the inorganic world in *not* supporting the argument of the teleological proof, but are in direct conflict with it.

But to return to Kant's immediate statement of the argument. Setting the above objection aside, and granting for the present that nature may be regarded as the outcome of an external artificer, we can argue only to a cause adequate to its production, *i.e.* to an extraordinarily wise and wonderfully powerful Being. Even if we ignore the existence of evil and defect in nature, the step from great power to omnipotence, and from great wisdom to omniscience, is one that can never be justified on empirical grounds. Since the Ideas of Reason, and above all the completely determined, individual Ideal of Reason, transcend experience, experience can never justify us in inferring their reality. The teleological argument can, indeed, only lead us to the point of admiring the greatness, wisdom, and power of the author of the world. In proceeding further it abandons experience altogether, and reasons, not from particular kinds and excellencies of natural design, but from the contingency of all such adaptation to the existence of a necessary Being, exactly in the manner of the cosmological argument. And it ends by assuming, in agreement with the ontological proof, that the only possible necessary Being is the Ideal of Reason. Thus after committing a number of fallacies on its own account, the teleological argument itself endorses all those that are involved in the more *a priori* proofs. The teleological argument rests on the cosmological, and the cosmological on the ontological, which therefore would be the only proof possible, were the proof of a completely transcendent proposition ever possible at all. The strange fact that the convincing force of the arguments thus varies inversely with their validity shows, Kant maintains, that we are correct in concluding that they do not really depend upon their logical cogency, and merely express, in abstract terms, beliefs deep-rooted in the human spirit.

SECTION VII

CRITICISM OF ALL THEOLOGY BASED ON SPECULATIVE PRINCIPLES OF REASON

A 631-3 = B 659-66. — On the distinction between "theist" and "deist," cf. *Encyclopædia Britannica*, vii. :

"The later distinction between 'theist' and 'deist,' which stamped the latter word as excluding the belief in providence or in the immanence of God, was apparently formulated in the end of the eighteenth century by those rationalists who were aggrieved at being identified with the naturalists."

A 633-4 = B 661-2. — Kant here does no more than indicate that by way of practical Reason it may be possible to postulate, though not theoretically to comprehend, a Supreme Being. On the distinction between postulates and hypotheses, cf. A 769 ff. = B 797 ff., and below, ff. Cf. also ff.

A 634 = B 662. — On relative necessity, cf. below, p, 571 ff.

A 635-9 = B 663-7 only summarises points already treated.

A 639-42 = B 667-70. — Kant concludes by declaring that the Ideal, in addition to its regulative function, possesses two further prerogatives. In the first place, it supplies a standard, in the light of which any knowledge of Divine Existence, acquired from other sources, can be purified and rendered consistent with itself. For it is "an Ideal without a flaw," the true crown and culmination of the whole of human knowledge.

"If there should be a moral theology ... transcendental theology ... will then prove itself indispensable in determining its concept and in constantly testing Reason which is so often deceived by sensibility, and which is frequently out of harmony with its own Ideas."

And secondly, though the Ideal fails to establish itself theoretically, the arguments given in its support suffice to show the quite insufficient foundations upon which all atheistic, deistic, and anthropomorphic philosophies rest.

Comment. — These concluding remarks cannot be accepted as representing Kant's true teaching. The Ideal, by his own showing, is by no means without a flaw. In so far as it involves the concept of unconditioned necessity, it is meaningless; it is purely logical, and therefore contains no indication of real content; it embodies a false view of the nature of negation, and therefore of the relation of realities to one another. In short, it is constituted in accordance with the false, un-Critical principles of Leibnizian metaphysics, and is found on examination to be non-existent even as a purely mental entity. Reduced to its proper terms, it becomes a mere schema regulative of the understanding in the extension of experience, and does not yield even a negative criterion for the testing of our ideals of Divine Existence. The criterion, which Kant really so employs, is not that of an *Ens realissimum*, but the concept of an Intuitive Understanding, which, as he has indicated in the chapter on *Phenomena and Noumena*, is our most adequate Ideal of completed Perfection. This latter is not itself, however, a spontaneously formed concept of natural Reason, and does not justify the assertion that the Idea of God is a necessary Idea of the human mind. In attempting to defend such a thesis, Kant is unduly influenced by the almost universal acceptance of deistic beliefs in the Europe of his time. His criticism of the Ideal of Reason and of rational theology is much more destructive, and really allows that theology much less value, even as natural dialectic, than he is willing to admit. Architectonic forbids that the extreme radical consequences of the teaching of the *Analytic* should be allowed to show in their full force. These shortcomings are, however, in great part remedied in the elaborate *Appendix* which Kant has attached to the *Dialectic*.

APPENDIX TO THE TRANSCENDENTAL DIALECTIC

THE REGULATIVE EMPLOYMENT OF THE IDEAS OF PURE REASON

Before we proceed to deal with this *Appendix* it will be of advantage to consider the section in the *Methodology* on *the Discipline of Pure Reason in regard to Hypotheses*. That section affords a very illuminating introduction to the problems here discussed, and is extremely important for understanding Kant's view of metaphysical science as yielding either complete certainty or else nothing at all. This is a doctrine which he from time to time suggests, to the considerable bewilderment of the modern reader. In discussing it he starts from the obvious objection, that though nothing can be known through Reason in its pure *a priori* employment, metaphysics may yet be possible in an empirical form, as consisting of hypotheses, constructed in conjectural explanation of the facts of experience. Kant replies by defining the conditions under which alone hypotheses can be entertained as such. There must always be something completely certain, and not only invented or merely "opined," namely, the *possibility* of the object to

which the hypothesis appeals. Once that is proved, it is allowable, on the basis of experience, to form opinions regarding its reality. Then, and only then, can such opinions be entitled hypotheses. Otherwise we are not employing the understanding to explain; we are simply indulging the imagination in its tendency to dream. Now since the categories of the pure understanding do not enable us to invent *a priori* the concept of a dynamical connection, but only to apprehend it when presented in experience, we cannot by means of these categories invent a single object endowed with a new quality not empirically given; and cannot, therefore, base an hypothesis upon any such conception.

"Thus it is not permissible to invent any new original powers, as, for instance, an understanding capable of intuiting its objects without the aid of senses; or a force of attraction without any contact; or a new kind of substance existing in space and yet not impenetrable. Nor is it legitimate to postulate any other form of communion of substances than that revealed in experience, any presence that is not spatial, any duration that is not temporal. In a word our Reason can employ as conditions of the possibility of things only the conditions of possible experience; it can never, as it were, *create* concepts of things, independently of those conditions. Such concepts, though not self-contradictory, would be without an object."

This does not, however, mean that the concepts of pure Reason can have no valid employment. They are, it is true, Ideas merely, with no object corresponding to them in any experience; but then it is also true that they are not hypotheses, referring to imagined objects, supposed to be possibly real. They are purely problematic. They are heuristic fictions (*heuristische Fiktionen*), the sole function of which is to serve as principles regulative of the understanding in its systematic employment. Used in any other manner they reduce to the level of merely mental entities (*Gedankendinge*) whose very possibility is indemonstrable, and which cannot therefore be employed as hypotheses for the explanation of appearances. Given appearances can be accounted for only in terms of laws known to hold among appearances. To explain natural phenomena by a transcendental hypothesis — mental processes by the assumption of the soul as a substantial, simple, spiritual being, or order and design in nature by the assumption of a Divine Author — is never admissible.

"...that would be to explain something, which in terms of known empirical principles we do not understand sufficiently, by something which we do not understand at all."

And Kant adds that the wildest hypotheses, if only they are physical, are more tolerable than a hyperphysical one. They at least conform to the conditions under which alone hypothetical explanation as such is allowable. "Outside this field, to form opinions, is merely to play with thoughts...."

A further condition, required to render an hypothesis acceptable, is its adequacy for determining *a priori* all the consequences which are actually given. If for that purpose supplementary hypotheses have to be called in, the force of the main assumption is proportionately weakened. Thus we can easily explain natural order and design, if we are allowed to postulate a Divine Author who is absolutely perfect and all-powerful. But that hypothesis lies open to all the objections suggested by defects and evils in nature, and can only be preserved through new hypotheses which modify the main assumption. Similarly the hypothesis of the human soul as an abiding and purely spiritual being, existing in independence of the body, has to be modified to meet the difficulties which arise from the phenomena of growth and decay. But the new hypotheses, then constructed, derive their whole authority from the main hypothesis which they are themselves defending.

Such is Kant's criticism of metaphysics when its teaching is based on the facts of experience hypothetically interpreted. In regard to transcendent metaphysics, there are, in Kant's view, only two alternatives. Either its propositions must be established independently of all experience in purely *a priori* fashion, and therefore as absolutely certain; or they must consist in hypotheses empirically grounded. The first alternative has in the *Analytic* and *Dialectic* been shown to be impossible; the second alternative he rejects for the above reasons.

But this does not close Kant's treatment of metaphysical hypotheses. He proceeds to develop a doctrine which, in its fearless confidence in the truth of Critical teaching, is the worthy outcome of his abiding belief in the value of a "sceptical method." As Reason is by its very nature dialectical, outside opponents are not those from whom we have most to fear. Their objections are really derived from a source which lies in ourselves, and until these have been traced to their origin, and destroyed from the root upwards, we can expect no lasting peace. Our duty, therefore, is to encourage our doubts, until by the very luxuriance of their growth they enable us to discover the hidden roots from which they derive their perennial vitality.

"External tranquillity is a mere illusion. The germ of these objections, which lies in the nature of human Reason, must be rooted out. But how can we uproot it, unless we give it freedom, nay, nourishment, to send out shoots so that it may discover itself to our eyes, and that we may then destroy it together with its root? Therefore think out objections which have never yet occurred to any opponent; lend him, indeed, your weapons, or grant him the most favourable position which he could possibly desire. You have nothing to fear in all this, but much to hope for; you may gain for yourselves a possession which can never again be contested."

In this campaign to eradicate doubt by following it out to its furthermost limits, the hypotheses of pure Reason, "leaden weapons though they be, since they are not steeled by any law of experience," are an indispensable part of our equipment. For though hypotheses are useless for the establishment of metaphysical propositions, they are, Kant teaches, both admirable and valuable for their defence. That is to say, their true metaphysical function is not dogmatic, but polemical. They are weapons of war to which we may legitimately resort for the maintenance of beliefs otherwise established. If, for instance, we have been led to postulate the immaterial, self-subsistent nature of the soul, and are met by the difficulty that experience would seem to prove that both the growth and the decay of our mental powers are due to the body, we can weaken this objection by formulating the hypothesis that the body is not the cause of our thinking, but only a restrictive condition of it, peculiar to our present state, and that, though it furthers our sensuous and animal faculties, it acts as an impediment to our spiritual life. Similarly, to meet the many objections against belief in the eternal existence of a finite being whose birth depends upon contingencies of all kinds, such as the food supply, the whims of government, or even vice, we can adduce the transcendental hypothesis that life has neither beginning in birth nor ending in death, the entire world of sense being but an image due to our present mode of knowledge, an image which like a dream has in itself no objective reality. Such hypotheses are not, indeed, even Ideas of Reason, but simply concepts *invented* to show that the objections which are raised depend upon the false assumption that the possibilities have been exhausted, and that the mere laws of nature comprehend the whole field of possible existences. These hypotheses at least suffice to reveal the uncertain character of the doubts which assail us in our practical beliefs.

"[Transcendental hypotheses] are nothing but private opinions. Nevertheless, we cannot properly dispense with them as weapons against the misgivings which are apt to occur; they are necessary even to secure our inner tranquillity. We must preserve to them this character, carefully guarding against the assumption of their independent authority or absolute validity, since otherwise they would drown Reason in fictions and delusions."

We may now return to A 642-68 = B 670-96. The teaching of this section is extremely self-contradictory, wavering between a subjective and an objective interpretation of the Ideas of Reason. The probable explanation is that Kant is here recasting older material, and leaves standing more of his earlier solutions than is consistent with his final conclusions. We can best approach the discussion by considering Kant's statements in A 645 = B 673 and in A 650 ff. = B 678 ff. They expound, though unfortunately in the briefest terms, a point of view which Idealism has since adopted as fundamental. Kant himself, very

strangely, never develops its consequences at any great length. The Idea, which Reason follows in the exercise of its sole true function, the systematising of the knowledge supplied by the understanding, is that of a unity in which the thought of the whole precedes the knowledge of its parts, and contains the conditions according to which the place of every part and its relation to the other parts are determined *a priori*. This Idea specialises itself in various forms, and in all of them directs the understanding to a knowledge that will be that of no mere aggregate but of a genuine system. Such concepts are not derived from nature; we interrogate nature *according to them*, and consider our knowledge defective so long as it fails to embody them. In A 650 = B 678 Kant further points out that this Idea of Reason does not merely direct the understanding to search for such unity, but also claims for itself objective reality. And he adds,

"...it is difficult to understand how there can be a logical principle by which Reason prescribes the unity of rules, unless we also presuppose a transcendental principle whereby such systematic unity is *a priori* assumed to be necessarily inherent in the objects."

For how could we treat diversity in nature as only disguised unity, if we were also free to regard that unity as contrary to the actual nature of the real?

"Reason would then run counter to its own vocation, proposing as its aim an Idea quite inconsistent with the constitution of nature."

Nor is our knowledge of the principle merely empirical, deduced from the unity which we find in contingent experience. On the contrary, there is an inherent and necessary law of Reason compelling us, antecedently to all specific experience, to look for such unity.

"...without it we should have no Reason at all, and without Reason no coherent employment of the understanding, and in the absence of this no sufficient criterion of empirical truth. In order, therefore, to secure an empirical criterion we are absolutely compelled to presuppose the systematic unity of nature as objectively valid and necessary." "It might be supposed that this is merely an economical contrivance of Reason, seeking to save itself all possible trouble, a hypothetical attempt, which, if it succeeds, will, through the unity thus attained, impart probability to the presumed principle of explanation. But such a selfish purpose can very easily be distinguished from the Idea. For in the latter we presuppose that this unity of Reason is in conformity with nature itself; and that, although we are indeed unable to determine the limits of this unity, Reason does not here beg but command."

This last alternative, that Reason is here propounding a tentative hypothesis, in order by trial to discover how far it can be empirically verified — an alternative which Kant in the above passage rejects as unduly subjective, and as consequently failing to recognise the objective claims and *a priori* authority of the Ideas of Reason, — is yet a view which he himself adopts and indeed develops at considerable length in this same section. This, as already stated, affords evidence of the composite character and varying origins of the material here presented.

The *Dissertation* of 1770 gives a purely subjectivist interpretation of the regulative principles, among which, from its pre-Critical standpoint, it classes the principle of causality and the principle of the conservation of matter.

"[We adopt principles] which delude the intellect into mistaking them for arguments derived from the object, whereas they are commended to us only by the peculiar nature of the intellect, owing to their convenience for its free and ample employment. They therefore ... rest on *subjective* grounds ... namely, on the conditions under which it seems easy and expeditious for the intellect to make use of its insight.... These rules of judging, to which we freely submit and to which we adhere as if they were axioms, solely for the reason that *were we to depart from them almost no judgment regarding a given object would be permissible to our intellect, I entitle principles of convenience*.... [One of these is] the popularly received canon, *principia non esse multiplicanda praeter summam necessitatem*, to which we yield our adhesion, not because we have insight into causal unity in the world either by reason or by experience, but because we seek it by an impulse of the intellect, which seems to itself to have advanced in the

explanation of phenomena only in the degree in which it is granted to it to descend from a single principle to the greatest number of consequences.”

This, in essentials, is the view which we find developed in A 646-9 = B 674-8. Reason is the faculty of deducing the particular from the general. When the general is admitted only as *problematical*, as a mere idea, while the particular is certain, we determine the universality of the rule by applying it to the particulars, and then upon confirmation of its validity proceed to draw conclusions regarding cases not actually given. This Kant entitles the *hypothetical* use of Reason. Reason must never be employed constitutively. It serves only for the introduction, as far as may be found possible, of unity into the particulars of knowledge. It seeks to make the rule *approximate* to universality. The unity which it demands

“...is a *projected* unity, to be regarded not as given in itself, but as a problem only. This unity aids us in discovering a principle for the manifold and special employment of the understanding, drawing its attention to cases which are not given, and thus rendering it more coherent.”

The unity is merely logical, or rather methodological. To postulate, in consequence of its serviceableness, real unity in the objects themselves would be to transform it into a transcendental principle of Reason, and to render

“...the systematic unity necessary, not only subjectively and logically, as method, but objectively also.”

The above paragraphs are intercalated between A 645 = B 673 and A 650-63 = B 678-91, in which, as we have already seen, the directly opposite view is propounded, namely, that such principles are *not* merely hypothetical, *nor* merely logical. In all cases they claim reality, and rest upon transcendental principles; they condition the very possibility of experience; and may therefore be asserted to be *a priori* necessary and to be objectively valid. To quote two additional passages:

“...we can conclude from the universal to the particular, only if universal qualities are ascribed to things as the foundation upon which the particular qualities rest.” “The foundation of these laws [cf. below, p-1] is not due to any secret design of making an experiment by putting them forward as merely tentative suggestions.... It is easily seen that they contemplate the parsimony of fundamental causes, the manifoldness of effects, and the consequent affinity of the parts of nature, as being in themselves both rational and natural. Hence these principles carry their recommendation directly in themselves, and not merely as methodological devices.”

Thus, in direct opposition to the preceding view of Reason’s function as hypothetical, Kant is now prepared to maintain that the maxims of Reason are without meaning and without application save in so far as they can be grounded in a transcendental principle.

Let us follow Kant’s detailed exposition of this last thesis. The logical maxim, to seek for systematic unity, rests upon the transcendental principle that the apparently infinite variety of nature does not exclude identity of species, that the various species are varieties of a few genera, and these again of still higher genera. This is the scholastic maxim: *entia praeter necessitatem non esse multiplicanda*. Upon this principle rests the possibility of concepts, and therefore of the understanding itself. It is balanced, however, by a second principle, no less necessary, the transcendental law of specification, namely, that there must be manifoldness and diversity in things, that every genus must specify itself in divergent species, and these again in sub-species. Or as it is expressed in its scholastic form: *entium varietates non temere esse minuendas*. This principle is equally transcendental. It expresses a condition no less necessary for the possibility of the understanding, and therefore of experience. As the understanding knows all that it knows by concepts only, however far it may carry the division of genera, it can never know by means of pure intuition, but always again by lower concepts. If, therefore, there were no lower concepts, there could be no higher concepts; the gap existing between individuals and genera could never be bridged; or rather, since neither individuals nor universals could then be apprehended, neither would

exist for the mind. As the higher concepts acquire all their content from the lower, they presuppose them for their own existence.

"Every concept may be regarded as a point which, in so far as it represents the standpoint of a spectator, has its own horizon.... This horizon must be capable of containing an infinite number of points, each of which again has its own narrower horizon; that is, every species contains sub-species, according to the principle of specification, and the logical horizon consists exclusively of smaller horizons (sub-species), never of points which possess no extent (individuals)."

Combining these two principles, that of *homogeneity* and that of *specification*, we obtain a third, that of *continuity*. The logical law of the *continuum formarum logicarum* presupposes the transcendental law, *lex continui in natura*. It provides that homogeneity be combined with the greatest possible diversity by prescribing a continuous transition from every species to every other, or in other words by requiring that between any two species or sub-species, however closely related, intermediate species be always regarded as possible. (The paragraph at the end of A 661 = B 689, with its proviso that we cannot make any definite empirical use of this law, is probably of later origin; it connects with the concluding parts of the section.) That this third law is also *a priori* and transcendental, is shown by the fact that it is not derived from the prior discovery of system in nature, but has itself given rise to the systematised character of our knowledge.

The psychological, chemical, and astronomical examples which Kant employs to illustrate these laws call for no special comment. They were taken from contemporary science, and in the advance of our knowledge have become more confusing than helpful. The citation in A 646 = B 674 of the concepts of "pure earth, pure water, pure air" as being "concepts of Reason" is especially bewildering. They are, even in the use which Kant himself ascribes to them, simply empirical hypotheses, formulated for the purposes of purely physical explanation; they are in no genuine sense universal, regulative principles.

In passing to A 663-8 = B 691-6 we find still another variation in the substance of Kant's teaching. He returns, though with a greater maturity of statement, and with a very different and much more satisfactory terminology, to the more sceptical view of A 646-9 = B 674-7. The interest of the above principles, Kant continues to maintain, lies in their transcendentality. Despite the fact that they are mere Ideas for the guidance of understanding, and can only be approached asymptotically, they are synthetic *a priori* judgments, and would seem to have an objective, though indeterminate, validity. So far his statements are in line with the preceding paragraphs. But he proceeds to add that this objective validity consists exclusively in their heuristic function. They differ fundamentally from the dynamical, no less than from the mathematical, principles of understanding, in that no schema of sensibility can be assigned to them. In other words, their object can never be exhibited *in concreto*; it transcends all possible experience. For this reason they are incapable of a transcendental deduction. They are among the conditions indispensably necessary to the possibility, not of each and every experience, but only of experience as systematised *in the interest of Reason*. In place of a schema they can possess only what may be called the *analogon* of a schema, that is, they represent the Idea of a *maximum*, which the understanding in the subjective interest of Reason — or, otherwise expressed, in the interest of a certain possible perfection of our knowledge of objects — is called upon to realise *as much as possible*. Thus they are at once *subjective* in the source from which they arise, and also *indeterminate* as to the conditions under which, and the extent to which, they can obtain empirical embodiment. The fact that in this capacity they represent a *maximum*, does not justify any assertion either as to the degree of unity which experience on detailed investigation will ultimately be found to verify, or as to the noumenal reality by which experience is conditioned.

In A 644-5 = B 672-3 Kant employs certain optical analogies to illustrate the illusion which the Ideas, in the absence of Critical teaching, inevitably generate. When the understanding is regulated by the Idea of a *maximum*, and seeks to view all the lines of experience as converging upon and pointing to it, it necessarily regards it, *focus imaginarius* though it be, as actually existing. The illusion, by which objects

are seen behind the surface of a mirror, is indispensably necessary if we are to be able to see what lies behind our backs. The transcendental illusion, which confers reality upon the Ideas of Reason, is similarly incidental to the attempt to view experience in its greatest possible extension.

ON THE FINAL PURPOSE OF THE NATURAL DIALECTIC OF HUMAN REASON

This section is thoroughly unified and consistent in its teaching. Its repetitious character is doubtless due to Kant's personal difficulty either in definitively accepting or in altogether rejecting the constructive, Idealist interpretation of the function of Reason. He at least succeeds in formulating a view which, while not asserting anything more than is required in the scientific extension of experience, indicates the many possibilities which such experience fails to exclude. As the Ideas of Reason are not merely empty thought-entities (*entia rationis ratiocinantis*), but have a certain kind of objective validity (*i.e.* are *entia rationis ratiocinatae*), they demand a transcendental deduction. What this deduction is, and how it differs from that of the categories, we must now determine. Its discovery will, Kant claims, crown and complete our Critical labours.

Kant begins by drawing a distinction between representing *an object absolutely*, and representing *an object in the Idea*.

"In the former case our concepts are employed to determine the object, in the latter case there is in truth only a schema for which no object, not even a hypothetical one, is directly given, and which only enables us to represent to ourselves indirectly other objects in their systematic unity, by means of their relation to this Idea."

An Idea is only a schema (Kant in terms of A 655 = B 693 ought rather to have said *analogon* of a schema) whereby we represent to ourselves, as for instance in the concept of a Highest Intelligence, not an objective reality but only such perfection of Reason as will tend to the greatest possible unity in the empirical employment of understanding.

With this introduction, Kant ushers in his famous "*als ob*" doctrine. We must view the things of the world *as if* they derived their existence from a Highest Intelligence. That Idea is heuristic only, not expository. Its purpose is not to enable us to comprehend such a Being, or even to think its existence, but only to show us how we should seek to determine the constitution and connection of the objects of experience. The three transcendental Ideas do not determine an object corresponding to them, but, *under the presupposition of such an object in the Idea*, lead us to systematic unity of *empirical* knowledge. When they are thus strictly interpreted as merely regulative of empirical enquiry, they will always endorse experience and never run counter to it. Reason, which seeks completeness of explanation, must therefore always act in accordance with them. Only thereby can experience acquire its fullest possible extension. This is the transcendental deduction of which we are in search. It establishes the indispensableness of the Ideas of Reason for the completion of experience, and their legitimacy as regulative principles.

We may here interrupt Kant's exposition so far as to point out that this argument does not do justice to the full force of his position. The true Critical contention — and only if we interpret the passage in the light of this contention can the proof be regarded as transcendental in the strict sense — is that the Ideas are necessary to the possibility of each and every experience, involved together with the categories as conditions of the very existence of consciousness. They are not merely regulative, but are regulative of an experience which they also help to make possible. They express the standards in whose light we condemn all knowledge which does not fulfil them; and we have consequently no option save to endeavour to conform to their demands. In other words, they are not derivative concepts obtained by merely omitting the restrictions essential to our empirical consciousness, but represent a presupposition necessarily involved in all consciousness. Some such restatement of the argument is demanded by the position which

Kant has himself outlined in A 645 = B 673 and in A 650 ff. = B 678 ff. Unfortunately he does not return to it. The more sceptical view which he has meantime been developing remains dominant. The deduction is left in this semi-Critical form.

A 672-6 = B 700-4 give a fuller statement of the "*als ob*" doctrine. In psychology we must proceed *as if* the mind were a simple substance endowed with personal identity (in this life at least), not in order to derive explanation of its changing states from the soul so conceived, but to derive them from each other in accordance with the Idea. In cosmology and theology (we may observe the straits to which Kant is reduced in his attempt to distinguish them) we ought to consider all phenomena both in their series and in their totality *as if* they were due to a highest and all-sufficient unitary ground. In so doing we shall not derive the order and system in the world from the object of the Idea, but only extract from the Idea the rule whereby the understanding attains the greatest possible satisfaction in the connecting of natural causes and effects.

In A 676-7 = B 704-5 Kant resorts to still another distinction — between *suppositio relativa* and *suppositio absoluta*. This distinction is suggested by the semi-objectivity of principles that are merely regulative. Though we have to recognise them as necessary, such necessity does not justify the assertion of their independent validity. When we admit a supreme ground as the source of the order and system which the principles demand, we do so only in order to think the universality of the principles with greater definiteness. Such supposition is relative to the needs of Reason in its *empirical* employment: not absolute, as pointing to the existence of such a being in itself.

"This explains why, in relation to what is given to the senses as existing, we require the Idea of a primordial Being necessary in itself, and yet can never form the slightest concept of it or of its absolute necessity."

This last statement leads to the further problem to which Kant here gives his final solution, how if, as has been shown in the *Dialectic*, the concepts of absolute necessity and of unconditionedness are without meaning, the Ideas of Reason can be entertained at all, even mentally. What is their actual content and how is it possible to conceive them? Kant's reply is developed in terms of the semi-Critical subjectivist point of view which dominates this section. The Ideas are mere Ideas. They yield not the slightest concept either of the internal possibility or of the necessity of any object corresponding to them. They only seem to do so, owing to a transcendental illusion. On examination we find that the concepts which we employ in thinking them as independently real, are one and all derived from experience. That is to say, we judge of them after the analogy of reality, substance, causality, and necessity in the sensible world.

"[They are consequently] *analoga* only of real things, not real things in themselves. We remove from the object of the Idea the conditions which limit the concept of the understanding, but which at the same time alone make it possible for us to have a determinate concept of anything. What we then think is, therefore, a something of which, as it is in itself, we have no concept whatsoever, but which we none the less represent to ourselves as standing in a relation to the sum-total of appearances analogous to that in which appearances stand to one another."

They do not carry our knowledge beyond the objects of possible experience, but only extend the empirical unity of experience. They are the schemata of regulative principles. In them Reason is concerned with nothing but its own inherent demands; and as their unity is the unity of a system which is to be sought only in experience, qualities derived from the sensible world can quite legitimately be employed in their specific determination. They are not inherently dialectical; their demands have the rationality which we have a right to expect in the Ideals of Reason. When Critically examined, they propound no problem which Reason is not in itself entirely competent to solve. It is to their misemployment that transcendental illusion is due. In the form in which they arise from the natural disposition of our Reason they are good and serviceable.

To the question what is the most adequate form in which the regulative schema can be represented, Kant gives an answer which shows how very far he is from regarding the Leibnizian *Ens realissimum* as the true expression of the Ideal of Reason. It is through the employment of teleological concepts that we can best attain the highest possible form of systematic unity.

"The highest formal unity ... is the *purposive* unity of things. The *speculative* [*i.e.* theoretical] interest of Reason makes it necessary to regard all order in the world *as if* it had originated in the purpose of a Supreme Reason. Such a principle opens out to our Reason, as applied in the field of experience, altogether new views as to how the things of the world may be connected according to teleological laws, and so enables it to arrive at their greatest systematic unity. The assumption of a Supreme Intelligence, as the one and only cause of the universe, though in the Idea alone, can therefore always benefit Reason and can never injure it."

For so long as this assumption is employed only as a regulative principle, even error cannot be really harmful. The worst that can happen is that where we expected a teleological connection, a merely mechanical or physical one is met with. If, on the other hand, we leave the solid ground of experience, and use the assumption to explain what we are unable to account for in empirical terms, we sacrifice all real insight, and confound Reason by transforming a concept, which is anthropomorphically determined for the purposes of empirical orientation, into a means of explaining order as non-natural and as imposed from without on the material basis of things.

This is a point of sufficient importance to call for more detailed statement. Hume in his *Dialogues* points out that the main defect in the teleological proof of God's existence is its assumption that order and design are foreign to the inherent constitution of things, and must be of non-natural origin. The argument is therefore weakened by every advance in the natural sciences. It also runs directly counter to the very phenomena, those of animal life, upon which it is chiefly based, since the main characteristic of the organic in its distinction from the inorganic is its inner wealth of productive and reproductive powers. With these criticisms Kant is in entire agreement. From them, in the passage before us, he derives an argument in support of a strictly regulative interpretation of his "*als ob*" doctrine. The avowed intention of the teleological argument is to prove *from nature* the existence of an intelligent supreme cause. If therefore its standpoint be held to with more consistency than its own defenders have hitherto shown, it will be found to rest upon the regulative principle, that we must study nature as if an *inherent* order were *native* to it, and so seek to approach by degrees, in proportion as such *natural unity* is empirically discovered, the absolute perfection which inspires our researches. But if we transform our Ideal into an instrument of explanation, beginning with what ought properly to be only our goal, we delude ourselves with the belief that what can only be acquired through the slow and tentative labours of empirical enquiry is already in our possession.

"If I begin with a supreme purposive Being as the ground of all things, the unity of nature is really surrendered, as being quite foreign and accidental to the nature of things, and as not to be known from its own general laws. There thus arises a vicious circle: we are assuming just that very point which is mainly in dispute."

Such a method of argument is self-destructive, since if we do not find order and perfection in the nature of things, and *therefore in their general and necessary laws*, we are not in a position to infer such a Being as the source of all causality.

To the question whether we may not interpret natural order, once it has been discovered by empirical investigation, as due to the divine will, Kant replies that such procedure is allowable only on the condition that it is the same to us whether we say that God has wisely willed it or that nature has wisely arranged it. We may admit the Idea of a Supreme Being only in so far as it is required by Reason as the regulative principle of all investigation of *nature*;

"...and we cannot, therefore, without contradicting ourselves, ignore the general laws of nature in view

of which the Idea was adopted, and look upon the purposiveness of nature as contingent and hyper-physical in its origin. For we were not justified in assuming above nature a Being of those qualities, but only in adopting the Idea of it in order to be able to view the appearances, according to the analogy of a causal determination, as systematically connected with one another." "Thus pure Reason, which at first seemed to promise nothing less than the extension of knowledge beyond all limits of experience, contains, if properly understood, nothing but regulative principles...."

CONCLUDING COMMENT ON THE DIALECTIC

I may now summarise Kant's answer to the three main questions of the *Dialectic*: (1) Whether, or in what degree, the so-called Ideas of Reason are concepts due to a faculty altogether distinct from the understanding, and how far, as thus originating in pure Reason, they allow of definition; (2) how far they are capable of a transcendental deduction; (3) what kind of objective validity this deduction proves them to possess.

These questions are closely interconnected; the solution of any one determines the kind of solution to be given to all three. Kant, as we have found, develops his final position through a series of very subtle distinctions by which he contrives to justify and retain, though in a highly modified form, the more crudely stated divisions between Ideas and categories, between Reason and understanding, upon which the initial argument of the *Dialectic* is based.

The answer amounts in essentials to the conclusion that understanding, in directing itself by means of Ideals, exercises a function so distinct from that whereby it conditions concrete and specific experience, that it may well receive a separate title; that the Ideas in terms of which it constructs these Ideals, though schematic (*i.e.* sensuous and empirical in content), are not themselves empirical, and so far from being merely extended concepts of understanding, express transcendental conditions upon which all use of the understanding rests.

Now if this position is to be justified, Kant ought to show that the fundamental Idea of Reason, that of the unconditioned, is altogether distinct from any concept of the understanding, and in particular that it must not be identified with the category of totality, nor be viewed as being merely the concept of conditioned existence with its various empirical limitations thought away. Needless to say, Kant does not fulfil these requirements in any consistent manner. The *Critique* contains the material for a variety of different solutions; it does not definitively commit itself to any one of them.

If the argument of A 650 ff. = B 678 ff. were developed we should be in possession of what may be called the Idealist solution. It would proceed somewhat as follows. Consciousness as such is always the awareness of a whole which precedes and conditions its parts. Such consciousness cannot be accounted for on the assumption that we are first conscious of the conditioned, and then proceed to remove limitations and to form for ourselves, by means of the more positive factors involved in this antecedent consciousness, an Idea of the totality within which the given falls. The Idea of the unconditioned, distinct from all concepts of understanding, is one of the *a priori* conditions of possible experience, and is capable of a transcendental deduction of equal validity with, and of the same general nature as, that of the categories. It is presupposed in the possibility of our contingently given experience.

As this Idea conditions all subordinate concepts, it cannot be defined in terms of them. That does not, however, deprive it of all meaning; its significance is of a unique kind; it finds expression in those Ideals which, while guiding the mind in the construction of experience, also serve as the criteria through which experience is condemned as only phenomenal.

But this, as we have found, is not a line of argument which Kant has developed in any detail. The passages which point to it occur chiefly in the introductory portions of the *Dialectic*; in its later sections they are both brief and scanty. When he sets himself, as in the chapter on the *Ideal of Pure Reason* and in the subsequent *Appendix*, to define his conclusions, it is a much more empirical, and indeed sceptical, line that he almost invariably follows. There are, he then declares, strictly no pure, *a priori* Ideas. The supposed Ideas of unconditionedness and of absolute necessity are discovered on examination to be without the least significance for the mind. The Ideas, properly defined, are merely schemata of regulative principles, and their whole content reduces without remainder to such categories as totality, substance,

causality, necessity, transcendently applied. As *Ideas*, they are then without real meaning; but they can be employed by analogy to define an Ideal which serves an indispensable function in the extension of experience. From this point of view, the transcendental deduction of the Ideas is radically distinct from that of the categories. The proof is not that they are necessary for the possibility of experience, but only that they are required for its perfect, or at least more complete, development. And as Kant is unable to prove that such completion is really possible, the objective validity of the Ideas is left open to question. They should be taken only as heuristic principles; the extent of their truth, even in the empirical realm, cannot be determined by the *a priori* method that is alone proper to a *Critique of Pure Reason*.

The first view is inspired by the fundamental teaching of the *Analytic*, and is the only view which will justify Kant in retaining his distinction between appearance and things in themselves. All that is positive in the second view can be combined with the first view; but, on the other hand, the negative implications of the second view are at variance with its own positive teaching. For when the Ideas are regarded as empirical in origin no less than in function, their entire authority is derived from experience, and cannot be regarded as being transcendental in any valid sense of that term. In alternating between these two interpretations of the function of Reason, Kant is wavering between the Idealist and the merely sceptical view of the scope and powers of pure thought. On the Idealist interpretation Reason is a metaphysical faculty, revealing to us the phenomenal character of experience, and outlining possibilities such as may perhaps be established on moral grounds. From the sceptical standpoint, on the other hand, Reason gives expression to what may be only our subjective preference for unity and system in the ordering of experience. According to the one, the criteria of truth and reality are bound up with the Ideas; according to the other, sense-experience is the standard by which the validity even of the Ideas must ultimately be judged. From the fact that Kant should have continued sympathetically to develop two such opposite standpoints, we would seem to be justified in concluding that he discerned, or at least desiderated, some more complete reconciliation of their teaching than he has himself thus far been able to achieve, and that no solution which would either subordinate the Ideal demands of thought, or ignore the gifts of experience, could ever have been definitively accepted by him as satisfactorily meeting the issues at stake. The Idealist solution is that to which his teaching as a whole most decisively points; but he is as conscious of the difficulties which lie in its path as he is personally convinced of its ultimate truth. His continuing appreciation of the value of sceptical teaching is a tacit admission that the Idealist doctrines, in the form which he has so far been able to give to them, are not really adequate to the complexity of the problems. As further confirmation of the tentative character of Kant’s conclusions in the *Critique of Pure Reason*, we have his own later writings. In the *Critique of Judgment*, published nine years later, in teaching less sceptical and more constructive, though still delicately balanced between the competing possibilities, and always, therefore, leaving the final decision to moral considerations, Kant ventures upon a restatement of the problems of the *Dialectic*. To this restatement both of the above tendencies contribute valuable elements.

APPENDICES

APPENDIX A

TRANSCENDENTAL DOCTRINE OF METHODS

CHAPTER I

THE DISCIPLINE OF PURE REASON

KANT is neither an intellectualist nor an anti-intellectualist. Reason, the proper duty of which is to prescribe a discipline to all other endeavours, itself requires discipline; and when it is employed in the metaphysical sphere, independently of experience, it demands not merely the correction of single errors, but the eradication of their causes through "a separate negative code," such as a Critical philosophy can alone supply. In the *Transcendental Doctrine of Elements* this demand has been met as regards the *materials* or *contents* of the Critical system; we are now concerned only with its *methods* or *formal conditions*.

This distinction is highly artificial. As already indicated, it is determined by the requirements of Kant's architectonic. The entire teaching of the *Methodology* has already been more or less exhaustively expounded in the earlier divisions of the *Critique*.

SECTION I

THE DISCIPLINE OF PURE REASON IN ITS DOGMATIC EMPLOYMENT

In dealing with the distinction between mathematical and philosophical knowledge, Kant is here returning to one of the main points of his *Introduction* to the *Critique*. His most exhaustive treatment of it is, however, to be found in a treatise which he wrote as early as 1764, his *Enquiry into the Clearness of the Principles of Natural Theology and Morals*. The continued influence of the teaching of that early work is obvious throughout this section, and largely accounts for the form in which certain of its tenets are propounded.

"...one can say with Bishop Warburton that nothing has been more injurious to philosophy than mathematics, that is, than the imitation of its method in a sphere where it is impossible of application...."

So far from being identical in general nature, mathematics and philosophy are, Kant declares, fundamentally opposed in all essential features. For it is in their methods, and not merely in their subject-matter, that the essential difference between them is to be found. Philosophical knowledge can be acquired only through *concepts*, mathematical knowledge is gained through the *construction* of concepts. The one is discursive merely; the other is intuitive. Philosophy can consider the particular only in the general; mathematics studies the general in the particular. Philosophical concepts, such as those of substance and causality, are, indeed, capable of application in transcendental synthesis, but in this employment they yield only empirical knowledge of the sensuously given; and from empirical concepts the universal and necessary judgments required for the possibility of metaphysical science can never be obtained.

The exactness of mathematics depends on definitions, axioms, and demonstrations, none of which are obtainable in philosophy. To take each in order.

I. Definitions. — To define in the manner prescribed by mathematics is to represent the *complete* concept of a thing. This is never possible in regard to empirical concepts. We are more certain of their denotation than of their connotation; and though they may be *explained*, they cannot be defined. Since new observations add or remove predicates, an empirical concept is always liable to modification.

"What useful purpose could be served by defining an empirical concept, such, for instance, as that of

water? When we speak of water and its properties, we do not stop short at what is thought in the word water, but proceed to experiments. The word, with the few marks which are attached to it, is more properly to be regarded as merely a designation than as a conception. The so-called definition is nothing more than a determining of the word."

Exact definition is equally impossible in regard to *a priori* forms, such as time or causality. Since they are not framed by the mind, but are *given* to it, the completeness of our analysis of them can never be guaranteed. Though they are known, they are known only as problems.

"As Augustine has said, 'I know well what time is, but if any one asks me, I cannot tell.'"

Mathematical definitions *make* concepts; philosophical definitions only explain them. Philosophy cannot, therefore, imitate mathematics by beginning with definitions. In philosophy the incomplete exposition must precede the complete; definitions are the final outcome of our enquiry, and not as in mathematics the only possible beginning of its proofs. Indeed, the mathematical concept may be said to be given by the very process in which it is constructively defined; and, as thus originating in the process of definition, it can never be erroneous. Philosophy, on the other hand, swarms with faulty definitions, which are none the less serviceable.

"In mathematics definition belongs *ad esse*, in philosophy *ad melius esse*. It is desirable to attain it, but often very difficult. Jurists are still without a definition of their concept of Right."

II. Axioms. — This paragraph is extremely misleading as a statement of Kant's view regarding the nature of geometrical axioms. In stating that they are self-evident, he does not really mean to assert what that phrase usually involves, namely, absolute *a priori* validity. For Kant the geometrical axioms are merely descriptions of certain *de facto* properties of the given intuition of space. They have the merely hypothetical validity of all propositions that refer to the contingently given. For even as a pure intuition, space belongs to the realm of the merely factual. This un-Critical opposition of the self-evidence of geometrical axioms to the synthetic character of such "philosophical" truths as the principle of causality is bound up with Kant's unreasoned conviction that space in order to be space at all, must be Euclidean. Kant's reference in this paragraph to the propositions of arithmetic is equally open to criticism. For though he is more consistent in recognising their synthetic character, he still speaks as if they could be described as self-evident, *i.e.* as immediately certain. The cause of this inconsistency is, of course, to be found in his intuitional theory of mathematical science. Mathematical propositions are obtained through intuition; those of philosophy call for an elaborate and difficult process of transcendental deduction. When modern mathematical theory rejects this intuitional view, it is really extending to mathematical concepts Kant's own interpretation of the function of the categories. Concepts condition the *possibility* of intuitional experience, and find in this conditioning power the ground of their objective validity. Here, as in the *Aesthetic*, Kant fails adequately to distinguish between the problems of pure and applied mathematics.

III. Demonstrations. — Kant again introduces his very unsatisfactory doctrine of the construction of concepts: and he even goes so far as to maintain, in complete violation of his own doctrine of transcendental deduction, that where there is no intuition, there can be no demonstration. Apodictic propositions, he declares, are either *dogmata* or *mathemata*; and the former are beyond the competence of the human mind. But no sooner has he made these statements than he virtually withdraws them by adding that, though apodictic propositions cannot be established directly from concepts, they can be indirectly proved by reference to something purely contingent, namely, possible experience. Thus the principle of causality can be apodictically proved as a condition of possible experience. Though it may not be called a *dogma*, it can be entitled a *principle*! In explanation of this distinction, which betrays a lingering regard for the self-evident maxims of rationalistic teaching, Kant adds that the principle of causality, though a principle, has itself to be proved.

"...it has the peculiarity that it first makes possible its own ground of proof, namely, experience...."

This, as we have noted, is exactly what mathematical axioms must also be able to do, if they are to establish their objective validity.

SECTION II

THE DISCIPLINE OF PURE REASON IN ITS POLEMICAL EMPLOYMENT

This section contains an admirable defence of the value of scepticism.

"Even poisons have their use. They serve to counteract other poisons generated in our system, and must have a place in every complete pharmacopeia. The objections against the persuasions and complacency of our purely speculative Reason arise from the very nature of Reason itself, and must therefore have their own good use and purpose, which ought not to be disdained. Why has Providence placed many things which are closely bound up with our highest interests so far beyond our reach, that we are only permitted to apprehend them in a manner lacking in clearness and subject to doubt, in such fashion that our enquiring gaze is more excited than satisfied? It is at least doubtful whether it serves any useful purpose, and whether it is not, indeed, perhaps even harmful to venture upon bold interpretations of such uncertain appearances. But there can be no manner of doubt that it is always best to grant Reason complete liberty, both of enquiry and of criticism, so that it may be without hindrance in attending to its own proper interests. These interests are no less furthered by the limitation than by the extension of its speculations; and they will always suffer when outside influences intervene to divert it from its natural path, and to constrain it by what is irrelevant to its own proper ends." "Whenever I hear that a writer of real ability has demonstrated away the freedom of the human will, the hope of a future life, and the existence of God, I am eager to read the book, for I expect him by his talents to increase my insight into these matters."

SECTION IV
THE DISCIPLINE OF PURE REASON IN REGARD TO ITS PROOFS

This section merely restates the general nature and requirements of transcendental proof. The exposition is much less satisfactory than that already given in the *Analytic* and *Dialectic*. The only really new factor is the distinction between apagogical and direct proof. The former may produce conviction, but cannot enable us to comprehend the grounds of the truth of our conviction. Also, outside mathematics, it is extremely dangerous to attempt to establish a thesis by showing its contradictory to be impossible. This is especially true in the sphere of our Critical enquiries, since the chief danger to be guarded against is the confounding of the subjectively necessary with the independently real. In this field of investigation it is never permissible to attempt to justify a synthetic proposition by refuting its opposite. Such seeming proofs can easily be secured, and have been the favourite weapons of dogmatic thinkers.

"Each must defend his position directly, by a legitimate proof that carries with it transcendental deduction of the grounds upon which it is itself made to rest. Only when this has been done, are we in a position to decide how far its claims allow of rational justification. If an opponent relies on subjective grounds, it is an easy matter to refute him. The dogmatist cannot, however, profit by this advantage. His own judgments are, as a rule, no less dependent upon subjective influences; and he can himself in turn be similarly cornered. But if both parties proceed by the direct method, *either* they will soon discover the difficulty, nay, the impossibility, of showing reason for their assertions, and will be left with no resort save to appeal to some form of prescriptive authority; *or* the *Critique* will the more easily discover the illusion to which their dogmatic procedure is due; and pure Reason will be compelled to relinquish its

exaggerated pretensions in the realm of speculation, and to withdraw within the limits of its proper territory — that of practical principles.”

CHAPTER II

THE CANON OF PURE REASON

SECTION I

THE ULTIMATE END OF THE PURE USE OF OUR REASON

The problems of the existence of God, the freedom of the will, and the immortality of the soul have, Kant declares, little *theoretical* interest. For, as he has already argued, even if we were justified in postulating God, freedom, and immortality, they would not enable us to account for the phenomena of sense-experience, the only objects of possible knowledge. But the three problems are also connected with our *practical* interests, and in that reference they constitute the chief subject of metaphysical enquiry. The practical is whatever is possible through freedom; and the decision as to *what we ought to do* is the supreme interest of pure Reason in its highest employment.

"...the ultimate intention of Nature in her wise provision for us has indeed, in the constitution of our Reason, been directed to our moral interests alone."

This is the position which Kant endeavours to establish in his *Foundations of the Metaphysics of Morals*, and in the *Critique of Practical Reason*. The very brief outline which he here gives of his argument is necessarily incomplete; and is in consequence somewhat misleading. He first disposes of the problem of freedom; and does so in a manner which shows that he had not, when this section was composed, developed his Critical views on the nature of moral freedom. He is for the present content to draw a quite un-Critical distinction between transcendental and practical freedom. The latter belongs to the will in so far as it is determined by Reason alone, independently of sensuous impulses. Reason prescribes objective *laws of freedom*, and the will under the influence of these laws overcomes the affections of sense. Such practical freedom can, Kant asserts, be proved by experience to be a natural cause. Transcendental freedom, on the other hand, *i.e.* the power of making a new beginning in the series of phenomena, is a problem which can never be empirically solved. It is a purely speculative question with which Reason in its practical employment is not in the least concerned. The canon of pure Reason has therefore to deal only with the two remaining problems, God and immortality. Comment upon these assertions can best be made in connection with the argument of the next section.

SECTION II

THE IDEAL OF THE HIGHEST GOOD, AS A DETERMINING GROUND OF THE ULTIMATE END OF PURE REASON

Reason in its speculative employment transcends experience, but solely for the sake of experience. In other words, speculative Reason has a purely empirical function. (This is the explanation of the somewhat paradoxical contention, to which Kant has already committed himself, that the problems of God and immortality, *though seemingly speculative in character*, really originate in our practical interests.) But pure Reason has also a practical use; and it is in this latter employment that it first discloses the genuinely metaphysical character of its present constitution and ultimate aims. The moral consciousness, in

revealing to us an Ideal of absolute value, places in our hands the only available key to the mysteries of existence. As this moral consciousness represents the deepest reality of human life, it may be expected to have greater metaphysical significance than anything else in human experience; and since the ends which it reveals also present themselves as *absolute* in value, and are indeed the only absolute values of which we can form any conception, this conclusion would seem to be confirmed.

Happiness has natural value; morality, *i.e.* the being worthy to be happy, has absolute value. The means of attaining the former obtain expression in prudential or pragmatic laws that are empirically grounded. The conditions of the latter are embodied in a categorical imperative of an *a priori* character. The former *advise* us how best to satisfy our natural desire for happiness; the latter *dictates* to us how we must behave in order to deserve happiness.

Kant's further argument is too condensed to be really clear, and if adequately discussed would carry us quite beyond the legitimate limits of this *Commentary*. I shall therefore confine myself to a brief and free restatement of his general position. The Critical teaching can be described as resulting in a new interpretation of the function of philosophy. The task of the philosopher, properly viewed, does not consist in the solution of *speculative* problems; such problems transcend our human powers. All that philosophy can reasonably attempt is to analyse and define the situations, cognitive and practical, in which, owing to the specific conditions of human existence, we find ourselves to be placed. Upon analysis of the cognitive situation Kant discovers that while all possibilities are open, the theoretical data are never such as to justify ontological assertions. When, however, he passes to the practical situation, wider horizons, definitely outlined, at once present themselves. The moral consciousness is the key to the meaning of the entire universe as well as of human life. Its values are the sole ultimate values, and enable us to interpret in *moral* terms (even though we cannot comprehend in any genuinely *theoretical* fashion) the meaning of the dispensation under which we live. The moral consciousness, like sense-experience, discloses upon examination a systematic unity of presupposed conditions. In the theoretical sphere this unity cannot be proved to be more than a postulated Ideal of *empirical* experience; and it is an Ideal which, even if granted to have absolute validity, is too indefinite to enable us to assert that ultimate reality is spiritual in character, or is teleologically ordered. The underlying conditions, on the other hand, of practical experience have from the start a purely noumenal reference. They have no other function than to define, in terms of the moral consciousness, the ultimate meaning of reality as a whole. They postulate a universe in which the values of spiritual experience are supported and conserved.

But the main difference in Kant's treatment of the two situations, cognitive and practical, only emerges into view when we recognise the differing modes in which the transcendental method of proof is applied in the two cases. The *a priori* forms of sensibility, understanding, and Reason are proved by reference to possible experience, as being its indispensable conditions. In moral matters, however, we must not appeal to experience. The actual is no test of the Ideal; "what is" is no test of what ought to be. And secondly, the moral law, if valid at all, must apply not merely within the limits of experience, but with absolute universality to all rational beings. The moral law, therefore, can neither be given us in experience, nor be proved as one of the conditions necessary to its possibility. Its validity, in other words, can be established neither through experience nor through theoretical reason.

Though such is Kant's own method of formulating the issue, it exaggerates the difference of his procedure in the two *Critiques*, and is very misleading as a statement of his real position. In one passage, in the *Critique of Practical Reason*, Kant does, indeed, assert that the moral law requires no deduction. It is, he claims, a *fact* of which we are *a priori* conscious: so far from itself requiring proof, it enables us to prove the reality of freedom. Yet in the very same section he argues that the deduction of freedom from the moral law is a credential of the latter, and is a sufficient substitute for all *a priori* justification. According to the first statement we have an immediate consciousness of the validity of the moral law; according to the second statement the moral law proves itself indirectly, by serving as a principle for the deduction of

freedom. The second form of statement alone harmonises with the argument developed in the third section of the *Foundations of the Metaphysics of Morals*, and more correctly expresses the intention of Kant's central argument in the *Critique of Practical Reason*. For the difference between the two transcendental proofs in the two *Critiques* does not really consist in any diversity of method, but solely in the differing character of the premisses from which each starts. The ambiguity of Kant's argument in the second *Critique* seems chiefly to be caused by his failure clearly to recognise that the moral law, though a form of pure Reason, exercises, in the process of its transcendental proof, a function which exactly corresponds to that which is discharged by possible experience in the first *Critique*. Our consciousness of the moral law is, like sense-experience, a given fact. It is *de facto*, and cannot be deduced from anything more ultimate than itself. But as given, it enables us to deduce its transcendental conditions. This does not mean that our immediate consciousness of it *as given* guarantees its validity. The nature of its validity is established only in the process whereby it reveals its necessary implications. The objects of sense-experience are assumed by ordinary consciousness to be absolutely real; in the process of establishing the transcendental conditions of such experience they are discovered to be merely phenomenal. The pure principles of understanding thus gain objective validity as the conditions of a given experience which reveals only appearances. Ordinary consciousness similarly starts from the assumption of the absolute validity of the moral law. But in this case the consciousness of the law is discovered on examination to be explicable, *even as a possibility*, only on the assumption that it is due to the autonomous activity of a noumenal being. By its existence it proves the conditions through which alone it is explicable. Its mere existence suffices to prove that its validity is objective in a deeper and truer sense than the principles of understanding. *The notion of freedom, and therefore all the connected Ideas of pure Reason, gain noumenal reality as the conditions of a moral consciousness which is incapable of explanation as illusory or even phenomenal*. Since the consciousness of the moral law is thus noumenally grounded, it has a validity with which nothing in the phenomenal world can possibly compare. It is the one form in which noumenal reality directly discloses itself to the human mind.

Obviously the essential crux of Kant's argument lies in the proof that the moral consciousness *is* only explicable in this manner, as the self-legislation of a noumenal being. Into the merits of his argument we cannot, however, here enter; and I need only draw attention to the manner in which it conflicts with the statement of the preceding section, that the possibility of transcendental freedom is a purely speculative question with which practical Reason is not concerned. The reality of freedom, as a form of noumenal activity, is the cardinal fact of Kant's metaphysics of morals. For though our consciousness of the moral law is the *ratio cognoscendi* of freedom, transcendental freedom is the *ratio essendi* of the moral law.

"With this faculty [of practical Reason], transcendental freedom is also established; freedom, namely, in that absolute sense in which speculative Reason required it, in its use of the concept of causality, in order to escape the antinomy into which it inevitably falls, when in the chain of cause and effect it tries to think the *unconditioned*.... Freedom is the only one of all the Ideas of the speculative Reason of which we *know* the possibility *a priori* (without, however, understanding it), because it is the condition of the moral law which we know." "[Freedom] is the only one of all the Ideas of pure Reason whose object is a thing of fact and to be reckoned among the *scibilia*." "It is thus very remarkable that of the three pure rational Ideas, God, freedom, and immortality, that of freedom is the only concept of the supersensible which (by means of the causality that is thought in it) proves its objective reality in nature by means of the effects it can produce there; and thus renders possible the connection of both the others with nature, and of all three with one another so as to form a Religion.... The concept of freedom (as fundamental concept of all unconditioned practical laws) can extend Reason beyond those bounds within which every natural (theoretical) concept must inevitably remain confined."

Thus freedom is for Kant a demonstrated fact, and in that respect differs from the Ideas of God and immortality, which are merely problematic conceptions, and which can be postulated only as articles of

“practical faith.”

This brings us to the final question, upon what grounds Kant ascribes validity to the Ideas of God and immortality. At this point in his argument Kant introduces the conception of the *Summum Bonum*. Reason, in prescribing the moral law, prescribes, as the final and complete end of all our actions, the *Summum Bonum*, *i.e.* happiness proportioned to moral worth. *Owing to the limitations of our faculties*, the complete attainment of this supreme end is conceivable by us only on the assumption of a future life wherein perfect worthiness may be attained, and of an omnipotent Divine Being who will apportion happiness in accordance with merit.

“[This Divine Being] must be omnipotent, in order that the whole of nature and its relation to morality ... may be subject to his will; omniscient, that he may know our innermost sentiments and their moral worth; omnipresent, that he may be immediately present for the satisfying of every need which the highest good demands; eternal, that this harmony of nature and freedom may never fail, etc.”

The moral ideal thus supplies us with a ground for regarding the universe as systematically ordered according to moral purposes, and also with a principle that enables us to infer the nature and properties of its Supreme Cause. In place of a demonology, which is all that physical theology can establish, we construct upon moral grounds a genuine theology.

The concepts thus obtained are, however, anthropomorphic; and for that reason alone must be denied all speculative value. This is especially evident in regard to the Idea of God. Owing to our incapacity to comprehend how moral merit can condition happiness, we conceive them as *externally* combined through the intervention of a supreme Judge and Ruler. As Kant indicates, we must not assert that this represents the actual situation. He himself seems to have inclined to a more mystical interpretation of the universe, conceiving the relation of happiness to virtue as being grounded in a supersensuous but necessary order that may, indeed, be bodied forth in the inadequate symbols of the deistic creed, but which in its true nature transcends our powers of understanding. So far as the Ideas of God and immortality are necessary to define the moral standpoint, they have genuine validity for all moral beings; but if developed on their own account as speculative dogmas, they acquire a definiteness of formulation which is not essential to their moral function, and which lays them open to suspicion even in their legitimate use.

These considerations also indicate Kant’s further reason for entitling the *Summum Bonum*, God and immortality, Ideas of *faith*. Though they can be established as presuppositions of the moral situation in which we find ourselves, such demonstration itself rests upon the acceptance of the moral consciousness as possessing a supersensuous sanction; and that in turn is determined by features in the moral situation not deducible from any higher order of considerations.

“Belief in matters of faith is a belief in a pure practical point of view, *i.e.* a moral faith, which proves nothing for theoretical, pure, rational cognition, but only for that which is practical and directed to the fulfilment of its duties; it in no way extends speculation.... If the supreme principle of all moral laws is a postulate, the possibility of its highest Object ... is thereby postulated along with it.” “So far, as practical Reason has the right to yield us guidance, we shall not look upon actions as obligatory because they are the commands of God, but shall regard them as divine commands because we have an inward obligation to them.... Moral theology is thus of immanent use only. It enables us to fulfil our vocation in this present world by showing us how to adapt ourselves to the system of all ends, and by warning us against the fanaticism and indeed the impiety of abandoning the guidance of a morally legislative Reason in the right conduct of our lives, in order to derive guidance directly from the Idea of the Supreme Being. For we should then be making a transcendent employment of moral theology; and that, like a transcendent use of pure speculation, must pervert and frustrate the ultimate ends of Reason.”

SECTION III

Kant first distinguishes between conviction (*Ueberzeugung*) and persuasion (*Ueberredung*). A judgment which is objectively grounded, and which is therefore valid for all other rational beings, is affirmed with conviction. When the affirmation is due only to the peculiar character of the subject, the manner in which it is asserted may be entitled persuasion. Persuasion is therefore “a mere illusion.” Conviction exists in three degrees, opinion, belief, and knowledge. In opinion we are conscious that the judgment is insufficiently grounded, and that our conviction is subjectively incomplete. In belief the subjective conviction is complete, but is recognised as lacking in objective justification. In knowledge the objective grounds and the subjective conviction are alike complete.

After pointing out that opinion is not permissible in judgments of pure Reason, Kant develops the further distinction between *pragmatic or doctrinal belief* and *moral belief*. When a belief is contingent (*i.e.* is affirmed with the consciousness that on fuller knowledge it may turn out to be false), and yet nevertheless supplies a ground for the employment of means to certain desired ends, it may be called *pragmatic* belief. Such belief admits of degree, and can be tested by wager or by oath. What may be called *doctrinal* belief is analogous in character, and is taken by Kant, in somewhat misleading fashion, as describing our mode of accepting such doctrines as the existence of God and the immortality of the soul. They are adopted as helpful towards a contingent but important end, the discovery of order in the system of nature. This account of the nature of Ideas is in line with Kant’s early view of them as *merely* regulative. Taken in connection with his repeated employment of the term ‘moral sentiments’ (*moralische Gesinnungen*), it tends to prove that this section is early in date of writing.

In *moral belief* the end, the *Summum Bonum*, is absolutely necessary, and as there is only one condition under which we can conceive it as being realised, namely, on the assumption of the existence of God and of a future life, the belief in God and immortality possesses the same certainty as the moral sentiments.

“The belief in a God and another world is so interwoven with my moral sentiment that as there is little danger of my losing the latter, there is equally little cause for fear that the former can ever be taken from me.”

As I have just suggested, this basing of moral belief upon subjective sentiments, which, as Kant very inconsistently proceeds to suggest, may possibly be lacking in certain men, marks this section as being of early origin. But in concluding the section, in reply to the objection that, in thus tracing such articles of faith to our “natural interest” in morality, philosophy admits its powerlessness to advance beyond the ordinary understanding, Kant propounds one of his abiding convictions, namely, that in matters which concern all men without distinction nature is not guilty of any partial distribution of her gifts, and that in regard to the essential ends of human nature the highest philosophy cannot advance beyond what is revealed to the common understanding. The reverence which Kant ever cherished for the memory of his parents, and for the religion which was so natural to them, must have predisposed him to a recognition of the widespread sources of the spiritual life. But Kant has himself placed on record his sense of the great debt which in this connection he also owed to the teaching of Rousseau.

“I am by disposition an enquirer. I feel the consuming thirst for knowledge, the eager unrest to advance ever further, and the delights of discovery. There was a time when I believed that this is what confers real dignity upon human life, and I despised the common people who know nothing. Rousseau has set me right. This imagined advantage vanishes. I learn to honor men, and should regard myself as of much less use than the common labourer, if I did not believe that my philosophy will restore to all men the common rights of humanity.”

The sublimity of the starry heavens and the imperative of the moral law are ever present influences on the life of man; and they require for their apprehension no previous initiation through science and philosophy. The naked eye reveals the former; of the latter all men are immediately aware. In their

universal appeal they are of the very substance of human existence. Philosophy may avail to counteract the hindrances which prevent them from exercising their native influence; it cannot be a substitute for the inspiration which they alone can yield.

CHAPTER III

THE ARCHITECTONIC OF PURE REASON

Adickes very justly remarks that "this is a section after Kant's own heart, in which there is presented, almost unsought, the opportunity, which he elsewhere so frequently creates for himself, of indulging in his favourite hobby." The section is of slight scientific importance, and is chiefly of interest for the light which it casts upon Kant's personality. Moreover the distinctions which Kant here draws are for the most part not his own philosophical property, but are taken over from the Wolffian system.

The distinctions may be exhibited in tabular form as follows:

KNOWLEDGE

1= 2= 3=

Kant further distinguishes between the "scholastic" and the "universal" or traditional meaning of the term philosophy. In the former sense philosophy is viewed from the point of view of its *logical* perfection, and the philosopher appears as an *artist* of Reason. Philosophy in the broader and higher sense is "the science of the relation of all knowledge to the essential ends of human Reason." The philosopher then appears as the *lawgiver* of human Reason. Of the essential ends, the *ultimate* end is man's moral destiny; to this the other essential ends of human Reason are subordinate means. For though the legislation of human Reason concerns nature as well as freedom, and has therefore to be dealt with by a philosophy of nature, *i.e.* of *all that is*, as well as by a philosophy of morals, *i.e.* of *that which ought to be*, the former is subordinate to the latter in the same degree in which in human life knowledge is subordinate to moral action. Whereas speculative metaphysics serves rather to ward off errors than to extend knowledge, in the metaphysics of morals "all culture [*Kultur*] of human Reason" finds its indispensable completion.

Empirical psychology is excluded from the domain of metaphysics. It is destined to form part of a complete system of anthropology, the pendant to the empirical doctrine of nature.

CHAPTER IV

THE HISTORY OF PURE REASON

This title, as Kant states, is inserted only to mark the place of the present chapter in a complete system of pure reason. The very cursory outline, which alone Kant here attempts to give, merely repeats the main historical distinctions of which the *Critique* has made use. The contrast between the sensationalism of Epicurus and the intellectualism of Plato has been developed in A 465 ff. = B 493 ff. The contrast between Locke and Leibniz is dwelt upon in A 43 ff. = B 60 ff. and A 270 ff. = B 326 ff. Under the title 'naturalist of pure Reason' Kant is referring to the 'common sense' school, which is typically represented by Beattie. In his *Logic* Kant gives a fuller account of his interpretation of the history of philosophy.

APPENDIX B

A MORE DETAILED STATEMENT OF KANT'S RELATIONS TO HIS PHILOSOPHICAL PREDECESSORS

The development of philosophy, prior to Kant, had rendered two problems especially prominent — the problem of sense-perception and the problem of judgment. The one raises the question of the interrelation of mind knowing and objects known; the other treats of the connection holding between subject and predicate in the various forms of judgment. The one enquires how it is possible to know reality; the other seeks to determine the criterion of truth. These two problems are, as Kant discovered, inseparable from one another; and the logical is the more fundamental of the two. Indeed it was Hume's analysis of the judgment involved in the causal principle that enabled Kant to formulate his Critical solution of the problem of perception. In this Appendix I propose to follow these problems as they rise into view in the systems of Descartes and his successors.

Galileo's revolutionary teaching regarding the nature of motion was the immediate occasion of Descartes' restatement of the problem of perception. That teaching necessitated an entirely new view of the nature of matter, and consequently of the interrelation of mind and body. Questions never before seriously entertained now became pressing. The solutions had to be as novel as the situation which they were designed to meet.

These new problems arose in the following manner. According to the medieval view, motion may properly be conceived on the analogy of human activity. It comes into being, exhausts itself in exercise, and ceases to be. It is a fleeting activity; only its "material" and "formal" conditions have any permanence of existence. According to Galileo's teaching, on the other hand, motion is as different from human activity as matter is from mind. It is ingenerable and indestructible. We know it only through the effect which in some incomprehensible fashion it produces in those bodies into which it enters, namely, their translation from one part of space to another. That this translatory motion is called by the same name as the power which generates it, doubtless in some degree accounts for the fact that our understanding of the one tends to conceal from us our entire ignorance of the other. We have only to reflect, however, in order to realise that motion is completely mysterious in its intrinsic dynamical nature. We cannot, for instance, profess to comprehend, even in the least degree, how motion, though incapable of existing apart from matter, should yet be sufficiently independent to be able to pass from one body to another.

Descartes, following out some of the chief consequences of this new teaching, concluded that matter is

passive and inert, that it is distinguished neither by positive nor by negative properties from the space which it fills, and that it is to motion that all the articulated organisation of animate and inanimate nature is due. Descartes failed, indeed, to appreciate the dynamical character of motion, and by constantly speaking as if it were reducible to the translatory motion, in which it manifests itself, he represented it as known in all its essential features. None the less, the rôles previously assigned to matter and motion are, in Descartes' system, completely reversed. Matter is subordinated to motion as the instrument to the agency by which it is directed and shaped. On the older view, material bodies had, through the possession of formative and vital forces, all manner of intrinsic powers. By the new view these composite and nondescript existences are resolved into two elements, all the properties of which can be quantitatively defined — into a matter which is uniform and homogeneous, and into motion whose sole effect is the translation of bodies in space. Matter is the passive and inert substance out of which motion, by its mere mechanical powers, can produce the whole range of material forms.

This revolutionary change in the physical standpoint involved restatement of the philosophical issues. But the resulting difficulties were found thoroughly baffling. Though Descartes and his successors were willing to adopt any hypothesis, however paradoxical, which the facts might seem to demand, their theories, however modified and restated, led only deeper into a hopeless *impasse*. The unsolved problems of the Cartesian systems formed the discouraging heritage to which Kant fell heir. If matter is always purely material, and motion is its sole organising power, there can be no real kinship between body and mind. The formative and vital forces, which in the Scholastic philosophy and in popular thought serve to maintain the appearance of continuity between matter and mind, can no longer be credited. Motion, which alone is left to mediate between the opposites, is purely mechanical, and (on Descartes' view) is entirely lacking in inner or hidden powers. The animal body is exclusively material, and is therefore as incapable of feeling or consciousness as any machine made by human hands. The bodily senses are not 'sensitive'; the brain cannot think. Mental experiences do, of course, accompany the brain-motions. But why a sensation should thus arise when a particular motion is caused in the brain, or how a mental resolution can be followed by a brain state, are questions to which no satisfactory answer can be given. The mental and the material, the spiritual and the mechanical, fall entirely apart.

The difficulties arising out of this incomprehensibility of the causal interrelations of mind and body are not, however, in themselves a valid argument against a dualistic interpretation of the real. The difficulties of accounting for the causal relation are, in essential respects, equally great even when the interaction is between homogeneous existences. The difficulties are due to the nature of causal action as such, not to the character of the bodies between which it holds. This, indeed, was clearly recognised by Descartes, and was insisted upon by his immediate successors. The transference of motion by impact is no less incomprehensible than the interaction of soul and body. If motion can exist only in matter, there is no possible method of conceiving how it can make the transition from one discrete portion of matter to another. Causal action is thus a problem which no philosophy can pretend to solve, and which every philosophy, whether monistic or dualistic, must recognise as transcending the scope of our present knowledge.

It is in another and more special form that Descartes' dualism first reveals its fatal defects, namely, in its bearing upon the problem of sense-perception. Descartes can solve the problem of knowledge only by first postulating the doctrine of representative perception. That doctrine is rendered necessary by the dualism of mind and body. Objects can be known only mediately by means of their action upon the sense-organs, and through the sense-organs upon the brain. The resulting brain states are in themselves merely forms of motion. They lead, however, in a manner which Descartes never professes to explain, to the appearance of sensations in the mental field. Out of these sensations the mind then constructs mental images of the distant bodies; and it is these mental images alone which are directly apprehended. Material bodies are invisible and intangible; they are knowable only through their mental duplicates. Thus,

according to the doctrine of representative perception, each mind is segregated in a world apart. It looks out upon a landscape which is as mental and as truly inward as are its feelings and desires. The apparently ultimate relation of mind knowing and object known is rendered complex and problematic through the distinction between mental objects and real things. Mental objects are in all cases images merely. They exist only so long as they are apprehended; and they are numerically and existentially distinct in each individual mind. Real things are not immediately perceived; they are hypothetically inferred. To ordinary consciousness the body which acts on the sense-organ is the object known; when reflective consciousness is philosophically enlightened, the object immediately known is recognised as a merely mental image, and the external object sinks to the level of an assumed cause.

The paradoxical character of this doctrine is accentuated by Galileo's distinction between primary and secondary qualities. Those physical processes, which are entitled light and heat, bear no resemblance to the sensations through which they become known. The many-coloured world of ordinary consciousness is an illusory appearance which can exist only in the human mind. We must distinguish between the sensible world which, though purely mental, appears, through an unavoidable illusion, to be externally real, and that very different world of matter and motion which reveals its independent nature only to reflective thinking. In the latter world the rich variety of sensuous appearance can find no place. There remain only the quantitative, mechanical properties of extension, figure and motion; and even these have to be interpreted in the revolutionary fashion of physical science.

The doctrine of representative perception cannot, however, defend successfully the positions which it thus involves. It wavers in unstable equilibrium. The facts, physical and physiological, upon which it is based, are in conflict with the conclusions in which it results. This has been very clearly demonstrated by many writers in recent times. The conflict manifested itself in the period between Descartes and Kant only through the uneasy questionings of Locke and Berkeley. The problem, fundamental though it be, is almost completely ignored by Spinoza, Leibniz, and Wolff.

Stated in modern terms, the inherently contradictory character of the doctrine consists in its unavoidable alternation between the realist attitude to which it owes its origin, and the idealist conclusion in which it issues. Such oscillation is due to the twofold simultaneous relation in which it regards ideas as standing to the objects that they are supposed to represent. The function of sensations is cognitive; their origin is mechanical. As cognitive they stand to objects in a relation of inclusion; they reveal the objects, reduplicating them in image before the mind. Yet in their origin they are effects, mechanically generated by the action of material bodies upon the sense-organs and brain. As they are effects mechanically generated, there is no guarantee that they resemble their causes; and if we may argue from other forms of mechanical causation, there is little likelihood that they do. They stand to their first causes in a relation of exclusion, separated from them by a large number of varying intermediate processes. There is thus a conflict between the function of sensations and their origin. Their origin in the external objects is supposed to confer upon them a representative power; and yet the very nature of this origin invalidates any such claim.

This irreconcilability of the subjectivist consequences of the doctrine with its realist basis was seized upon by Berkeley. To remove the contradiction, he denied the facts from which the doctrine had been developed. That is to say, starting from its results he disproved its premisses. Arguing from the physical and physiological conditions of perception Descartes had concluded that only sensations can be directly apprehended by the mind. Berkeley starts from this conclusion, and virtually adopts it as an assumption which cannot be questioned, and which does not call for proof. Since, he contends, we know only sensations, the assertion that they are due to material causes is mere hypothesis, and is one for which there may be no valid grounds. As Descartes himself had already suggested, there is a second possible method of interpreting the relevant facts. There may exist an all-powerful Being who produces the sensations in our minds from moment to moment; and provided that they are produced in the same order as now, the

whole material world might be annihilated without our being in the least aware that so important an event had taken place. Since we can experience only sensations, any hypothesis which will account for the order of their happening is equally legitimate. The whole question becomes one of relative simplicity in the explanation given. The simpler analysis, other things being equal, must hold the field.

Berkeley reinforces this argument by pointing to the many embarrassing consequences to which Descartes' dualism must lead. We postulate bodies in order to account for the origin of our sensations, and yet are unable to do so by their means. The dualistic theory creates more difficulties than it solves, without a single counter-advantage, save perhaps — so Berkeley argues — that it seems to harmonise better with the traditional prejudices of the philosophic consciousness.

If we grant Berkeley his premisses, the main lines of his argument are fairly cogent, however unconvincing may be his own positive views. The crux, however, of the Berkeleian idealism lies almost exclusively in the establishment of its fundamental assumption, that only ideas (*i.e.* images) can be known by the mind. This assumption Berkeley, almost without argument, takes over from his predecessors. It was currently accepted, and from it, therefore, he believed that he could safely argue. It rests, however, upon the assumption of facts which he himself questions. In rejecting the Cartesian dualism he casts down the ladder by which alone it is possible to climb into his position. For save through the facts of physics and physiology there seems to be no possible method of disproving the belief of ordinary consciousness, that in perception we apprehend independent material bodies. And until that belief can be shown to be false and ungrounded, the Berkeleian idealism is without support. It cannot establish the fundamental assumption upon which its entire argument proceeds. Thus, though Berkeley convincingly demonstrates the internal incoherence of the doctrine of representative perception — the inconsistency of its conclusions with the physical and physiological facts upon which alone it can be based — he cannot himself solve the problem in answer to which that doctrine was propounded. His services, like those of so many other reformers, were such as he did not himself foresee. In simplifying the problem, he prepared the way for the more sceptical treatment of its difficult issues by Hume.

At this point, in the philosophy of Hume, the problem of perception comes into the closest possible connection with the logical problem, referred to above. The question, how mind knowing is related to the objects known, is found to depend upon the question, how in certain crucial cases predicates may legitimately be referred to their subject. This logical problem arises in two forms, a narrower and a wider. The narrower issue concerns only the principle of causality. With what right do we assert that every event must have a cause? What is the ground which justifies us in thus predicating of events a causal character? Obviously, this logical question is fundamental, and must be answered before we can hope to solve the more special problem, as to our right to interpret sensations as effects of material bodies. Hume was the first to emphasise the vital interconnection of these two lines of enquiry.

The wider issue is the generating problem of Kant's *Critique*: How in a judgment can a predicate be asserted of a subject in which it is not already involved? In other words, what is it that in such a case justifies us in connecting the predicate with the subject? Though this problem was never directly raised by any pre-Kantian thinker, not even by Hume, it is absolutely vital to all the pre-Kantian systems. Thus Descartes' philosophy is based upon a distinction, nowhere explicitly drawn but everywhere silently assumed, between abstract and fruitful ideas. The former contain just so much content and no more; this content may be explicitly unfolded in a series of judgments, but no addition is thereby made to our knowledge. The latter, on the other hand, are endowed with an extraordinary power of inner growth. To the attentive mind they disclose a marvellous variety of inner meaning. The chief problem of scientific method consists, according to Descartes, in the discovery of these fruitful ideas, and in the separation of them from the irrelevant accompaniments which prevent them from unfolding their inner content. Once they are discovered, the steady progress of knowledge is assured. They are the springs of knowledge, and from them we have only to follow down the widening river of truth.

Descartes professed to give a complete list of the possible fruitful ideas. They are, he claimed, better known than any other concepts. They lie at the basis of all experience, and no one can possibly be ignorant of them; though, owing to their simplicity and omnipresence, their philosophical importance has been overlooked. When, however, Descartes proceeded to classify them, he found that while such ideas as space, triangle, number, motion, contain an inexhaustible content that is progressively unfolded in the mathematical sciences, those ideas, on the other hand, through which we conceive mental existences, — the notions of mind, thought, self — do not by any means prove fruitful upon attentive enquiry. As Malebranche later insisted, we can define mind only in negative terms; its whole meaning is determined through its opposition to the space-world, which alone is truly known. Though it is the function of mind to know, it cannot know itself. And when we remove from our list of ideas those which are not really fruitful, we find that only mathematical concepts remain. They alone have this apparently miraculous property of inexhaustibly developing before the mind. Scientific knowledge is limited to the material world; and even there, the limits of our mathematical insight are the limits of our knowledge.

Malebranche believed no less thoroughly than Descartes in the asserted power and fruitfulness of mathematical concepts. Under the influence of this belief, he developed, as so many other thinkers from Plato onwards have done, a highly mystical theory of scientific knowledge. It is a revelation of eternal truth, and yet is acquired by inner reflection, not laboriously built up by external observation. It comes by searching of the mind, not by exploration of the outer world. But Malebranche was not content, like Descartes, merely to accept this type of knowledge. He proceeded to account for it in metaphysical terms. The fruitfulness of mathematical ideas is due, he claimed, to the fundamental concept of extension in which they all share. This idea, representing, as it does, an infinite existence, is too great to be contained within the finite mind. Through it the mind is widened to the apprehension of something beyond itself; we know it through consciousness of its archetype in the mind of God. It is the one point at which consciousness transcends its subjective limits. Its fruitfulness is due to, and is the manifestation of, this divine source. The reason why we are condemned to remain ignorant of everything beyond the sphere of quantity is that extension alone holds this unique position. It is the only fruitful idea which the mind possesses, and other concepts, such as triangle, circle, or number, are fruitful only in proportion as they share in it. We can acquire no genuine knowledge even of the nature of the self. Being ignorant of mind, we cannot comprehend the self which is one of its modes. It is as if we sought to comprehend the nature of a triangle, in the absence of any conception of space. Were we in possession of the archetypal idea of mind, we should not only be able to deduce from it those various feelings and emotions which we have already experienced, and those sensations of the secondary qualities which we falsely ascribe to the influence of external objects, but we should also be able to discover by pure contemplation innumerable other emotions and qualities, which entirely transcend our present powers. And all of these would then be experienced in their ideal nature, and not, as now, merely through feeble and confused feeling. If mathematicians destroy their bodily health through absorption in the progressive clarification of the mysteries of space, what might not happen if the archetypal idea of mind were revealed to us? Could we attend to the preservation of a body which would incessantly distract us from the infinite and overwhelming experiences of our divine destiny?

This romantic conception of the possibilities of rational science reveals more clearly than any other Cartesian doctrine the real bearing and perverse character of the rationalistic preconceptions which underlie the Cartesian systems. The Cartesians would fain make rational science, conceived on the analogy of the mathematical disciplines, coextensive with the entire realm of the real. This grotesque enterprise is conceived as abstractly possible even by so cautious a thinker as John Locke. His reason for condemning the physical sciences as logically imperfect is that they fail to conform to this rationalistic ideal. Hence those sentences which sound so strangely in the mouth of Locke, the sensationalist.

"It is the contemplation of our abstract ideas that alone is able to afford us general knowledge." "The

true method of advancing knowledge is by considering our abstract ideas.” “[Did we know the real essence of gold] it would be no more necessary that gold should exist, and that we should make experiments upon it, than it is necessary for the knowing of the properties of a triangle, that a triangle should exist in any matter: the idea in our minds would serve for the one as well as for the other.” “In the knowledge of bodies, we must be content to glean what we can from particular experiments, since we cannot, from a discovery of their real essences, grasp at a time whole sheaves, and in bundles comprehend the nature and the properties of whole species together.”

Locke’s empirical doctrine of knowledge is thus based upon a rationalistic theory of the real. It is not, he holds, the constitution of reality, but the *de facto* limitations of our human faculties which make empirical induction the only practicable mode of discovery in natural science. Indeed, Locke gives more extreme expression than even Descartes does, to the mystically conceived mathematical method. Being ignorant of mathematics, and not over well-informed even in the physical sciences, Locke was not checked by any too close acquaintance with the real character and necessary limits of this method; and he accordingly makes statements in that unqualified fashion which seldom fails to betray the writer who is expounding views which he has not developed for himself by first-hand study of the relevant facts.

But though the unique character of mathematical knowledge thus forced itself upon the attention of all the Cartesian thinkers, and in the above manner led even the most level-headed of Descartes’ successors to dream strange dreams, no real attempt was made (save in the neglected writings of Leibniz) to examine, in a sober spirit, the grounds and conditions of its possibility. In the English School, Locke’s eulogy of abstract ideas served only to drive his immediate successors to an opposite extreme. Both Berkeley and Hume attempted to explain away, in an impossible manner, those fundamental differences, which, beyond all questioning, profoundly differentiate mathematical from empirical judgments. It is not surprising that Kant, who had no direct acquaintance with Hume’s *Treatise*, should have asserted that had Hume realised the bearing of his main teaching upon the theory of mathematical science, he would have hesitated to draw his sceptical conclusions. Such, however, was not the case. Hume’s theory of mathematical reasoning undoubtedly forms the least satisfactory part of his philosophy. He did, however, perceive the general bearing of his central teaching. It was in large degree his ignorance of the mathematical disciplines that concealed from him the thorough unsatisfactoriness of his general position, and which prevented him from formulating the logical problem in its full scope — the problem, namely, how judgments which make additions to our previous knowledge, and yet do not rest upon mere sensation, are possible. He treated it only as it presents itself in those judgments which involve the concept of causality. But this analysis of causal judgments awoke Kant from his dogmatic slumber, and so ultimately led to the raising of the logical problem in its widest form: — how synthetic *a priori* judgments, whether mathematical, physical, or metaphysical, are possible.

Hume discussed the causal problem both in regard to the general principle of causality and in its bearing upon our particular judgments of causal relation. The problems concerned in these two discussions are essentially distinct. The first involves immensely wider issues, and so far as can be judged from the existing circumstantial evidence, it was this first discussion, not as has been so often assumed by Kant’s commentators the second and more limited problem, which exercised so profound an influence upon Kant at the turning-point of his speculations. In stating it, it will be best to take Hume’s own words.

“To begin with the first question concerning the necessity of a cause: ’Tis a general maxim in philosophy, that *whatever begins to exist*, must have a cause of existence. This is commonly taken for granted in all reasonings, without any proof given or demanded. ’Tis supposed to be founded on intuition, and to be one of those maxims, which though they may be deny’d with the lips, ’tis impossible for men in their hearts really to doubt of. But if we examine this maxim by the idea of knowledge above explain’d we shall discover in it no mark of any such intuitive certainty; but on the contrary shall find, that ’tis of a

nature quite foreign to that species of conviction."

The principle that every event must have a cause, is neither intuitively nor demonstratively certain. So far from there existing a *necessary* connection between the idea of an event as something happening in time and the idea of a cause, no connection of any kind is discoverable by us. We can conceive an object to be non-existent at this moment, and existent the next, without requiring to conjoin with it the altogether different idea of a productive source.

This had been implicitly recognised by those few philosophers who had attempted to give demonstrations of the principle. By so doing, however, they only reinforce Hume's contention that it possesses no rational basis. When Hobbes argues that as all the points of time and place in which we can suppose an object to begin to exist, are in themselves equal, there must be some cause determining an event to happen at one moment rather than at another, he is assuming the very principle which he professes to prove. There is no greater difficulty in supposing the time and place to be fixed without a cause, than in supposing the existence to be so determined. If the denial of a cause is not intuitively absurd in the one case, it cannot be so in the other. If the first demands a proof, so likewise must the second. Similarly with the arguments advanced by Locke and Clarke. Locke argues that if anything is produced without a cause, it is produced by nothing, and that that is impossible, since nothing can never be a cause any more than it can be something, or equal to two right angles. Clarke's contention that if anything were without a cause, it would produce *itself*, *i.e.* exist before it existed, is of the same character. These arguments assume the only point which is in question.

"When we exclude all causes we really do exclude them, and neither suppose nothing nor the object itself to be the causes of the existence, and consequently can draw no argument from the absurdity of these suppositions to prove the absurdity of that exclusion."

The remaining argument, that every effect must have a cause, since this is implied in the very idea of an effect, is "still more frivolous."

"Every effect necessarily presupposes a cause; effect being a relative term, of which cause is the correlative. But this does not prove that every being must be preceded by a cause; no more than it follows, because every husband must have a wife, that therefore every man must be married."

The far-reaching conclusion, that the principle of causality has no possible rational basis, Hume extends and reinforces through his other doctrines, viz. that synthetic reason is merely generalised belief, and that belief is in all cases due to the ultimate instincts and propensities which *de facto* constitute our human nature. The synthetic principles which lie at the basis of our experience are non-rational in character. Each is due to a 'blind and powerful instinct,' which, demanding no evidence, and ignoring theoretical inconsistency for the sake of practical convenience, necessitates belief.

"Nature by an absolute and uncontrollable necessity has determined us to judge as well as to breathe and feel." "All these operations are a species of natural instincts, which no reasoning or process of the thought and understanding is able either to produce or to prevent."

Reason is "nothing but a wonderful and unintelligible instinct in our souls." It justifies itself by its practical uses, but can afford no standard to which objective reality must conform.

It is from this point of view that Hume states his answer to the problem of perception. Our natural belief in the permanence and identity of objects, as expressed through the principle of substance and attribute, leads us to interpret the objects of sense-perception as independent realities. We interpret our subjective sensations as being qualities of independent substances. Our other natural belief, in the dynamical interdependence of events, as expressed through the principle of causality, leads, however, to the opposite conclusion, that the known objects are merely mental. For by it we are constrained to interpret sensations, not as objective qualities, but only as subjective effects, expressive of the reactions of our psycho-physical organism. The Cartesian problems owe their origin to the mistaken attempt to harmonise, in a theoretical fashion, these two conflicting principles. The conflict is inevitable and the

antinomy is insoluble, so long as the two principles are regarded as objectively valid. The only satisfactory solution comes through recognition that reason is unable to account, save in reference to practical ends, even for its own inevitable demands. The principle of substance and attribute and the principle of causality co-operate in rendering possible such organisation of our sense-experience as is required for practical life. But when we carry this organisation further than practical life itself demands, the two principles at once conflict.

Kant shows no interest in this constructive part of Hume's philosophy; and must, indeed, have been almost entirely ignorant of it, since it finds only very imperfect expression in the *Enquiry*, and is ignored in Beattie's *Nature of Truth*. Accordingly, Kant does not regard Hume as offering a positive explanation of knowledge, but rather as representing the point of view of thoroughgoing scepticism. But even had he been acquainted at first hand with Hume's *Treatise*, he would undoubtedly have felt little sympathy with Hume's naturalistic view of the function of reason. His training in the mathematical sciences would have enabled him to detect the inadequacy of Hume's treatment of mathematical knowledge, and his strong moral convictions would have led him to rebel against the naturalistic assumptions which underlie Hume's entire position. The Berkeley-Hume comedy is thus repeated with reversed rôles. Just as Berkeley's anti-materialistic philosophy was mainly influential as a step towards the naturalism of Hume, and as such still survives in the philosophies of John Stuart Mill, Herbert Spencer, Huxley, Mach and Karl Pearson, so in turn Hume's anti-metaphysical theory of knowledge was destined to be one of the chief contributory sources of the German speculative movement.

We may now turn to Hume's treatment of the narrower problem — that of justifying our *particular* causal judgments. Hume's attitude towards this question is predetermined by the more fundamental argument, above stated, which precedes it in the *Treatise*, but which is entirely omitted from the corresponding chapters of the *Enquiry*. As the general principle of causality is of an irrational character, the same must be true of those particular judgments which are based upon it. Much of Hume's argument on this question is, indeed, merely a restatement of what had already been pointed out by his predecessors. There is no necessary connection discoverable between *any* cause and its effect. This is especially evident as regards the connection between brain states and mental experiences. No explanation can be given why a motion in the brain should produce sensations in the mind, or why a mental resolution should produce movements in the body. Such sequences may be empirically verified; they cannot be rationally understood. That this likewise holds, though in less obvious fashion, of the causal interrelations of material bodies, had been emphasised by Geulincx, Malebranche, Locke, and Berkeley. The fact that one billiard ball should communicate motion to another by impact is, when examined, found to be no less incomprehensible than the interaction of mind and body. Hume, in the following passage, is only reinforcing this admitted fact, in terms of his own philosophy.

"We fancy that were we brought on a sudden into this world we could at first have inferred that one billiard ball would communicate motion to another upon impulse; and that we needed not to have waited for the event, in order to pronounce with certainty upon it. Such is the influence of custom, that, where it is strongest, it not only covers our natural ignorance, but even conceals itself, and seems not to take place merely because it is found in the highest degree."

Nor are we conscious of any causal power within the self. When Berkeley claims that mind has the faculty of producing images at will, he is really ascribing to it creative agency. And such creation, as Malebranche had already pointed out, is not even conceivable.

"I deny that my will produces in me my ideas, for I cannot even conceive how it could produce them, since my will, not being able to act or will without knowledge, presupposes my ideas and does not make them." "Is there not here," Hume asks, "either in a spiritual or material substance, or both, some secret mechanism or structure of parts, upon which the effect depends, and which, being entirely unknown to us, renders the power or energy of the will equally unknown and incomprehensible?"

But the fact that Hume thus restates conclusions already emphasised by his predecessors will not justify us in contending (as certain historians of philosophy seem inclined to do) that in his treatment of the causal problem he failed to make any important advance upon the teaching of the Occasionalists. Hume was the first to perceive the essential falsity of the Cartesian, rationalistic view of the causal nexus. For Descartes, an effect is that which can be deduced with logical necessity from the concept of its cause. The Occasionalists similarly argued that because natural events can never be deduced from one another they must in all cases be due to supernatural agency; like Descartes, they one and all failed to comprehend that since by an effect we mean that which follows *in time* upon its cause, and since, therefore, the principle of causality is the law of *change*, the nature of causality cannot be expressed in logical terms. Hume was the first to appreciate the significance of this fundamental fact; and an entirely new set of problems at once came into view. If causal connection is not, as previous thinkers had believed, logical in character, if it does not signify logical dependence of the so-called effect upon its cause, its true connotation must lie elsewhere; and until this has been traced to its hidden source, any attempted solution of metaphysical problems is certain to involve many false assumptions. The answer that is given to the problem of the origin and content of the causal concept must determine our interpretation alike of sense-experience and of pure thought.

The problem presents on examination, however, a most paradoxical aspect. As Hume has already shown, every effect is an event distinct from its cause, and there is never any connection, beyond that of mere sequence, discoverable between them. We observe only sequence; we assert necessary connection. What, then, is in our minds when this latter assertion is made? And how, if the notion of necessitated connection cannot be gained through observation of the external events, is it acquired by us? Hume again propounds a naturalistic solution. Causation, *i.e. necessitated* sequence in time, is not in any sense a conception; it is not a comprehended relation between events, but a misunderstood feeling in our minds. We cannot form any, even the most remote, conception of how one event can produce another. Neither imagination nor pure thought, however freely they may act, are capable of inventing any such notion. But nature, by the manner in which it has constituted our minds, deludes us into the belief that we are in actual possession of this idea. The repeated sequence of events, in fixed order, generates in us the feeling of a tendency to pass from the perception or idea of the one to the idea of the other. This feeling, thus generated by custom, and often in somewhat confused fashion combined with the feeling of ‘animal nisus,’ which is experienced in bodily effort, is mistaken by the mind for a definite concept of force, causality, necessary connection. As mere feeling it can afford no insight into the relation holding between events, and as merely subjective can justify no inference in regard to that relation. The terms force, causality, necessitated sequence in time, have a practical value, as names for our instinctive, natural expectations; but when employed as instruments for the *theoretical* interpretation of experience, they lead us off on a false trail.

This is one of the fundamental points upon which Hume reveals a deeper speculative insight than either Malebranche, Geulincx, or Locke. Though these latter insist upon our ignorance of the relation holding between events, they still assume that causation and natural necessity are concepts which have a quite intelligible meaning; and in consequence they fail to draw the all-important conclusion, that the general principle of causality has neither intuitive nor demonstrative validity. For that is the revolutionary outcome of Hume’s analysis of the notion of necessitated connection. The principle of causality is a synthetic judgment in which no connection is discoverable between its subject and its predicate. That is the reason why it is neither self-evident nor capable of being established upon more ultimate grounds.

As has already been stated, the wider problem concerning the *principle* of causality is developed only in the *Treatise*; the problem regarding the *concept* of causality is discussed both in the *Treatise* and in the *Enquiry*. An appreciation of the wider problem is required, however, in order to set this second problem in its true light, for it is only through its connection with the wider issue that Hume’s reduction of the

concept of causality to a merely instinctive, non-rational expectation acquires its full significance. Hume's analysis then amounts, as Kant was the first to realise, to an attack upon the objective validity of all constructive thinking. Not only rationalism, but even such metaphysics as may claim to base its conclusions upon the teaching of experience, is thereby rendered altogether impossible. The issue is crucial, and must be honestly faced, before metaphysical conclusions, no matter what their specific character may be, whether *a priori* or empirical, can legitimately be drawn. If we may not assert that an event must have some cause, even the right to enquire for a cause must first be justified. And if so fundamental a principle as that of causality is not self-evident, are there any principles which can make this claim?

The account which we have so far given of Hume's argument covers only that part of it which is directed against the rationalist position, and which was therefore so influential in turning Kant on to the line of his Critical speculations. But Hume attacked with equal vigour the empiricist standpoint; and as this aspect of his teaching, constituting as it did an integral part of Kant's own philosophy, must undoubtedly have helped to confirm Kant in his early rationalist convictions, we may profitably dwell upon it at some length. In opposition to the empiricists, Hume argues that experience is incapable of justifying any inference in regard to matters of fact. It cannot serve as a basis from which we can inductively extend our knowledge of facts beyond what the senses and memory reveal. Inductive inference, when so employed, necessarily involves a *petitio principii*; we assume the very point we profess to have proved.

The argument by which Hume establishes this important contention is as follows. All inductive reasoning from experience presupposes the validity of belief in causal connection. For when we have no knowledge of causes, we have no justification for asserting the continuance of uniformities. Now it has been shown that we have no experience of any necessary relation between so-called causes and their effects. The most that experience can supply are sequences which repeat themselves. In regarding the sequences as causal, and so as universally constant, we make an assertion for which experience gives no support, and to which no amount of repeated experience, recalled in memory, can add one jot of real evidence. To argue that because the sequences have remained constant in a great number of repeated experiences, they are therefore more likely to remain constant, is to assume that constancy in the past is a ground for inferring it in the future; and that is the very point which demands proof. In drawing the conclusion we virtually assume that there is a necessary connection, *i.e.* an absolutely constant relation, between events. But since no *single* experience of causal sequence affords ground for inferring that the sequence will continue in the future, no number of repeated experiences, recalled in memory, can contribute to the strengthening of the inference. It is meaningless to talk even of likelihood or probability. The fact that the sun has without a single known exception arisen each day in the past does not (if we accept the argument disproving all knowledge of necessary connection) constitute *proof* that it will rise to-morrow.

"None but a fool or a madman will be unaffected in his expectations or natural beliefs by this constancy, but he is no philosopher who accepts this as in the nature of evidence."

Since, for all that we know to the contrary, bodies may change their nature and mode of action at any moment, it is vain to pretend that we are scientifically assured of the future because of the past.

"My practice, you say, refutes my doubts. But you mistake the purport of my question. As an agent, I am quite satisfied in the point; but as a philosopher, who has some share of curiosity, I will not say scepticism, I want to learn the foundation of this inference. No reading, no enquiry has yet been able to remove my difficulty or give me satisfaction in a matter of such importance. Can I do better than propose the difficulty to the public, even though, perhaps, I have small hopes of obtaining a solution? We shall at least, by this means, be sensible of our ignorance, if we do not augment our knowledge."

Kant was the first, after thirty years, to take up this challenge. Experience is no source of evidence until

the causal postulate has been *independently* proved. Only if the principle of causality can be established prior to all specific experience, only if we can predetermine experience as necessarily conforming to it, are empirical arguments valid at all. Hume's enquiry thus directly leads to the later, no less than to the earlier form of Kant's epoch-making question. In its earlier formulation it referred only to *a priori* judgments; in its wider application it was found to arise with equal cogency in connection with empirical judgments. And as thus extended, it generated the problem: How is sense-experience, regarded as a form of *knowledge*, possible at all? By showing that the principle of causality has neither intuitive nor demonstrative validity, Hume cuts the ground from under the rationalists; by showing that sense-experience cannot by itself yield conclusions which are objectively valid, he at the same time destroys the empiricist position. In this latter contention Kant stands in complete agreement with Hume. That the sensuously given is incapable of grounding even probable inferences, is a fundamental presupposition (never discussed, but always explicitly assumed) of the Critical philosophy. It was by challenging the sufficiency of Hume's other line of argument, that which is directed against the rationalists, that Kant discovered a way of escape from the sceptical dilemma. The conditions of experience can be proved by a transcendental method, which, though *a priori* in character, does not lie open to Hume's sceptical objections. Each single experience involves rational principles, and consequently even a single empirical observation may suffice to justify an inductive inference. Experience conforms to the demands of pure *a priori* thought; and can legitimately be construed in accordance with them.

We may now pass to the philosophy in which Kant was educated. It gave to his thinking that rationalist trend, to which, in spite of all counter-influences, he never ceased to remain true. It also contributed to his philosophy several of its constructive principles. Only two rationalist systems need be considered, those of Leibniz and of Wolff. Kant, by his own admission, had been baffled in his attempts (probably not very persevering) to master Spinoza's philosophy. It was with Wolff's system that he was most familiar; but both directly and indirectly, both in his early years and in the 'seventies, the incomparably deeper teaching of Leibniz must have exercised upon him a profoundly formative influence. In defining the points of agreement and of difference between Hume and Leibniz, we have already outlined Leibniz's general view of the nature and powers of pure thought, and may therefore at once proceed to the relevant detail of his main tenets.

Upon two fundamental points Leibniz stands in opposition to Spinoza. He seeks to maintain the reality of the contingent or accidental. These terms are indeed, as he conceives them, synonymous with the actual. Necessity rules only in the sphere of the possible. Contingency or freedom is the differentiating characteristic of the real. This point of view is bound up with his second contention, namely, that the real is a kingdom of ends. It is through divine choice of the best among the possible worlds that the actual present order has arisen. There are thus two principles which determine the real: the principle of contradiction which legislates with absolute universality, and the principle of the best, or, otherwise formulated, of sufficient reason, which differentiates reality from truth, limiting thought, in order that, without violating logic, it may freely satisfy the moral needs. Leibniz thus vindicates against Spinoza the reality of freedom and the existence of ends.

Though Leibniz agrees with Spinoza that the philosophically perfect method would be to start from an adequate concept of the Divine Being, and to deduce from His attributes the whole nature of finite reality, he regards our concept of God as being too imperfect to allow of such procedure. We are compelled to resort to experience, and by analysis to search out the various concepts which it involves. By the study of these concepts and their interrelations, we determine, in obedience to the law of contradiction, the nature of the possible. The real, in contradistinction from the possible, involves, however, the notion of ends. The existence of these ends can never be determined by logical, but only by moral considerations. The chief problem of philosophical method is, therefore, to discover the exact relation in which the logical and the teleological, the necessary and the contingent, stand to one another.

The absence of contradiction is in itself a sufficient guarantee of possibility, *i.e.* even of the possibility of real existence. How very far Leibniz is willing to go on this line is shown by his acceptance of the ontological argument. The whole weight of his system rests, indeed, upon this proof. The notion of God is, he maintains, the sole concept which can determine itself in a purely logical manner not only as possible but also as real. If we are to avoid violating the principle of contradiction, the *Ens perfectissimum* must be regarded as possessing the perfection of real existence. And since God is perfect in moral as in all other attributes, His actions must be in conformity with moral demands. In creating the natural order God must therefore have chosen that combination of possibilities which constitutes the best of all possible worlds. By means of this conceptual bridge we are enabled to pass by pure *a priori* thinking from the logically possible to the factually real.

Pure logical thinking is thus an instrument whereby ultimate reality can be defined in a valid manner. *Pure thought is speculative and metaphysical in its very essence.* It uncovers to us what no experience can reveal, the wider universe which exists eternally in the mind of God. Every concept (whether mathematical, dynamical, or moral), provided only that it is not self-contradictory, is an eternal essence, with the intrinsic nature of which even God must reckon in the creation of things. When, therefore, we are determining the unchanging nature of the eternally possible, there is no necessary reference to Divine existence. The purely logical criterion suffices as a test of truth. Every judgment which is made in regard to such concepts must express only what their content involves. All such judgments must be analytic in order to be true.

When, however, we proceed from the possible to the real, that is to say, from the necessary to the contingent, the logical test is no longer sufficient; and only by appeal to the second principle, that of sufficient reason, can judgments about reality be logically justified. Whether or not the principle of sufficient reason is deducible, as Wolff sought to maintain, from the principle of contradiction, is a point of quite secondary importance. That is a question which does not deserve the emphasis which has been laid upon it. What is chiefly important is that for Leibniz, as for Wolff, both principles are principles of analysis. The principle of sufficient reason is not an instrument for determining necessary relations between independent substances. The sufficient ground of a valid predicate must in all cases be found in the concept of the subject to which it is referred. The difference between the two principles lies elsewhere, namely, in the character of the connection established between subject and predicate. In the one case the denial of the proposition involves a direct self-contradiction. In the other the opposite of the judgment is perfectly conceivable; our reason for asserting it is a moral (employing the term in the eighteenth-century sense), not a logical ground. The subject is so constituted, that in the choice of ends, in pursuit of the good, it must by its very nature so behave. The principle of sufficient reason, which represents in our finite knowledge the divine principle of the best, compels us to recognise the predicate as involved in the subject — as involved through a ground which inclines without necessitating. Often the analysis cannot be carried sufficiently far to enable us thus to transform a judgment empirically given into one which is adequately grounded. None the less, in recognising it as true, we postulate that the predicate is related to the subject in this way. There are not for Leibniz two methods of establishing truth, sense-perception to reveal contingent fact, and general reasoning to establish necessary truth. A proposition can be accepted as true only in so far as we can at least *postulate*, through absence of contradiction and through sufficient reason, its analytic character. It must express some form of identity. The proposition, Caesar crossed the Rubicon, is given us as historical fact. The more complete our knowledge of Caesar and of his time, the further we can carry the analysis; and that analysis if completely executed would displace the merely factual validity of the judgment by insight into its metaphysical truth. Thus experience, with its assertions of the here and now about particulars inexhaustibly concrete, sets to rational science an inexhaustible task. We can proceed in our analysis indefinitely, pushing out the frontiers of thought further and further into the empirical realm. Only by the Divine Mind can the task be completed, and all things

seen as ordered in complete obedience to the two principles of thought.

Leibniz, in propounding this view, develops a genuinely original conception of the relation holding between appearance and reality. Only monads, that is, spiritual beings, exist. Apart from the representative activity of the monads there are no such existences as space and time, as matter and motion. The mathematical and physical sciences, in their present forms, therefore, cannot be interpreted as revealing absolute existences. But, if ideally developed, they would emancipate themselves from mechanical and sensuous notions; and would consist of a body of truths, which, as thus perfected, would be discovered to constitute the very being of thought. Pure thought or reason consists in the apprehension of such truths. To discover and to prove them thought does not require to issue out beyond itself. It creates this conceptual world in the very act of apprehending it; and as this realm of truth thus expresses the necessary character of all thought, whether divine or human, it is universal and unchanging. Each mind apprehends the same eternal truth; but owing to imperfection each finite being apprehends it with some degree of obscurity and confusion, fragmentarily, in terms of sense, and so falls prey to the illusion that the self stands in mechanical relations to a spatial and temporal world of matter and motion.

Leibniz supports this doctrine by his theory of sense-experience as originating spontaneously from within the individual mind. Thereby he is only repeating that pure thought generates its whole content from within itself. Sense-experience, in its intrinsic nature, is nothing but pure thought. Such thought, owing to the inexhaustible wealth of its conceptual significance, so confuses the mind which thus generates it, that only by prolonged analysis can larger and larger portions of it be construed into the conceptual judgments which have all along constituted its sole content. And in the process, space, time, and motion lose all sensuous character, appearing in their true nature as orders of relation which can be adequately apprehended only in conceptual terms. They remain absolutely real as objects of thought, though as sensible existences they are reduced to the level of mere appearance. Such is the view of thought which is unfolded in Leibniz’s writings, in startling contrast to the naturalistic teaching of his Scotch antagonist.

As already indicated, Kant’s first-hand knowledge of Leibniz’s teaching was very limited. He was acquainted with it chiefly through the inadequate channel of Wolff’s somewhat commonplace exposition of its principles. But even from such a source he could derive what was most essential, namely, Leibniz’s view of thought as absolute in its powers and unlimited in its claims. How closely Wolff holds to the main tenet of Leibniz’s system appears from his definition of philosophy as “the science of possible things, so far as they are possible.” He thus retains, though without the deeper suggestiveness of Leibniz’s speculative insight, the view that thought precedes reality and legislates for it. By the possible is not meant the existentially or psychologically possible, but the conceptually necessary, that which, prior to all existence, has objective validity, sharing in the universal and necessary character of thought itself.

As Riehl has very justly pointed out, Wolff’s philosophy had, prior even to the period of Kant’s earliest writings, been displaced by empirical, psychological enquiries and by eclectic, popular philosophy. Owing to the prevailing lack of thoroughness in philosophical thinking, “Problemlosigkeit” characterised the whole period. The two exclusively alternative views of the function of thought stood alongside one another within each of the competing systems, quite unreconciled and in their mutual conflict absolutely destructive of all real consistency and thoroughness of thought. It was Kant who restored rationalism to its rightful place. He reinvigorated the flaccid tone of his day by adopting in his writings, both early and late, the strict method of rational science, and by insisting that the really crucial issues be boldly faced. In essentials Kant holds to Wolff’s definition of philosophy as “the science of possible things, so far as they are possible.” As I have just remarked, the possible is taken in an objective sense, and the definition consequently gives expression to the view of philosophy upon which Kant so frequently insists, as lying wholly in the sphere of pure *a priori* thought. Its function is to determine prior to specific experience what experience must be; and obviously that is only possible by means of an *a priori*, purely conceptual method. His *Critique*, as its title indicates, is a criticism of pure reason by pure reason. Nothing which

escapes definition through pure *a priori* thinking can come within its sphere. The problem of the “possibility of experience” is the problem of discovering the conditions which *necessarily* determine experience to be what it is. Kant, of course, radically transforms the whole problem, in method of treatment as well as in results, when in defining the subject-matter of enquiry he substitutes experience for things absolutely existent. This modification is primarily due to the influence of Hume. But the constant occurrence in Kant’s philosophy of the term “possibility” marks his continued belief in the Idealist view of thought. Though pure thought never by itself amounts to knowledge — therein Kant departs from the extreme rationalist position — only through it is any knowledge, empirical or *a priori*, possible at all. Philosophy, in order to exist, must be a system of *a priori* rational principles. Nothing empirical or hypothetical can find any place in it. Yet at the same time it is the system of the *a priori* conditions only of experience, not of ultimate reality. Such is the twofold relation of agreement and difference in which Kant stands to his rationalist predecessors.

SCIENCE AND RELIGION — KANT, LAMBERT, LAPLACE, SIR WILLIAM HERSCHEL by Walter Libby

Hutton had advanced the study of geology by concentrating attention on the observable phenomena of the earth's crust, and turning away from speculations about the origin of the world and the relation of this sphere to other units of the cosmos. In the same century, however, other scientists and philosophers were attracted by these very problems which seemed not to promise immediate or demonstrative solution, and through their studies they arrived at conclusions which profoundly affected the science, the ethics, and the religion of the civilized world.

Whether religion be defined as a complex feeling of elation and humility — a sacred fear — akin to the æsthetic sense of the sublime; or, as an intellectual recognition of some high powers which govern us below — of some author of all things, of some force social or cosmic which tends to righteousness; or, as the outcrop of the moral life touched with light and radiant with enthusiasm; or, as partaking of the nature of all these: it cannot be denied that the eighteenth century contributed to its clarification and formulation, especially through the efforts of the German philosopher, Immanuel Kant (1724-1804). Yet it is not difficult to show that the philosophy of Kant and of those associated with him was greatly influenced by the science of the time, and that, in fact, in his early life he was a scientist rather than a philosopher in the stricter sense. His *General Natural History and Theory of the Heavens*, written at the age of thirty-one, enables us to follow his transition from science to philosophy, and, more especially, to trace the influence of his theory of the origin of the heavenly bodies on his religious conceptions.

For part of this theory Kant was indebted to Thomas Wright of Durham (1711-1786). Wright was the son of a carpenter, became apprenticed to a watchmaker, went to sea, later became an engraver, a maker of mathematical instruments, rose to affluence, wrote a book on navigation, and was offered a professorship of navigation in the Imperial Academy of St. Petersburg. It was in 1750 that he published, in the form of nine letters, the work that stimulated the mind of Kant, *An Original Theory or New Hypothesis of the Universe*. The author thought that the revelation of the structure of the heavens naturally tended to propagate the principles of virtue and vindicate the laws of Providence. He regarded the universe as an infinity of worlds acted upon by an eternal Agent, and full of beings, tending through their various states to a final perfection. Who, conscious of this system, can avoid being filled with a kind of enthusiastic ambition to contribute his atom toward the due admiration of its great and Divine Author?

Wright discussed the nature of mathematical certainty and the various degrees of moral probability proper for conjecture (thus pointing to a distinction that ultimately became basal in the philosophy of Kant). When he claimed that the sun is a vast body of blazing matter, and that the most distant star is also a sun surrounded by a system of planets, he knew that he was reasoning by analogy and not enunciating what is immediately demonstrable. Yet this multitude of worlds opens out to us an immense field of probation and an endless scene of hope to ground our expectation of an ever future happiness upon, suitable to the native dignity of the awful Mind which made and comprehended it.

The most striking part of Wright's *Original Theory* relates to the construction of the Milky Way, which he thought analogous in form to the rings of Saturn. From the center the arrangement of the systems and the harmony of the movements could be discerned, but our solar system occupies a section of the belt, and what we see of the creation gives but a confused picture, unless by an effort of imagination we attain the right point of view. The various cloudy stars or light appearances are nothing but a dense accumulation of stars. What less than infinity can circumscribe them, less than eternity comprehend them, or less than Omnipotence produce or support them? He passes on to a discussion of time and space with regard to the

known objects of immensity and duration, and in the ninth letter says that, granting the creation to be circular or orbicular, we can suppose in the center of the whole an intelligent principle, the to-all-extending eye of Providence, or, if the creation is real, and not merely ideal, a sphere of some sort. Around this the suns keep their orbits harmoniously, all apparent irregularities arising from our eccentric view. Moreover, space is sufficient for many such systems.

Kant resembled his predecessor in his recognition of the bearing on moral and religious conceptions of the study of the heavens and also in his treatment of many astronomical details, sometimes merely adopting, more frequently developing or modifying, the teachings of Wright. He held that the stars constitute a system just as much as do the planets of our solar system, and that other solar systems and other Milky Ways may have been produced in the boundless fields of space. Indeed, he is inclined to identify with the latter systems the small luminous elliptical areas in the heavens reported by Maupertuis in 1742. Kant also accepted Wright's conjecture of a central sun or globe and even made selection of one of the stars to serve in that office, and taught that the stars consist like our sun of a fiery mass. One cannot contemplate the world-structure without recognizing the excellent orderliness of its arrangement, and perceiving the sure indications of the hand of God in the completeness of its relations. Reason, he says in the *Allgemeine Naturgeschichte*, refuses to believe it the work of chance. It must have been planned by supreme wisdom and carried into effect by Omnipotence.

Kant was especially stimulated by the analogy between the Milky Way and the rings of Saturn. He did not agree with Wright that they, or the cloudy areas, would prove to be stars or small satellites, but rather that both consisted of vapor particles. Giving full scope to his imagination, he asks if the earth as well as Saturn may not have been surrounded by a ring. Might not this ring explain the supercelestial waters that gave such cause for ingenuity to the medieval writers? Not only so, but, had such a vaporous ring broken and been precipitated to the earth, it would have caused a prolonged Deluge, and the subsequent rainbow in the heavens might very well have been interpreted as an allusion to the vanished ring, and as a promise. This, however, is not Kant's characteristic manner in supporting moral and religious truth.

To account for the origin of the solar system, the German philosopher assumes that at the beginning of all things the material of which the sun, planets, satellites, and comets consist, was uncompounded, in its primary elements, and filled the whole space in which the bodies formed out of it now revolve. This state of nature seemed to be the very simplest that could follow upon nothing. In a space filled in this way a state of rest could not last for more than a moment. The elements of a denser kind would, according to the law of gravitation, attract matter of less specific gravity. Repulsion, as well as attraction, plays a part among the particles of matter disseminated in space. Through it the direct fall of particles may be diverted into a circular movement about the center toward which they are gravitating.

Of course, in our system the center of attraction is the nucleus of the sun. The mass of this body increases rapidly, as also its power of attraction. Of the particles gravitating to it the heavier become heaped up in the center. In falling from different heights toward this common focus the particles cannot have such perfect equality of resistance that no lateral movements should be set up. A general circulatory motion is in fact established ultimately in one direction about the central mass, which receiving new particles from the encircling current rotates in harmony with it.

Mutual interference in the particles outside the mass of the sun prevents all accumulation except in one plane and that takes the form of a thin disk continuous with the sun's equator. In this circulating vaporous disk about the sun differences of density give rise to zones not unlike the rings of Saturn. These zones ultimately contract to form planets, and as the planets are thrown off from the central solar mass till an equilibrium is established between the centripetal and centrifugal forces, so the satellites in turn are formed from the planets. The comets are to be regarded as parts of the system, akin to the planets, but more remote from the control of the centripetal force of the sun. It is thus that Kant conceived the nebular hypothesis, accounting (through the formation of the heavenly bodies from a cloudy vapor similar to that

still observable through the telescope) for the revolution of the planets in one direction about the sun; the rotation of sun and planets; the revolution and rotation of satellites; the comparative densities of the heavenly bodies; the materials in the tails of comets; the rings of Saturn, and other celestial phenomena. Newton, finding no matter between the planets to maintain the community of their movements, asserted that the immediate hand of God had instituted the arrangement without the intervention of the forces of Nature. His disciple Kant now undertook to explain an additional number of phenomena on mechanical principles. Granted the existence of matter, he felt capable of tracing the cosmic evolution, but at the same time he maintained and strengthened his religious position, and did not assume (like Democritus and Epicurus) eternal motion without a Creator or the coming together of atoms by accident or haphazard.

It might be objected, he says, that Nature is sufficient unto itself; but universal laws of the action of matter serve the plan of the Supreme Wisdom. There is convincing proof of the existence of God in the very fact that Nature, even in chaos, cannot proceed otherwise than regularly and according to law. Even in the essential properties of the elements that constituted the chaos, there could be traced the mark of that perfection which they have derived from their origin, their essential character being a consequence of the eternal idea of the Divine Intelligence. Matter, which appears to be merely passive and wanting in form and arrangement, has in its simplest state a tendency to fashion itself by a natural development into a more perfect constitution. Matter must be considered as created by God in accordance with law and as ever obedient to law, not as an independent or hostile force needing occasional correction. To suppose the material world not under law would be to believe in a blind fate rather than in Providence. It is Nature's harmony and order revealed to our understanding that give us a clue to its creation by an understanding of the highest order.

In a work written eight years later Kant sought to furnish people of ordinary intelligence with a proof of the existence of God. It might seem irrelevant in such a production to give an exposition of physical phenomena, but, intent on his method of mounting to a knowledge of God by means of natural science, he here repeats in summarized form his theory of the origin of the heavenly bodies. Moreover, the influence of his astronomical studies persisted in his maturest philosophy, as can be seen in the well-known passage at the conclusion of his ethical work, the *Critique of the Practical Reason* (1788): "There are two things that fill my spirit with ever new and increasing awe and reverence — the more frequently and the more intently I contemplate them — the star-strewn sky above me and the moral law within." His religious and ethical conceptions were closely associated with — indeed, dependent upon — an orderly and infinite physical universe.

In the mathematician, astronomer, physicist, and philosopher, J. H. Lambert (1728-1777), Kant found a genius akin to his own, and through him hoped for a reformation of philosophy on the basis of the study of science. Lambert like his contemporary was a disciple of Newton, and in 1761 he published a book in the form of letters expressing views in reference to the Milky Way, fixed stars, central sun, very similar to those published by Kant in 1755. Lambert had heard of Wright's work, so similar to his own, a year after the latter was written.

Comets, now robbed of many of the terrors with which ancient superstition endowed them, might, he says, seem to threaten catastrophe, by colliding with the planets or by carrying off a satellite. But the same hand which has cast the celestial spheres in space, has traced their course in the heavens, and does not allow them to wander at random to disturb and destroy each other. Lambert imagines that all these bodies have exactly the volume, weight, position, direction, and speed necessary for the avoidance of collisions. If we confess a Supreme Ruler who brought order from chaos, and gave form to the universe; it follows that this universe is a perfect work, the impress, picture, reflex of its Creator's perfection. Nothing is left to blind chance. Means are fitted to ends. There is order throughout, and in this order the dust beneath our feet, the stars above our heads, atoms and worlds, are alike comprehended.

Laplace in his statement of the nebular hypothesis made no mention of Kant. He sets forth, in the

Exposition of the Solar System, the astronomical data that the theory is designed to explain: the movements of the planets in the same direction and almost in the same plane; the movements of the satellites in the same direction as those of the planets; the rotation of these different bodies and of the sun in the same direction as their projection, and in planes little different; the small eccentricity of the orbits of planets and satellites; the great eccentricity of the orbits of comets. How on the ground of these data are we to arrive at the cause of the earliest movements of the planetary system?

A fluid of immense extent must be assumed, embracing all these bodies. It must have circulated about the sun like an atmosphere and, in virtue of the excessive heat which was engendered, it may be assumed that this atmosphere originally extended beyond the orbits of all the planets, and was contracted by stages to its present form. In its primitive state the sun resembled the nebulæ, which are to be observed through the telescope, with fiery centers and cloudy periphery. One can imagine a more and more diffuse state of the nebulous matter.

Planets were formed, in the plane of the equator and at the successive limits of the nebulous atmosphere, by the condensation of the different zones which it abandoned as it cooled and contracted. The force of gravity and the centrifugal force sufficed to maintain in its orbit each successive planet. From the cooling and contracting masses that were to constitute the planets smaller zones and rings were formed. In the case of Saturn there was such regularity in the rings that the annular form was maintained; as a rule from the zones abandoned by the planet-mass satellites resulted. Differences of temperature and density of the parts of the original mass account for the eccentricity of orbits, and deviations from the plane of the equator.

In his *Celestial Mechanics* (1825) Laplace states that, according to Herschel's observations, Saturn's rotation is slightly quicker than that of its rings. This seemed a confirmation of the hypothesis of the *Exposition du Système du Monde*.

When Laplace presented the first edition of this earlier work to Napoleon, the First Consul said: "Newton has spoken of God in his book. I have already gone through yours, and I have not found that name in it a single time." To this Laplace is said to have replied: "First Citizen Consul, I have not had need of that hypothesis." The astronomer did not, however, profess atheism; like Kant he felt competent to explain on mechanical principles the development of the solar system from the point at which he undertook it. In his later years he desired that the misleading anecdote should be suppressed. So far was he from self-sufficiency and dogmatism that his last utterance proclaimed the limitations of even the greatest intellects: "What we know is little enough, what we don't know is immense" (*Ce que nous connaissons est peu de chose, ce que nous ignorons est immense*).

Sir William Herschel's observations, extended over many years, confirmed both the nebular hypothesis and the theory of the systematic arrangement of the stars. He made use of telescopes 20 and 40 feet in focal length, and of 18.7 and 48 inches aperture, and was thereby enabled, as Humboldt said, to sink a plummet amid the fixed stars, or, in his own phrase, to gauge the heavens. *The Construction of the Heavens* was always the ultimate object of his observations. In a contribution on this subject submitted to the Royal Society in 1787 he announced the discovery of 466 new nebulæ and clusters of stars. The sidereal heavens are not to be regarded as the concave surface of a sphere, from the center of which the observer might be supposed to look, but rather as resembling a rich extent of ground or chains of mountains in which the geologist discovers many strata consisting of various materials. The Milky Way is one stratum and in it our sun is placed, though perhaps not in the very center of its thickness.

By 1811 he had greatly increased his observations of the nebulæ and could arrange them in series differing in extent, condensation, brightness, general form, possession of nuclei, situation, and in resemblance to comets and to stars. They ranged from a faint trace of extensive diffuse nebulosity to a nebulous star with a mere vestige of cloudiness. Herschel was able to make the series so complete that the difference between the members was no more than could be found in a series of pictures of the human

figure taken from the birth of a child till he comes to be a man in his prime. The difference between the diffuse nebulous matter and the star is so striking that the idea of conversion from one to the other would hardly occur to any one without evidence of the intermediate steps. It is highly probable that each successive state is the result of the action of gravity.

In his last statement, 1818, he admitted that to his telescopes the Milky Way had proved fathomless, but on “either side of this assemblage of stars, presumably in ceaseless motion round their common center of gravity, Herschel discovered a canopy of discrete nebulous masses, such as those from the condensation of which he supposed the whole stellar universe to be formed.”

In the theory of the evolution of the heavenly bodies, as set forth by Kant, Laplace, and Herschel, it was assumed that the elements that composed the earth are also to be found elsewhere throughout the solar system and the universe. The validity of this assumption was finally established by spectrum analysis. But this vindication was in part anticipated, at the beginning of the nineteenth century, by the analysis of meteorites. In these were found large quantities of iron, considerable percentages of nickel, as well as cobalt, copper, silicon, phosphorus, carbon, magnesium, zinc, and manganese.

FOREWORD

There is a story that Schopenhauer used to begin his lectures on Kant by saying: “Let no one *tell* you what is contained in the *Critique of Pure Reason*.” The writer of this little book hopes that no one will imagine that he has disregarded this warning. There are no short-cuts to the understanding of a great philosopher, and the only way to appreciate the greatness of a philosophic system is to study the philosopher’s own writings. All that the writer of a book like this can hope to do is to persuade others to undertake that study by interesting them in the problems with which it deals, and by offering a few suggestions which may help to an understanding of it. I have said nothing about the numerous other works which Kant wrote. For the three *Critiques* contain his system, and the understanding of that is all-important.

CHAPTER I. THE IDEA OF CRITICISM

"It is a difficult matter," says Heine, "to write the life history of Immanuel Kant, for he had neither life nor history. He lived a mechanically ordered, abstract, old bachelor kind of existence in a quiet, retired alley in Königsberg, an old town in the north-east corner of Germany." The times he lived in were stirring enough. He was born in 1724, and died in 1804. He lived through the Seven Years' War that first made Germany a nation, he followed with sympathy the United States War of Independence, he saw the French Revolution and the beginning of the career of Napoleon. Yet in all his long life he never moved out of the province in which he was born, and nothing was allowed to interrupt the steady course of his lecturing, studying, and writing. "Getting up," continues Heine, "drinking coffee, lecturing, eating, going for a walk, everything had its fixed time; and the neighbours knew that it must be exactly half-past four when Immanuel Kant, in his gray frock-coat, with his Spanish cane in his hand, stepped from his door and walked towards the little lime-tree avenue, which is called after him the Philosopher's Walk." "Strange contrast," reflects Heine, "between the man's outward life and his destructive, world-smashing thoughts." As the political history of the eighteenth century came to an end when the French Revolution spilled over the borders of France and drove Napoleon up and down Europe, breaking up the old political systems and inaugurating modern Europe, so its opposing currents of thought were gathered together in the mind of a weak-chested, half-invalid little man in Königsberg, and from their meeting a new era in philosophy began.

There are some philosophers to whom truth seems to come almost unsought, as an immediate authoritative vision. Kant was not one of these. His greatest work, the *Critique of Pure Reason*, was conceived when he was forty-eight, and published in 1781, when he was fifty-seven. It was the outcome of half a lifetime's patient study and thought. Heine says of him: "He was the perfect type of the small shopkeeper. Nature had meant him to weigh coffee and sugar, but fate willed that he should weigh other things and put a God on his scales, and his weighing was exact." The sneer is unjust, but there is something in the simile; for Kant's philosophy was a kind of taking stock, a survey of the great movement of thought from the time when the Renaissance and the Reformation made thought free, an attempt to estimate the achievements of the new sciences, to deal with their conflicting claims and ideals and say what it all came to. In Kant modern science, which began with Descartes and Galileo, first became conscious of itself.

This taking stock Kant called *Criticism*. His great books are all called Critiques — the *Critique of Pure Reason*, the *Critique of Practical Reason*, the *Critique of Judgment*. He called his philosophy the Critical Philosophy or Critical Idealism. Essential to an understanding of Kant is an understanding of what he meant by criticism, and why he opposes it to dogmatism and scepticism; for the necessity and possibility of such a criticism was his great philosophical discovery. We have called Kant's work a survey of the achievements of the thought of his times, but it was very much more than that, and has a much more universal significance than could belong to any history of the thought of one epoch. For these achievements of thought, though great, were conflicting and partial. They contrasted with failure and barrenness in other directions, and they seemed to be due to different methods. This success of thought in one direction and its failure in another, and this uncertainty about the true method of science, were problems which at once presented themselves to an impartial observer, and Kant held that they could be answered only by taking stock of actual attainments, and by criticism of the powers and range of human thought in general.

The problem that presented itself to him will be understood if we look for a moment at the history of thought in the seventeenth and eighteenth centuries. One thing that Kant noted in it was the steady and sure

progress of physics. “With the experiments of Galileo and Torricelli,” he says in the preface to the second edition of the first *Critique*, “a new light flashed on all students of nature.” The continued success of physics meant the successful application of mathematics to the concrete world, and along with it a remarkable development of mathematics itself. This sudden success inspired men to feel that they had discovered a way of explaining the universe; they contrasted the fertility of their new methods with the barrenness of scholastic speculation in morals and theology; they felt confident that all that was wanted to the attainment of certain knowledge in all spheres of human interest was the extension of these methods. If men would only set to work the right way, they were sure that all difficulties would be overcome; and, by reflection upon their own success, they hoped to explain what the right way was.

Unfortunately this was not easy, for the advance from pure mathematics to physics, from a study of the nature of pure mathematical conceptions to an inquiry into the laws of falling bodies, implied a change whose nature was not clear to the men who had themselves made the advance. A conflict arose between those who thought more of the fact that knowledge, to be certain, must be capable of mathematical expression, and those who thought more of the basis of experiment and observation on which the new sciences depended, who remembered that these sciences began when Galileo, instead of thinking in the abstract how bodies ought to fall, dropped bodies of different weights from the top of the leaning tower of Pisa and observed what actually happened. Descartes was the great representative of the first school. He began by insisting on the difference between mathematical truth which could be, as he said, clearly and distinctly conceived, and ordinary opinion about things which was full of guesswork and imagination. Scientific knowledge was possible, he thought, only by apprehending the real or primary qualities of things which were mathematical, in contradistinction to their secondary qualities — their colour, smell, &c. — which were less real. Thence he came to think that the real world was mathematical in nature, like a huge, intricate geometrical figure. The elements of mere fact, in our present knowledge, its dependence on observation and experiment, he thought of as temporary defects which the progress of science would remove. What we ordinarily call perception, indeed, in the sense of awareness of things in time and space, was described by Descartes’ successors as confused thinking. Our knowledge of the world would, it was hoped, become a vast mathematical system, all the detail and complexity of which would be rigorously deducible from a few central truths.

This general way of thinking was called Rationalism. Kant ordinarily calls it Dogmatism. It was attacked by other scientists for its view of the nature of space and time. No one who reflects at all can fail to distinguish a difference between the way in which we see the truth of a geometrical proposition — that, *e.g.*, the three angles of a triangle are equal to two right angles — and the way in which we judge that such and such a figure drawn on a board is a triangle, or make judgments about the way in which things are actually arranged in space or succeed in time. Judgments of the latter kind involve words like “here” and “there,” “now” and “then,” words which are all a kind of pointing. It seems impossible from considering the nature of a triangle to deduce why any existing thing should be called triangular, and all statements about the position of things in space and time seem to be derived not from a consideration of the general nature of space and time, but from observation. Now the science which had made perhaps the most striking progress in the time we are speaking of, physical astronomy, involved any number of statements about the position of bodies in space. The Rationalist school admitted this, but held that that was due to the fact that science was not sufficiently thought out. In time, they hoped, all statements about position in space would disappear. To think of things in spatial order was to think confusedly. Newton, on the other hand, held that space could not be explained away, that astronomy implied an absolute space in which things existed, that the spatial relations of things could not be explained by the nature of the things themselves, but only by a reference to absolute space in which they all were. This meant that observation or perception was something of which you could not hope and should not wish to get rid, and that an ideal of knowledge in which all applied mathematics should have been transmuted into pure mathematics was a

vain one. Astronomy implied both mere observation and apprehension of necessary relations. Here was a science which seemed to employ both methods together. Galileo, in fact could not have made his discovery without observation but men had observed bodies falling for ages without discovering the laws of motion. Further, the laws of motion, once discovered, made men in some degree independent of observation, made them able to say of actual concrete things not only what had happened, but what must happen.

Such difficulties as these arose from reflection on the aims and methods of the mathematical sciences, but there was much genuinely scientific inquiry in the seventeenth and eighteenth centuries, which showed no signs of taking mathematical form; chemistry and biology, for example, were still almost entirely empirical. Furthermore, thinkers were not concerned with science alone. These centuries saw a great revival of interest in speculation on human affairs, history, politics, morals and theology. England, which was the home of free discussion on questions of politics and morals, and where, more than in most other countries, there was free discussion on theology, became also the home of empiricism. The empirical movement, indeed, drew much of its impetus from a reaction against Hobbes, the only great English thinker who unhesitatingly applied the mechanical and deterministic assumptions of the new sciences to morals and politics, and arrived by this uncompromising method at results so obviously repellent that no man of any sense could accept them, and so consistently presented that they could not be refuted save by a refutation of the assumptions upon which they were founded. Such a refutation was, in fact, undertaken by Locke, the first great representative of the empirical school. He was interested alike in the more obviously empirical sciences of chemistry and biology, and in politics. He was not a very consistent or systematic thinker, but he had other gifts perhaps as valuable. He was a man of great common sense and breadth of view, and was able thereby to take a conspectus of the general situation in the various spheres of inquiry, to notice the obvious differences in our knowledge of mathematics, of chemical and biological fact, and of theology, and to see that these constituted a problem. We find in him the first statement of the necessity of philosophical criticism. It is contained in his account of the origin of the *Essay concerning Human Understanding*. “Were it fit to trouble thee with the history of this *Essay*, I should tell thee that five or six friends, meeting at my chamber, and discoursing on a subject very remote from this” (they were discussing the “principles of morality and revealed religion”), “found themselves quickly at a stand, by the difficulties that rose on every side. After we had awhile puzzled ourselves, without coming any nearer a resolution of those doubts which perplexed us, it came into my thoughts that we took a wrong course; and that, before we set ourselves upon inquiries of that nature, it was necessary to examine our own abilities, and see what *objects* our understandings were, or were not, fitted to deal with.”

We have here the same general starting point of inquiry as we shall afterwards find in Kant. There are certain, obstinate puzzles which we meet with in discussion which can only be solved by going back and inquiring into the nature of knowledge and the powers of our minds. Unfortunately, as Kant points out, Locke went the wrong way about his task. He describes it as “a plain historical inquiry.” He thought that he had only to look into his mind and see what was in it, as he might open a door and look into a room. The result is that he thinks of all knowledge as consisting simply in looking at what is present to the mind. We can know, therefore, whatever can be present to the mind, and the limitations of knowledge are discovered by asking what can be so present to the mind. The conclusions to which he comes as to different spheres of human inquiry are roughly these: We can have knowledge of mathematics because there we are concerned only with ideas present to the mind, and with noting their agreement and disagreement. We can have no knowledge of such questions as the immortality of the soul, or the nature of spirits, for they are beyond our observation. As regards existing things, we can have knowledge of them, in so far as they are present to our minds, and no further. The meaning of “present to the mind” was never clearly analysed by Locke; but he meant, for example, that we can observe that an object which is yellow, and which we call gold, is also heavy, and can be dissolved by Aqua Regia, but we cannot say why that is

so, and we ought not, on Locke's principles, to have any ground for supposing that these qualities will go on co-existing.

The element of truth in Locke's position is this. When we are examining concrete things like pieces of gold or any chemical substance, we find in them a number of varying qualities whose connection we cannot understand. We do not know why a metal of a certain specific gravity should also be yellow; we can only note the fact. Hence in chemistry our method must be quite different from the method of mathematics. In mathematics we start from the definition, and we can understand the connection of the properties of a geometrical figure, and see that they all follow necessarily from the definition. But in sciences like chemistry a definition does not take us any further; we can only find out the properties of a substance by observation and experiment. Locke explains this difference by saying that in the former case we are only concerned with agreement among our own ideas, in the second place we are concerned somehow with things outside us. This explanation will not stand. It is not true that mathematics is simply analysis of an arbitrary definition, as Locke seems to suggest. It involves construction, or, as Kant calls it, synthesis. It is a process of discovering new truths. Secondly, our statements about concrete objects are not statements of qualities we see co-existing at the moment. They are statements about all gold or all men; in other words, they are universal, and Locke found it impossible to explain the universality of such propositions — what we mean, *e.g.* when we talk about the nature of gold or of man, not of this gold or this man that I see before me. Lastly, this distinction of mathematics and the empirical sciences by a distinction of spheres does not allow, as we saw, for a science like astronomy, which builds on mathematics and yet applies to the concrete world.

These difficulties were seen more clearly by Hume, at once the greatest and the most thorough-going of empiricists. He cut the knot in regard to mathematics by asserting that geometry, just because it has clearly an application to the existing world, had no more certainty than any other empirical inquiry, while arithmetic and algebra, he agreed, were certain, but confined their application to the sphere of our own ideas. Both positions are almost obviously inconsistent with the facts. In considering the nature of our judgments about concrete existences he raised a more profound problem. All such judgments, as he said, imply the principle of causation, or of what is called, in modern times, the principle of the uniformity of nature. That principle we take with us in our investigation of the existing world. Yet, as Hume saw, we do not observe causes; we only observe succession and change. We seem, therefore, to put into the world we see a necessity and uniformity which the observed facts do not warrant. How is this to be explained?

Hume's answer is ingenious. The principle of causation cannot be rationally justified, and the necessary connection we predicate of changes in the outside world is not in the things; it is only a feeling in ourselves, and is the result of custom. After seeing the same succession several times, we come somehow to feel differently about it, and that feeling of difference we express by saying that we have before us an instance not of simple succession, but of cause and effect.

This is not the place to discuss the difficulties of Hume's position; it is enough to notice how entirely passive it makes the mind, and how alien such an explanation is from the spirit of inquiry and discovery. If cause is simply the effect of custom on the mind, then the facts either produce that effect or they do not. In neither case is there anything to find out. But the scientist, in investigating causes, however strongly he may hold that he has to observe the facts, knows also that he has a problem to solve, that he has to discover the right way to go about it, must adopt some principle in dealing with the facts. Pure passivity will help him little.

Hume's account of causation, then, is really a denial of even empirical science, and yet it helped to make clear an important truth; for, although we do not get the *principle* of causation from experience, we have to go to experience to discover causal laws. We do not discover causation by analysing a cause and seeing that it is such that, from its nature, it must produce a certain effect. All knowledge of causation goes back to observed succession, though all cases of observed and even repeated succession are not cases of

causation. Hume, therefore, was right in saying that where there could be no observed succession there could be no knowledge of causation.

Both the rationalistic and the empirical explanations of science had failed, the one because it could find no room for observation of facts, the other because it could find no room for principles governing that observation; and we shall see that Kant started with a consciousness of this double failure. He saw that Hume's criticism of causation raised problems for which the rationalist had no answer, and yet that the position reached by Hume was incompatible with the existence of science.

The same failure of both rationalism and empiricism had become evident in another sphere — that of morals and religion. The relation of philosophy to science is always twofold. Philosophy is partly concerned with analysing and reflecting on the methods of the different sciences, partly with seeking to adjust the rival and conflicting claims of the two great departments of man's life — science and religion.

It might seem, at first sight, as though in morals and religion rationalism were the only possible method to be approved by philosophy, for, inasmuch as morals are concerned with what ought to be, not with what is, they cannot depend on observation, but must be deduced from some principle above experience; nor are objects of religion, God and the soul, objects of observation. No man can "by searching find out God."

It was natural, therefore, that both on the Continent and in England morality and religion began by being rationalistic. Descartes believed that his mathematical method could be applied with success to demonstrate the truths of religion, while Locke includes morality along with mathematics among the a priori and certain sciences. But the history of eighteenth century controversy showed that, in spite of rationalist methods, neither morality nor religion could attain that certainty and general agreement which marked the mathematical sciences. Spinoza, applying the same method as Descartes, but with more consistency, arrived at a conception of God which most of his contemporaries regarded as "horrid atheism," and the general result of rational theology is well described by one of Kant's correspondents when he says that the more proofs of the existence of God he learnt, the more his doubts increased. In England the attempts made to found morality upon rationalist principles produced systems too barren to withstand the attack of empiricism fortified by the growing interest in history and anthropology. The Deist movement, an attempt to free religion from the incrustations of faith and deduce it from pure reason, showed that a religion founded on pure reason contained nothing worth believing. In Hume we have the final discrediting of reason in these spheres. He shows ingeniously that "the good Berkeley's" argument for the existence of God could be turned round to disprove the existence of the soul, and he concluded that religion was a sphere with which reason had no concern. In the sphere of morals the distinction between what ought to be and what is, the distinction on which rationalistic morals are based, had been discredited by a reduction of all conduct to Utilitarianism, a search for pleasure and a flight from pain mediated by sympathy. The consequences are described by Kant in his preface to the *Critique of Pure Reason*: "At present, after everything has been tried, so they say, and tried in vain, there reign in philosophy weariness and complete indifferentism, the mother of chaos and night in all sciences," though he hopefully continues, "but at the same time the source, or at least the prelude, of their near reform and of a new light, after an ill-applied study has rendered them dark, confused, and useless."

The earlier of the modern thinkers — Descartes among the rationalists, and Bacon among the empiricists — are full of hope. They have confidence in the human spirit. But increased reflection seemed only to bring distrust with it. The history of rationalism in theology showed that, in such matters, reason could prove absolutely opposing positions. Most men were ready to accept Hume's dictum that any one who follows his reason must be a fool and take refuge in an indifferentism which accepts whatever happens to be there.

The remedy for this state of affairs, Kant finds, is the critical method; for disbelief in reason is the reaction from overconfidence in it. Men had thought that reason could prove everything. Because these

hopes had been frustrated, they now thought that it could prove nothing. Philosophy, he was convinced, would oscillate between overweening confidence and unwarranted distrust in itself until it had criticised human reason and discovered what it could do and what it could not. This is the task he set before himself. As the failure of eighteenth century philosophy, which had led to distrust of all philosophy, had been twofold — failure to give an intelligible explanation of the processes of scientific thought, and failure to find any standard by which to mediate between the conflicting claims of science and religion — the task of the critical philosophy is twofold. It attempts to explain and to justify the methods and assumptions of the sciences, and to find some solution of the conflict between theories of the world which seem to be based upon these methods and the assumptions and claims of morality and religion.

CHAPTER II. KANT'S STATEMENT OF THE PROBLEM. SYNTHETIC A PRIORI JUDGMENTS

In the preface to the second edition of the *Critique of Pure Reason* Kant finds the necessity of criticism in the contrast between certain rational sciences and metaphysics. Mathematics and physics, he observes, are obviously certain sciences. They are not empirical, they make steady progress, the results they have reached are secure and unanimously accepted, and have a certainty which no mere empirical investigation could attain. Metaphysics, on the other hand, though as ancient an inquiry, seems incapable of any settled results. Its history is a record, not of steady progress, but of bewildering marches and countermarches. The confident conclusions of one philosopher are as confidently denied by another, and the endless indecisive conflict produces in the minds of most men the conviction that in philosophy one doctrine is as good as another, and therefore none are worth very much. In the sphere where reason might be expected to be most at home, reason is impotent; yet the achievements of reason in those other spheres of the a priori sciences should preserve us from any general scepticism of the powers of reason. The task of criticism will be to examine the part played by reason in science, and to ask how far its failure in metaphysics is due to mistakes in method, and how far to the different nature of the objects of the a priori sciences and of metaphysics. Kant points out that it was some time before either mathematics or physics followed the secure path of a science. The contrast between the haphazard and empirical observations of the Babylonians or Egyptians and the science of the Greeks was due to the discovery of a new method. The discovery by Galileo and Torricelli of modern physics came about by a similar revolution in method. The *Critique*, therefore, is to be a treatise on method. It will examine the method of reason in the sciences, and ask what conclusions can be drawn as to the proper method of metaphysics.

In the *Prolegomena*, a work in which he summarises the results of the first *Critique*, Kant describes the *Critique* as an answer to three questions: How is mathematics possible? How is pure science of nature or physics possible? and, How is metaphysics possible? Something of the nature of his answer to the third, and for him the most important, question, may be gathered from the fact that he explains that the third question should not be put in the form, How is metaphysics as a science possible? That question can only be answered by saying that it is not possible. But it is still allowable and necessary to ask, How is metaphysics possible as a natural disposition of the mind? For the main result of his inquiries into the place of reason in the sciences is to show that reason is successful in the sciences only because of the presence of certain conditions which are wanting in metaphysics. At first sight we might think it natural that the objects of metaphysics which Kant enumerates as God, Freedom, and Immortality should be understood by reason, and find it more difficult to explain how reason should apply to the world of ordinary experience. The knowledge of everyday things is thought of as empirical, a matter of observation; while we are inclined to think that, if there is rational knowledge, it is knowledge of something else, of the mere agreement or disagreement of ideas (as Hume thought), or of the essences of things, known independently and apart from perception, as Plato thought. Kant argues that the combination of a priori reasoning and empirical observation, which earlier thinkers had found so puzzling in the exact sciences, exhibits the only possible use of reason, that reason, divorced from and with no reference to the world of experience, is barren, and that consequently metaphysics, if that be taken to mean a rational knowledge of objects which are outside of our experience, does not exist. We are left with metaphysics as a natural disposition; for Kant holds that the questions which metaphysics seeks to answer arise from the nature of reason and its relation to experience, though their answer is to be sought not in knowledge but in

action.

This last point must be elucidated later. In the meantime we must see how this inquiry into the nature of reason crystalises itself into a seemingly abstract and trivial question: How are synthetic a priori judgments possible? It is baffling at first to find an inquiry of the scope we have indicated suddenly take such a narrow form, but a little consideration will show the importance of the question. Knowledge may be regarded as either analysis or synthesis, as a puzzling out or unravelling of what we somehow know already, or as a putting together of what had previously been known or observed separately. The rationalist school, whom we described in the last chapter, were inclined to regard all knowledge as analytical. They thought of progress in knowledge as an advance from obscure to clear apprehension, and as a thinking out or making clear of something which had always been known somehow. Mathematics, the typical form of knowledge for the rationalists, had been thought of as the analysis of what was implied or given in the definitions. The conception of analytic a priori knowledge was thus familiar and simple. On the other hand, the empiricists had thought of knowledge as primarily synthesis — or, as they called it, association — a connecting together of ideas in their nature separate. Knowledge of a thing was thought of as the observing together of several ideas. Judgments about objects were regarded as judgments about the co-existence of separate ideas, ideas which were not thought of as being bound by any logical necessity. We do not understand why a substance with the specific gravity of gold should be yellow; we only observe the co-existence of certain qualities. The judgment, then, gold is yellow, is synthetic; it is an assertion of the co-existence of separate qualities. It is also empirical; it does not express a reasoned insight into the necessary connection of gold and yellow. It seems rather a record of observation. Synthetic knowledge, then, was thought of as in its nature empirical and a posteriori. Hume, who thought of all knowledge of the world in experience as synthetic, denied to such knowledge any necessity or certainty.

Hume, however, had noticed that the principle of causation, the judgment that every event has a cause, is both a priori and synthetic. It is not, he held, derived from experience; rather it is a principle which guides our investigation of experience. It is not got from analysis of the notion of causation, nor is it simply concerned with the agreement or disagreement of our ideas. It asserts the necessary connection of two perfectly separate existing things. Hume himself, as we saw, tried to explain away these uncomfortable facts. He was too wedded to his belief that all knowledge was derived from passively received impressions to face them rightly. Kant, coming to the problem with different prepossessions, with the belief that most knowledge was analytic, was impressed with Hume's proof that the principle of causation could not be derived from analysis. The very basis of all science of nature, then, contradicted the belief that knowledge was analytical. Kant was also, with Hume, convinced that the principle of causation was not derived from experience, for he saw that experience assumed it. At the same time, he was not prepared, like Hume, to explain it away. Further, he saw that the problem raised by the principle of causation was a wide one. For other judgments, he held, are both synthetic and a priori, among them mathematical judgments. As we shall see afterwards, Kant proved the impossibility of arriving at knowledge of God or the soul by mere analysis of concepts. The judgments of metaphysics, about God or the soul, are also synthetic. But the validity of the judgments of metaphysics is under dispute. If we examine the synthetic a priori judgments of mathematics and of science whose validity is certain, we may then discover whether such judgments in metaphysics can or can not have similar certainty. We may thus see that the problem of the possibility of synthetic a priori judgments is a restatement in logical terms of the problem of the relation between the a priori sciences and metaphysics.

Something more must be said of the importance of synthetic a priori judgments in Kant's account of knowledge. Their existence, we have seen, exposes the shortcomings of both rationalism, which allowed only for analytic a priori judgments, and empiricism, which allowed only of synthetic a posteriori judgments. Both these theories tended to regard knowledge as an analysis or description of what was

present to the mind, and differed really only in their view of what was present. For, though the empiricist thought of empirical knowledge as synthesis, the synthesis was not ascribed to the mind, but to associating ideas; the mind only observed, and knowledge was merely the apprehension of objects by the senses. We see what is before our eyes, and notice the differences and similarities in what is before us. The rationalist conceived of thought as simply apprehending the nature of the real, freed from the illusions of sense perception. The mathematician has before his thought the nature of a triangle, and sees intellectually what that nature implies. We may try to mediate between the two by saying that while all knowing is observing, some is observing of objects of thought and some of objects of sense, the one being called understanding, the other perception. In most scientific judgments, however, we are not simply observing objects either of thought or of sense. Scientific judgments are more than descriptions of what is present to the mind or to the senses; they are essentially anticipations. They go beyond what is immediately given. This is shown by the fact that it is the characteristic of a scientific proposition that it can be verified. If we understand it rightly, we see that it implies that, under such-and-such conditions, such-and-such things will be experienced. Hence the importance of experiment to science. A scientific proposition is, of course, grounded on observation of perceived fact and understanding of universal connection, but it is an assertion of something beyond that.

If, then, all scientific judgments are synthetic, and if both rationalism and empiricism failed to account for the manner in which such judgments go beyond what is immediately given to the mind, ought we not to say that the real problem for Kant is to show not merely how synthetic a priori judgments are possible, but how any synthetic judgments are possible? This seems at first sight plausible, but the suggestion must be rejected; for, when Kant asks how a judgment is possible, he is not asking how we come to make it, but how we know that it is valid. Now, if we consider any empirical judgment about the facts of nature, we must recognise that Locke and Hume were right in denying certainty to such judgments. In all general statements about concrete facts we to a certain extent go beyond our evidence. Empirical scientific statements are not theoretically certain. They may, of course, be certain enough for all practical purposes. They are reasonable expectations of what will happen, but reasonable expectation is a very different thing from the certainty of mathematical insight.

Now Kant maintained that, while such empirical judgments are not certain, they all imply the certainty of a number of general principles on which they depend. These general principles are the synthetic a priori judgments with which he is especially concerned. When we apply the principles of trigonometry to an engineering problem, we know that our measurements are only approximate, and that the result also will only be approximate; but the possibility of arriving at such approximate results depends on the absolute truth of the trigonometrical principles, and on the assumption that they express not simply the agreement or disagreement of ideas, but hold of the real. When we apply the rules of arithmetic to counting objects, there may be a certain arbitrariness in deciding on our unit. There is no such arbitrariness in the rule. All scientific judgments of causation are only approximately certain, but they all imply the certainty of the principle of causation, and are based on the assumption that such a principle is of universal application. This and the other principles assumed in our empirical judgments are, then, the synthetic judgments with which Kant is concerned. Now, it is of the nature of our empirical knowledge that it is fragmentary and not uniform, that we are concerned with an indefinite number of things whose connections we do not wholly understand, and which we cannot therefore anticipate. Yet we assume that all these objects will obey the rules of arithmetic and geometry, and will all be subject in their changes to the principle of causation. On such assumptions all the sciences of applied mathematics depend. How are they justifiable? That is Kant’s question.

Kant, when he considers mathematics, is concerned with the assumptions of applied mathematics, of those sciences which, though mathematical, make statements about existing objects, and in which the old distinction between understanding and perception which was based on the difference in the objects of

these two faculties breaks down. The sciences which Kant is investigating imply that principles which are clearly not derived from mere observation are yet the basis on which we order and arrange what we observe. Now, if we held that the objects of mathematics were independent entities quite separate from the things we perceive, it would be impossible to explain how we might assume that the things we perceive would be subject to the rules of mathematics. If, on the other hand, we held that in mathematics we were simply concerned with the various objects of the senses, it would be impossible to explain how mathematics can have a generality and necessity which no statements can have which rest on observation of the various things we see. The existence of applied mathematics implies firstly that understanding and perception are distinct, and that neither of them can be reduced to the other, for that would mean that we should have to give up either the element of observation and experiment or the element of necessity and a priority, and secondly, that understanding and perception are combined, and must be combined for any advance in science.

Now, Kant finds his answer to the problem he has raised by concentrating his attention on the fact that, while understanding and perception are distinct, they are both present in all knowledge. His argument is that we are necessarily in a difficulty if we think of understanding and perception as having each its separate objects, and then try to explain their combination. If we begin with their combination, we may see that the reference of principles of thought to objects of sense is not an accident, but that these principles of thought or of understanding, as Kant calls them, are only concerned with objects of sense, and have no other meaning. If we object, But how can principles of thought be universal if they are concerned with the many and varying objects of sense? Kant's answer is that they are not concerned directly with these objects, but with the conditions under which these objects can be understood. They are therefore not statements about objects, but statements of the conditions of possible experience. If we find out that all perceiving and thinking imply certain conditions, then we can affirm the validity of principles based upon these conditions, so long as we do not try to apply the principles beyond our perceiving.

We may put the point in another way by asking by what right the mind can prescribe to or anticipate experience. Kant's answer is just in so far as we can determine the conditions under which alone objects can be known. If that can be done, we can say, These principles will hold of objects in so far as they are known. In the preface to the second edition of the *Critique of Pure Reason* Kant reverts to the discoveries of Galileo and Torricelli, and points out that their success was due to their asking of nature the right question, and the right question was that which reason could understand. "When Galileo let balls of a particular weight, which he had determined himself, roll down an inclined plane, or Torricelli made the air carry a weight, which he had previously determined to be equal to that of a definite volume of water, a new light flashed on all students of nature. They comprehended that reason has insight into that only which she herself produces on her own plan, and that she must move forward with the principles of her judgments, according to fixed law, and compel nature to answer her questions, but not let herself be led by nature, as it were in leading-strings. Otherwise accidental observations, made on no previously fixed plan, will never converge towards a necessary law, which is the only thing that reason seeks or requires. Reason, holding in one hand its principles, according to which alone concordant phenomena can be admitted as laws of nature, and in the other the experiment which it has devised according to those principles, must approach nature in order to be taught by it, but not in the character of a pupil who agrees to everything the master likes, but as an appointed judge, who compels the witnesses to answer the questions which he himself proposes."

Kant, here, is concerned with reason in its application to experience, and he makes it clear that there is much in all such inquiries which cannot be anticipated a priori. "Reason must approach nature in order to be taught by it." The answer to the questions and experiments cannot be known beforehand. The empirical element in science cannot be explained away. Reason dictates not the answer but the question, and so far the form of the answer. Reason, then, it is suggested, is concerned with the principles or conditions,

according to which we can understand things. It is not a method of observing or analysing objects; rather it states the methods and principles according to which objects must be observed if they are to be understood. The principles are not statements about the nature of objects, but principles of the possibility of experience. This new attitude to reason Kant describes as the Copernican change in philosophy. It constitutes Kant's idealism. Its nature and importance we must examine in the next chapter.

CHAPTER III. KANT'S IDEALISM. TIME AND SPACE.

The great discovery which Kant considered he had made as to the nature of reason was that reason was not a method of observing objects as they really exist, but was concerned directly only with our ways of understanding objects. This discovery is the essence of Kant's idealism, and its main purport is expressed in the distinction Kant so often makes between things in themselves and phenomena. This distinction is used as the key to the solution of all his difficulties. But the doctrine it implies is very easy to misunderstand, partly because idealism is generally used in a very different sense from that in which Kant uses it, partly because Kant's statement of the distinction between things in themselves and phenomena depended on a view of knowledge which he was very much concerned to refute, but with which we are not now familiar. If we are to understand Kant's philosophy, we must know what he means by idealism, and wherein his idealism differs from that of his predecessors.

The word idealism is, naturally, contrasted with realism. It suggests an assertion that something is not real, but only an idea. If we know it to be combined with a distinction between things in themselves, and phenomena, or appearances, it seems to suggest that the objects of knowledge are somehow illusions, or only appearances in the mind, as contrasted with real things. Something like this had been held by Kant's predecessors. For the fundamental principle of the idealism on which most of Kant's predecessors had been agreed, and which is sometimes called Cartesian, and sometimes subjective idealism, is that the mind somehow knows itself and its own actions and states, with more directness and certainty than it knows external objects. The doctrine is commonly based upon a confused view of sense perception.

Sense perception is obviously possible only through processes in the sensory organs, and objects were thought of as producing impressions through the sensory organs in the brain, and the mind as then becoming aware of them in the brain. Hence, when Locke says that the mind only knows its own ideas, he tends to mean (though the facts are sometimes too much for him and he is nobly inconsistent) that the mind only knows objects inside the brain. The main objection to this doctrine, apart from the fact that it is based on a confusion, is that it makes it quite inexplicable how the notion of an outside world ever arises. For if we know, and must eternally know, only ideas inside our head, why should we ever imagine that there an outside world exists. Yet if nothing *outside* us were observed — if we knew of no process which went on between outside objects and the brain, the doctrine would have no basis on which to rest. There cannot be any meaning in saying something is "only an idea," if we do not know what is real in the sense of its having an existence independent of our minds.

Locke supposed that, although we knew only ideas, we could somehow refer from our ideas to an outside world. For he thought that truth was concerned with the agreement of our ideas with reality. This form of the doctrine, the commonest, is sometimes called Representationism. For it thinks of the mind as concerned with representations, or pictures, or images which it may compare with the real objects. Its futility is obvious enough. We can only compare a picture with the thing it represents, if we can know both. If we can only know ideas, we can never know that they are only ideas, and can never compare them with anything else.

This difficulty was seen by Berkeley, the most consistent of subjective idealists, and led him to deny the existence of outside objects, and hold that existence or reality meant being perceived and nothing more. But if we take Berkeley's position, it becomes very difficult to say what we mean by judgments being true. If things only exist as we think of them, or perceive them, or rather if they are only our thinking of or perceiving them, the question of the truth or falsity of our statements about them cannot arise.

This idealism Kant is careful to refute, and he points out that there is no evidence for its fundamental proposition that we know our mind more directly than we know objects. We are only conscious of

ourselves in knowing something not ourselves. We do not invent the notion of externality or outsideness in space from an experience in which it originally has no part. Externality is implied in our most simple experience. We begin with consciousness of outside things, and only become conscious of our own mental states or processes later. But it is important to observe that, the truth or falsity of subjective idealism has no bearing whatsoever on the question with which Kant was concerned. If I ask how I can lay down rules about what I have not yet experienced, I am not in the least helped by being told that I only experience what is in my mind. For the question will equally arise, How do I know what is going to be in my mind? The question idealism ordinarily discusses, as to whether the objects of our awareness are in our mind or outside, are in their nature mental and dependent on the mind or not, is entirely and absolutely irrelevant to Kant's purposes.

But it is a fact, and one that has got to be explained that in judgment we go beyond what is present to our minds, and that, in so anticipating what we shall experience, we assume that certain principles hold of all that has been or may be present. With that difficulty idealism, as ordinarily understood, has nothing to do. Representationism tried to give some account of this going beyond what is present to our minds by suggesting that truth is a reference from ideas to reality; but, as we saw, if we know only ideas, such a reference is impossible. The doctrines opposed to representationism, that only ideas exist, or that we directly know real objects, allow the existence of nothing contrasted with what we are apprehending to which a reference in judgment can be made. No one who is satisfied with any of these positions can have seen Kant's problem.

If Kant then, is not a subjective idealist what does he mean by saying, as he constantly does, that we only know phenomena, and why should that limitation of knowledge help him in any of his difficulties? He means, in the first place, that all knowledge depends upon perception. The first paragraph of the first part of the *Critique of Pure Reason* makes that clear. "Whatever the process and the means may be by which knowledge reaches its objects, there is one that reaches them directly and forms the ultimate material of all thought, viz. perception. This is possible only when the object is given, and the object can be given only (to human beings, at least) through a certain affection of the mind."

Now, although we perceive an objective reality, sense perception obviously gives a very imperfect knowledge of objects. We see only some sides and aspects of things, and not others. What we see depends on changes in our position. Further, we know that what we see is only a small part of the nature of anything. We think of reality as an interconnected system, but we only perceive a very small part of it, and what we perceive depends upon the particular time and the particular part of space in which we live. In our experience we are never really content simply with what we perceive; we perceive much too little for that. We are always inferring from what we see to something beyond it. What is that something beyond, which, as we have seen, is implied in all judgment? We might hold that it was the things as they really are as distinguished from things as they appear, or phenomena, and that, when we turned from perception to thought, we turned from illusion to reality. Kant denied this. He held that, if you examine a scientific judgment about anything you perceive, such as that yellow thing is gold, you will find that, if you know what the judgment means, you will be able to say: Then, under such-and-such conditions — if you weigh it, for example — you will have such-and-such a perception. The appeal is not from what you perceive to what you think, but from what you perceive now to what you will perceive under such-and-such conditions. Such a reference indeed, implies thought and what is ordinarily called a concept; but our knowledge of concepts used in science always means that, if we know what is meant *e.g.* by calling anything gold, we know how it will behave under such-and-such conditions. The concept, in Kant's words, is a function of unity in our representations. The task of thought, then, is not to turn the mind away from what we perceive, but to help us to transcend some of the limitations of our perceptions, or, to speak more accurately, to set somewhat further back the limits of our perception; for thought never entirely transcends these limits. Our knowledge is always conditioned by the fact that we are finite minds living in

a particular place and at a particular time; but thought can extend the range of our perception in space and in time.

The limitations of our perception have, for Kant, a double aspect, which determines his division of the first part of the *Critique* into two parts — the *Æsthetic* and the *Analytic*. In the first place, our direct knowledge of space at any one time is always knowledge only of a part of space; our direct knowledge of time, whether in present consciousness or in memory of our own experience, is knowledge of only a part of time; and the things in the space we directly perceive, or in the time we experience, are what they are by their relation to space outside the space we see, and time beyond the time we experience, and that limited space and time we treat, therefore, as parts of one all-embracing space and one all-embracing time, and in the conception of an indefinitely extended space and time we can think of the space in which all things exist, and the time in which all things occur, of which we only see and experience a small part. The science of astronomy obviously talks of space and time far beyond anything we could ever perceive, but we go beyond such direct perception in such simple expressions as "forty miles from here" or "three days hence." And, when Kant says that space and time are only phenomenal, he does not mean that they are mental, but that we only know them through perception, and that we get at absolute space and time not by going from what we perceive to what we think, but by thinking of what we perceive indefinitely extended. All definite statements about space must come back in the end to "so far from *here*," all about time to "so long from *now*," and the fact that all our knowledge of space and time is got by adding to or extending in thought the space and time we directly perceive does, according to Kant, solve some obstinate puzzles about the nature of space and time.

In the second place, if we consider our knowledge of objects, we realise that, as we said, at any one moment we only perceive them in part or from one position. What we directly perceive of them is fragmentary and discontinuous, one aspect seen now, and another aspect seen at another time. But we do not think of the things as existing in that discontinuous way; we think of them as having a nature of their own. That does not contradict, but is something very much more than, what we perceive, and our knowledge of any object is got by piecing together the aspects we directly perceive; but that piecing together, or synthesis, is not haphazard. It is governed by rules — rules partly derived from the nature of the particular thing we are concerned with, and partly more general rules, which come from the relation of this work of piecing together to the framework of space and time by help of which it is done.

Kant's conception of knowledge, then, is something like this. Each of us is in direct contact with reality, but we perceive directly only a small part of it, and, as our consciousness moves on in time, and as we change our position in space, we are directly conscious of different small portions of reality. A part of the whole is illumined by direct perception, but the whole stretches beyond that indefinitely in space and time. In the part we directly perceive there is a temporal order and a spatial order. Things are given to us arranged in space and ordered in time, and these arrangements or orders in the space and time that is directly given to us in perception have certain rules, and we think of these principles of arrangement as extending indefinitely beyond the space and time given to us in perception. When we make judgments about reality beyond our perception, we think of things as so arranged in the space and time beyond our perception as we should see them arranged were the range of our perception sufficiently wide. Further, it is most important to remember that we do not remain in one place and at one time and make guesses of what may happen in the darkness beyond. Though our perception at any one moment is limited, we can connect what we see at one time with what we see at another. We can, by means of language and writing, use the perception of others to fill out our experience, until gradually our scientific judgments, our knowledge of what we should perceive under all sorts of possible experience, seems to bulk much more largely than could our individual perceptions. But we are still, Kant would say, getting at our knowledge of what is beyond by piecing together what we and other people have perceived, and the whole is always much more than that.

What, then, is meant by the contention that we can know things in themselves which Kant is earnest to refute? It might mean that we do in perception attain to a complete knowledge, but that would be obviously untrue. As Kant understood the claim, it meant rather something like this: In thought we are obviously not limited by our perception. We are always assuming certain principles, such as the laws of space or the principle of causation, to hold of all reality, both what we do and what we do not directly perceive. May we not say, then, that these principles hold of all reality, and argue from that fact to what the nature of the whole must be? If everything that we know is caused, *e.g.*, may we not apply the principle of causation to all reality and say that it must have a cause?

When we come to consider the *Dialectic*, the second main division of the first *Critique*, we shall notice Kant's detailed analysis of these arguments, and how he points out that you can in this way get contradictory results. In the meantime it must be observed that in these arguments we start from principles applied to what we perceive and expressing connections between the different things we perceive, and then apply them beyond everything we do or could perceive. That means that we imagine that we can take these principles out of relation not only to this or that detail of perception, but out of relation to any perception at all, and thus apprehend reality by thought independently of perception.

Kant's answer is that thought cannot directly apprehend the nature of the whole, and these universal principles, such as the principle of causation, are only principles by which we connect one perception with another to amend the discontinuous and fragmentary nature of our perception; they are rules for the synthesis of what we perceive. By so synthesising our perceptions we come to a less imperfect knowledge of the whole, but apart from perceptions the principles have no meaning at all.

Kant's idealism, *i.e.* his insistence that we know only phenomena, not things in themselves, is relevant to his problem, because it implies the denial of the view that thought has objects apprehended independently of perception, and because it insists that we can only know directly what we perceive, or things as they appear to us, that in our process from perception to knowledge we start with what is present to our perception and end with what is or with what might be present to our perception, and that this process is possible by reason of our continued consciousness in time. The process, Kant holds, is governed by certain principles. These depend upon the part played by space and time in all our perception, and the manner in which we employ space and time in piecing together our discontinuous perceptions.

Now, obviously it is quite possible to hold this position without having thought out what is implied in being present to the mind in perception. This is what Kant did. He describes perception in different and inconsistent ways. The reason for this inconsistency is that Kant is not concerned with the nature of perception, but with the relation of what is immediately perceived to what is not but may be immediately perceived, and he therefore never worked out any consistent account of perception. He sometimes talks of perception reaching objects directly, and refutes the view that we perceive only what is in our mind. (This, indeed, is implied in his distinction of space and time as forms of *external* and *internal* sense respectively.) But usually he takes the ordinary idealist view that we do not perceive things, but affections produced in us by things. Owing to this inconsistency Kant constantly seems to be stating very much more than he has any right to. This is especially true in all that he says about knowledge being confined to phenomena and not extending to things in themselves. When he talks of our knowing only phenomena, he sometimes seems to mean that we know objects, things in themselves, only in part, in so far as they appear to us. That would make the distinction between the phenomenon and the thing in itself a distinction between the same thing imperfectly and perfectly understood. He sometimes, and this is his more usual view, seems to mean that we are aware of appearances, entities separate and distinguishable from the objects which produce them in our minds. But if we work out in any of Kant's arguments the point of his appeal to the fact that knowledge is only of phenomena, we shall find that in every case the difference between a subjective idealist and a realist view of perception, of what "being present to the mind" means,

is irrelevant, and that his argument holds on either theory.

We must now turn to Kant's account of space and time which is given in the *Æsthetic*, the first part of the *Critique*. He begins by showing the impossibility of the two views of the nature of space and time which then held the field, the views of Newton and Leibniz. Newton had thought of space and time as realities, things in themselves existing along with other things. But obviously we cannot think of space as a separate thing existing by itself; for space without things would have no determination or possibility of determination, and would be to us just nothing, whereas, as it is, it is something to us. The same holds of time. The Newtonian doctrine, Kant says, "forces us to assume two eternal, infinite, and self-subsisting non-realities, which are there, without any reality in them, only that they may comprehend all reality." Just because things are in space and time, space and time are not themselves things. But if this makes us say that space and time are only relations between or qualities of things, we find ourselves in difficulties as obvious. We do not come to apprehend space and time by comparing things and seeing that they have a common quality of being "spatial" or "temporal," as we come to apprehend redness, *e.g.*, by seeing red things. The perception of space and time is implied in each and every perception of things. We cannot, therefore, derive them from our study of things; we must begin with them. Further, Kant notices, as against Leibniz, that space and time are not ordinary concepts because they have no instances. Different men are instances of man, but different spaces or times are only parts or determinations of the one space and the one time. As against the view, then, that would make space and time only relations, derived from our comparison of things which are not temporal or spatial, Kant insists that space and time are a priori. We cannot see things without seeing them outside one another — *i.e.* in space — or experience succession or change without experiencing it in time. Space and time, then, have a certain independence of things in space and time. The qualitative differences of things in space or events in time do not affect the nature of space and time, and we can and do study and discuss spatial and temporal relations quite independently of such differences.

Space and time, then, can be abstracted from things in space and time. Yet, on the other hand, we cannot think that space and time exist independently of things. They do not exist in abstraction; for, though the specific differences of things in space and time are irrelevant to the nature of space and time, if there were no things, or if there were no differences, there could be no space and time as we know them. "The empirical perception," says Kant, "is not compounded of phenomena and space, of the sensation and the empty perception." Space and time, therefore, Kant says, are not things in themselves.

What, then, are they? Kant's answer is that they are forms of our perception. Space is the form of external perception, and time is the form of internal perception, and Kant holds that by this answer we can understand both how our knowledge of space and time may be a priori, how spatial and temporal distinctions may be abstracted from the differences of things, and how we may avoid the difficulties consequent on regarding time and space as independent things.

What, then, does Kant mean by *form*? He seems to mean two things, which he does not clearly distinguish. The first meaning is best described in his own words: "In the phenomenon I call what corresponds to the sensation the matter of the phenomenon, and that which causes that the manifold of the phenomenon is perceived as arranged in specific relations I call the form of the phenomenon." We are here face to face with the ultimate difference of form and matter, or order and that which is ordered. When Kant calls time and space the form of our perception he is simply calling attention to the fact that in all that we perceive we find this distinction. It is something found, given, not made by us. By the word "form" Kant does not mean anything specially subjective as contrasted with matter or content, for he carefully distinguishes between space and time, and such qualities as colour, which get their nature in part, he thinks, from the specific nature of the sense organ. Compared with such qualities space and time are objective. The phrase "forms of our perception," then, does not really explain anything about space and time; it only emphasises the fact that the distinction between space and time and objects in them is

found in what we perceive, and that there is no meaning in discussing either side of the distinction as though it were quite independent of what we perceive.

But form has also another meaning which justifies Kant in calling space and time *only* forms of our perception, and hence subjective. For, while these forms are *found* in what we perceive, the distinctive part which they play in our knowledge is due to the fact that we use space and time as a framework by which to connect our scattered experiences. We come to think of the space and time we perceive as parts of an absolute space and an absolute time. We perceive parts of space and time, but absolute space and absolute time we do not perceive. They are the form we perceive imagined indefinitely extended. We order the particular parts of space and time which we do perceive in reference to absolute space and time. Yet absolute space and time are only known through the finite parts of space and time which we actually experience. Hence absolute space and time are not perceived realities or perceived orders, but ways in which we organise and arrange what we perceive. Now, the qualities of space and time which are hard to think of as the qualities of a thing that exists, *i.e*. their infinite divisibility and infinite extension, are qualities of absolute space and time. When we say that space is infinitely divisible, we do not mean that any existing thing is made up of an infinite number of parts. The divisibility of space and the divisibility of matter are quite different. An inch as a spatial determination is infinitely divisible, but the divisibility of the actual stuff which any inch may measure is a matter of empirical investigation, and ought to admit of a definite answer. That means that, while we use determinations of space which we consider infinitely divisible and infinitely extensible to measure things in space, we do not consider that these determinations, fractions, or multiples of inches or centimetres, have anything to do with the constitution of the thing they measure. It was not put together in fractions of inches. Thus we must distinguish between space as the form of what we perceive, the next-each-otherness of things, and the use we make of that form to construct by means of measurement order in all different perception. The first is obviously the form only of what we perceive, and gives rise to no transcendental questions. But the second, infinite space, though it seems to transcend our perception, has still only meaning in reference to perception, is only a way of ordering our perceptions. The same holds good of time.

We can see now what Kant means by saying that time and space are empirically real and transcendentally ideal. Kant does not maintain that space and time are illusions. They are a constant element of what is given us in perception. It is only when we try and go beyond our perceptions, and take space and time as things existing independently of what we perceive, thus trying to transcend the limits of possible perception, that we fall into illusion. Space and time have meaning only as elements in what we perceive, or in connecting what we perceive now with what we may perceive.

CHAPTER IV. THE CATEGORIES AND THE PRINCIPLES OF PURE UNDERSTANDING

Kant makes the distinction between perception and understanding depend upon the distinction between the receptivity and the spontaneity of the mind. In the *Æsthetic* he has been concerned with time and space as elements in what seems to be given to the mind. Before we begin to ask the questions of science, before we analyse, describe, or classify, before we have to think, we perceive. Time and space are not got at by thinking or generalisation. For before we can say anything about any part of our experience, it is *given* us in a certain spatial and temporal order. If we open our eyes at any moment, we are, without any conscious effort of thought on our part, confronted with an elaborate content. It seems simple to distinguish this receptive attitude of the mind in perception from its activity in thinking.

The distinction is not really so simple as it appears. For we all know that what we perceive depends, at least to some extent, on the mind's activity. We are familiar with the reflection that men see what they want to see or what they are looking for. This is clearly shown in the case of hearing by the difference in what we hear when we are listening to a language we understand and when we are listening to an unfamiliar language, or in the common experience when, after failing to hear what someone has said, we think what it must have been, and then seem to recall the sound, not as we heard it, but as we should have heard it if we had heard it rightly. Anyone who reflects on the process of fast reading will realise that we do not perceive or notice all the letters on a page; we fill in from our imagination, as we discover when we read words that are not on the page. It is a very hard thing, giving up all interpretation and inference, to describe faithfully just what is there to see.

Passive perception, then, does not exist, and our thought affects our perception. Yet, at the same time, the distinction between thought and perception, although not simple, is real. For although our previous thought affects our perception and we see things already classified, see books, and tables, and chairs, not merely coloured surfaces, yet we can distinguish between simple immediate perception and the process of thought which begins when we ask, What is that? *i.e.* when we begin to make judgments.

The characteristic of thought, according to Kant, is synthesis, or putting together, and all synthesis is the work of the mind. When we begin to describe and classify the contents of our perception, we pick out separate qualities from the continuous whole we perceive, and group them together. This grouping is, of course, determined by the likenesses and differences which we perceive everywhere, but we do not, in judging, confine ourselves to noticing likeness and difference. For any content of our perception has some point of resemblance, and some of difference with any other. We are concerned with likenesses that go with or are the signs of other likenesses. On the basis of perceived likeness we erect the notion of things and qualities of a certain kind. In doing this we go beyond what we see, and unite and arrange the contents of our perception through concepts. That is what we are doing when we say that is a so-and-so. For example, if I say that rock is like a dog, I am simply expressing a likeness I perceive. I do not imply that the rock is therefore alive or will bark; I am not going beyond how the rock looks; but if I say that object is a dog, I assert that all that is implied in being a dog will hold of that object, *i.e.* that it will have a certain appearance and behaviour, which is known. I can anticipate, therefore, how it will behave, look, and sound under certain circumstances. All these phenomena, the appearance, the barking, and running, though I may perceive them at different times and places, are grouped together in the judgment, "That is a dog." This is what Kant means by saying, "Concepts depend on functions. By function I mean the unity of the act of arranging different representations under one common representation." Concepts, therefore, always refer to perception, and it is by means of concepts that we are enabled to introduce such order into what we perceive, that we can anticipate from what we perceive what we shall perceive. "Perceptions

without concepts are blind.” Without concepts what we perceive would not lead us in any way beyond what is immediately given. “Thoughts without contents are empty.” Concepts are nothing, and have no meaning apart from the contents of perception which they unify.

Most of these concepts are what is called empirical. We get at them by observing likenesses and differences in what we perceive, and observing which are significant and important, and which are what we call accidental. Science, in its discovery of laws, is only carrying further this process which is implied in all simple judgments. By observing likenesses and differences, their uniformities and variations, and discovering those which are a key to the rest, we improve our concepts, and thereby have more knowledge of what we call natural laws, and can more and more anticipate experience. With these empirical concepts and their development Kant is not concerned. But there are certain concepts of which Hume had observed that they are not obtained in the ordinary way from an examination of the contents of experience. The two with which he chiefly concerned himself were substance and cause. These concepts seems to play an especially important part in the ordering and arranging of the concepts of experience. For the work of science, in moving from a simple observation of likenesses and differences to a knowledge of empirical laws, depends upon certain assumptions or principles, like the principle of causation or the principle of the conservation of energy. These principles imply concepts not derived, like the others, from generalisation from experience; they are the synthetic a priori judgments which, as we have seen, constituted a special problem for Kant.

Kant is first concerned to ask where these a priori concepts come from, and how many of them there are. This inquiry he calls the metaphysical deduction of the categories. Having answered that question, he then goes on to ask by what right we assume these principles in our dealing with experience. This, the most important and difficult section of the *Critique*, he calls the transcendental deduction of the categories.

Most concepts, as we saw, are empirical. We take certain likenesses and differences we observe as the mark of a real unity in the things. The different natures of different things we do not fully know, but we distinguish them by the different uniformities we observe, and in order to explain our experience we assume the unity underlying these perceived likenesses. Iron, dog, fire, are names for the natures of things which we see manifested in our experience. The concept, then, is got from what we perceive, though it stands for something more than we perceive. How, then, can there be any concepts which are not got from the empirical differences of things we perceive? Let us take such a concept as substance, and see whether we can discover where it comes from. Locke had been puzzled by discovering that he could not, in any object, find anything which was its substantiality. Calling anything a substance is not like saying that it is hard, or green, or heavy; we are not concerned with specific differences in things, but we are not therefore saying what is meaningless. There is something, namely substance, which we can distinguish from the hardness, or colour, or weight that we perceive. That something we do not perceive; we assume it whenever we talk of a thing being hard, and green, and heavy. A thing’s substantiality is just the unity of its perceivable qualities. But such a unity is implied in the concept of any object. Substance, then, is a name for one of the general principles implied in our assuming that what we perceive are real objects.

Kant generalises the result of this inquiry into particular concepts of this kind. He holds that a priori concepts or categories (*i.e.* the concepts which we do not get from empirical differences of things) stand for principles implied in thinking of things as objects or in judging. If we want, therefore, to find out the number of the categories, we must ask how many different kinds of unity are implied in judgment, or what are the conditions of judging any object. Kant does not here help, but rather misleads us in this inquiry. For he unfortunately thought that the different kinds of judgment could be discovered without further ado by taking the list given in formal logic. He therefore first makes a list of categories, based on the logical forms of judgment, and then tries to show the connection between these categories and the principles which were, as he had discovered, assumed in the mathematical sciences.

The actual movement of his thought is, I think, different. He asks if there are any general conditions implied in all judgment. His answer is that all judgments, all statements, that is, which claim to be true, imply determination of time and space. From that determination certain principles can be deduced. If time and space are implied in all judging, then these principles will equally be implied, and will hold of all things which can be objects for us.

It will be easier to understand Kant's arguments if we invert the order of the *Critique* and begin with examining the nature of the principles of the understanding or of one of them.

The categories which are of importance in Kant's argument are quantity, quality, substance, causation, and reciprocity, and necessity, possibility, and actuality. The last three are less important than the others, and we shall not deal with them.

To the first five of these categories correspond the following principles:

(1) Quantity. "All phenomena are, with reference to their perception, extensive quantities."

(2) Quality. "In all phenomena the real, which is the object of a sensation, has intensive quantity, that is, a degree."

The last three are classed under a general heading of *Analogies of Experience*, whose principle is: "Experience is possible only through the representation of a necessary connection of perceptions." They are

(3) *The principle of the permanence of substance*. "In all changes of phenomena the substance is permanent, and its quantum is neither increased nor diminished in nature."

(4) *Principle of the succession of time, according to the Law of Causality*. "All changes take place according to the law of connection between cause and effect."

(5) *Principle of co-existence, according to the law of reciprocity or community*. "All substances, so far as they can be perceived as co-existent in space, are always affecting each other reciprocally."

These principles, Kant points out, are assumed in the sciences of applied mathematics. The application of geometry to the world we experience assumes that all phenomena are extensive quantities; physics assumes that quantitative expression can be given to the qualities of objects other than their size, their weight, *e.g.*, and all scientific determination of change assumes the three principles which Kant calls analogies of experience: the permanence or conservation of amount in changes, the necessary connection of things in time, and the reciprocal interdependence of things which exist at the same time. These principles are not proved by science; their validity is assumed in all scientific investigation. On what, then, does it rest?

We shall follow Kant's argument more easily if we take his account of one of these principles — the principle of causation. For what is said of that will hold, with necessary changes, of the others, and, as we have noticed, it was Hume's criticism of causation which first led Kant to formulate the critical problem. Hume had pointed out that we had never such insight into causal connection as to be able, from mere inspection of a cause, to foretell the effect without any reference to experience. He declared, on the contrary, that there was no difference between observed succession and causation so far as concerned the objects observed. In each case we see first one thing and then another. The difference, then, between mere succession and causal connection can only be in us, in the way we come to feel about certain successions we observe. In technical language, the necessity of causation is subjective.

How does Kant answer this position? He begins, as is usual with him, by taking the problem a little further back. Causation is a connection we predicate between what we see at one time, and what we see at another. Now if we take into account only the fact that we see one thing at one time and another thing at another, there is no difference between what we see when we successively see two things which we judge to co-exist, and when we see two things one of which we judge to have succeeded the other in time. Hume, therefore, proved too much. His argument would show that we have no grounds for distinguishing between apprehension of succession and succession in apprehending, but such a distinction is the basis of

our apprehension and understanding of change or movement. If, then, we examine how we distinguish between apprehension of succession and succession in apprehending, we may see on what the principle of causation is based.

An instance will help to make this point clear. Suppose that I am sitting in a room, and look first at the door and then turn round and look at the window. There are two successive acts of apprehending; the content of the first is the door, of the second, the window, but the succession, I say, is in my apprehending. The door and the window have co-existed all the time. Suppose, again, that I look out of the window and see a cab in front of the house opposite, come back into the room, and then look out again and see the cab in front of a house further down. Here, again, are two successive acts of apprehending, the content of the first houses with cab in front of one house, of the second houses with cab in front of another. This time I say the houses have gone on co-existing, but the cab has moved. The difference in what I see this time is due not to me, but to the cab. The succession is in the thing apprehended. If we just think of the contents apprehended, we have first A, then B, and say A and B co-exist in the first instance, and have CD and CE, and say D and E have been successive in the other. Why in the second case do we not say when we look out of the window the second time: Here is another row of houses, which, though they look exactly the same as the ones I saw last time, have got the cab in a different place? That is the land of thing one does say in a dream. Why would it be inadmissible in waking life?

Let us first ask how we ever come to make the distinction between change in the content of our perception, which is due to change in us, and change in the things we perceive. Look out of a window into a busy street. As we look certain things remain the same, the houses opposite, the lamp-posts, and so on, but other things change. The permanence of part of the contents guarantees us that the change we perceive is not due to us: if it were, these would change also. Therefore it must be in certain of the things. Change is perceived against a background that is permanent and does not change. But any such particular perception is, of course, very limited. We do not see all the world at once, and we only come to know a larger extent of reality by means of memory, which enables us to put together what we see at one time with what we see at another. We have got to try and understand how it is that we make this distinction, which is clear to us in small isolated bits of experience, hold of all experience. Now if reality did not change, and we were conscious of our own movements, we could go from one point to another of reality and back again, and could be aware that the changes in our perception were all due, not to change in reality, but to us — were our history. We should know that the different things we saw were co-existing all the time, and we should, in describing them, try to describe them, as in a map, as we should perceive them if we saw them all at once. The succession would be subjective, the co-existence objective. If we perceived nothing but change, we should be incapable of distinguishing between our changes and the change outside us, for all succession in our experiencing would be experience of what was successive, and there could be no distinction between psychology and science. Our experience of reality is not like either of these suppositions, but like both of them combined. Some succession of our experiencing is experience of the co-existing, some experience of succession.

Reality stretches out beyond us in space, some of it changing and some of it permanent; we cannot tell simply from the difference in what we perceive whether the difference comes from change in us or change in the thing. We can tell that only on the assumption that we are having fragmentary views of a whole that is continuous. The only continuity we know is the continuity of our own experience made possible by memory, and we try to interpret that experience in the light of the larger continuity of the world which our experience breaks up. As we go from one place to another, notice now this thing, now that, we can test interpretations made on this assumption. Wrong interpretations are those which make our experience inconsistent. If we thought that what happened at one time had no relation with what happened at another, that anything might happen any time, our experience and our own life would be the merest jumble. Our experience attains consistency only as we learn more and more to disentangle the differences in

experience which come from our changes, from the changes and the variety which are part of the whole connected system of reality, of which we see now one fragment, then another. The distinction between succession in our apprehending and apprehension of succession, which is the basis of all experience of change, implies the recognition of change as not arbitrary but part of a connected system of reality. As Kant puts it in his formulation of the principle of the analogies of experience, “Experience is only possible by means of the representation of a necessary connection of perceptions.”

But if our perception of reality is fragmentary, how can we think of reality as other than fragmentary, how can we fill up the gaps? Only by thinking of the whole as a connected system in space and time. For it is the nature of space and time that they can be thought of independently of the specific nature of the things in space and time, and that the space and time we perceive in any one experience must be thought of as parts of an all-embracing space and an all-embracing time. We cannot follow the whole history of a change from A to B, we can only say that, if our experience is to have any consistency, we must think that the fact that we first saw A and then saw B implies in this case that the change from A to B is part of the continuous system of change in time, that it is determined in time. But to think of an event as determined in time is not to think of it as determined by time, for time in itself could not produce one thing more than another. It is to think of it as determined by the nature of what precedes it in time. We therefore conclude that like causes have like effects; for, if anything could cause anything, we should never know that change in what we observed was due to change in us — in the position of our bodies, *e.g.* — and the experience of objective change would be impossible.

The principle does not tell us of itself what causes what. That can only be discovered by empirical investigation. That is necessary because we do not, as we seem to have assumed above, simply see one thing becoming another. We see parts of all kinds of changes. Hence succession may be objective but not causal. Science has, by observation and experiment, to disentangle and isolate different changes, but it could not do this without assuming the principle of causality.

Causation, then, and the other assumptions of the physical sciences, are shown by Kant to be “grounds of the possibility of experience.” We cannot deny them without denying elementary distinctions in our experience, without which life would be a chaos, and which are assumed and justified every moment. While Kant thus demonstrates the validity of such principles, he is also insistent on the limitations of their application. They are principles which give consistency to experience, but must not be applied save in reference to what we experience. They apply, in his words, “only to phenomena.” The purport of this limitation can, again, be most easily seen by examining the principle of causality. By means of that principle we connect one event with another, but the reality is not two different but connected events, but a continuous process. The continuous process escapes us, because our perception of it is fragmentary and discontinuous. Inasmuch as a judgment of causal connection asserts that the events we separately notice are connected, it is true, but it is false if taken to imply that reality consists of a series of discontinuous events or stages which are yet connected. Such an assumption would mean, in Kant’s words, that causation is applied not to phenomena (things as they appear to us), but to things in themselves (things considered apart from the manner in which they appear to us). If we realise its falsehood, we can, he thinks, evade the contradictions which he examines in the *Dialectic*.

CHAPTER V. THE ANTINOMIES AND CRITICISM OF THE PROOFS OF THE EXISTENCE OF GOD

So far we have been considering the positive side of Kant's argument, his attempt to confirm the validity of the principles of science. We must now notice the negative side, his attempt to limit the application of these principles, and his denial of the possibility of knowledge in certain spheres.

We saw that Kant in his *Prolegomena* summed up the argument of the three chief divisions of the *Critique* as an answer to the questions: How is mathematics possible? How is pure science of nature possible? and, How is metaphysics possible? He qualified the last question by adding "as a natural disposition of the mind." The argument of the *Dialectic* is that metaphysics, in the sense of inquiry into objects which transcend the bounds of experience, is not possible as a science, but that metaphysical questions arise naturally from the nature of human reason. They cannot be answered. All we can do is to see why we cannot answer them.

Kant thought of knowledge as a process of extending the bounds of perception, of piecing together the fragmentary glimpses we get of the world, stretching them out in spatial and temporal determinations that go beyond what we have actually experienced, connecting and linking up the events which we perceive discontinuously. As science extends, the range of our knowledge widens, but the process of extension never reaches its completion. There are always more facts to be discovered and explained. Science, therefore, can never rest content with its achievements, but must always demand that the investigation of conditions should be pushed further back and on. From this sense of the incompleteness of all actual knowledge, and of all there is that might be but is not known, arises what Kant calls an ideal of reason, a demand that, in all investigation into the conditioned, we should go on till we come to the totality of conditions. This ideal he holds to be serviceable and necessary. It has, however, a natural tendency to pass from an ideal to an idea, and in so doing it gives rise to the contradictions with which the *Dialectic* is concerned. If all our investigation is governed by the thought that it must go on until it reaches completion, we naturally speculate on the fulfilment of that ideal, and try to form an idea of that totality of conditions, of how we should think the world if we knew it in its completeness. Herein we hypostatize the ideal or make it an idea, and we fall into contradiction; for we cannot really know the whole without knowing all its parts. If we give up the slow and never-completed process of knowing one part after another, and try to jump to the idea of the whole, we reach quite contrary results, as we apply to the conception of the whole one or other of two assumptions implied in our investigation of the parts.

Kant sharply distinguishes between the principles of the pure understanding and the ideas of reason. The former are implied in all our knowledge, and the fact that experience is not chaotic confirms them at every moment. The second are ideals which guide knowledge, but are never realised. He calls them ideas of reason, because it is the special task of reason to lay down rules for the proper and complete working of the understanding. This task, he thinks, is exemplified in the logical nature of the syllogism which brings into unity the judgments of the understanding. As he used the forms of judgment as a guiding thread to discover a complete list of categories of the understanding, so he uses the forms of syllogism to discover a complete list of the ideas of reason. In both cases Kant's reference to logical forms is far-fetched. Actually the list in the *Dialectic* seems to be influenced by a number of considerations not always consistent.

There are three main divisions of the *Dialectic*. (The first Kant calls the paralogisms of rational psychology.) All knowing and experience imply the unity of the self which knows. In actual experience

that unity is qualified by the nature of what it unites, but we may try to think of it apart from and independent of this. This leads to an attempt to know the self by asking what must be its nature if it has the unity implied in knowing, and to argue that the soul is a substance and simple, not affected by the changes in the matter which it knows and therefore immortal.

The second division arises from the fact that in knowledge we are concerned with series — a series of addings together and a series of divisions, as of parts of space and time; a series of things arising one from the other, as in causation; and a series of things in dependence one upon the other. The *ideas* of reason come from the thought of these series completed, and produce what Kant calls antinomies. For if we start with the thought that what we are trying to apprehend must be a whole, we get one series of results; if with the thought that we can only apprehend the whole by going from condition to condition indefinitely, we get another. Kant distinguishes four antinomies, each with thesis and antithesis. The thesis of the first is, "The world has a beginning in time, and is limited also in regard to space"; the antithesis, "The world has no beginning and no limits in space, but is infinite, in respect both to time and space." The thesis of the second is, "Every compound substance in the world consists of simple parts, and nothing exists anywhere but the simple or what is composed of it"; the antithesis is the contrary of this. The thesis of the third is, "Causality, according to the laws of nature, is not the only causality from which all the phenomena of the world can be deduced. In order to account for these phenomena it is necessary also to admit another causality, that of freedom"; the antithesis, "There is no freedom, but everything in the world takes place entirely according to the laws of nature." The thesis of the fourth is, "There exists an absolutely necessary Being belonging to the world, either as a part or as a cause of it"; the antithesis is a denial of this.

The problems of the third division of the *Dialectic* arises from an attempt to think of a whole which shall include both the known world and the mind that knows. This attempt, which Kant calls the ideal of pure reason, leads to proofs of the existence of God.

As the *Dialectic* proceeds, it becomes clear that Kant has another list to hand. He enumerates, as the three great objects of metaphysical inquiry, God, Freedom, and immortality, and in his discussion of the ideas of reason he treats them principally as attempts to give definite and dogmatic answers to the problems suggested by these three topics.

Immortality is the subject of what Kant calls the paralogisms of rational psychology. He argues that all attempts to prove the immortality of the soul by a priori arguments involve an argument of this kind: they begin by noting that death is always dissolution of some kind, that, therefore, what is not made up of parts and cannot be dissolved, cannot die. Then they urge that the soul is not made up of parts, and therefore cannot die. The fallacy in this argument is that it treats the unity of the self as though it were an object of knowledge. We can show that knowledge is only possible if the self has a unity other than that of a spatial whole, but we cannot therefore argue that it must be exactly like a spatial whole, in the sense that death in it can only be brought about by dissolution, but unlike a spatial whole in that in it there is nothing to be dissolved. The real nature of the unity of the self, Kant argues, cannot be known. All we can do is to reject a priori arguments either for or against its immortality.

Freedom is treated in the third antinomy of pure reason, and to that Kant devotes most attention, but others of the antinomies are concerned with the difficulties arising from the application of spatial and temporal determinations to reality as a whole, and to the category of necessity. Kant makes a distinction between the first two and the second two antinomies. It is the first two that express the inadequacy of temporal or spatial determination to reality as a whole. All such determination implies measurement, and measurement is always a relation of part to part. The antitheses of both antinomies express the inadequacy of any number to the expression of the nature of the whole, the thesis the inadequacy of regarding reality as an aggregate or addition of any kind. Each is strong in what it denies, and Kant's solution is that both thesis and antithesis are false, because you cannot apply spatial or temporal determination to the world as

a whole.

In contrast the solution of the other antinomies is that both thesis and antithesis are true, and that is possible because they are concerned with different things. The third antinomy arises from the difficulty of applying the category of causation to the world as a whole. The assumption underlying the thesis is not, as is sometimes asserted, merely that the notion of infinity in itself implies a contradiction, but that a determinate result must have a determinate cause. If we think of what actually exists now as having been caused by what has preceded it, we must think of that which has had a determinate result being itself determinate. It is the familiar argument for a first cause. In causation we seem to be relating one event to another event, and are really only putting the question of origination further back. Yet, if we say that therefore we must suppose an absolute origination of change, a beginning of the series, we have to answer the question, How is it possible to think of the originating number of the series? For to think that something can arise from nothing is to contradict the principle of causation.

Kant's solution to this difficulty is important, for it had great influence upon his ethical theory. The category of causation applies only to phenomena. If we think of things as phenomena we must recognise that they are subject to the principle of causation; if we think of them as things in themselves, the category of causation does not apply to them, and their action may be free. The same action may therefore on its phenomenal side be determined, and on its nominal side, as the action of a thing in itself, be free. This may seem to be solving one contradiction by propounding another, till we remember that in causation we do not explain the relation of cause to effect. The relation we discover is between one instance of cause and effect and another. Like causes have like effects. The principle applies, then, in so far as things are like one another. It applies to changes which are aggregates or complexes of simpler changes which are like other changes. If and in so far as there are things which are more than aggregates of their elements, and are therefore unique, there are things to whose changes no laws of cause and effect are adequate. The point may be illustrated by the way we think about character. If we think of a man's character as his characteristics, his being this or that *kind* of person, we must think of his action as so far determined, but that does not prevent us from thinking of his individuality as something more than any sum or combination of characteristics, as something essentially alive, which escapes all attempts to bind it by rules. It is the difference in Kant's words between man regarded "from the point of view of anthropology," and man regarded as a responsible moral being. We shall see in the next chapter that this distinction is the basis of Kant's moral theory. Here it must be noted that he does not claim that his solution of the third antinomy proves the fact of freedom. That, he held, no merely intellectual argument could prove. It only defends the possibility of freedom.

The third division of the *Dialectic* is an examination of the proofs of the existence of God. When we study Kant's account of them, we find we are concerned not, as elsewhere in the *Dialectic*, with a conflict springing from the nature of reason itself, but with the relation of thought and conduct. Kant distinguishes three proofs of the existence of God — the ontological, the cosmological, and the physico-theological — but he maintains that the last two really rest upon and imply the first. The first, the ontological proof, is the argument that the very conception of a perfect being implies existence. It is the only proof of moral importance, inasmuch as it attempts to argue a priori that a being of perfect morality must exist. Kant's answer to it is that, to argue that we could not conceive a perfect being unless we conceived that being's existence, is to suppose that to conceive of a thing, and to conceive of the same thing existing, is to conceive of different things. Existence, he says, adds nothing to the concept of an object. Kant's objection to the ontological proof has been criticised. But the proof either assumes that God is a being independent of and separate from the rest of reality, and then, as Kant says, we may conceive God as existing, but our conception not being necessitated, carries no necessity with it. (If I conceive a hundred dollars to be in my pocket, he says, I conceive them to be there; but that does not mean the dollars are there.) Or if we say that reality must be thought of as existing, the answer is, Yes, but must reality necessarily be thought of as

morally perfect? It is this last assumption which alone makes the ontological proof worth proving; for arguments about the existence or non-existence of God are mere quarrels about words, except in so far as they are concerned with moral issues. But moral issues cannot be solved by a consideration of purely intellectual assumptions. The nature of the other two proofs of God's existence makes this clear. The second, the cosmological, is the argument that if anything exists, something must necessarily exist. Kant's answer is that this is sound so far as it goes, but it does not prove that what necessarily exists is a morally perfect being. The third, the physico-theological argument, is the familiar argument from design. Kant treats this argument with much greater respect than the other two, but insists that we must see how far it will carry us. If we are going to infer the nature of God from the nature of the world as we see it, we must do so honestly. But though we see design in the world, we do not see perfection, and on the basis of this argument we cannot ignore the imperfection and want of harmony which is as patent as the harmony and design.

Kant's analysis of these proofs seems negative. Its real purport is to insist that religion cannot be dissociated from moral experience, that the knowledge of God, which is the concern of religion, is not got by intellectual speculation, but in the moral life. When he said that he had limited reason to make room for faith, he did not mean that men could not prove the existence of God, but might believe in it if they pleased. He meant that God is implied and known above all in moral action. His criticism of these classical proofs is thus the beginning of that revivified philosophy of religion whose chief representatives have been Schleiermacher and Ritschl.

CHAPTER VI. KANT'S MORAL THEORY

Kant's moral theory is an integral part of his philosophical system. If the *Critique of Pure Reason* argues the impotence of reason in the sphere of speculation, the *Critique of Practical Reason* affirms its sovereignty in the sphere of practice. The second *Critique* is thus the complement of the first. Kant's treatment of moral problems being largely the consequence of the conclusions of the first *Critique*, his moral theory is thus mainly metaphysical. The title of one of his works on moral theory, *Fundamental Principles of the Metaphysic of Morals*, bears this out. There were, no doubt, other influences which had their effect on his conception of morality. He tells us himself that he was inspired by the teaching of Rousseau on the dignity and worth of man. He was undoubtedly repelled into a reaction against the sentimental school of Shaftesbury, which in its German adherents insisted on the agreeable and gentlemanly nature of virtue with an almost sickly sentiment. This reaction accounts for the extreme emphasis laid by Kant on the divorce between duty and any kind of inclination. But his doctrine as a whole can only be understood in the light of the conclusions of the first *Critique*.

Kant's conception of freedom or autonomy of the will is the key to his moral theory. "On the hypothesis of freedom of the will," he says, "morality together with its principle follows from it by mere analysis of the conception." We saw in the last chapter that Kant regarded human action, when looked at from an anthropological point of view, as phenomenal, and therefore subject to the law of cause and effect. If we think of man as a creature of inclination, with likes and dislikes, we seem, in considering men's differences from one another in this respect, to be dealing with matters of fact over which men have no control. We are born and grow up with different natures, with the result that one man likes one thing, another another; one man's temptations do not tempt another, what one man finds easy another finds difficult. We seem here to be in a world where causation rules. If men act differently, it is because their external environment, acting upon their different natures, calls out different responses. So far, then, says Kant, as men act according to inclination, do things because they like doing them, or avoid them because they dislike them, their actions are what he calls heteronomous, governed by laws over which they have no control. We assume, whenever we are trying to explain human actions, that they are the result of the interaction of character and environment, and are not to be praised or blamed but understood. *Tout comprendre est tout pardonner*.

But when we consider our moral judgments we seem to be in a different world, for there are some actions which we think we or others ought to have done or ought not to have done, and this obligation has nothing to do with our likes and dislikes. If we look back upon a past action of our own, we may see why we did it, understand how the temptation to it appealed with peculiar strength to something in our nature, yet nevertheless we may say that we ought not to have done it, and with that judgment goes the conviction that we need not have done it. The conception of "what ought to be" is on a different plane from the conception of "what is," and assumes a different kind of causality. It assumes that, when we are done with our analysis of character, of a man's likes and dislikes and the effect of circumstances upon them, we can still assume that it is in his power to do what he ought and to abstain from doing what he ought not. We praise the first and blame the second, whether in ourselves or others, just because we assume, over and above inclination and disinclination, a possibility of acting or not acting as duty demands.

Thus Kant analyses the assumption of moral judgment. But it is still no more than an assumption, and he has to ask how it can be reconciled with the seemingly contradictory principle of causation. The analysis of the third antinomy in the first *Critique*, as we saw, prepared the way by maintaining that the same action might be phenomenally determined, and free as the action of a thing in itself, were there another form of causality — free causality or self-determination. For the existence of such another form of

causality the first *Critique* offered no evidence. Kant's concern is to show that morality assumes it; for the claim of duty is that a man should not act as a creature of inclination, of likes and dislikes. Duty claims to cut across all such empirical considerations. The motive to do what duty demands must come from elsewhere. It may then be found to be a claim that man should act not as a part of the physical world, but as a moral being. For man, as well as an observer and understander of other men, is also a moral agent. As such he stands in quite different relations to other men. He treats them and himself as moral agents, responsible for their actions. As a member of the world of moral relations he acknowledges a system of rights and duties, he holds himself responsible to other men as they are responsible to him, and all this has nothing to do with what a man wants or does not want to do, with how easy or how difficult he may find it to perform what duty demands. In this he is assuming in himself and other men a power of determining the will in accordance with the moral law. That, just because it takes no account of likes and dislikes, cannot be derived from these or from considerations of circumstances or environment. It must be deducible from the nature of man as a moral being. In obeying the moral law, then, man will be obeying a law that comes from himself. His will will be self-legislative. This power of acting in accordance with a law that comes from the nature of man as a rational, responsible being, and not as a member of the world of causes and effects, is moral freedom; it is the assumption of all moral judgment and action. It cannot, Kant holds, be *explained*. For all explanation is the work of the understanding, and that can explain only phenomena. It is enough that the first *Critique* has shown that phenomenal causality is not inconsistent with the possibility of another causality. In the moral sphere we act and judge as if we were free. The moral law and duty make claims upon us on the same assumption. Moral freedom, then, is the ground of the possibility of moral experience.

Kant's account of duty is determined by the sharp separation which he makes of man as moral agent and man regarded "from the point of view of anthropology." The commands of duty must be derived solely from the nature of man as a moral agent. If they were the consequence of man's empirical nature or his surroundings, they would have no claim to override his promptings of inclination or pleasure. He describes these commands as categorical, and the principle of morality as a categorical imperative. The meaning of this phrase lies in its opposition to hypothetical. Many commands and principles are, Kant says, hypothetical. They assume that men desire certain ends, happiness or health or success, and the actions they advise are advised as means to such ends. The law of morality is quite different from such prudential maxims. It does not say, "If you want to be happy or to save your soul, then act thus and thus." Its commands are absolute, for they appeal to man simply as a rational being. They must therefore be derived solely from a consideration of man's rationality. It is difficult at first sight to see how any commands can be deduced from a consideration so abstract. How, we might say, can man's rationality be known and recognised except in the content of what he does and thinks?

Kant seeks to derive his imperative from the contrast between acting as a moral agent and following inclination. Man regards himself as a moral agent, morally responsible for his conduct, and he regards others as morally responsible, whatever his or their particular nature or character may be. That means that he must act as he thinks any one else would be bound to act, and from this Kant deduces his formulation of the categorical imperative: "*Act only according to that maxim which you can at the same time will to be a universal law*." Another formula indicates more clearly the relation of duty to a society of moral agents responsible to one another: "*Act so that you treat humanity, in your person and in the person of every one else, always as an end as well as a means, never merely as a means*." It is only by following such imperatives that we can rise above the promptings of circumstance, for only thus is the will self-legislative. In obeying such an imperative our will is self-determined, for it is following a principle that is derived from man's nature as independent and transcendent of the world of phenomena. Hence in moral action we are in contact with the reality of things more truly than in any understanding of phenomena. The moral law has a dignity which no natural inclinations or likings can have, and the good-will, the will

which follows such a law, has a similar worth and dignity. “There is nothing in the world — nay, even beyond the world — nothing conceivable, which can be regarded as good without qualification, saving alone a good will.”

Such in outline is Kant’s account of morality. A discussion of some of the difficulties which a consideration of it suggests may help to make its purport more clear. Kant holds that the principles of right action can be deduced directly from the imperative he has formulated, and need take therefore no account of historical circumstance. Now, it is easy to show that, when we do an action which we know to be wrong, we are making an exception in our own favour. We cannot universalise the maxim of our own conduct. When we do what we know to be wrong, we recognise what is right. We say, “This is how any one ought to act in these circumstances, but I am not going to do it.” We must learn to look upon ourselves as we should look upon and judge any other moral agent. If, when taxed with wrongdoing, we reply, “I wanted to do it,” or “That is the kind of person I am,” or “That is the way I am made,” we are abandoning the moral position, and the answer is, “Whether you wanted it or not, you ought not to have done it,” or, “Well, you ought to become different.” But this does not help us when, looking at actions from a moral standpoint, it is difficult to say what ought to be done. Kant tries to show that wrong action, if universalised, is always contradictory. He takes the instance of telling a lie. If that were universal no one would believe any one else, and there would be no point in telling a lie. Lying is essentially parasitical. But this does not help us in the familiar problem in casuistry, whether it is allowable to tell a lie to save life. For here we have a conflict between two maxims, both of which can be universalised. We cannot regard such a situation as simply involving a question of telling the truth or of saving life. We must consider the circumstances of the case. This is even more evident if we apply Kant’s rule to the question of whether celibacy is ever justified. If celibacy were universal, there would soon be nobody to be celibate, but it does not therefore follow that some people under certain circumstances ought not to be celibate. The question cannot be answered without reference to circumstances. The moral of this is that the categorical imperative does not enable us to act without individual moral judgment in individual cases. Further, in one of the instances which Kant gives he admits that there are certain ways of action which might be universalised, but which he nevertheless holds to be wrong. He instances the duty of being industrious. A society could quite well be imagined in which every one was lazy, but he says, “It cannot be willed.” The ultimate appeal here is to what the moral reason wills. That means that we must admit that the moral reason or moral judgment has a content not derivable simply from the conception of the moral law; that there are certain kinds of life, certain kinds of action, which we judge to be good, and others which we judge to be bad. But, if this is so, we must give up the sharp separation Kant makes between the moral law and nature, and allow that things in nature can have a moral value. It may still be true that they only have moral value through their relation to a good will, and have no moral significance apart from such a relation.

The difficulties created by Kant’s sharp separation of the moral and the phenomenal worlds are equally apparent in his discussion of motives. He conceives the individual as phenomenal, to be determined solely by pleasure and pain. The power of the moral law is manifest, therefore, when its commands run counter to inclination, and the motive of respect for the moral law conquers inclination. It is true to say that a man’s likes and dislikes in themselves are not to the point when we are asking what he ought to do, but Kant sometimes speaks as though there could be no moral value in an action which did not go against inclination. This is perilously near that morbid theory of conscience which assumes that the fact that an action would be very disagreeable to the agent is itself proof that the proposal to perform it is the voice of conscience. Here again we have to say that the fact that inclinations viewed merely as inclinations have no moral value, does not show that, relatively to the good will, one may not be better than another. There is nothing to be proud of in the fact that we dislike doing our duty.

This sharp separation between the world of morality and science was somewhat tempered in Kant’s

third *Critique*, which we shall examine in the next chapter.

CHAPTER VII. THE “CRITIQUE OF JUDGMENT” — ÆSTHETICS AND TELEOLOGY

The *Critique of Judgment* is at once the most interesting and the most difficult of Kant’s three *Critiques*. It seems to cover a much wider ground than either of the two earlier *Critiques*. It concerns itself with the relation of empirical investigation to the a priori principles of understanding discussed in the first *Critique*, with an attempt to bridge the gulf between the world of freedom and the world of nature as described in the second *Critique*, with a discussion of the principles of æsthetics and of the conflict between the rival claims of the principles of mechanism and teleology, a conflict which, since the discoveries of Darwin and the increasing interest taken in biology, is becoming every day more important. On all these points Kant has much of importance to say. Modern theories of æsthetic are mainly based on an acceptance of the distinctions which he first laid down clearly. Much modern philosophy of a type which is little in sympathy with the doctrines of the first *Critique* — Pragmatism, for example — is an elaboration of his account of the regulative principles which guide empirical investigation, while speculation on the rival methods of biology has hardly advanced beyond the solution suggested by Kant. Yet the very suggestiveness of this book makes it hard to understand. It is difficult to see the connection which Kant supposed to exist between these very various problems. The form of the book, like the form of the first *Critique*, is marked by subdivisions suggested by formal logic, which seem to have little or no connection with the subjects discussed under them, so that the whole is a curious combination of formal system and discursive content. Kant himself regarded this *Critique* as the triumphant vindication of his whole system, in that it brought together and reconciled subjects which he had previously distinguished too sharply. Many later writers have thought rather that in it the inconsistencies which they believe to exist in Kant’s thought come to a head.

We have not space here to vindicate the *Critique of Judgment* as “the crowning phase of the critical philosophy,” as a recent writer has called it, or to examine singly Kant’s treatment of the various subjects of interest with which it is concerned. It is important, however, to follow the connection which Kant supposed to exist between these different subjects. If we can understand that, we shall gain considerable insight into Kant’s system as a whole.

Kant names the book the *Critique of Judgment*, or, more exactly, the *Critique of the Faculty of Judgment*. Judgment is distinguished from understanding, whose principles are more peculiarly the subject of the first *Critique*. The understanding, according to Kant, is the faculty of rules. Judgment is shown in the application of rules to individual instances. It is the element of individuality and spontaneity in all thinking, for which no rules can be discovered. Judgment cannot be taught, different men possess it in different degrees; it is akin to genius. When, then, Kant turns to examine the faculty of judgment, he is asking whether the mind, in dealing with individuals in all their variety and difference, and in attempting to understand them, is guided by any general rules or principles. The import of this question becomes clear in his relation of it to the familiar question of causation. The principle of causation, as we have seen, is, according to Kant, an a priori principle of the understanding, and is assumed in all experience; but it does not of itself enable us to determine in any particular case what causes what. That is the task of empirical investigation, and needs, as we know, the imagination and insight of the individual investigator; in Kantian language, it is the work of the faculty of judgment. Besides the a priori principle of causation, therefore, we have an indefinite number of empirical causal laws. Kant asks whether the scientist in investigating such laws, and more particularly in considering their relation to one another, is guided by any principles. He finds that the scientist assumes that this indefinite variety is capable of being reduced to some kind of unity, assumes that there is continuity in nature, that knowledge will not remain an

aggregate of disconnected rules. Chemistry, for example, has discovered that the overwhelming variety of natural changes can be reduced to the action and interaction of a small number of elements. The chemist proposes to go on and see whether the different elements may not themselves be seen to be forms of one substance.

These assumptions are, according to Kant, quite different from the principles of the understanding. For the latter are grounds of the possibility of experience. We cannot deny them without making experience unmeaning. This cannot be said of the former. It obviously cannot be essential to experience that the multiplicity of the laws of nature should be reducible to unity, for such unity has never been discovered. Experience has been quite possible without it. This distinction between two kinds of principles Kant expresses by calling those with which we are now concerned regulative. The purpose they serve is the regulation and improvement of knowledge. They do not, like the principles of the understanding, prescribe to nature. We assume in them that nature is, in Kant's words, purposive to the understanding — that is, we first think out what order of nature would be intelligible, and then look to see whether we cannot discover in nature such an order. This assumption does not prove that there is any such order, but in science we act as if it were there to be found out.

This suggestion of Kant's has been elaborated in many modern writers on philosophy, who have pointed out how much scientific method is governed by the notion of the most easily intelligible theory, and they have argued that science assumes, for the convenience of method, principles which it never completely proves. These principles are called sometimes methodological assumptions, sometimes postulates. The difference between such modern writers and Kant is that the former think that all a priori principles are of this nature, and that the principle of causation, for example, is itself only a postulate.

The faculty of judgment, then, according to Kant, assumes for regulative purposes that nature is purposive to our understanding. What does this last phrase mean? We are often concerned to know the relation of things to our purposes. It has been pointed out that very many of our empirical concepts represent rather our practical interest in things than our desire to understand them as they are. Kant's phrase implies that, apart from any such relation to particular purposes, there is a more general purpose of mere intelligibility, which some objects obviously serve more than others.

Here we pass to the consideration of art, for in our judgments of beauty Kant holds that we similarly disregard the relation of the beautiful object to any particular purpose, and seem to be concerned with general purposiveness. The judgment of beauty is, for Kant, the supreme act of the faculty of judgment. It is reflection on an individual for its own sake, without attempting to fit it to our desires or see it as an instance of our concepts or rules. Kant therefore proceeds to examine our judgments of beauty, which show how reflection on individual objects may display general rules, and then proceeds, in the last part of the *Critique*, to discuss the part played by the concept of purposiveness in our understanding of nature.

It would seem at first sight that Kant is not interested in art for its own sake, but for the light which it throws upon the nature of our intellectual faculties. Nevertheless he is careful to insist on the distinction between artistic and scientific judgments. The judgment of beauty, he insists, is free, is not determined by a concept. We are not concerned, in such judgments, with asking what an object is. In so far as, in our appreciation of beauty, we bring in such considerations we are wrong. He therefore rules out any theory that beauty is concerned with faithful representation. Beauty consists in the form of an object, and in nothing else. The judgment of beauty, besides being free, is also disinterested. The relation of the beautiful object to our purposes is irrelevant to its beauty. The judgment of beauty cannot, therefore, be determined by rules of any kind. It is always individual and immediate, and the immediate feeling of beauty counts for more than any rules or canons of taste. Kant therefore vindicates art as independent of either science or morality. Yet, once we realise its independence, the nature of art throws light upon both science and morality; for the judgment of beauty, although free and not determined by concepts, claims universal validity. We might put Kant's point in another way by saying that art is significant, and yet is not

significant of anything *in particular*. Its meaning cannot be reduced to scientific statement nor abstracted from its form, and yet art has meaning. Kant finds the explanation of the fact that the judgment of beauty is free, and yet claims universal validity, in the suggestion that a beautiful object is one the contemplation of which arouses and enlivens the two faculties of the intelligence, the imagination and the understanding, in their proper proportion or harmony. All knowledge needs imagination, the power of seeing resemblances and differences in objects, and understanding which by concepts gives unity and rules to the imagination. In science the imagination is subordinate to the understanding, for the aim of science is definiteness and precision. In art the imagination is free, and yet art is not the mere seeing of resemblances and differences; it also has its unity. It aims at the best proportion of variety and unity. This is independent of the varying natures of individual persons, and therefore the judgment of beauty can claim to be universally valid.

Beautiful objects, then, are "purposive to the understanding," inasmuch as their form stimulates in the most harmonious degree the two faculties of intelligence, and in art we find proof that there is a principle of general intelligibility, which may guide the work of the scientist. The purpose of the scientist is quite different from that of the artist, but if he is to reduce his facts to order and intelligibility he must be guided by a principle which is seen in its pure form in the artist.

In the second place, an understanding of the nature of art has significance for moral theory, because the judgment of beauty is disinterested, and shows that pleasure may be independent of desire. In æsthetic pleasure we are not merely determined by our inclinations, for art is of all human activities free and creative. We enjoy art not because it serves any of our individual desires and purposes, it is enjoyed by something in us that is universal. Art, then, contradicts the position which Kant assumes in the second *Critique*, that we cannot follow pleasure without being slaves of our phenomenal nature. It is a disinterested enjoyment, and is witness to the possibility of disinterested pleasure in the good. Further, Kant held that in one kind of æsthetic enjoyment, appreciation of the sublime, the contrast between our weakness and the vast extent and overwhelming powers of nature, calls forth in us a conviction accompanied by pleasure of the yet greater might of the moral law within us. Art therefore may become the symbol of morality, and the third *Critique* does much to soften the rigour of the teaching of the second.

In the last part of the *Critique of Judgment* Kant applies his doctrine of regulative principles to the understanding of nature. The faculty of judgment, as we saw, is concerned with the attempt to give unity to the detail of the natural world. In this work it has two regulative principles, mechanism and teleology. Reality cannot be formed according to both these principles; for mechanism assumes that reality can be regarded as a pattern or complex of recurring or interchangeable parts whose changes are necessitated, teleology that the world cannot be explained without supposing purpose to be an operating agency in change. Mechanism seeks to explain things as the necessary result of their original condition, teleology in the light of their highest development. The two principles have therefore been held to be inconsistent. The scientist, jealous for the validity of his discovery of mechanism, combats the very notion of purposive agency. The theologian thinks that to admit mechanism anywhere is to give up his whole position.

Kant's solution of this antinomy is that both mechanism and teleology are only regulative principles. They tell us nothing of the ultimate nature of reality, except that we can explain much of it by regarding it as if it were a machine, and much by regarding it as if it were the field of purposive agency. Reality must be consistent with both these facts, but more we cannot say. The moral is that we should continue to treat them as regulative principles, and push each principle of explanation as far as it will go.

Kant is here, as usual, the enemy alike of scientific and of theological dogmatism. He will not allow any limit to be set to the work of scientific investigation, and yet will not allow a principle of scientific method to be converted from an explanation of perceived facts into a theory of the universe.

Besides mediating between the conflicting claims of mechanism and teleology, Kant also modifies the notion of teleology. When we think of reality as purposive, we do not necessarily think of it as having a definite purpose, as being subordinate, for example, to the well-being of man. The principle of

purposiveness arises properly, he holds, from the contemplation of living things, from the perception of the difference between an organism and a machine. An organism is purposive in the sense in which a work of art is. In applying the principle we are trying to understand reality as though the relation of all the different things in it were like the relation of the parts of an organism or a picture. But this principle, like the principle of mechanism, does not carry us further than the facts we have examined, for an organism or a work of art can only be understood by study of the individual relations of all its parts. We can never know the universe as an organism, for we can never know all its parts. We can understand and put together more and more of them, but we never come to the end.

The third *Critique*, then, enforces the lesson of the first, that knowledge is the work of individual finite minds, trying to understand elements in a whole that transcends the limits of their experience, pushing back the spatial and temporal limits which confine each individual, but never removing them altogether. The critical philosophy teaches the impossibility of absolute knowledge, but it does so not by suggesting general scepticism of all knowledge, but by enforcing the validity of scientific knowledge within its own limits.

BIBLIOGRAPHY

TRANSLATIONS

There are two accessible translations of the *Critique of Pure Reason* — Meiklejohn (Bell & Co.) and Max Müller (Macmillan).

Kant’s ethical writings have been translated by Abbott (Longmans).

There is a translation of the *Critique of Pure Reason* by Bernard (Macmillan), and of the first part of it, the *Critique of Æsthetic Judgment*, by Meredith (Clarendon Press). This last book has introductory essays and notes.

The student beginning the study of Kant will find *Watson’s Selections from Kant* (MacLehose & Sons) useful if he cannot read the *Critiques* in full.

COMMENTARIES

The most useful small books on Kant are Adamson, *The Philosophy of Kant* (Blackwood), and Watson, *The Philosophy of Kant Explained* (MacLehose). The best and most thorough work on Kant in English is Caird, *The Critical Philosophy of Kant*, 2 vols. (MacLehose).

IMMANUEL KANT by Elbert Hubbard

From ‘Little Journeys to the Homes of Great Philosophers’

The canons of scientific evidence justify us neither in accepting nor rejecting the ideas upon which morality and religion repose. Both parties to the dispute beat the air; they worry their own shadow; for they pass from Nature into the domain of speculation, where their dogmatic grips find nothing to lay hold upon. The shadows which they hew to pieces grow together in a moment like the heroes in Valhalla, to rejoice again in bloodless battles. Metaphysics can no longer claim to be the cornerstone of religion and morality. But if she can not be the Atlas that bears the moral world she can furnish a magic defense. Around the ideas of religion she throws her bulwark of invisibility; and the sword of the skeptic and the battering-ram of the materialist fall harmless on vacuity.

We find that most men fit easily into types. You describe to me one Durham cow and you picture all Durham cows. So it is with men: they belong to breeds, which we politely call denominations, sects or parties. Tell me the man’s sect, and I know his dress, his habit of life, his thought. His dress is the uniform of his party, and his thought is that which is ordered and prescribed. Dull indeed is the intellect which can not correctly prophesy the opinions to which this man will arrive on any subject.

Durham cows are not exactly alike, I well know, but a trifle more length of leg, a variation in color, or an off-angle of the horn, and that cow is forever barred from exhibition as a Durham. She is fit only for beef, and the first butcher that makes a bid takes her, hide and horns.

Members of sects do not think exactly alike, but there are well-defined limits of thought and action, beyond which they dare not stray lest the butcher bag them. In joining a sect they have given bonds to uniformity, and have signed their willingness to think and act like all other members of the sect.

Herbert Spencer deals with this “jiner” propensity in man, and describes it as a manifestation of the herding instinct in animals. It is a combination for mutual protection — a social contract, each one waiving a part of his personality in order to secure a supposed benefit. A herd of cattle can stand against a pack of wolves, but a cow alone is doomed.

Few men indeed can stand against the pack. Wise are the many who seek safety in numbers! Think of those who have stood out alone and expressed their individuality, and you count on your fingers God’s patriots dead and turned to dust.

The paradox of things is shown in that the entrenched many, having found safety in aggregation, pay their debt of homage to the bold few who lived their lives and paid the penalty by death.

Across the disk of existence, each decade, there glide five hundred million souls, and disappear forever in the dim and dusk of the eternity that lies behind. Out of the bare handful that are remembered, we cherish only the memories of those who stood alone and expressed their honest, inmost thought. And this thought is, always and forever, the thought of liberty. Exile, ostracism, death, have been their fate, and on the smoke of martyr-fires their souls mounted to immortality.

Future generations often confuse these men with Deity, the Maker of the Worlds. And thus do we arrive at truth by indirection, for in very fact these were the Sons of God, vitalized by Divinity, part and parcel of the Power that guides the planets on their way and holds the worlds in space. Upon their tombs we carve a single word: *Savior*.

Kant was sixty years old before he was known to any extent beyond his native town; but so fast then did his fame travel that at his death it was recognized that the greatest thinker of the world had passed away.

Kant founded no school; but Fichte, Schelling, Hegel, Herde and Schopenhauer were all his children — and all but Schopenhauer showed their humanity by denouncing him, for men are prone to revile that which has benefited them most. Kant marks an epoch and all thinkers who came after him are his debtors. His philosophy has passed into the current coin of knowledge.

Kant's lifelong researches revolve around four propositions:

1. Who am I?
2. What am I?
3. What can I do?
4. What can I know?

The answer to Number Four is that I can not know anything. That is to say, the wise man is the man who knows that he does not know. And this disposes of Number One and Number Two, leaving only Number Three for our consideration. It took, however, a good many years and a vast amount of study and writing for Kant to thus simplify. For years he toiled with algebraic formulas and syllogistic theorems before he concluded that the best wisdom of life lies in simplification, not complexity.

"What can I do?" resolves itself into, "What must I do?" And the answer is: You must do four things in order to retain your place as a normal being upon this earth: eat, work, associate with your kind, rest. Just four things we must do, and outside of this everything is incidental, accidental, irrelevant and inconsequential. Then how to eat, work, associate and rest wisely and best constitutes life. Every man should be free to work out these four equations for himself, his freedom ending where another man's rights begin. To these four questions we should bring our highest reason, our ripest experience and our best endeavor. As for himself we know that Kant made a schedule of life which evolved a sickly boy into a reasonably strong man who banished pain, sorrow and regret from his existence and lived a long life of deep, quiet satisfaction, sane to the end, watching every symptom of approaching dissolution with keen interest, and at the last passing into quiet sleep, his spirit gliding peacefully away, perhaps to answer those two great questions which he said were unanswerable here: "Who am I?" "What am I?"

Immanuel Kant was born in Seventeen Hundred Twenty-four at the City of Konigsberg, in the northeastern corner of Prussia. There he received his education; there he was a teacher for nearly half a century; and there, in his eightieth year, he died. He was never out of East Prussia and never journeyed sixty miles from his birthplace during his whole life. Professor Josiah Royce of Harvard, himself in the sage business, and perhaps the best example that America has produced of the pure type of philosopher, says, "Kant is the only modern thinker who in point of originality is worthy to be ranked with Plato and Aristotle." Like Emerson, Kant regarded traveling as a fool's paradise; only Emerson had to travel much before he found it out, while Kant gained the truth by staying at home. Once a lady took him for a carriage ride, and on learning from the footman that they were seven miles from home he was so displeased that he refused to utter a single orphic on the way back; and further, the story is that he never after entered a vehicle, and living for thirty years was never again so far from the lodging he called home.

In his lectures on physical geography Kant would often describe mountains, rivers, waterfalls, volcanoes, with great animation and accuracy, yet he had never seen any of these. Once a friend offered to take him to Switzerland, so he could actually see the mountains; but he warmly declined, declaring that the man who was not satisfied until he could touch, taste and see was small, mean and quibbling as was Thomas, the doubting disciple. Moreover, he had samples of the strata of the Alps, and this was enough, which reminds us of the man who had a house for sale and offered to send a prospective purchaser a sample brick.

Mind was the great miracle to Kant — the ability to know all about a thing by seeing it with your

inward eye. “The Imagination hath a stage within the brain upon which all scenes are played,” and the play to Kant was greater than the reality. Or, to use his own words: “Time and Space have no existence apart from Mind. There is no such thing as Sound unless there be an ear to receive the vibrations. Things and places, matter and substance come under the same law, and exist only as mind creates them.”

The parents of Kant were very lowly people. His father was a day laborer — a leather-cutter who never achieved even to the honors and emoluments of a saddler. There were seven children in the family, and never a servant crossed the threshold. One daughter survived Immanuel, and in her eighty-fourth year she expressed regrets that her brother had proved so recreant to the teachings of his parents as practically to alienate him from all his relatives. One brother became a Lutheran minister and lived out an honored career; the others vanish and fade away into the mist of forgetfulness.

So far as we know, all the children were strong and well except this one. At birth he weighed but five pounds, and his weakness was pitiable. He was the kind of child the Spartans used to make way with quickly, for the good of the State. He had a big, bulging head, thin legs, a weak chest, and one shoulder was so much higher than the other that it amounted almost to a deformity.

As the years went by, the parents saw he was not big enough to work, but hope was not dead — they would make a preacher of him! To this end he was sent to the “Fredericianium,” a graded school of no mean quality. The master of this school was a worthy clergyman by the name of Schultz, who was attracted to the Kant boy, it seems, on account of his insignificant size. It was the affection of the shepherd for the friendless ewe lamb. A little later the teacher began to love the boy for his big head and the thoughts he worked out of it. Brawn is bought with a price — young men who bank on it get it as legal tender. Those who have no brawn have to rely on brain or go without honors. Immanuel Kant began to ask his school-teacher questions that made the good man laugh.

At sixteen Kant entered Albertina University. And there he was to remain his entire life — student, tutor, teacher, professor.

He must have been an efficient youth, for before he was eighteen he realized that the best way to learn is to teach. The idea of becoming a clergyman was at first strong upon him; and Pastor Schultz occasionally sent the youth out to preach, or lead religious services in rural districts. This embryo preacher had a habit of placing a box behind the pulpit and standing on it while preaching. Then we find him reasoning the matter out in this way: “I stand on a box to preach so as to impress the people by my height or to conceal my insignificant size. This is pretense and a desire to carry out the idea that the preacher is bigger every way than common people. I talk with God in pretended prayer, and this looks as if I were on easy and familiar terms with Deity. Is it like those folks who claim to be on friendly terms with princes: If I do not know anything about God, why should I pretend I do?”

This desire to be absolutely honest with himself gradually grew until he informed the Pastor that he had better secure young men for preachers who could impress people without standing on a box. As for himself, he would impress people by the size of his head, if he impressed them at all. Let it here be noted that Kant then weighed exactly one hundred pounds, and was less than five feet high. His head measured twenty-four inches around, and fifteen and one-half inches over “firmness” from the opening of the ears. To put it another way, he wore a seven-and-a-half hat.

It is a great thing for a man to pride himself on what he is and make the best of it. The pride of craftsman betokens a valuable man. We exaggerate our worth, and this is Nature’s plan to get the thing done.

Kant’s pride of intellect, in degree, came from his insignificant form, and thus do all things work together for good. But this bony little form was often full of pain, and he had headaches, which led a wit to say, “If a head like yours aches, it must be worse than to be a giraffe and have a sore throat.”

Young Kant began to realize that to have a big head, and get the right use from it, one must have vital

power enough to feed it.

The brain is the engine — the lungs and digestive apparatus the boiler. Thought is combustion.

Young Kant, the uncouth, became possessed of an idea that made him the butt of many gibes and jeers. He thought that if he could breathe enough, he would be able to think clearly, and headaches would be gone. Life, he said, was a matter of breathing, and all men died from one cause — a shortness of breath. In order to think clearly, you must breathe.

We believe things first and prove them later; our belief is usually right, when derived from experience, but the reasons we give are often wrong. For instance, Kant cured his physical ills by going out of doors, and breathing deeply and slowly with closed mouth. Gradually his health began to improve. But the young man, not knowing at that time much about physiology, wrote a paper proving that the benefit came from the fresh air that circulated through his brain. And of course in one sense he was right. He related the incident of this thesis many years after in a lecture, to show the result of right action and wrong reasoning.

The doctors had advised Kant he must quit study, but when he took up his breathing fad, he renounced the doctors, and later denounced them. If he were going to die, he would die without the benefit of either the clergy or the physicians.

He denied that he was sick, and at night would roll himself in his blankets and repeat half-aloud, "How comfortable I am, how comfortable I am," until he fell asleep.

Near his house ran a narrow street, just a half-mile long. He walked this street up and back, with closed mouth, breathing deeply, waving a rattan cane to ward away talkative neighbors, and to keep up the circulation in his arms. Once and back — in a month he had increased this to twice and back. In a year he had come to the conclusion that to walk the length of that street eight times was the right and proper thing — that is to say, four miles in all. In other words, he had found out how much exercise he required — not too much or too little. At exactly half-past three he came out of his lodging, wearing his cocked hat and long, snuff-colored coat, and walked. The neighbors used to set their clocks by him. He walked and breathed with closed mouth, and no one dare accost him or walk with him. The hour was sacred and must not be broken in upon: it was his holy time — his time of breathing.

The little street is there now — one of the sights of Konigsberg, and the cab-drivers point it out as the Philosopher's Walk. And Kant walked that little street eight times every afternoon from the day he was twenty to within a year of his death, when eighty years old.

This walking and breathing habit physiologists now recognize as eminently scientific, and there is no sensible physician but will endorse Kant's wisdom in renouncing doctors and adopting a regimen of his own. The thing you believe in will probably benefit you — faith is hygienic.

The persistency of the little man's character is shown in the breathing habit — he believed in himself, relied on himself, and that which experience commended, he did.

This firmness in following his own ideas saved his life. When we think of one born in obscurity, living in poverty, handicapped by pain, weakness and deformity; never traveling; and then by sheer persistency and force of will rising to the first place among thinking men of his time, one is almost willing to accept Kant's dictum, "Mind is supreme, and the Universe is but the reflected thought of God."

Kant was great enough to doubt appearances and distrust popular conclusions. He knew that fallacies of reasoning follow fast upon actions — reason follows by slow freight. It is quite necessary that we should believe in a Supreme Power, but quite irrelevant that we should prove it.

Truth for the most part is unpopular, and the proof of this statement lies in the fact that it is so seldom told. Preachers tell people what they wish to hear, and indeed this must be so as long as the congregation that hears the preaching pays for it. People will not pay for anything they do not like. Hence, preaching leads naturally to sophistication and hypocrisy, and the promise of endless bliss for ourselves and a hell for our enemies comes about as a matter of course. What men will listen to and pay for is the real science

of theology. That is to say, the science of theology is the science of manipulating men. Success in theology consists in finding a fallacy that is palatable and then banking on it. Again and again Kant points out that a clergyman's advice is usually worthless, because pure truth is out of his province — unaccustomed, undesirable, inexpedient.

And Kant thought this was true also of doctors — doctors care more about pleasing their patients than telling them truth. "In fact," he said, "no doctor with a family to support can afford to tell his patients that his symptoms are no token of a disease — rather uncomfortable feelings are proof of health, for dead men don't have them." Most of the aches, pains and so-called irregularities are remedial moves on the part of Nature to keep the man well. Kant says that doctors treat symptoms, not diseases, and often the treatment causes the disease; so no man can tell what proportion of diseases is caused by medicine and what by other forms of applied ignorance.

As for lawyers, our little philosopher considered them, for the most part, sharks and wreckers. A lawyer looks over an estate, not with the idea of keeping it intact, but of dissolving it, and getting a part of it for himself. Not that men prefer to do what is wrong, but self-interest can always produce sufficient reasons to satisfy the conscience. Lawyers, being attaches of courts of justice, regard themselves as protectors of the people, when really they are the plunderers of the people, and their business is quite as much to defeat justice as to administer it. The evasion of law is as truly a lawyer's work as compliance with law. Then our philosopher explains that if law and justice were synonymous, this state of affairs would be most deplorable; but as it is, no particular harm is worked, save in the moral degradation of the lawyers. The connivance of lawyers tames the rank injustices of law; hence, to a degree, we live in a land where there is neither law nor justice — save such justice as can be appropriated by the man who is diplomat enough to do without lawyers and wise enough to have no property. Justice, however, to Kant is a very uncertain quantity, and he is rather inclined to regard the idea that men are able to administer justice as on a par with the assumption of the priest that he is dealing with God.

Kant once said, "When a woman demands justice, she means revenge."

A pupil here interposed, and asked the master if this was not equally true of men, and the answer was, "I accept the amendment — it certainly is true of all men I ever saw in courtrooms."

"Does death end all?"

"No," said Kant; "there is the litigation over the estate."

Kant's constant reiteration that he had no use for doctors, lawyers and preachers, we can well imagine did not add to his popularity. As for his reasoning concerning lawyers, we can all, probably, recall a few jug-shaped attorneys who fill the Kant requirements — takers of contingent fees and stirrers-up of strife: men who watch for vessels on the rocks and lure with false lights the mariner to his doom. But matters since Kant's day have changed considerably for the better. There is a demand now for a lawyer who is a businessman and who will keep people out of trouble instead of getting them in. And we also have a few physicians who are big enough to tell a man there is nothing the matter with him, if they think so, and then charge him accordingly — in inverse ratio to the amount of medicine administered.

And while we no longer refer to the clergyman as our spiritual adviser, except, perhaps, in way of pleasantry, he surely is useful as a social promoter.

The parents of Kant were Lutherans — punctilious and pious. They were descended from Scotch soldiers who had come over there two hundred years before and settled down after the war, just as the Hessians settled down and went to farming in Pennsylvania, their descendants occasionally becoming Daughters of the Revolution, because their grandsires fought with Washington.

This Scotch strain gave a sturdy bias to the Kants — these Lutherans were really rebels, and as every one knows, there are only two ways of dealing with a religious Scotchman — agree with him or kill him.

Most people said that Kant was supremely stubborn — he himself called it "firmness in the right."

Once, when a couple of calumniators were thinking up all the bad things they could say about him, one of them exclaimed, “He isn’t five feet high!”

“Liar!” came the shrill voice of the Philosopher, who had accidentally overheard them, “Liar! I am exactly five feet!” And he drew himself up, and struck his staff proudly and defiantly on the ground.

Which reminds one of the story told of Professor Josiah Royce, who once rang up six fares on the register when he wished to stop a Boston street-car. When the conductor protested, the philosopher called him “up-start,” “curmudgeon” and “nincompoop,” and showed the fallacy of his claim that thirty cents had been lost, since nobody had found it. Moreover, he offered to prove his proposition by algebraic equation, if one of the gentlemen present had chalk and blackboard on his person.

Once Kant was looking at the flowers in a beautiful garden. But instead of looking through the iron pickets, he stooped over and was squinting through the key-hole of the lock. A student coming along asked him why he didn’t look through the pickets and thus get a perfect view.

“Go on, you fool,” was the stern reply; “I am studying the law of optics — the unobstructed vision reveals too much — the vivid view is only gotten through a small aperture.”

All of which was believed to be a sudden inspiration in way of reply that came to the great professor when caught doing an absent-minded thing. That Kant was not above a little pious prevarication is shown by a story he himself tells. He was never inside of a church once during the last fifty years of his life. But when he became Chancellor of the University, one of his duties was to lead a procession to the Cathedral, where certain formal religious services were held. Kant tried to have the exercises in a hall, but failing in this, he did his duty, and marched like a pigmy drum-major at the head of the cavalcade.

“Now he will have to go in,” the scoffers said.

But he didn’t. Arriving at the church-door, he excused himself, pleading an urgent necessity, walked around to the back of the church, sacrificed, like Diogenes, to all the gods at once, and made off for home, quietly chuckling to himself at the thought of how he had circumvented the enemy.

Every actor has just so many make-ups and no more. Usually the characters he assumes are variations of a single one. Steele Mackaye used to say, “There are only five distinct dramatic situations.” The artist, too, has his properties. And the recognition of this truth caused Massillon to say, “The great preacher has but one sermon, yet out of this he makes many — by giving portions of it backwards, or beginning in the middle and working both ways, or presenting patchwork pieces, tinted and colored by his mood.” All public speakers have canned goods they fall back upon when the fresh fruit of thought grows scarce.

The literary man also has his puppets, pet phrases, and situations to his liking. Victor Hugo always catches the attention by a blind girl, a hunchback, a hunted convict or some mutilated and maimed unfortunate.

In his lectures, Kant used to please the boys by such phrases as this, “I dearly love the muse, although I must admit that I have never been the recipient of any of her favors.” This took so well that later he was encouraged to say, “The Old Metaphysics is positively unattractive, but the New Metaphysics is to me most lovely, although I can not boast that I have ever been honored by any of her favors.”

A large audience caused Kant to lose his poise — he became self-conscious — but in his own little lecture-room, with a dozen, or fifty at the most (because this was the capacity of the room), he was charming. He would fix his eye on a single boy, and often upon a single button on this boy’s coat, and forgetting the immediate theme in hand, would ramble into an amusing and most instructive monolog of criticism concerning politics, pedagogy or current events. In his writing he was exact, heavy and complex, but in these heart-to-heart talks, Herder, who attended Kant’s lectures for five years, says, “The man had a deal of nimble wit, and here Kant was at his best.”

So we have two different men — the man who wrote the “Critique” and the man who gave the lectures and clarified his thought by explaining things to others. It was in the lectures that he threw off this: “Men are creatures that can not do without their kind, yet are sure to quarrel when together.” This took fairly

well, and later he said, “Men can not do without men, yet they hate each other when together.” And in a year after, comes this: “A man is miserable without a wife, and is seldom happy after he gets one.” No doubt this caused a shout of applause from the students, college boys being always on the lookout for just such things; and coming from a very confirmed old bachelor it was peculiarly fetching.

To say that Kant was devoid of wit, as many writers do, is not to know the man. About a year after the “Critique of Pure Reason” appeared, he wrote this: “I am obliged to the learned public for the silence with which it has honored my book, as this silence means a suspension of judgment and a wise determination not to voice a premature opinion.” He knew perfectly well that the “learned public” had not read his book, and moreover, could not, intelligently, and the silence betokened simply a stupid lack of interest. Moreover, he knew there was no such thing as a learned public. Kant’s remark reveals a keen wit, and it also reveals something more — the pique of the unappreciated author who declares he doesn’t care what the public thinks of him, and thereby reveals the fact that he does.

Here are a couple of remarks that could only have been made in the reign of Frederick the Great, and under the spell of a college lecture: “The statement that man is the noblest work of God was never made by anybody but man, and must therefore be taken ‘cum grano salis.’” “We are told that God said He made man in His own image, but the remark was probably ironical.”

Schopenhauer says: “The chief jewel in the crown of Frederick the Great is Immanuel Kant. Such a man as Kant could not have held a salaried position under any other monarch on the globe at that time and have expressed the things that Kant did. A little earlier or a little later, and there would have been no such person as Immanuel Kant. Rulers are seldom big men, but if they are big enough to recognize and encourage big men, they deserve the gratitude of mankind!”

THE LAST DAYS OF IMMANUEL KANT by Thomas De Quincey

I take it for granted that every person of education will acknowledge some interest in the personal history of Immanuel Kant. A great man, though in an unpopular path, must always be an object of liberal curiosity. To suppose a reader thoroughly indifferent to Kant, is to suppose him thoroughly unintellectual; and, therefore, though in reality he should happen *not* to regard him with interest, it is one of the fictions of courtesy to presume that he does. On this principle I make no apology to the reader for detaining him upon a short sketch of Kant's life and domestic habits, drawn from the authentic records of his friends and pupils. It is true, that, without any illiberality on the part of the public in this country, the *works* of Kant are not regarded with the same interest which has gathered about his *name*; and this may be attributed to three causes — first, to the language in which they are written; secondly, to the supposed obscurity of the philosophy which they teach, whether intrinsic or due to Kant's particular mode of expounding it; thirdly, to the unpopularity of all speculative philosophy, no matter how treated, in a country where the structure and tendency of society impress upon the whole activities of the nation a direction exclusively practical. But, whatever may be the immediate fortunes of his writings, no man of enlightened curiosity will regard the author himself without something of a profounder interest. Measured by one test of power, viz., by the number of books written directly for or against himself, to say nothing of those which he has indirectly modified, there is no philosophic writer whatsoever, if we except Aristotle, who can pretend to approach Kant in the extent of the influence which he has exercised over the minds of men. Such being his claims upon our notice, I repeat that it is no more than a reasonable act of respect to the reader — to presume in him so much interest about Kant as will justify a sketch of his life.

Immanuel Kant, [Footnote: By the paternal side, the family of Kant was of Scotch derivation; and hence it is that the name was written by Kant the father — *Cant*, that being a Scotch name, and still to be found in Scotland. But Immanuel, though he always cherished his Scotch descent, substituted a *K* for a *C*, in order to adapt it better to the analogies of the German language.] the second of six children, was born at Königsberg, in Prussia, a city at that time containing about fifty thousand inhabitants, on the 22d of April, 1724. His parents were people of humble rank, and not rich even for their own station, but able (with some assistance from a near relative, and a trifle in addition from a gentleman, who esteemed them for their piety and domestic virtues,) to give their son Immanuel a liberal education. He was sent when a child to a charity school; and, in the year 1732, removed to the Royal (or Frederician) Academy. Here he studied the Greek and Latin classics, and formed an intimacy with one of his schoolfellows, David Ruhnken, (afterwards so well known to scholars under his Latin name of Ruhn-kenius,) which lasted until the death of the latter. In 1737, Kant lost his mother, a woman of excellent character, and of accomplishments and knowledge beyond her rank, who contributed to the future eminence of her illustrious son by the direction which she gave to his youthful thoughts, and by the elevated morals to which she trained him. Kant never spoke of her to the end of his life without the utmost tenderness, and acknowledgment of his great obligations to her maternal care. In 1740, at Michælmas, he entered the University of Königsberg. In 1746, when about twenty-two years old, he printed his first work, upon a question partly mathematical and partly philosophic, viz., the valuation of living forces. The question had been first moved by Leibnitz, in opposition to the Cartesians, and was here finally settled, after having occupied most of the great mathematicians of Europe for more than half a century. It was dedicated to the King of Prussia, but never reached him — having, in fact, never been published. [Footnote: To this circumstance we must attribute its being so little known amongst the philosophers and mathematicians of foreign countries, and also the fact that D'Alembert, whose philosophy was miserably below his mathematics, many years afterwards still continued to represent the dispute as a verbal one.] From this

time until 1770, he supported himself as a private tutor in different families, or by giving private lectures in Königsberg, especially to military men on the art of fortification. In 1770, he was appointed to the Chair of Mathematics, which he exchanged soon after for that of Logic and Metaphysics. On this occasion, he delivered an inaugural disputation — [*De Mundi Sensibilis atque Intelligibilis Forma et Principiis*] — which is remarkable for containing the first germs of the Transcendental Philosophy. In 1781, he published his great work, the *Critik der Reinen Vernunft*, or *Investigation of the Pure Reason*. On February 12, 1804, he died.

These are the great epochs of Kant's life. But his was a life remarkable not so much for its incidents, as for the purity and philosophic dignity of its daily tenor; and of this the best impression will be obtained from Wasianski's account of his last years, checked and supported by the collateral testimonies of Jachmann, Rink, Borowski, and other biographers. We see him here struggling with the misery of decaying faculties, and with the pain, depression, and agitation of two different complaints, one affecting his stomach, and the other his head; over all which the benignity and nobility of his mind are seen victoriously eminent to the last. The principal defect of this and all other memoirs of Kant is, that they report too little of his conversation and opinions. And perhaps the reader will be disposed to complain, that some of the notices are too minute and circumstantial, so as to be at one time undignified, and at another unfeeling. As to the first objection, it may be answered, that biographical gossip of this sort, and ungentlemanly scrutiny into a man's private life, though not what a man of honor would choose to write, may be read without blame; and, where a great man is the subject, sometimes with advantage. With respect to the other objection, I know not how to excuse Mr. Wasianski for kneeling at the bed-side of his dying friend, to record, with the accuracy of a short-hand reporter, the last flutter of his pulse and the struggles of expiring nature, except by supposing that the idea of Kant, as a person belonging to all ages, in his mind transcended and extinguished the ordinary restraints of human sensibility, and that, under this impression, he gave *that* to his sense of a public duty which, it may be hoped, he would willingly have declined on the impulse of his private affections.

The following paper on The Last Days of Kant, is gathered from the German of Wasianski, Jachmann, Borowski, and others.

My knowledge of Professor Kant began long before the period to which this little memorial of him chiefly refers. In the year 1773, or 1774, I cannot exactly remember which, I attended his lectures. Afterwards, I acted as his amanuensis; and in that office was naturally brought into a closer connection with him than any other of his pupils; so that, without any request on my part, he granted me a general privilege of free admission to his class-room. In 1780 I took orders, and withdrew myself from all connection with the university. I still continued, however, to reside in Königsberg; but wholly forgotten, or wholly unnoticed at least, by Kant. Ten years afterwards, (that is to say, in 1790,) I met him by accident at a party given on occasion of the marriage of one of the professors. At table, Kant distributed his conversation and attentions pretty generally; but after the entertainment, when the company broke up into parties, he came and seated himself very obligingly by my side. I was at that time a florist — an amateur, I mean, from the passion I had for flowers; upon learning which, he talked of my favorite pursuit, and with very extensive information. In the course of our conversation, I was surprised to find that he was perfectly acquainted with all the circumstances of my situation. He reminded me of our previous connection; expressed his satisfaction at finding that I was happy; and was so good as to desire that, if my engagements allowed me, I would now and then come and dine with him. Soon after this, he rose to take his leave; and, as our road lay the same way, he proposed to me that I should accompany him home. I did so, and received an invitation for the next week, with a general invitation for every week after, and permission to name my own day. At first I was unable to explain the distinction with which Kant had treated me; and I conjectured that some obliging friend had spoken of me in his hearing, somewhat more advantageously than I could pretend to deserve; but more intimate experience has convinced me that he

was in the habit of making continual inquiries after the welfare of his former pupils, and was heartily rejoiced to hear of their prosperity. So that it appeared I was wrong in thinking he had forgotten me.

This revival of my intimacy with Professor Kant, coincided pretty nearly, in point of time, with a complete change in his domestic arrangements. Up to this period it had been his custom to eat at a *table d'hôte*. But he now began to keep house himself, and every day invited two friends to dine with him, and upon any little festival from five to eight; for he was a punctual observer of Lord Chesterfield's rule — that his dinner party, himself included, should not fall below the number of the Graces — nor exceed that of the Muses. In the whole economy of his household arrangements, and especially of his dinner parties, there was something peculiar and amusingly opposed to the usual conventional restraints of society; not, however, that there was any neglect of decorum, such as sometimes occurs in houses where there are no ladies to impress a better tone upon the manners. The invariable routine was this: The moment that dinner was ready, Lampe, the professor's old footman, stepped into the study with a certain measured air, and announced it. This summons was obeyed at the pace of double quick time — Kant talking all the way to the eating-room about the state of the weather [Footnote: His reason for which was, that he considered the weather one of the principal forces which act upon the health; and his own frame was exquisitely sensible to all atmospheric influences.] — a subject which he usually pursued during the earlier part of the dinner. Graver themes, such as the political events of the day, were never introduced before dinner, or at all in his study. The moment that Kant had taken his seat, and unfolded his napkin, he opened the business of dinner with a particular formula— '*Now, then, gentlemen!*' and the tone and air with which he uttered these words, proclaimed, in a way which nobody could mistake, relaxation from the toils of the morning, and determinate abandonment of himself to social enjoyment. The table was hospitably spread; three dishes, wine, &c., with a small second course, composed the dinner. Every person helped himself; and all delays of ceremony were so disagreeable to Kant, that he seldom failed to express his displeasure with anything of that sort, though not angrily. He was displeased also if people ate little; and treated it as affectation. The first man to help himself was in his eyes the politest guest; for so much the sooner came his own turn. For this hatred of delay, Kant had a special excuse, having always worked hard from an early hour in the morning, and eaten nothing until dinner. Hence it was, that in the latter period of his life, though less perhaps from actual hunger than from some uneasy sensation of habit or periodical irritation of stomach, he could hardly wait with patience for the arrival of the last person invited.

There was no friend of Kant's but considered the day on which he was to dine with him as a day of pleasure. Without giving himself the air of an instructor, Kant really was so in the very highest degree. The whole entertainment was seasoned with the overflow of his enlightened mind, poured out naturally and unaffectedly upon every topic, as the chances of conversation suggested it; and the time flew rapidly away, from one o'clock to four, five, or even later, profitably and delightfully. Kant tolerated no *calms*, which was the name he gave to the momentary pauses in conversation, or periods when its animation languished. Some means or other he always devised for restoring its tone of interest, in which he was much assisted by the tact with which he drew from every guest his peculiar tastes, or the particular direction of his pursuits; and on these, be they what they might, he was never unprepared to speak with knowledge, and the interest of an original observer. The local affairs of Königsberg must have been interesting indeed, before they could be allowed to occupy the attention at *his* table. And, what may seem still more singular, it was rarely or never that he directed the conversation to any branch of the philosophy founded by himself. Indeed he was perfectly free from the fault which besets so many *savans* and *literati*, of intolerance towards those whose pursuits had disqualified them for any particular sympathy with his own. His style of conversation was popular in the highest degree, and unscholastic; so much so, that any stranger who should have studied his works, and been unacquainted with his person, would have found it difficult to believe, that in this delightful companion he saw the profound author of the Transcendental Philosophy.

The subjects of conversation at Kant's table were drawn chiefly from natural philosophy, chemistry, meteorology, natural history, and above all, from politics. The news of the day, as reported in the public journals, was discussed with a peculiar vigilance of examination. With regard to any narrative that wanted dates of time and place, however otherwise plausible, he was uniformly an inexorable sceptic, and held it unworthy of repetition. So keen was his penetration into the interior of political events, and the secret policy under which they moved, that he talked rather with the authority of a diplomatic person who had access to cabinet intelligence, than as a simple spectator of the great scenes which were unfolding in Europe. At the time of the French Revolution, he threw out many conjectures, and what were then accounted paradoxical anticipations, especially in regard to military operations, which were as punctually fulfilled as his own memorable conjecture in regard to the hiatus in the planetary system between Mars and Jupiter,[Footnote: To which the author should have added — and in regard to the hiatus between the planetary and cometary systems, which was pointed out by Kant several years before his conjecture was established by the good telescope of Dr. Herschel. Vesta and Juno, further confirmations of Kant's conjecture, were discovered in June 1804, when Wasianski wrote.] the entire confirmation of which he lived to witness on the discovery of Ceres by Piazzi, in Palermo, and of Pallas, by Dr. Olbers, at Bremen. These two discoveries, by the way, impressed him much; and they furnished a topic on which he always talked with pleasure; though, according to his usual modesty, he never said a word of his own sagacity in having upon *à priori* grounds shown the probability of such discoveries many years before.

It was not only in the character of a companion that Kant shone, but also as a most courteous and liberal host, who had no greater pleasure than in seeing his guests happy and jovial, and rising with exhilarated spirits from the mixed pleasures — intellectual and liberally sensual — of his Platonic banquets. Chiefly, perhaps, with a view to the sustaining of this tone of genial hilarity, he showed himself somewhat of an artist in the composition of his dinner parties. Two rules there were which he obviously observed, and I may say invariably: the first was, that the company should be miscellaneous; this for the sake of securing sufficient variety to the conversation: and accordingly his parties presented as much variety as the world of Königsberg afforded, being drawn from all the modes of life, men in office, professors, physicians, clergymen, and enlightened merchants. His second rule was, to have a due balance of *young* men, frequently of *very* young men, selected from the students of the university, in order to impress a movement of gaiety and juvenile playfulness on the conversation; an additional motive for which, as I have reason to believe, was, that in this way he withdrew his mind from the sadness which sometimes overshadowed it, for the early deaths of some young friends whom he loved.

And this leads me to mention a singular feature in Kant's way of expressing his sympathy with his friends in sickness. So long as the danger was imminent, he testified a restless anxiety, made perpetual inquiries, waited with patience for the crisis, and sometimes could not pursue his customary labors from agitation of mind. But no sooner was the patient's death announced, than he recovered his composure, and assumed an air of stern tranquillity — almost of indifference. The reason was, that he viewed life in general, and therefore, that particular affection of life which we call sickness, as a state of oscillation and perpetual change, between which and the fluctuating sympathies of hope and fear, there was a natural proportion that justified them to the reason; whereas death, as a permanent state that admitted of no *more* or *less*, that terminated all anxiety, and for ever extinguished the agitation of suspense, he would not allow to be fitted to any state of feeling, but one of the same enduring and unchanging character. However, all this philosophic heroism gave way on one occasion; for many persons will remember the tumultuous grief which he manifested upon the death of Mr. Ehrenboth, a young man of very fine understanding and extensive attainments, for whom he had the greatest affection. And naturally it happened, in so long a life as his, in spite of his provident rule for selecting his social companions as much as possible amongst the young, that he had to mourn for many a heavy loss that could never be supplied to him.

To return, however, to the course of his day, immediately after the termination of his dinner party, Kant

walked out for exercise; but on this occasion he never took any companion, partly, perhaps, because he thought it right, after so much convivial and colloquial relaxation, to pursue his meditations,[Footnote: Mr. Wasianski is wrong. To pursue his meditations under these circumstances, might perhaps be an inclination of Kant's to which he yielded, but not one which he would justify or erect into a maxim. He disapproved of eating alone, or *solipsismus convictorii*, as he calls it, on the principle, that a man would be apt, if not called off by the business and pleasure of a social party, to think too much or too closely, an exercise which he considered very injurious to the stomach during the first process of digestion. On the same principle he disapproved of walking or riding alone; the double exercise of thinking and bodily agitation, carried on at the same time, being likely, as he conceived, to press too hard upon the stomach.] and partly (as I happen to know) for a very peculiar reason, viz., that he wished to breathe exclusively through his nostrils, which he could not do if he were obliged continually to open his mouth in conversation. His reason for this was, that the atmospheric air, being thus carried round by a longer circuit, and reaching the lungs, therefore, in a state of less rawness, and at a temperature somewhat higher, would be less apt to irritate them. By a steady perseverance in this practice, which he constantly recommended to his friends, he flattered himself with a long immunity from coughs, colds, hoarseness, and every mode of defluxion; and the fact really was, that these troublesome affections attacked him very rarely. Indeed I myself, by only occasionally adopting his rule, have found my chest not so liable as formerly to such attacks.

At six o'clock he sat down to his library table, which was a plain ordinary piece of furniture, and read till dusk. During this period of dubious light, so friendly to thought, he rested in tranquil meditation on what he had been reading, provided the book were worth it; if not, he sketched his lecture for the next day, or some part of any book he might then be composing. During this state of repose he took his station winter and summer by the stove, looking through the window at the old tower of Lobenicht; not that he could be said properly to see it, but the tower rested upon his eye, — obscurely, or but half revealed to his consciousness. No words seemed forcible enough to express his sense of the gratification which he derived from this old tower, when seen under these circumstances of twilight and quiet reverie. The sequel, indeed, showed how important it was to his comfort; for at length some poplars in a neighboring garden shot up to such a height as to obscure the tower, upon which Kant became very uneasy and restless, and at length found himself positively unable to pursue his evening meditations. Fortunately, the proprietor of the garden was a very considerate and obliging person, who had, besides, a high regard for Kant; and, accordingly, upon a representation of the case being made to him, he gave orders that the poplars should be cropped. This was done, the old tower of Lobenicht was again unveiled, and Kant recovered his equanimity, and pursued his twilight meditations as before.

After the candles were brought, Kant prosecuted his studies till nearly ten o'clock. A quarter of an hour before retiring for the night, he withdrew his mind as much as possible from every class of thoughts which demanded any exertion or energy of attention, on the principle, that by stimulating and exciting him too much, such thoughts would be apt to cause wakefulness; and the slightest interference with his customary hour of falling asleep, was in the highest degree unpleasant to him. Happily, this was with him a very rare occurrence. He undressed himself without his servant's assistance, but in such an order, and with such a Roman regard to decorum and the *to prepon*, that he was always ready at a moment's warning to make his appearance without embarrassment to himself or to others. This done, he lay down on a mattress, and wrapped himself up in a quilt, which in summer was always of cotton, — in autumn, of wool; at the setting-in of winter he used both — and against very severe cold, he protected himself by one of eider-down, of which the part which covered his shoulders was not stuffed with feathers, but padded, or rather wadded closely with layers of wool. Long practice had taught him a very dexterous mode of *nesting* himself, as it were, in the bed-clothes. First of all, he sat down on the bedside; then with an agile motion he vaulted obliquely into his lair; next he drew one corner of the bedclothes under his left shoulder, and

passing it below his back, brought it round so as to rest under his right shoulder; fourthly, by a particular *tour d'adresse*, he treated the other corner in the same way, and finally contrived to roll it round his whole person. Thus swathed like a mummy, or (as I used to tell him) self-involved like the silk-worm in its cocoon, he awaited the approach of sleep, which generally came on immediately. For Kant's health was exquisite; not mere negative health, or the absence of pain, but a state of positive pleasurable sensation, and a genial sense of the entire possession of all his activities. Accordingly, when packed up for the night in the way I have described, he would often ejaculate to himself (as he used to tell us at dinner)— 'Is it possible to conceive a human being with more perfect health than myself?' In fact, such was the innocence of his life, and such the happy condition of his situation, that no uneasy passion ever arose to excite him — nor care to harass — nor pain to awake him. Even in the severest winter his sleeping-room was without a fire; only in his latter years he yielded so far to the entreaties of his friends as to allow of a very small one. All nursing or self-indulgence found no quarter with Kant. In fact, five minutes, in the coldest weather, sufficed to supersede the first chill of the bed, by the diffusion of a general glow over his person. If he had any occasion to leave his room in the night-time, (for it was always kept dark day and night, summer and winter,) he guided himself by a rope, which was duly attached to his bed-post every night, and carried into the adjoining apartment.

Kant never perspired, [Footnote: This appears less extraordinary, considering the description of Kant's person, given originally by Reichardt, about eight years after his death. 'Kant,' says this writer, 'was drier than dust both in body and mind. His person was small; and possibly a more meagre, arid, parched anatomy of a man, has not appeared upon this earth. The upper part of his face was grand; forehead lofty and serene, nose elegantly turned, eyes brilliant and penetrating; but below it expressed powerfully the coarsest sensuality, which in him displayed itself by immoderate addiction to eating and drinking.' This last feature of his temperament is here expressed much too harshly.] night or day. Yet it was astonishing how much heat he supported habitually in his study, and in fact was not easy if it wanted but one degree of this heat. Seventy-five degrees of Fahrenheit was the invariable temperature of this room in which he chiefly lived; and if it fell below that point, no matter at what season of the year, he had it raised artificially to the usual standard. In the heats of summer he went thinly dressed, and invariably in silk stockings; yet, as even this dress could not always secure him against perspiring when engaged in active exercise, he had a singular remedy in reserve. Retiring to some shady place, he stood still and motionless — with the air and attitude of a person listening, or in suspense — until his usual *aridity* was restored. Even in the most sultry summer night, if the slightest trace of perspiration had sullied his night-dress, he spoke of it with emphasis, as of an accident that perfectly shocked him.

On this occasion, whilst illustrating Kant's notions of the animal economy, it may be as well to add one other particular, which is, that for fear of obstructing the circulation of the blood, he never would wear garters; yet, as he found it difficult to keep up his stockings without them, he had invented for himself a most elaborate substitute, which I shall describe. In a little pocket, somewhat smaller than a watch-pocket, but occupying pretty nearly the same situation as a watch-pocket on each thigh, there was placed a small box, something like a watch-case, but smaller; into this box was introduced a watch-spring in a wheel, round about which wheel was wound an elastic cord, for regulating the force of which there was a separate contrivance. To the two ends of this cord were attached hooks, which hooks were carried through a small aperture in the pockets, and so passing down the inner and the outer side of the thigh, caught hold of two loops which were fixed on the off side and the near side of each stocking. As might be expected, so complex an apparatus was liable, like the Ptolemaic system of the heavens, to occasional derangements; however, by good luck, I was able to apply an easy remedy to these disorders which sometimes threatened to disturb the comfort, and even the serenity, of the great man.

Precisely at five minutes before five o'clock, winter or summer, Lampe, Kant's servant, who had formerly served in the army, marched into his master's room with the air of a sentinel on duty, and cried

aloud in a military tone,— ‘Mr. Professor, the time is come.’ This summons Kant invariably obeyed without one moment’s delay, as a soldier does the word of command — never, under any circumstances, allowing himself a respite, not even under the rare accident of having passed a sleepless night. As the clock struck five, Kant was seated at the breakfast-table, where he drank what he called *one* cup of tea; and no doubt he thought it such; but the fact was, that in part from his habit of reverie, and in part also for the purpose of refreshing its warmth, he filled up his cup so often, that in general he is supposed to have drunk two, three, or some unknown number. Immediately after he smoked a pipe of tobacco, (the only one which he allowed himself through the entire day,) but so rapidly, that a pile of glowing embers remained unsmoked. During this operation he thought over his arrangements for the day, as he had done the evening before during the twilight. About seven he usually went to his lecture-room, and from that he returned to his writing-table. Precisely at three quarters before one he rose from his chair, and called aloud to the cook,— ‘It has struck three quarters.’ The meaning of which summons was this: — Immediately after taking soup, it was his constant practice to swallow what he called a dram, which consisted either of Hungarian wine, of Rhenish, of a cordial, or (in default of these) of Bishop. A flask of this was brought up by the cook on the proclamation of the three quarters. Kant hurried with it to the eating-room, poured out his *quantum*, left it standing in readiness, covered, however, with paper, to prevent its becoming vapid, and then went back to his study, and awaited the arrival of his guests, whom to the latest period of his life he never received but in full dress.

Thus we come round again to dinner, and the reader has now an accurate picture of the course of Kant’s day; the rigid monotony of which was not burthensome to him; and probably contributed, with the uniformity of his diet, and other habits of the same regularity, to lengthen his life. On this consideration, indeed, he had come to regard his health and his old age as in a great measure the product of his own exertions. He spoke of himself often under the figure of a gymnastic artist, who had continued for nearly fourscore years to support his balance upon the slack-rope of life, without once swerving to the right or to the left. In spite of every illness to which his constitutional tendencies had exposed him, he still kept his position in life triumphantly. However, he would sometimes observe sportively, that it was really absurd, and a sort of insult to the next generation for a man to live so long, because he thus interfered with the prospects of younger people.

This anxious attention to his health accounts for the great interest which he attached to all new discoveries in medicine, or to new ways of theorizing on the old ones. As a work of great pretension in both classes, he set the highest value upon the theory of the Scotch physician Brown, or (as it is usually called, from the Latin name of its author,) the Brunonian Theory. No sooner had Weikard adopted [Footnote: This theory was afterwards greatly modified in Germany; and, judging from the random glances which I throw on these subjects, I believe that in this recast it still keeps its ground in that country.] and made it known in Germany, than Kant became familiar with it. He considered it not only as a great step taken for medicine, but even for the general interests of man, and fancied that in this he saw something analogous to the course which human nature has held in still more important inquiries, viz.: first of all, a continual ascent towards the more and more elaborately complex, and then a treading back, on its own steps, towards the simple and elementary. Dr. Beddoes’s Essays, also, for producing by art and curing pulmonary consumption, and the method of Reich for curing fevers, made a powerful impression upon him; which, however, declined as those novelties (especially the last) began to sink in credit. As to Dr. Jenner’s discovery of vaccination, he was less favorably disposed to it; he apprehended dangerous consequences from the absorption of a brutal miasma into the human blood, or at least into the lymph; and at any rate he thought, that, as a guarantee against the variolous infection, it required a much longer probation. Groundless as all these views were, it was exceedingly entertaining to hear the fertility of argument and analogy which he brought forward to support them. One of the subjects which occupied him at the latter end of his life, was the theory and phenomena of galvanism, which, however, he never

satisfactorily mastered. Augustin's book upon this subject was about the last that he read, and his copy still retains on the margin his, pencil-marks of doubts, queries and suggestions.

The infirmities of age now began to steal upon Kant, and betrayed themselves in more shapes than one. Connected with Kant's prodigious memory for all things that had any intellectual bearings, he had from youth labored under an unusual weakness of this faculty in relation to the common affairs of daily life. Some remarkable instances of this are on record, from the period of his childish days; and now, when his second childhood was commencing, this infirmity increased upon him very sensibly. One of the first signs was, that he began to repeat the same stories more than once on the same day. Indeed, the decay of his memory was too palpable to escape his own notice; and, to provide against it, and secure himself from all apprehension of inflicting tedium upon his guests, he began to write a syllabus, or list of themes, for each day's conversation, on cards, or the covers of letters, or any chance scrap of paper. But these memoranda accumulated so fast upon him, and were so easily lost, or not forthcoming at the proper moment, that I prevailed on him to substitute a blank-paper book, which I had directed to be made, and which still remains, with some affecting memorials of his own conscious weakness. As often happens, however, in such cases, he had a perfect memory for the remote events of his life, and could repeat with great readiness, and without once stumbling, very long passages from German or Latin poems, especially from the AEneid, whilst the very words that had been uttered but a moment before dropped away from his remembrance. The past came forward with the distinctness and liveliness of an immediate existence, whilst the present faded away into the obscurity of infinite distance.

Another sign of his mental decay was the weakness with which he now began to theorize. He accounted for everything by electricity. A singular mortality at this time prevailed amongst the cats of Vienna, Basle, Copenhagen, and other places. Cats being so eminently an electric animal, of course he attributed this epizootic to electricity. During the same period, he persuaded himself that a peculiar configuration of clouds prevailed; this he took as a collateral proof of his electrical hypothesis. His own headaches, too, which in all probability were a mere remote effect of old age, and a direct one of an inability [Footnote: Mr. Wasianski is quite in the wrong here. If the hindrances which nature presented to the act of thinking were now on the increase, on the other hand, the disposition to think, by his own acknowledgment, was on the wane. The power and the habit altering in proportion, there is no case made out of that disturbed equilibrium to which apparently he would attribute the headaches. But the fact is, that, if he had been as well acquainted with Kant's writings as with Kant personally, he would have known, that some affection of the head of a spasmodic kind was complained of by Kant at a time when nobody could suspect him of being in a decaying state.] to think as easily and as severely as formerly, he explained upon the same principle. And this was a notion of which his friends were not anxious to disabuse him, because, as something of the same character of weather (and therefore probably the same general tendency of the electric power) is found to prevail for whole cycles of years, entrance upon another cycle held out to him some prospect of relief. A delusion which secured the comforts of hope was the next best thing to an actual remedy; and a man who, in such circumstances, is cured of his delusion, '*cui demptus per vim mentis gratissimus error*,' might reasonably have exclaimed, '*Pol, me occidistis, amici.*'

Possibly the reader may suppose, that, in this particular instance of charging his own decays upon the state of the atmosphere, Kant was actuated by the weakness of vanity, or some unwillingness to face the real fact that his powers were decaying. But this was not the case. He was perfectly aware of his own condition, and, as early as 1799, he said, in my presence, to a party of his friends— 'Gentlemen, I am old, and weak, and childish, and you must treat me as a child.' Or perhaps it may be thought that he shrank from the contemplation of death, which, as apoplexy seemed to be threatened by the pains in his head, might have happened any day. But neither was this the case. He now lived in a continual state of resignation, and prepared to meet any dispensation of Providence. 'Gentlemen,' said he one day to his guests, 'I do not fear to die. I assure you, as in the presence of God, that if I were this night to be made

suddenly aware that I was on the point of being summoned, I would raise my hands to heaven, fold them, and say, Blessed be God! If indeed it were possible that a whisper such as this could reach my ear — Fourscore years thou hast lived, in which time thou hast inflicted much evil upon thy fellow-men, the case would be otherwise.' Whosoever has heard Kant speak of his own death, will bear witness to the tone of earnest sincerity which, on such occasions, marked his manner and utterance.

A third sign of his decaying faculties was, that he now lost all accurate measure of time. One minute, nay, without exaggeration, a much less space of time, stretched out in his apprehension of things to a wearisome duration. Of this I can give one rather amusing instance, which was of constant recurrence. At the beginning of the last year of his life, he fell into a custom of taking immediately after dinner a cup of coffee, especially on those days when it happened that I was of his party. And such was the importance he attached to this little pleasure, that he would even make a memorandum beforehand, in the blank-paper book I had given him, that on the next day I was to dine with him, and consequently that there was to be coffee. Sometimes it would happen, that the interest of conversation carried him past the time at which he felt the craving for it; and this I was not sorry to observe, as I feared that coffee, which he had never been accustomed to, [Footnote: How this happened to be the case in Germany, Mr. Wasianski has not explained. Perhaps the English merchants at Königsberg, being amongst Kant's oldest and most intimate friends, had early familiarized him to the practice of drinking tea, and to other English tastes. However, Jachmann tells us, (,) that Kant was extravagantly fond of coffee, but forced himself to abstain from it under a notion that it was very unwholesome.] might disturb his rest at night. But, if this did not happen, then commenced a scene of some interest. Coffee must be brought 'upon the spot,' (a word he had constantly in his mouth during his latter days,) 'in a moment.' And the expressions of his impatience, though from old habit still gentle, were so lively, and had so much of infantine naïveté about them, that none of us could forbear smiling. Knowing what would happen, I had taken care that all the preparations should be made beforehand; the coffee was ground; the water was boiling; and the very moment the word was given, his servant shot in like an arrow, and plunged the coffee into the water. All that remained, therefore, was to give it time to boil up. But this trifling delay seemed unendurable to Kant. All consolations were thrown away upon him: vary the formula as we might, he was never at a loss for a reply. If it was said— 'Dear Professor, the coffee will be brought up in a moment.'— '*Will* be!' he would say, 'but there's the rub, that it only *will* be:

Man never *is*, but always *to be* blest.'

If another cried out— 'The coffee is coming immediately.'— 'Yes,' he would retort, 'and so is the next hour: and, by the way, it's about that length of time that I have waited for it.' Then he would collect himself with a stoical air, and say— 'Well, one can die after all: it is but dying; and in the next world, thank God! there is no drinking of coffee, and consequently no — waiting for it.' Sometimes he would rise from his chair, open the door, and cry out with a feeble querulousness— 'Coffee! coffee!' And when at length he heard the servant's step upon the stairs, he would turn round to us, and, as joyfully as ever sailor from the mast-head, he would call out— 'Land, land! my dear friends, I see land.'

This general decline in Kant's powers, active and passive, gradually brought about a revolution in his habits of life. Heretofore, as I have already mentioned, he went to bed at ten, and rose a little before five. The latter practice he still observed, but not the other. In 1802 he retired as early as nine, and afterwards still earlier. He found himself so much refreshed by this addition to his rest, that at first he was disposed to utter a *Euraeka*, as over some great discovery in the art of restoring exhausted nature: but afterwards, on pushing it still farther, he did not find the success answer his expectations. His walks he now limited to a few turns in the King's gardens, which were at no great distance from his own house. In order to walk more firmly, he adopted a peculiar method of stepping; he carried his foot to the ground, not forward, and obliquely, but perpendicularly, and with a kind of stamp, so as to secure a larger basis, by setting down the entire sole at once. Notwithstanding this precaution, upon one occasion he fell in the street. He was

quite unable to raise himself; and two young ladies, who saw the accident, ran to his assistance. With his usual graciousness of manner he thanked them fervently for their assistance, and presented one of them with a rose which he happened to have in his hand. This lady was not personally known to Kant; but she was greatly delighted with his little present, and still keeps the rose as a frail memorial of her transitory interview with the great philosopher.

This accident, as I have reason to think, was the cause of his henceforth renouncing exercise altogether. All labors, even that of reading, were now performed slowly, and with manifest effort; and those which cost him any bodily exertion became very exhausting to him. His feet refused to do their office more and more; he fell continually, both when moving across the room, and even when standing still: yet he seldom suffered from these falls; and he constantly laughed at them, maintaining that it was impossible he could hurt himself, from the extreme lightness of his person, which was indeed by this time the merest skeleton. Very often, especially in the morning, he dropped asleep in his chair from pure weariness: on these occasions he fell forward upon the floor, and lay there unable to raise himself up, until accident brought one of his servants or his friends into the room. Afterwards these falls were prevented, by substituting a chair with circular supports, that met and clasped in front.

These unseasonable dozings exposed him to another danger. He fell repeatedly, whilst reading, with his head into the candles; a cotton night-cap which he wore was instantly in a blaze, and flaming about his head. Whenever this happened, Kant behaved with great presence of mind. Disregarding the pain, he seized the blazing cap, drew it from his head, laid it quietly on the floor, and trod out the flames with his feet. Yet, as this last act brought his dressing-gown into a dangerous neighborhood to the flames, I changed the form of his cap, persuaded him to arrange the candles differently, and had a decanter of water placed constantly by his side; and in this way I applied a remedy to a danger, which would else probably have been fatal to him.

From the sallies of impatience, which I have described in the case of the coffee, there was reason to fear that, with the increasing infirmities of Kant, would grow up a general waywardness and obstinacy of temper. For my own sake, therefore, and not less for his, I now laid down one rule for my future conduct in his house; which was, that I would, on no occasion, allow my reverence for him to interfere with the firmest expression of my opinion on subjects relating to his own health; and in cases of great importance, that I would make no compromise with his particular humors, but insist, not only on my view of the case, but also on the practical adoption of my views; or, if this were refused me, that I would take my departure at once, and not be made responsible for the comfort of a person whom I had no power to influence. And this behavior on my part it was that won Kant's confidence; for there was nothing which disgusted him so much as any approach to fawning or sycophancy. As his imbecility increased, he became daily more liable to mental delusions; and, in particular, he fell into many fantastic notions about the conduct of his servants, and, in consequence, into a peevish mode of treating them. Upon these occasions I generally observed a deep silence. But sometimes he would ask me for my opinion; and when this happened, I did not scruple to say, 'Ingenuously, then, Mr. Professor, I think that you are in the wrong.'— 'You think so?' he would reply calmly, at the same time asking for my reasons, which he would listen to with great patience, and openness to conviction. Indeed, it was evident that the firmest opposition, so long as it rested upon assignable grounds and principles, won upon his regard; whilst his own nobleness of character still moved him to habitual contempt for timorous and partial acquiescence in his opinions, even when his infirmities made him most anxious for such acquiescence.

Earlier in life Kant had been little used to contradiction. His superb understanding, his brilliancy in conversation, founded in part upon his ready and sometimes rather caustic wit, and in part upon his prodigious command of knowledge — the air of noble self-confidence which the consciousness of these advantages impressed upon his manners — and the general knowledge of the severe innocence of his life — all combined to give him a station of superiority to others, which generally secured him from open

contradiction. And if it sometimes happened that he met a noisy and intemperate opposition, supported by any pretences to wit, he usually withdrew himself from that sort of unprofitable altercation with dignity, by contriving to give such a turn to the conversation as won the general favor of the company to himself, and impressed, silence, or modesty at least, upon the boldest disputant. From a person so little familiar with opposition, it could scarcely have been anticipated that he should daily surrender his wishes to mine — if not without discussion, yet always without displeasure. So, however, it was. No habit, of whatever long standing, could be objected to as injurious to his health, but he would generally renounce it. And he had this excellent custom in such cases, that either he would resolutely and at once decide for his own opinion, or, if he professed to follow his friend's, he would follow it sincerely, and not try it unfairly by trying it imperfectly. Any plan, however trifling, which he had once consented to adopt on the suggestion of another, was never afterwards defeated or embarrassed by unseasonable interposition from his own humors. And thus, the very period of his decay drew forth so many fresh expressions of his character, in its amiable or noble features, as daily increased my affection and reverence for his person.

Having mentioned his servants, I shall here take occasion to give some account of his man-servant Lampe. It was a great misfortune for Kant, in his old age and infirmities, that this man also became old, and subject to a different sort of infirmities. This Lampe had originally served in the Prussian army; on quitting which he entered the service of Kant. In this situation he had lived about forty years; and, though always dull and stupid, had, in the early part of this period, discharged his duties with tolerable fidelity. But latterly, presuming upon his own indispensableness, from his perfect knowledge of all the domestic arrangements, and upon his master's weakness, he had fallen into great irregularities and neglect of his duties. Kant had been obliged, therefore, of late, to threaten repeatedly that he would discharge him. I, who knew that Kant, though one of the kindest-hearted men, was also one of the firmest, foresaw that this discharge, once given, would be irrevocable: for the word of Kant was as sacred as other men's oaths. Consequently, upon every opportunity, I remonstrated with Lampe on the folly of his conduct, and his wife joined me on these occasions. Indeed, it was high time that a change should be made in some quarter; for it now became dangerous to leave Kant, who was constantly falling from weakness, to the care of an old ruffian, who was himself apt to fall from intoxication. The fact was, that from the moment I undertook the management of Kant's affairs, Lampe saw there was an end to his old system of abusing his master's confidence in pecuniary affairs, and the other advantages which he took of his helpless situation. This made him desperate, and he behaved worse and worse; until one morning, in January, 1802, Kant told me, that, humiliating as he felt such a confession, the fact was, that Lampe had just treated him in a way which he was ashamed to repeat. I was too much shocked to distress him by inquiring into the particulars. But the result was, that Kant now insisted, temperately but firmly, on Lampe's dismissal. Accordingly, a new servant, of the name of Kaufmann, was immediately engaged; and on the next day Lampe was discharged with a handsome pension for life.

Here I must mention a little circumstance which does honor to Kant's benevolence. In his last will, on the assumption that Lampe would continue with him to his death, he had made a very liberal provision for him; but upon this new arrangement of the pension, which was to take effect immediately, it became necessary to revoke that part of his will, which he did in a separate codicil, that began thus:— 'In consequence of the ill behavior of my servant Lampe, I think fit,' &c. But soon after, considering that such a record of Lampe's misconduct might be seriously injurious to his interests, he cancelled the passage, and expressed it in such a way, that no trace remained behind of his just displeasure. And his benign nature was gratified with knowing, that, this one sentence blotted out, there remained no other in all his numerous writings, published or confidential, which spoke the language of anger, or could leave any ground for doubting that he died in charity with all the world. Upon Lampe's calling to demand a written character, he was, however, a good deal embarrassed; his stern reverence for truth being, in this instance, armed against the first impulses of his kindness. Long and anxiously he sat, with the certificate lying

before him, debating how he should fill up the blanks. I was present, but in such a matter I did not take the liberty of suggesting any advice. At last, he took his pen, and filled up the blank as follows:—' — has served me long and faithfully,' — (for Kant was not aware that he had robbed him,)— 'but did not display those particular qualifications which fitted him for waiting on an old and infirm man like myself.'

This scene of disturbance over, which to Kant, a lover of peace and tranquillity, caused a shock that he would gladly have been spared; it was fortunate that no other of that nature occurred during the rest of his life. Kaufmann, the successor of Lampe, turned out to be a respectable and upright man, and soon conceived a great attachment to his master's person. Things now put on a new face in Kant's family: by the removal of one of the belligerents, peace was once more restored amongst his servants; for hitherto there had been eternal wars between Lampe and the cook. Sometimes it was Lampe that carried a war of aggression into the cook's territory of the kitchen; sometimes it was the cook that revenged these insults, by sallying out upon Lampe in the neutral ground of the hall, or invaded him even in his own sanctuary of the butler's pantry. The uproars were everlasting; and thus far it was fortunate for the peace of the philosopher, that his hearing had begun to fail; by which means he was spared many an exhibition of hateful passions and ruffian violence, which annoyed his guests and friends. But now all things had changed: deep silence reigned in the pantry; the kitchen rang no more with martial alarums; and the hall was unvexed with skirmish or pursuit. Yet it may be readily supposed that to Kant, at the age of seventy-eight, changes, even for the better, were not welcome: so intense had been the uniformity of his life and habits, that the least innovation in the arrangement of articles as trifling as a penknife, or a pair of scissors, disturbed him; and not merely if they were pushed two or three inches out of their customary position, but even if they were laid a little awry; and as to larger objects, such as chairs, &c., any dislocation of their usual arrangement, any trans position, or addition to their number, perfectly confounded him; and his eye appeared restlessly to haunt the seat of the mal-arrangement, until the ancient order was restored. With such habits the reader may conceive how distressing it must have been to him, at this period of decaying powers, to adapt himself to a new servant, a new voice, a new step, &c.

Aware of this, I had on the day before he entered upon his duties, written down for the new servant upon a sheet of paper the entire routine of Kant's daily life, down to the minutest and most trivial circumstances; all which he mastered with the greatest rapidity. To make sure, however, we went through a rehearsal of the whole ritual; he performing the manoeuvres, I looking on and giving the word. Still I felt uneasy at the idea of his being left entirely to his own discretion on his first *debut* in good earnest, and therefore I made a point of attending on this important day; and in the few instances where the new recruit missed the accurate manoeuvre, a glance or a nod from me easily made him comprehend his failure.

One part only there was of the daily ceremonial, where all of us were at a loss, as it was a part which no mortal eyes had ever witnessed but those of Lampe: this was breakfast. However, that we might do all in our power, I myself attended at four o'clock in the morning. The day happened, as I remember, to be the 1st of February, 1802. Precisely at five, Kant made his appearance; and nothing could equal his astonishment on finding me in the room. Fresh from the confusion of dreaming, and bewildered alike by the sight of his new servant, by Lampe's absence, and by my presence, he could with difficulty be made to comprehend the purpose of my visit. A friend in need is a friend indeed; and we would now have given any money to that learned person who could have instructed us in the arrangement of the breakfast table. But this was a mystery revealed to none but Lampe. At length Kant took this task upon himself; and apparently all was now settled to his satisfaction. Yet still it struck me that he was under some embarrassment or constraint. Upon this I said — that, with his permission, I would take a cup of tea, and afterwards smoke a pipe with him. He accepted my offer with his usual courteous demeanor; but seemed unable to familiarize himself with the novelty of his situation. I was at this time sitting directly opposite to him; and at last he frankly told me, but with the kindest and most apologetic air, that he was really under the necessity of begging that I would sit out of his sight; for that, having sat alone at the breakfast table for

considerably more than half a century, he could not abruptly adapt his mind to a change in this respect; and he found his thoughts very sensibly disturbed. I did as he desired; the servant retired into an antiroom, where he waited within call; and Kant recovered his wonted composure. Just the same scene passed over again, when I called at the same hour on a fine summer morning some months after.

Henceforth all went right: or, if occasionally some little mistake occurred, Kant showed himself very considerate and indulgent, and would remark of his own accord, that a new servant could not be expected to know all his peculiar ways and humors. In one respect, indeed, this man adapted himself to Kant's scholarlike taste, in a way which Lampe was incapable of doing. Kant was somewhat fastidious in matters of pronunciation; and this man had a great facility in catching the true sound of Latin words, the titles of books, and the names or designations of Kant's friends: not one of which accomplishments could Lampe, the most insufferable of blockheads, ever attain to. In particular, I have been told by Kant's old friends, that for the space of more than thirty years, during which he had been in the habit of reading the newspaper published by Hartung, Lampe delivered it with the same identical blunder on every day of publication.— 'Mr. Professor, here is Hart*mann's* journal.' Upon which Kant would reply— 'Eh! what? — What's that you say? Hartmann's journal? I tell you, it is not Hartmann, but Hartung: now, repeat it after me — not Hartmann, but Hartung.' Then Lampe, looking sulky, and drawing himself up with the stiff air of a soldier on guard, and in the very same monotonous tone with which he had been used to sing out his challenge of — *Who goes there?* would roar— 'not Hartmann, but Hartung.' 'Now again!' Kant would say: on which again Lampe roared— 'not Hartmann, but Hartung.' 'Now a third time,' cried Kant: on which for a third time the unhappy Lampe would howl out— 'not Hartmann, but Hartung.' And this whimsical scene of parade duty was continually repeated: duly as the day of publication came, the irreclaimable old dunce was put through the same manoeuvres, which were as invariably followed by the same blunder on the next. In spite, however, of this advantage, in the new servant, and his general superiority to his predecessor, Kant's nature was too kind and good, and too indulgent to all people's infirmities but his own, not to miss the voice and the 'old familiar face' that he had been accustomed to for forty years. And I met with what struck me as an affecting instance of Kant's yearning after his old good-for-nothing servant in his memorandum-book: other people record what they wish to remember; but Kant had here recorded what he was to forget. 'Mem.: February, 1802, the name of Lampe must now be remembered no more.'

In the spring of this year, 1802, I advised Kant to take the air. It was very long since he had been out of doors, [Footnote: Wasianski here returns thanks to some unknown person, who, having observed that Kant in his latter walks took pleasure in leaning against a particular wall to view the prospect, had caused a seat to be fixed at that point for his use.] and walking was now out of the question. But I thought the motion of a carriage and the air would be likely to revive him. On the power of vernal sights and sounds I did not much rely; for these had long ceased to affect him. Of all the changes that spring brings with it, there was one only that now interested Kant; and he longed for it with an eagerness and intensity of expectation, that it was almost painful to witness: this was the return of a hedge sparrow that sang in his garden, and before his window. This bird, either the same, or one of the next generation, had sung for years in the same situation; and Kant grew uneasy when the cold weather, lasting longer than usual, retarded its return. Like Lord Bacon, indeed, he had a childlike love for birds in general, and in particular, took pains to encourage the sparrows to build above the windows of his study; and when this happened, (as it often did, from the silence which prevailed in his study,) he watched their proceedings with the delight and the tenderness which others give to a human interest. To return to the point I was speaking of, Kant was at first very unwilling to accede to my proposal of going abroad. 'I shall sink down in the carriage,' said he, 'and fall together like a heap of old rags.' But I persisted with a gentle importunity in urging him to the attempt, assuring him that we would return immediately if he found the effort too much for him. Accordingly, upon a tolerably warm day of early [Footnote: Mr. Wasianski says

— *late* in summer: but, as he elsewhere describes by the same expression of 'late in summer,' a day which was confessedly *before* the longest day, and as the multitude of birds which continued to sing will not allow us to suppose that the summer could be very far advanced, I have translated accordingly.] summer, I, and an old friend of Kant's, accompanied him to a little place which I rented in the country. As we drove through the streets, Kant was delighted to find that he could sit upright, and bear the motion of the carriage, and seemed to draw youthful pleasure from the sight of the towers and other public buildings, which he had not seen for years. We reached the place of our destination in high spirits. Kant drank a cup of coffee, and attempted to smoke a little. After this, he sat and sunned himself, listening with delight to the warbling of birds, which congregated in great numbers about this spot. He distinguished every bird by its song, and called it by its right name. After staying about half an hour, we set off on our homeward journey, Kant still cheerful, but apparently satiated with his day's enjoyment.

I had on this occasion purposely avoided taking him to any public gardens, that I might not disturb his pleasure by exposing him to the distressing gaze of public curiosity. However, it was known in Königsberg that Kant had gone out; and accordingly, as the carriage moved through the streets which led to his residence, there was a general rush from all quarters in that direction, and, when we turned into the street where the house stood, we found it already choked up with people. As we slowly drew up to the door, a lane was formed in the crowd, through which Kant was led, I and my friend supporting him on our arms. Looking at the crowd, I observed the faces of many persons of rank, and distinguished strangers, some of whom now saw Kant for the first time, and many of them for the last.

As the winter of 1802-3 approached, he complained more than ever of an affection of the stomach, which no medical man had been able to mitigate, or even to explain. The winter passed over in a complaining way; he was weary of life, and longed for the hour of dismission. 'I can be of service to the world no more,' said he, 'and am a burden to myself.' Often I endeavored to cheer him by the anticipation of excursions that we would make together when summer came again. On these he calculated with so much earnestness, that he had made a regular scale or classification of them — l. Airings; 2. Journeys; 3. Travels. And nothing could equal the yearning impatience expressed for the coming of spring and summer, not so much for their own peculiar attractions, as because they were the seasons for travelling. In his memorandum-book, he made this note:— 'The three summer months are June, July, and August' — meaning that they were the three months for travelling. And in conversation he expressed the feverish strength of his wishes so plaintively and affectingly, that everybody was drawn into powerful sympathy with him, and wished for some magical means of ante-dating the course of the seasons.

In this winter his bed-room was often warmed. This was the room in which he kept his little collection of books, of about four hundred and fifty volumes, chiefly presentation-copies from the authors. It may seem singular that Kant, who read so extensively, should have no larger library; but he had less need of one than most scholars, having in his earlier years been librarian at the Royal Library of the Castle; and since then having enjoyed from the liberality of Hartknoch, his publisher, (who, in his turn, had profited by the liberal terms on which Kant had made over to him the copyright of his own works,) the first sight of every new book that appeared.

At the close of this winter, that is in 1803, Kant first began to complain of unpleasant dreams, sometimes of very terrific ones, which awakened him in great agitation. Oftentimes melodies, which he had heard in earliest youth sung in the streets of Königsberg, resounded painfully in his ears, and dwelt upon them in a way from which no efforts of abstraction could release him. These kept him awake to unseasonable hours; and often when, after long watching, he had fallen asleep, however deep his sleep might be, it was suddenly broken up by terrific dreams, which alarmed him beyond description. Almost every night, the bell-rope, which communicated with a bell in the room above his own, where his servant slept, was pulled violently, and with the utmost agitation. No matter how fast the servant might hurry down, he was almost always too late, and was pretty sure to find his master out of bed, and often making

his way in terror to some other part of the house. The weakness of his feet exposed him to such dreadful falls on these occasions, that at length (but with much difficulty) I persuaded him to let his servant sleep in the same room with himself.

The morbid affection of the stomach began now to be more and more distressing; and he tried various applications, which he had formerly been loud in condemning, such as a few drops of rum upon a piece of sugar, naphtha, [Footnote: For Kant's particular complaint, as described by other biographers, a quarter of a grain of opium, every twelve hours, would have been the best remedy, perhaps a perfect remedy.] &c. But all these were only palliatives; for his advanced age precluded the hope of a radical cure. His dreadful dreams became continually more appalling: single scenes, or passages in these dreams, were sufficient to compose the whole course of mighty tragedies, the impression from which was so profound as to stretch far into his waking hours. Amongst other phantasmata more shocking and indescribable, his dreams constantly represented to him the forms of murderers advancing to his bedside; and so agitated was he by the awful trains of phantoms that swept past him nightly, that in the first confusion of awaking he generally mistook his servant, who was hastening to his assistance, for a murderer. In the day-time we often conversed upon these shadowy illusions; and Kant, with his usual spirit of stoical contempt for nervous weakness of every sort, laughed at them; and, to fortify his own resolution to contend against them, he wrote down in his memorandum-book, 'There must be no yielding to panics of darkness.' At my suggestion, however, he now burned a light in his chamber, so placed as that the rays might be shaded from his face. At first he was very averse to this, though gradually he became reconciled to it. But that he could bear it at all, was to me an expression of the great revolution accomplished by the terrific agency of his dreams. Heretofore, darkness and utter silence were the two pillars on which his sleep rested: no step must approach his room; and as to light, if he saw but a moonbeam penetrating a crevice of the shutters, it made him unhappy; and, in fact, the windows of his bed-chamber were barricadoed night and day. But now darkness was a terror to him, and silence an oppression. In addition to his lamp, therefore, he had now a repeater in his room; the sound was at first too loud, but, after muffling the hammer with cloth, both the ticking and the striking became companionable sounds to him.

At this time (spring of 1803) his appetite began to fail, which I thought no good sign. Many persons insist that Kant was in the habit of eating too much for health. [Footnote: Who these worthy people were that criticised Kant's eating, is not mentioned. They could have had no opportunity of exercising their abilities on this question, except as hosts, guests, or fellow-guests; and in any of those characters, a gentleman, one would suppose, must feel himself degraded by directing his attention to a point of that nature. However, the merits of the case stand thus between the parlies: Kant, it is agreed by all his biographers, ate only once a day; for as to his breakfast, it was nothing more than a very weak infusion of tea, (vide Jachmann's Letters, ,) with no bread, or eatable of any kind. Now, his critics, by general confession, ate their way, from 'morn to dewy eve,' through the following course of meals: 1. Breakfast early in the morning; 2. Breakfast *à la fourchette* about ten, A.M.; 3. Dinner at one or two; 4. Vesper Brod; 5. Abend Brod; all which does really seem a very fair allowance for a man who means to lecture upon abstinence at night. But I shall cut this matter short by stating one plain fact; there were two things, and no more, for which Kant had an inordinate craving during his whole life; these were tobacco and coffee; and from both these he abstained almost altogether, merely under a sense of duty, resting probably upon erroneous grounds. Of the first he allowed himself a very small quantity, (and everybody knows that temperance is a more difficult virtue than abstinence;) of the other none at all, until the labors of his life were accomplished.] I, however, cannot assent to this opinion; for he ate but once a day, and drank no beer. Of this liquor, (I mean the strong black beer,) he was, indeed, the most determined enemy. If ever a man died prematurely, Kant would say— 'He has been drinking beer, I presume.' Or, if another were indisposed, you might be sure he would ask, 'But does he drink beer?' And, according to the answer on this point, he regulated his anticipations for the patient. Strong beer, in short, he uniformly maintained to

be a slow poison. Voltaire, by the way, had said to a young physician who denounced coffee under the same bad name of a 'slow poison,' 'You're right there, my friend, however; slow it is, and horribly slow; for I have been drinking it these seventy years, and it has not killed me yet;' but this was an answer which, in the case of beer, Kant would not allow of.

On the 22d of April, 1803, his birth-day, the last which he lived to see, was celebrated in a full assembly of his friends. This festival he had long looked forward to with great expectation, and delighted even to hear the progress made in the preparations for it. But when the day came, the over-excitement and tension of expectation seemed to have defeated itself. He tried to appear happy; but the bustle of a numerous company confounded and distressed him; and his spirits were manifestly forced. He seemed first to revive to any real sense of pleasure at night, when the company had departed, and he was undressing in his study. He then talked with much pleasure about the presents which, as usual, would be made to his servants on this occasion; for Kant was never happy himself, unless he saw all around him happy. He was a great maker of presents; but at the same time he had no toleration for the studied theatrical effect, the accompaniment of formal congratulations, and the sentimental pathos with which birth-day presents are made in Germany. [Footnote: In this, as in many other things, the taste of Kant was entirely English and Roman; as, on the other hand, some eminent Englishmen, I am sorry to say, have, on this very point, shown the effeminacy and *falsetto* taste of the Germans. In particular, Mr. Coleridge, describing, in The Friend, the custom amongst German children of making presents to their parents on Christmas Eve, (a custom which he unaccountably supposes to be peculiar to Ratzeburg,) represents the mother as 'weeping aloud for joy' — the old idiot of a father with 'tears running down his face,' &c. &c., and all for what? For a snuff-box, a pencil-case, or some article of jewellery. Now, we English agree with Kant on such maudlin display of stage sentimentality, and are prone to suspect that papa's tears are the product of rum-punch. Tenderness let us have by all means, and the deepest you can imagine, but upon proportionate occasions, and with causes fitted to justify it and sustain its dignity.] In all this, his masculine taste gave him a sense of something fade and ludicrous.

The summer of 1803 was now come, and, visiting Kant one day, I was thunderstruck to hear him direct me, in the most serious tone, to provide the funds necessary for an extensive foreign tour. I made no opposition, but asked his reasons for such a plan; he alleged the miserable sensations he had in his stomach, which were no longer endurable. Knowing what power over Kant a quotation from a Roman poet had always had, I simply replied— 'Post equitem sedet atra cura,' and for the present he said no more. But the touching and pathetic earnestness with which he was continually ejaculating prayers for warmer weather, made it doubtful to me whether his wishes on this point ought not, partially at least, to be gratified; and I therefore proposed to him a little excursion to the cottage we had visited the year before. 'Anywhere,' said he, 'no matter whither, provided it be far enough.' Towards the latter end of June, therefore, we executed this scheme; on getting into the carriage, the order of the day with Kant was, 'Distance, distance. Only let us go far enough,' said he: but scarcely had we reached the city-gates before the journey seemed already to have lasted too long. On reaching the cottage we found coffee waiting for us; but he would scarcely allow himself time for drinking it, before he ordered the carriage to the door; and the journey back seemed insupportably long to him, though it was performed in something less than twenty minutes. 'Is this never to have an end?' was his continual exclamation; and great was his joy when he found himself once more in his study, undressed, and in bed. And for this night he slept in peace, and once again was liberated from the persecution of dreams.

Soon after he began again to talk of journeys, of travels in remote countries, &c., and, in consequence, we repeated our former excursion several times; and though the circumstances were pretty nearly the same on every occasion, and always terminating in disappointment as to the immediate pleasure anticipated, yet, undoubtedly, they were, on the whole, salutary to his spirits. In particular, the cottage itself, standing under the shelter of tall alders, with a valley stretched beneath it, through which a little

brook meandered, broken by a water-fall, whose pealing sound dwelt pleasantly on the ear, sometimes, on a quiet sunny day, gave a lively delight to Kant: and once, under accidental circumstances of summer clouds and sun-lights, the little pastoral landscape suddenly awakened a lively remembrance which had been long laid asleep, of a heavenly summer morning in youth, which he had passed in a bower upon the banks of a rivulet that ran through the grounds of a dear and early friend, Gen. Von Lossow. The strength of the impression was such, that he seemed actually to be living over that morning again, thinking as he then thought, and conversing with those that were no more.

His very last excursion was in August of this year, (1803,) not to my cottage, but to the garden of a friend. But on this day he manifested great impatience. It had been arranged that he was to meet an old friend at the gardens; and I, with two other gentlemen, attended him. It happened that *out* party arrived first; and such was Kant's weakness, and total loss of power to estimate the duration of time, that, after waiting a few moments, he insisted that some hours had elapsed — that his friend could not be expected — and went away in great discomposure of mind. And so ended Kant's travelling in this world.

In the beginning of autumn the sight of his right eye began to fail him; the left he had long lost the use of. This earliest of his losses, by the way, he discovered by mere accident, and without any previous warning. Sitting down one day to rest himself in the course of a walk, it occurred to him that he would try the comparative strength of his eyes; but on taking out a newspaper which he had in his pocket, he was surprised to find that with his left eye he could not distinguish a letter. In earlier life he had two remarkable affections of the eyes: once, on returning from a walk, he saw objects double for a long space of time; and twice he became stone-blind. Whether these accidents are to be considered as uncommon, I leave to the decision of oculists. Certain it is, they gave very little disturbance to Kant; who, until old age had reduced his powers, lived in a constant state of stoical preparation for the worst that could befall him. I was now shocked to think of the degree in which his burthensome sense of dependence would be aggravated, if he should totally lose the power of sight. As it was, he read and wrote with great difficulty: in fact, his writing was little better than that which most people can produce as a trial of skill with their eyes shut. From old habits of solitary study, he had no pleasure in hearing others read to him; and he daily distressed me by the pathetic earnestness of his entreaties that I would have a reading-glass devised for him. Whatever my own optical skill could suggest, I tried; and the best opticians were sent for to bring their glasses, and take his directions for altering them; but all was to no purpose.

In this last year of his life Kant very unwillingly received the visits of strangers; and, unless under particular circumstances, wholly declined them. Yet, when travellers had come a very great way out of their road to see him, I confess that I was at a loss how to conduct myself. To have refused too pertinaciously, could not but give me the air of wishing to make myself of importance. And I must acknowledge, that, amongst some instances of importunity and coarse expressions of low-bred curiosity, I witnessed, on the part of many people of rank, a most delicate sensibility to the condition of the aged recluse. On sending in their cards, they would generally accompany them by some message, expressive of their unwillingness to gratify their wish to see him at any risk of distressing him. The fact was, that such visits *did* distress him much; for he felt it a degradation to be exhibited in his helpless state, when he was aware of his own incapacity to meet properly the attention that was paid to him. Some, however, were admitted, [Footnote: To whom it appears that Kant would generally reply, upon their expressing the pleasure it gave them to see him, 'In me you behold a poor superannuated, weak, old man.'] according to the circumstances of the case, and the state of Kant's spirits at the moment. Amongst these, I remember that we were particularly pleased with M. Otto, the same who signed the treaty of peace between France and England with the present Lord Liverpool, (then Lord Hawkesbury.) A young Russian also rises to my recollection at this moment, from the excessive (and I think unaffected) enthusiasm which he displayed. On being introduced to Kant, he advanced hastily, took both his hands, and kissed them. Kant, who, from living so much amongst his English friends, had a good deal of the English dignified reserve about him,

and hated anything like *scenes*, appeared to shrink a little from this mode of salutation, and was rather embarrassed. However, the young man's manner, I believe, was not at all beyond his genuine feelings; for next day he called again, made some inquiries about Kant's health, was very anxious to know whether his old age were burthensome to him, and above all things entreated for some little memorial of the great man to carry away with him. By accident the servant had found a small cancelled fragment of the original MS. of Kant's 'Anthropologie:' this, with my sanction, he gave to the Russian; who received it with rapture, kissed it, and then gave him in return the only dollar he had about him; and, thinking that not enough, actually pulled off his coat and waistcoat and forced them upon the man. Kant, whose native simplicity of character very much indisposed him to sympathy with any extravagances of feeling, could not, however, forbear smiling good-humoredly on being made acquainted with this instance of *naïveté* and enthusiasm in his young admirer.

I now come to an event in Kant's life, which ushered in its closing stage. On the 8th of October, 1803, for the first time since his youth, he was seriously ill. When a student at the University, he had once suffered from an ague, which, however, gave way to pedestrian exercise; and in later years, he had endured some pain from a contusion on his head; but, with these two exceptions, (if they can be considered such,) he had never (properly speaking) been ill. The cause of his illness was this: his appetite had latterly been irregular, or rather I should say depraved; and he no longer took pleasure in anything but bread and butter, and English cheese.[Footnote: Mr. W. here falls into the ordinary mistake of confounding the cause and the occasion, and would leave the impression, that Kant (who from his youth up had been a model of temperance) died of sensual indulgence. The cause of Kant's death was clearly the general decay of the vital powers, and in particular the atony of the digestive organs, which must soon have destroyed him under any care or abstinence whatever. This was the cause. The accidental occasion, which made that cause operative on the 7th of October, might or might not be what Mr. W. says. But in Kant's burthensome state of existence, it could not be a question of much importance whether his illness were to commence in an October or a November.] On the 7th of October, at dinner, he ate little else, in spite of everything that I and another friend then dining with him, could urge to dissuade him. And for the first time I fancied that he seemed displeased with my importunity, as though I were overstepping the just line of my duties. He insisted that the cheese never had done him any harm, nor would now. I had no course left me but to hold my tongue; and he did as he pleased. The consequence was what might have been anticipated — a restless night, succeeded by a day of memorable illness. The next morning all went on as usual, till nine o'clock, when Kant, who was then leaning on his sister's arm, suddenly fell senseless to the ground. A messenger was immediately despatched for me; and I hurried down to his house, where I found him lying in his bed, which had now been removed into his study, speechless and insensible. I had already summoned his physician; but, before he arrived, nature put forth efforts which brought Kant a little to himself. In about an hour he opened his eyes, and continued to mutter unintelligibly till towards the evening, when he rallied a little, and began to talk rationally. For the first time in his life, he was now, for a few days, confined to his bed, and ate nothing. On the 12th October, he again took some refreshment, and would have had his favorite food; but I was now resolved, at any risk of his displeasure, to oppose him firmly. I therefore stated to him the whole consequences of his last indulgence, of all which he manifestly had no recollection. He listened to what I said very attentively, and calmly expressed his conviction that I was perfectly in the wrong; but for the present he submitted. However, some days after, I found that he had offered a florin for a little bread and cheese, and then a dollar, and even more. Being again refused, he complained heavily; but gradually he weaned himself from asking for it, though at times he betrayed involuntarily how much he desired it.

On the 13th of October, his usual dinner parties were resumed, and he was considered convalescent; but it was seldom indeed that he recovered the tone of tranquil spirits which he had preserved until his late attack. Hitherto he had always loved to prolong this meal, the only one he took — or, as he expressed

it in classical phrase, ‘coenam *ducere;*’ but now it was difficult to hurry it over fast enough for his wishes. From dinner, which terminated about two o’clock, he went straight to bed, and at intervals fell into slumbers; from which, however, he was regularly awoke by phantasmata or terrific dreams. At seven in the evening came on duly a period of great agitation, which lasted till five or six in the morning — sometimes later; and he continued through the night alternately to walk about and lie down, occasionally tranquil, but more often in great distress. It now became necessary that somebody should sit up with him, his man-servant being wearied out with the toils of the day. No person seemed to be so proper for this office as his sister, both as having long received a very liberal pension from him, and also as his nearest relative, who would be the best witness to the fact that her illustrious brother had wanted no comforts or attention in his last hours, which his situation admitted of. Accordingly she was applied to, and undertook to watch him alternately with his footman — a separate table being kept for her, and a very handsome addition made to her allowance. She turned out to be a quiet gentle-minded woman, who raised no disturbances amongst the servants, and soon won her brother’s regard by the modest and retiring style of her manners; I may add, also, by the truly sisterly affection which she displayed towards him to the last.

The 8th of October had grievously affected Kant’s faculties, but had not wholly destroyed them. For short intervals the clouds seemed to roll away that had settled upon his majestic intellect, and it shone forth as heretofore. During these moments of brief self-possession, his wonted benignity returned to him; and he expressed his gratitude for the exertions of those about him, and his sense of the trouble they underwent, in a very affecting way. With regard to his man-servant in particular, he was very anxious that he should be rewarded by liberal presents; and he pressed me earnestly on no account to be parsimonious. Indeed Kant was nothing less than princely in his use of money; and there was no occasion on which he was known to express the passion of scorn very powerfully, but when he was commenting on mean and penurious acts or habits. Those who knew him only in the streets, fancied that he was not liberal; for he steadily refused, upon principle, to relieve all common beggars. But, on the other hand, he was liberal to the public charitable institutions; he secretly assisted his own poor relations in a much ampler way than could reasonably have been expected of him; and it now appeared that he had many other deserving pensioners upon his bounty; a fact that was utterly unknown to any of us, until his increasing blindness and other infirmities devolved the duty of paying these pensions upon myself. It must be recollected, also, that Kant’s whole fortune, which amounted to about twenty thousand dollars, was the product of his own honorable toils for nearly threescore years; and that he had himself suffered all the hardships of poverty in his youth, though he never once ran into any man’s debt, — circumstances in his history, which, as they express how fully he must have been acquainted with the value of money, greatly enhance the merit of his munificence.

In December, 1803, he became incapable of signing his name. His sight, indeed, had for some time failed him so much, that at dinner he could not find his spoon without assistance; and, when I happened to dine with him, I first cut in pieces whatever was on his plate, next put it into a spoon, and then guided his hand to find the spoon. But his inability to sign his name did not arise merely from blindness: the fact was, that, from irretention of memory, he could not recollect the letters which composed his name; and, when they were repeated to him, he could not represent the figure of the letters in his imagination. At the latter end of November, I had remarked that these incapacities were rapidly growing upon him, and in consequence I prevailed on him to sign beforehand all the receipts, &c., which would be wanted at the end of the year; and, afterwards, on my representation, to prevent all disputes, he gave me a regular legal power to sign on his behalf.

Much as Kant was now reduced, yet he had occasionally moods of social hilarity. His birth-day was always an agreeable subject to him: some weeks before his death, I was calculating the time which it still wanted of that anniversary, and cheering him with the prospect of the rejoicings which would then take place: ‘All your old friends,’ said I, ‘will meet together, and drink a glass of champagne to your health.’

‘That,’ said he, ‘must be done upon the spot:’ and he was not satisfied till the party was actually assembled. He drank a glass of wine with them, and with great elevation of spirits celebrated this birthday which he was destined never to see.

In the latter weeks of his life, however, a great change took place in the tone of his spirits. At his dinner-table, where heretofore such a cloudless spirit of joviality had reigned, there was now a melancholy silence. It disturbed him to see his two dinner companions conversing privately together, whilst he himself sat like a mute on the stage with no part to perform. Yet to have engaged him in the conversation would have been still more distressing; for his hearing was now very imperfect; the effort to hear was itself painful to him; and his expressions, even when his thoughts were accurate enough, became nearly unintelligible. It is remarkable, however, that at the very lowest point of his depression, when he became perfectly incapable of conversing with any rational meaning on the ordinary affairs of life, he was still able to answer correctly and distinctly, in a degree that was perfectly astonishing, upon any question of philosophy or of science, especially of physical geography, [Footnote: *Physical* Geography, in opposition to *Political*.] chemistry, or natural history. He talked satisfactorily, in his very worst state, of the gases, and stated very accurately different propositions of Kepler’s, especially the law of the planetary motions. And I remember in particular, that upon the very last Monday of his life, when the extremity of his weakness moved a circle of his friends to tears, and he sat amongst us insensible to all we could say to him, cowering down, or rather I might say collapsing into a shapeless heap upon his chair, deaf, blind, torpid, motionless, — even then I whispered to the others that I would engage that Kant should take his part in conversation with propriety and animation. This they found it difficult to believe. Upon which I drew close to his ear, and put a question to him about the Moors of Barbary. To the surprise of everybody but myself, he immediately gave us a summary account of their habits and customs; and told us by the way, that in the word *Algiers*, the *g* ought to be pronounced hard (as in the English word *gear*).

During the last fortnight of Kant’s life, he busied himself unceasingly in a way that seemed not merely purposeless but self-contradictory. Twenty times in a minute he would unloose and tie his neck handkerchief — so also with a sort of belt which he wore about his dressing-gown, the moment it was clasped, he unclasped it with impatience, and was then equally impatient to have it clasped again. But no description can convey an adequate impression of the weary restlessness with which from morning to night he pursued these labors of Sisyphus — doing and undoing — fretting that he could not do it, fretting that he had done it.

By this time he seldom knew any of us who were about him, but took us all for strangers. This happened first with his sister, then with me, and finally with his servant. Such an alienation distressed me more than any other instance of his decay: though I knew that he had not really withdrawn his affection from me, yet his air and mode of addressing me gave me constantly that feeling. So much the more affecting was it, when the sanity of his perceptions and his remembrances returned; but these intervals were of slower and slower occurrence. In this condition, silent or babbling childishly, self-involved and torpidly abstracted, or else busy with self-created phantoms and delusions, what a contrast did he offer to *that* Kant who had once been the brilliant centre of the most brilliant circles for rank, wit, or knowledge, that Prussia afforded! A distinguished person from Berlin, who had called upon him during the preceding summer, was greatly shocked at his appearance, and said, ‘This is not Kant that I have seen, but the shell of Kant!’ How much more would he have said this, if he had seen him now!

Now came February, 1804, which was the last month that Kant was destined to see. It is remarkable that, in the memorandum book which I have before mentioned, I found a fragment of an old song, (inserted by Kant, and dated in the summer about six months before the time of his death,) which expressed that February was the month in which people had the least weight to carry, for the obvious reason that it was shorter by two and by three days than the others; and the concluding sentiment was in a tone of fanciful pathos to this effect— ‘Oh, happy February! in which man has least to bear — least pain, least sorrow,

least self-reproach!' Even of this short month, however, Kant had not twelve entire days to bear; for it was on the 12th that he died; and in fact he may be said to have been dying from the 1st. He now barely vegetated; though there were still transitory gleams flashing by fits from the embers of his ancient intellect.

On the 3d of February the springs of life seemed to be ceasing from their play, for, from this day, strictly speaking, he ate nothing more. His existence henceforward seemed to be the mere prolongation of an impetus derived from an eighty years' life, after the moving power of the mechanism was withdrawn. His physician visited him every day at a particular hour; and it was settled that I should always be there to meet him. Nine days before his death, on paying his usual visit, the following little circumstance occurred, which affected us both, by recalling forcibly to our minds the ineradicable courtesy and goodness of Kant's nature. When the physician was announced, I went up to Kant and said to him, 'Here is Dr. A —— .' Kant rose from his chair, and, offering his hand to the Doctor, murmured something in which the word 'posts' was frequently repeated, but with an air as though he wished to be helped out with the rest of the sentence. Dr. A —— , who thought that, by *posts*, he meant the stations for relays of post-horses, and therefore that his mind was wandering, replied that all the horses were engaged, and begged him to compose himself. But Kant went on, with great effort to himself, and added— 'Many posts, heavy posts — then much goodness — then much gratitude.' All this he said with apparent incoherence, but with great warmth, and increasing self-possession. I meantime perfectly divined what it was that Kant, under his cloud of imbecility, wished to say, and I interpreted accordingly. 'What the Professor wishes to say, Dr. A —— , is this, that, considering the many and weighty offices which you fill in the city and in the university, it argues great goodness on your part to give up so much of your time to him,' (for Dr. A —— would never take any fees from Kant;) 'and that he has the deepest sense of this goodness.' 'Right,' said Kant, earnestly, 'right!' But he still continued to stand, and was nearly sinking to the ground. Upon which I remarked to the physician, that I was so well acquainted with Kant, that I was satisfied he would not sit down, however much he suffered from standing, until he knew that his visitors were seated. The Doctor seemed to doubt this — but Kant, who heard what I said, by a prodigious effort confirmed my construction of his conduct, and spoke distinctly these words— 'God forbid I should be sunk so low as to forget the offices of humanity.'

When dinner was announced, Dr. A —— took his leave. Another guest had now arrived, and I was in hopes, from the animation which Kant had so recently displayed, that we should to-day have a pleasant party, but my hopes were vain — Kant was more than usually exhausted, and though he raised a spoon to his mouth, he swallowed nothing. For some time everything had been tasteless to him; and I had endeavored, but with little success, to stimulate the organs of taste by nutmeg, cinnamon, &c. To-day all failed, and I could not even prevail upon him to taste a biscuit, rusk, or anything of that sort. I had once heard him say that several of his friends, who had died of *marasmus,* had closed their illness by four or five days of entire freedom from pain, but totally without appetite, and then slumbered tranquilly away. Through this state I apprehended that he was himself now passing.

Saturday, the 4th of February, I heard his guests loudly expressing their fears that they should never meet him again; and I could not but share these fears myself. However, on

Sunday, the 5th, I dined at his table in company with his particular friend Mr. R. R. V. Kant was still present, but so weak that his head drooped upon his knees, and he sank down against the right side of the chair. I went and arranged his pillows so as to raise and support his head; and, having done this, I said— 'Now, my dear Sir, you are again in right order.' Great was our astonishment when he answered clearly and audibly in the Roman military phrase— 'Yes, *testudine et facie;*' and immediately after added, 'Ready for the enemy, and in battle array.' His powers of mind were (if I may be allowed that expression) smouldering away in their ashes; but every now and then some lambent flame, or grand emanation of light, shot forth to make it evident that the ancient fire still slumbered below.

Monday, the 6th, he was much weaker and more torpid: he spoke not a word, except on the occasion of my question about the Moors, as previously stated, and sate with sightless eyes, lost in himself, and manifesting no sense of our presence, so that we had the feeling of some mighty shade or phantom from some forgotten century being seated amongst us.

About this time, Kant had become much more tranquil and composed. In the earlier periods of his illness, when his yet unbroken strength was brought into active contest with the first attacks of decay, he was apt to be peevish, and sometimes spoke roughly or even harshly to his servants. This, though very opposite to his natural disposition, was altogether excusable under the circumstances. He could not make himself understood: things were therefore brought to him continually which he had not asked for; and often it happened that what he really wanted he could not obtain, because all his efforts to name it were unintelligible. A violent nervous irritation, besides, affected him from the unsettling of the equilibrium in the different functions of his nature; weakness in one organ being made more palpable to him by disproportionate strength in another. But now the strife was over; the whole system was at length undermined, and in rapid and harmonious progress to dissolution. And from this time forward, no movement of impatience, or expression of fretfulness, ever escaped him.

I now visited him three times a-day; and on

Tuesday, Feb. 7th, going about dinner-time, I found the usual party of friends sitting down alone; for Kant was in bed. This was a new scene in his house, and increased our fears that his end was now at hand. However, having seen him rally so often, I would not run the risk of leaving him without a dinner-party for the next day; and accordingly, at the customary hour of one, we assembled in his house on

Wednesday, Feb. 8th. I paid my respects to him as cheerfully as possible, and ordered dinner to be served up. Kant sat at the table with us; and, taking a spoon with a little soup in it, put it to his lips; but immediately put it down again, and retired to bed, from which he never rose again, except during the few minutes when it was re-arranged.

Thursday, the 9th, he had sunk into the weakness of a dying person, and the corpse-like appearance had already taken possession of him. I visited him frequently through the day; and, going at ten o’clock at night, I found him in a state of insensibility. I could not draw any sign from him that he knew me, and I left him to the care of his sister and his servant.

Friday, the 10th, I went to see him at six o’clock in the morning. It was very stormy, and a deep snow had fallen in the night-time. And, by the way, I remember that a gang of house-breakers had forced their way through the premises in order to reach Kant’s next neighbor, who was a goldsmith. As I drew near to his bed-side, I said, ‘Good morning.’ He returned my salutation by saying, ‘Good morning,’ but in so feeble and faltering a voice that it was hardly articulate. I was rejoiced to find him sensible, and I asked him if he knew me:— ‘Yes,’ he replied; and, stretching out his hand, touched me gently upon the cheek. Through the rest of the day, whenever I visited him, he seemed to have relapsed into a state of insensibility.

Saturday, the 11th, he lay with fixed and rayless eyes; but to all appearance in perfect peace. I asked him again, on this day, if he knew me. He was speechless, but he turned his face towards me and made signs that I should kiss him. Deep emotion thrilled me, as I stooped down to kiss his pallid lips; for I knew that in this solemn act of tenderness he meant to express his thankfulness for our long friendship, and to signify his affection and his last farewell. I had never seen him confer this mark of his love upon anybody, except once, and that was a few weeks before his death, when he drew his sister to him and kissed her. The kiss which he now gave to me was the last memorial that he knew me.

Whatever fluid was now offered to him passed the oesophagus with a rattling sound, as often happens with dying people; and there were all the signs of death being close at hand.

I wished to stay with him till all was over; and as I had been witness of his life, to be witness also of his departure; and therefore I never quitted him except when I was called off for a few minutes to attend

some private business. The whole of this night I spent at his bed-side. Though he had passed the day in a state of insensibility, yet in the evening he made intelligible signs that he wished to have his bed put in order; he was therefore lifted out in our arms, and the bed-clothes and pillows being hastily arranged, he was carried back again. He did not sleep; and a spoonful of liquid, which was sometimes put to his lips, he usually pushed aside; but about one o'clock in the night he himself made a motion towards the spoon, from which I collected that he was thirsty; and I gave him a small quantity of wine and water sweetened; but the muscles of his mouth had not strength enough to retain it, so that to prevent its flowing back he raised his hand to his lips, until with a rattling sound it was swallowed. He seemed to wish for more; and I continued to give him more, until he said, in a way that I was just able to understand,— 'It is enough.' And these were his last words. At intervals he pushed away the bed-clothes, and exposed his person; I constantly restored the clothes to their situation, and on one of these occasions I found that the whole body and extremities were already growing cold, and the pulse intermitting.

At a quarter after three o'clock on Sunday morning, February 12, Kant stretched himself out as if taking a position for his final act, and settled into the precise posture which he preserved to the moment of death. The pulse was now no longer perceptible to the touch in his hands, feet or neck. I tried every part where a pulse beats, and found none anywhere but in the left hip, where it beat with violence, but often intermitted.

About ten o'clock in the forenoon he suffered a remarkable change; his eye was rigid and his face and lips became discolored by a cadaverous pallor. Still, such was the effect of his previous habits, that no trace appeared of the cold sweat which naturally accompanies the last mortal agony.

It was near eleven o'clock when the moment of dissolution approached. His sister was standing at the foot of the bed, his sister's son at the head. I, for the purpose of still observing the fluctuations of the pulse in his hip, was kneeling at the bed-side; and I called his servant to come and witness the death of his good master. Now began the last agony, if to him it could be called an agony, where there seemed to be no struggle. And precisely at this moment, his distinguished friend, Mr. R. R. V., whom I had summoned by a messenger, entered the room. First of all, the breath grew feebler; then it missed its regularity of return; then it wholly intermitted, and the upper lip was slightly convulsed; after this there followed one slight respiration or sigh; and after that no more; but the pulse still beat for a few seconds — slower and fainter, till it ceased altogether; the mechanism stopped; the last motion was at an end; and exactly at that moment the clock struck eleven.

Soon after his death the head of Kant was shaved; and, under the direction of Professor Knorr, a plaster cast was taken, not a masque merely, but a cast of the whole bead, designed (I believe) to enrich the craniological collection of Dr. Gall.

The corpse being laid out and properly attired, immense numbers of people of every rank, from the highest to the lowest, flocked to see it. Everybody was anxious to make use of the last opportunity he would have for entitling himself to say— 'I too have seen Kant.' This went on for many days — during which, from morning to night, the house was thronged with the public. Great was the astonishment of all people at the meagreness of Kant's appearance; and it was universally agreed that a corpse so wasted and fleshless had never been beheld. His head rested upon the same cushion on which once the gentlemen of the university had presented an address to him; and I thought that I could not apply it to a more honorable purpose than by placing it in the coffin, as the final pillow of that immortal head.

Upon the style and mode of his funeral, Kant had expressed his wishes in earlier years in a separate memorandum. He there desired that it should take place early in the morning, with as little noise and disturbance as possible, and attended only by a few of his most intimate friends. Happening to meet with this memorandum, whilst I was engaged at his request in arranging his papers, I very frankly gave him my opinion, that such an injunction would lay me, as the executor of his will, under great embarrassments; for that circumstances might very probably arise under which it would be next to impossible to carry it into effect. Upon this Kant tore the paper, and left the whole to my own discretion. The fact was, I foresaw that

the students of the University would never allow themselves to be robbed of this occasion for expressing their veneration by a public funeral. The event showed that I was right; for a funeral such as Kant's, one so solemn and so magnificent, the city of Königsberg has never witnessed before or since. The public journals, and separate accounts in pamphlets, etc., have given so minute an account of its details, that I shall here notice only the heads of the ceremony.

On the 28th of February, at two o'clock in the afternoon, all the dignitaries of church and state, not only those resident in Königsberg, but from the remotest parts of Prussia, assembled in the church of the Castle. Hence they were escorted by the whole body of the University, splendidly dressed for the occasion, and by many military officers of rank, with whom Kant had always been a great favorite, to the house of the deceased Professor; from which the corpse was carried by torch-light, the bells of every church in Königsberg tolling, to the Cathedral which was lit up by innumerable wax-lights. A never-ending train of many thousand persons followed it on foot. In the Cathedral, after the usual burial rites, accompanied with every possible expression of national veneration to the deceased, there was a grand musical service, most admirably performed, at the close of which Kant's mortal remains were lowered into the academic vault, where he now rests among the ancient patriarchs of the University. PEACE BE TO HIS DUST, AND EVERLASTING HONOR!

AN OUTLINE OF THE HISTORY OF CHRISTIAN THOUGHT SINCE KANT by Edward Caldwell Moore

CONTENTS

PREFATORY NOTE
CHAPTER I. A. INTRODUCTION
CHAPTER II. IDEALISTIC PHILOSOPHY
CHAPTER III. THEOLOGICAL RECONSTRUCTION
CHAPTER IV. THE CRITICAL AND HISTORICAL MOVEMENT
CHAPTER V. THE CONTRIBUTION OF THE NATURAL AND SOCIAL SCIENCES
CHAPTER VI. THE ENGLISH-SPEAKING PEOPLES: ACTION AND REACTION

PREFATORY NOTE

It is hoped that this book may serve as an outline for a larger work, in which the Judgments here expressed may be supported in detail. Especially, the author desires to treat the literature of the social question and of the modernist movement with a fulness which has not been possible within the limits of this sketch. The philosophy of religion and the history of religions should have place, as also that estimate of the essence of Christianity which is suggested by the contact of Christianity with the living religions of the Orient.

PASQUE ISLAND, MASS.,
July 28, 1911.

CHAPTER I. A. INTRODUCTION

The Protestant Reformation marked an era both in life and thought for the modern world. It ushered in a revolution in Europe. It established distinctions and initiated tendencies which are still significant. These distinctions have been significant not for Europe alone. They have had influence also upon those continents which since the Reformation have come under the dominion of Europeans. Yet few would now regard the Reformation as epoch-making in the sense in which that pre-eminence has been claimed. No one now esteems that it separates the modern from the mediæval and ancient world in the manner once supposed. The perspective of history makes it evident that large areas of life and thought remained then untouched by the new spirit. Assumptions which had their origin in feudal or even in classical culture continued unquestioned. More than this, impulses in rational life and in the interpretation of religion, which showed themselves with clearness in one and another of the reformers themselves, were lost sight of, if not actually repudiated, by their successors. It is possible to view many things in the intellectual and religious life of the nineteenth century, even some which Protestants have passionately reprobated, as but the taking up again of clues which the reformers had let fall, the carrying out of purposes of their movement which were partly hidden from themselves.

Men have asserted that the Renaissance inaugurated a period of paganism. They have gloried that there supervened upon this paganism the religious revival which the Reformation was. Even these men will, however, not deny that it was the intellectual rejuvenation which made the religious reformation possible or, at all events, effective. Nor can it be denied that after the Revolution, in the Protestant communities the intellectual element was thrust into the background. The practical and devotional prevailed. Humanism was for a time shut out. There was more room for it in the Roman Church than among Protestants. Again, the Renaissance itself had been not so much an era of discovery of a new intellectual and spiritual world. It had been, rather, the rediscovery of valid principles of life in an ancient culture and civilisation. That thorough-going review of the principles at the basis of all relations of the life of man, which once seemed possible to Renaissance and Reformation, was postponed to a much later date. When it did take place, it was under far different auspices.

There is a remarkable unity in the history of Protestant thought in the period from the Reformation to the end of the eighteenth century. There is a still more surprising unity of Protestant thought in this period with the thought of the mediæval and ancient Church. The basis and methods are the same. Upon many points the conclusions are identical. There was nothing of which the Protestant scholastics were more proud than of their agreement with the Fathers of the early Church. They did not perceive in how large degree they were at one with Christian thinkers of the Roman communion as well. Few seem to have realised how largely Catholic in principle Protestant thought has been. The fundamental principles at the basis of the reasoning have been the same. The notions of revelation and inspiration were identical. The idea of authority was common to both, only the instance in which that authority is lodged was different. The thoughts of God and man, of the world, of creation, of providence and prayer, of the nature and means of salvation, are similar. Newman was right in discovering that from the first he had thought, only and always, in what he called Catholic terms. It was veiled from him that many of those who ardently opposed him thought in those same terms.

It is impossible to write upon the theme which this book sets itself without using the terms Catholic and Protestant in the conventional sense. The words stand for certain historic magnitudes. It is equally impossible to conceal from ourselves how misleading the language often is. The line between that which has been happily called the religion of authority and the religion of the spirit does not run between

Catholic and Protestant. It runs through the middle of many Protestant bodies, through the border only of some, and who will say that the Roman Church knows nothing of this contrast? The sole use of recurrence here to the historic distinction is to emphasise the fact that this distinction stands for less than has commonly been supposed. In a large way the history of Christian thought, from earliest times to the end of the eighteenth century, presents a very striking unity.

In contrast with this, that modern reflection which has taken the phenomenon known as religion and, specifically, that historic form of religion known as Christianity, as its object, has indeed also slowly revealed the fact that it is in possession of certain principles. Furthermore, these principles, as they have emerged, have been felt to be new and distinctive principles. They are essentially modern principles. They are the principles which, taken together, differentiate the thinker of the nineteenth century from all who have ever been before him. They are principles which unite all thinkers at the end of the nineteenth and the beginning of the twentieth centuries, in practically every portion of the world, as they think of all subjects except religion. It comes more and more to be felt that these principles must be reckoned with in our thought concerning religion as well.

One of these principles is, for example, that of dealing in true critical fashion with problems of history and literature. Long before the end of the age of rationalism, this principle had been applied to literature and history, other than those called sacred. The thorough going application of this scientific method to the literatures and history of the Old and New Testaments is almost wholly an achievement of the nineteenth century. It has completely altered the view of revelation and inspiration. The altered view of the nature of the documents of revelation has had immeasurable consequences for dogma.

Another of these elements is the new view of nature and of man’s relation to nature. Certain notable discoveries in physics and astronomy had proved possible of combination with traditional religion, as in the case of Newton. Or again, they had proved impossible of combination with any religion, as in the case of Laplace. The review of the religious and Christian problem in the light of the ever increasing volume of scientific discoveries — this is the new thing in the period which we have undertaken to describe. A theory of nature as a totality, in which man, not merely as physical, but even also as social and moral and religious being, has place in a series which suggests no break, has affected the doctrines of God and of man in a way which neither those who revered nor those who repudiated religion at the beginning of the nineteenth century could have imagined.

Another leading principle grows out of Kant’s distinction of two worlds and two orders of reason. That distinction issued in a new theory of knowledge. It laid a new foundation for an idealistic construing of the universe. In one way it was the answer of a profoundly religious nature to the triviality and effrontery into which the great rationalistic movement had run out. By it the philosopher gave standing forever to much that prophets and mystics in every age had felt to be true, yet had never been able to prove by any method which the ordered reasoning of man had provided. Religion as feeling regained its place. Ethics was set once more in the light of the eternal. The soul of man became the object of a scientific study.

There have been thus indicated three, at least, of the larger factors which enter into an interpretation of Christianity which may fairly be said to be new in the nineteenth century. They are new in a sense in which the intellectual elements entering into the reconsideration of Christianity in the age of the Reformation were not new. They are characteristic of the nineteenth century. They would naturally issue in an interpretation of Christianity in the general context of the life and thought of that century. The philosophical revolution inaugurated by Kant, with the general drift toward monism in the interpretation of the universe, separates from their forebears men who have lived since Kant, by a greater interval than that which divided Kant from Plato. The evolutionary view of nature, as developed from Schelling and Comte through Darwin to Bergson, divides men now living from the contemporaries of Kant in his youthful studies of nature, as those men were not divided from the followers of Aristotle.

Of purpose, the phrase Christian thought has been interpreted as thought concerning Christianity. The

problem which this book essays is that of an outline of the history of the thought which has been devoted, during this period of marvellous progress, to that particular object in consciousness and history which is known as Christianity. Christianity, as object of the philosophical, critical, and scientific reflection of the age — this it is which we propose to consider. Our religion as affected in its interpretation by principles of thought which are already widespread, and bid fair to become universal among educated men — this it is which in this little volume we aim to discuss. The term religious thought has not always had this significance. Philosophy of religion has signified, often, a philosophising of which religion was, so to say, the atmosphere. We cannot wonder if, in these circumstances, to the minds of some, the atmosphere has seemed to hinder clearness of vision. The whole subject of the philosophy of religion has within the last few decades undergone a revival, since it has been accepted that the aim is not to philosophise upon things in general in a religious spirit. On the contrary, the aim is to consider religion itself, with the best aid which current philosophy and science afford. In this sense only can we give the study of religion and Christianity a place among the sciences.

It remains true, now as always, that the majority, at all events, of those who have thought profoundly concerning Christianity will be found to have been Christian men. Religion is a form of consciousness. It will be those who have had experience to which that consciousness corresponds, whose judgments can be supposed to have weight. That remark is true, for example, of æsthetic matters as well. To be a good judge of music one must have musical feeling and experience. To speak with any deeper reasonableness concerning faith, one must have faith. To think profoundly concerning Christianity one needs to have had the Christian experience. But this is very different from saying that to speak worthily of the Christian religion, one must needs have made his own the statements of religion which men of a former generation may have found serviceable. The distinction between religion itself, on the one hand, and the expression of religion in doctrines and rites, or the application of religion through institutions, on the other hand, is in itself one of the great achievements of the nineteenth century. It is one which separates us from Christian men in previous centuries as markedly as it does any other. It is a simple implication of the Kantian theory of knowledge. The evidence for its validity has come through the application of historical criticism to all the creeds. Mystics of all ages have seen the truth from far. The fact that we may assume the prevalence of this distinction among Christian men, and lay it at the base of the discussion we propose, is assuredly one of the gains which the nineteenth century has to record.

It follows that not all of the thinkers with whom we have to deal will have been, in their own time, of the number of avowedly Christian men. Some who have greatly furthered movements which in the end proved fruitful for Christian thought, have been men who in their own time alienated from professed and official religion. In the retrospect we must often feel that their opposition to that which they took to be religion was justifiable. Yet their identification of that with religion itself, and their frank declaration of what they called their own irreligion, was often a mistake. It was a mistake to which both they and their opponents in due proportion contributed. A still larger class of those with whom we have to do have indeed asserted for themselves a personal adherence to Christianity. But their identification with Christianity, or with a particular Christian Church, has been often bitterly denied by those who bore official responsibility in the Church. The heresy of one generation is the orthodoxy of the next. There is something perverse in Gottfried Arnold’s maxim, that the true Church, in any age, is to be found with those who have just been excommunicated from the actual Church. However, the maxim points in the direction of a truth. By far the larger part of those with whom we have to do have had acknowledged relation to the Christian tradition and institution. They were Christians and, at the same time, true children of the intellectual life of their own age. They esteemed it not merely their privilege, but also their duty, to endeavour to ponder anew the religious and Christian problem, and to state that which they thought in a manner congruous with the thoughts which the men of the age would naturally have concerning other themes.

It has been to most of these men axiomatic that doctrine has only relative truth. Doctrine is but a composite of the content of the religious consciousness with materials which the intellect of a given man or age or nation in the total view of life affords. As such, doctrine is necessary and inevitable for all those who in any measure live the life of the mind. But the condition of doctrine is its mobile, its fluid and changing character. It is the combination of a more or less stable and characteristic experience, with a reflection which, exactly in proportion as it is genuine, is transformed from age to age, is modified by qualities of race and, in the last analysis, differs with individual men. Dogma is that portion of doctrine which has been elevated by decree of ecclesiastical authority, or even only by common consent, into an absoluteness which is altogether foreign to its nature. It is that part of doctrine concerning which men have forgotten that it had a history, and have decided that it shall have no more. In its very notion dogma confounds a statement of truth, which must of necessity be human, with the truth itself, which is divine. In its identification of statement and truth it demands credence instead of faith. Men have confounded doctrine and dogma; they have been taught so to do. They have felt the history of Christian doctrine to be an unfruitful and uninteresting theme. But the history of Christian thought would seek to set forth the series of interpretations put, by successive generations, upon the greatest of all human experiences, the experience of the communion of men with God. These interpretations ray out at all edges into the general intellectual life of the age. They draw one whole set of their formative impulses from the general intellectual life of the age. It is this relation of the progress of doctrine to the general history of thought in the nineteenth century, which the writer designed to emphasise in choosing the title of this work.

As was indicated in the closing paragraphs of the preceding volume of this series, the issue of the age of rationalism had been for the cause of religion on the whole a distressing one. The majority of those who were resolved to follow reason were agreed in abjuring religion. That they had, as it seems to us, but a meagre understanding of what religion is, made little difference in their conclusion. Bishop Butler complains in his *Analogy* that religion was in his time hardly considered a subject for discussion among reasonable men. Schleiermacher in the very title of his *Discourses* makes it plain that in Germany the situation was not different. If the reasonable eschewed religious protests in Germany, evangelicals in England, the men of the great revivals in America, many of them, took up a corresponding position as towards the life of reason, especially toward the use of reason in religion. The sinister cast which the word rationalism bears in much of the popular speech is evidence of this fact. To many minds it appeared as if one could not be an adherent both of reason and of faith. That was a contradiction which Kant, first of all in his own experience, and then through his system of thought, did much to transcend. The deliverance which he wrought has been compared to the deliverance which Luther in his time achieved for those who had been in bondage to scholasticism in the Roman Church. Although Kant has been dead a hundred years, both the defence of religion and the assertion of the right of reason are still, with many, on the ancient lines. There is no such strife between rationality and belief as has been supposed. But the confidence of that fact is still far from being shared by all Christians at the beginning of the twentieth century. The course in reinterpretation and readjustment of Christianity, which that calm conviction would imply, is still far from being the one taken by all of those who bear the Christian name. If it is permissible in the writing of a book like this to have an aim besides that of the most objective delineation, the author may perhaps be permitted to say that he writes with the earnest hope that in some measure he may contribute also to the establishment of an understanding upon which so much both for the Church and the world depends.

We should say a word at this point as to the general relation of religion and philosophy. We realise the evil which Kant first in clearness pointed out. It was the evil of an apprehension which made the study of religion a department of metaphysics. The tendency of that apprehension was to do but scant justice to the historical content of Christianity. Religion is an historical phenomenon. Especially is this true of Christianity. It is a fact, or rather, a vast complex of facts. It is a positive religion. It is connected with

personalities, above all with one transcendent personality, that of Jesus. It sprang out of another religion which had already emerged into the light of world-history. It has been associated for two thousand years with portions of the race which have made achievements in culture and left record of those achievements. It is the function of speculation to interpret this phenomenon. When speculation is tempted to spin by its own processes something which it would set beside this historic magnitude or put in place of it, and still call that Christianity, we must disallow the claim. It was the licence of its speculative endeavour, and the identification of these endeavours with Christianity, which finally discredited Hegelianism with religious men. Nor can it be denied that theologians themselves have been sinners in this respect. The disposition to regard Christianity as a revealed and divinely authoritative metaphysic began early and continued long. When the theologians also set out to interpret Christianity and end in offering us a substitute, which, if it were acknowledged as absolute truth, would do away with Christianity as historic fact, as little can we allow the claim.

Again, Christianity exists not merely as a matter of history. It exists also as a fact in living consciousness. It is the function of psychology to investigate that consciousness. We must say that, accurately speaking, there is no such thing as Christian philosophy. There are philosophies, good or bad, current or obsolete. These are Christian only in being applied to the history of Christianity and the content of the Christian consciousness. There is, strictly speaking, no such thing as Christian consciousness. There is the human consciousness, operating with and operated upon by the impulse of Christianity. It is the great human experience from which we single out for investigation that part which is concerned with religion, and call that the religious experience. It is essential, therefore, that those general investigations of human consciousness and experience, as such, which are being carried on all about us should be reckoned with, if our Christian life and thought are not altogether to fall out of touch with advancing knowledge. For this reason we have misgiving about the position of some followers of Ritschl. Their opinion, pushed to the limit, seems to mean that we have nothing to do with philosophy, or with the advance of science. Religion is a feeling of which he alone who possesses it can give account. He alone who has it can appreciate such an account when given. We acknowledge that religion is in part a feeling. But that feeling must have rational justification. It must also have rational guidance if it is to be saved from degenerating into fanaticism.

To say that we have nothing to do with philosophy ends in our having to do with a bad philosophy. In that case we have a philosophy with which we operate without having investigated it, instead of having one with which we operate because we have investigated it. The philosophy of which we are aware we have. The philosophy of which we are not aware has us. No doubt, we may have religion without philosophy, but we cannot formulate it even in the rudest way to ourselves, we cannot communicate it in any way whatsoever to others, except in the terms of a philosophy. In the general sense in which every man has a philosophy, this is merely the deposit of the regnant notions of the time. It may be amended or superseded, and our theology with it. Yet while it lasts it is our one possible vehicle of expression. It is the interpreter and the critique of what we have experienced. It is not open to a man to retreat within himself and say, I am a Christian, I feel thus, I think so, these thoughts are the content of Christianity. The consequence of that position is that we make the religious experience to be no part of the normal human experience. If we contend that the being a Christian is the great human experience, that the religious life is the true human life, we must pursue the opposite course. We must make the religious life coherent with all the other phases and elements of life. If we would contend that religious thought is the truest and deepest thought, we must begin at this very point. We must make it conform absolutely to the laws of all other thought. To contend for its isolation, as an area by itself and a process subject only to its own laws, is to court the judgment of men, that in its zeal to be Christian it has ceased to be thought.

Our most profitable mode of procedure would seem to be this. We shall seek to follow, as we may,

those few main movements of thought marking the nineteenth century which have immediate bearing upon our theme. We shall try to register the effect which these movements have had upon religious conceptions. It will not be possible at any point to do more than to select typical examples. Perhaps the true method is that we should go back to the beginnings of each one of these movements. We should mark the emergence of a few great ideas. It is the emergence of an idea which is dramatically interesting. It is the moment of emergence in which that which is characteristic appears. Our subject is far too complicated to permit that the ramifications of these influences should be followed in detail. Modifications, subtractions, additions, the reader must make for himself.

These main movements of thought are, as has been said, three in number. We shall take them in their chronological order. There is first the philosophical revolution which is commonly associated with the name of Kant. If we were to seek with arbitrary exactitude to fix a date for the beginning of this movement, this might be the year of the publication of his first great work, *Kritik der reinen Vernunft*, in 1781. Kant was indeed himself, both intellectually and spiritually, the product of tendencies which had long been gathering strength. He was the exponent of ideas which in fragmentary way had been expressed by others, but he gathered into himself in amazing fashion the impulses of his age. Out from some portion of his works lead almost all the paths which philosophical thinkers since his time have trod. One cannot say even of his work, *Der Religion innerhalb der Grenzen der blossen Vernunft*, 1793, that it is the sole source, or even the greatest source, of his influence upon religious thinking. But from the body of his work as a whole, there came a new theory of knowledge which has changed completely the notion of revelation. There came also a view of the universe as an ideal unity which, especially as elaborated by Fichte, Schelling and Hegel, has radically altered the traditional ideas of God, of man, of nature and of their relations, the one to the other.

Footnote 1:(return)

In the text the titles of books which are discussed are given for the first time in the language in which they are written. Books which are merely alluded to are mentioned in English.

We shall have then, secondly, to note the historical and critical movement. It is the effort to apply consistently and without fear the maxims of historical and literary criticism to the documents of the Old and New Testaments. With still greater arbitrariness, and yet with appreciation of the significance of Strauss' endeavour, we might set as the date of the full impact of this movement upon cherished religious convictions, that of the publication of his *Leben Jesu*, 1835. This movement has supported with abundant evidence the insight of the philosophers as to the nature of revelation. It has shown that that which we actually have in the Scriptures is just that which Kant, with his reverence for the freedom of the human mind, had indicated that we must have, if revelation is to be believed in at all. With this changed view has come an altered attitude toward many statements which devout men had held that they must accept as true, because these were found in Scripture. With this changed view the whole history, whether of the Jewish people or of Jesus and the origins of the Christian Church, has been set in a new light.

In the third place, we shall have to deal with the influence of the sciences of nature and of society, as these have been developed throughout the whole course of the nineteenth century. If one must have a date for an outstanding event in this portion of the history, perhaps that of the publication of Darwin's *Origin of Species*, 1859, would serve as well as any other. The principles of these sciences have come to underlie in a great measure all the reflection of cultivated men in our time. In amazing degree they have percolated, through elementary instruction, through popular literature, and through the newspapers, to the masses of mankind. They are recognised as the basis of a triumphant material civilisation, which has made everything pertaining to the inner and spiritual life seem remote. Through the social sciences there has come an impulse to the transfer of emphasis from the individual to society, the disposition to see everything in its social bearing, to do everything in the light of its social antecedents and of its social consequences. Here again we have to note the profoundest influence upon religious conceptions. The very

notion connected with the words redemption and salvation appears to have been changed.

In the case of each of these particular movements the church, as the organ of Christianity, has passed through a period of antagonism to these influences, of fear of their consequences, of resistance to their progress. In large portions of the church at the present moment the protest is renewed. The substance of these modern teachings, which yet seem to be the very warp and woof of the intellectual life of the modern man, is repudiated and denounced. It is held to imperil the salvation of the soul. It is pronounced impossible of combination with belief in a divinely revealed truth concerning the universe and a saving faith for men. In other churches, outside the churches, the forms in which men hold their Christianity have been in large measure adjusted to the results of these great movements of thought. They have, as these men themselves believe, been immensely strengthened and made sure by those very influences which were once considered dangerous.

In connection with this indication of the nature of our materials, we have sought to say something of the time of emergence of the salient elements. It may be in point also to give some intimation of the place of their origins, that is to say, of the participation of the various nationalities in this common task of the modern Christian world. That international quality of scholarship which seems to us natural, is a thing of very recent date. That a discovery should within a reasonable interval become the property of all educated men, that scholars of one nation should profit by that which the learned of another land have done, appears to us a thing to be assumed. It has not always been so, especially not in matters of religious faith. The Roman Church and the Latin language gave to medieval Christian thought a certain international character. Again the Renaissance and Reformation had a certain world wide quality. The relations of the English Church in the reigns of the last Tudors to Germany, Switzerland, and France are not to be forgotten. But the life of the Protestant national churches in the eighteenth century shows little of this trait. The barriers of language counted for something. The provincialism of national churches and denominational predilections counted for more.

In the philosophical movement we must begin with the Germans. The movement of English thought known as deism was a distinct forerunner of the rationalist movement, within the particular area of the discussion of religion. However, it ran into the sand. The rationalist movement, considered in its other aspects, never attained in England in the eighteenth century the proportions which it assumed in France and Germany. In France that movement ran its full course, both among the learned and, equally, as a radical and revolutionary influence among the unlearned. It had momentous practical consequences. In no sphere was it more radical than in that of religion. Not in vain had Voltaire for years cried, '*Écrasez l'infâme*,' and Rousseau preached that the youth would all be wise and pure, if only the kind of education which he had had in the religious schools were made impossible. There was for many minds no alternative between clericalism and atheism. Quite logically, therefore, after the downfall of the Republic and of the Empire there set in a great reaction. Still it was simply a reversion to the absolute religion of the Roman Catholic Church as set forth by the Jesuit party. There was no real transcending of the rationalist movement in France in the interest of religion. There has been no great constructive movement in religious thought in France in the nineteenth century. There is relatively little literature of our subject in the French language until recent years.

In Germany, on the other hand, the rationalist movement had always had over against it the great foil and counterpoise of the pietist movement. Rationalism ran a much soberer course than in France. It was never a revolutionary and destructive movement as in France. It was not a dilettante and aristocratic movement as deism had been in England. It was far more creative and constructive than elsewhere. Here also before the end of the century it had run its course. Yet here the men who transcended the rationalist movement and shaped the spiritual revival in the beginning of the nineteenth century were men who had themselves been trained in the bosom of the rationalist movement. They had appropriated the benefits of

it. They did not represent a violent reaction against it, but a natural and inevitable progress within and beyond it. This it was which gave to the Germans their leadership at the beginning of the nineteenth century in the sphere of the intellectual life. It is worthy of note that the great heroes of the intellectual life in Germany, in the period of which we speak, were most of them deeply interested in the problem of religion. The first man to bring to England the leaven of this new spirit, and therewith to transcend the old philosophical standpoint of Locke and Hume, was Coleridge with his *Aids to Reflection*, published in 1825. But even after this impulse of Coleridge the movement remained in England a sporadic and uncertain one. It had nothing of the volume and conservativeness which belonged to it in Germany.

Coleridge left among his literary remains a work published in 1840 under the title of *Confessions of an Enquiring Spirit*. What is here written is largely upon the basis of intuition and forecast like that of Remarus and Lessing a half-century earlier in Germany. Strauss and others were already at work in Germany upon the problem of the New Testament, Vatke and Reuss upon that of the Old. This was a different kind of labour, and destined to have immeasurably greater significance. George Eliot’s maiden literary labour was the translation into English of Strauss’ first edition. But the results of that criticism were only slowly appropriated by the English. The ostensible results were at first radical and subversive in the extreme. They were fiercely repudiated in Strauss’ own country. Yet in the main there was acknowledgement of the correctness of the principle for which Strauss had stood. Hardly before the decade of the sixties was that method accepted in England in any wider way, and hardly before the decade of the seventies in America. Ronan was the first to set forth, in 1863, the historical and critical problem in the new spirit, in a way that the wide public which read French understood.

When we come to speak of the scientific movement it is not easy to say where the leadership lay. Many Englishmen were in the first rank of investigators and accumulators of material. The first attempt at a systematisation of the results of the modern sciences was that of Auguste Comte in his *Philosophie Positive*. This philosophy, however, under its name of Positivism, exerted a far greater influence, both in Comte’s time and subsequently, in England than it did in France. Herbert Spencer, after the middle of the decade of the sixties, essayed to do something of the sort which Comte had attempted. He had far greater advantages for the solution of the problem. Comte’s foil in all of his discussions of religion was the Catholicism of the south of France. None the less, the religion which in his later years he created, bears striking resemblance to that which in his earlier years he had sought to destroy. Spencer’s attitude toward religion was in his earlier work one of more pronounced antagonism or, at least, of more complete agnosticism than in later days he found requisite to the maintenance of his scientific freedom and conscientiousness. Both of these men represent the effort to construe the world, including man, from the point of view of the natural and also of the social sciences, and to define the place of religion in that view of the world which is thus set forth. The fact that there had been no such philosophical readjustment in Great Britain as in Germany, made the acceptance of the evolutionary theory of the universe, which more and more the sciences enforced, slower and more difficult. The period of resistance on the part of those interested in religion extended far into the decade of the seventies.

A word may be added concerning America. The early settlers had been proud of their connection with the English universities. An extraordinary number of them, in Massachusetts at least, had been Cambridge men. Yet a tradition of learning was later developed, which was not without the traits of isolation natural in the circumstances. The residence, for a time, even of a man like Berkeley in this country, altered that but little. The clergy remained in singular degree the educated and highly influential class. The churches had developed, in consonance with their Puritan character, a theology and philosophy so portentous in their conclusions, that we can without difficulty understand the reaction which was brought about. Wesleyanism had modified it in some portions of the country, but intensified it in others. Deism apparently had had no great influence. When the rationalist movement of the old world began to make itself felt, it

was at first largely through the influence of France. The religious life of the country at the beginning of the nineteenth century was at a low ebb. Men like Belaham and Priestley were known as apostles of a freer spirit in the treatment of the problem of religion. Priestley came to Pennsylvania in his exile. In the large, however, one may say that the New England liberal movement, which came by and by to be called Unitarian, was as truly American as was the orthodoxy to which it was opposed. Channing reminds one often of Schleiermacher. There is no evidence that he had learned from Schleiermacher. The liberal movement by its very impetuosity gave a new lease of life to an orthodoxy which, without that antagonism, would sooner have waned. The great revivals, which were a benediction to the life of the country, were thought to have closer relation to the theology of those who participated in them than they had. The breach between the liberal and conservative tendencies of religious thought in this country came at a time when the philosophical reconstruction was already well under way in Europe. The debate continued until long after the biblical-critical movement was in progress. The controversy was conducted upon both sides in practically total ignorance of these facts. There are traces upon both sides of that insight which makes the mystic a discoverer in religion, before the logic known to him will sustain the conclusion which he draws. There will always be interest in the literature of a discussion conducted by reverent and, in their own way, learned and original men. Yet there is a pathos about the sturdy originality of good men expended upon a problem which had been already solved. The men in either camp proceeded from assumptions which are now impossible to the men of both. It was not until after the Civil War that American students of theology began in numbers to study in Germany. It is a much more recent thing that one may assume the immediate reading of foreign books, or boast of current contribution from American scholars to the labour of the world’s thought upon these themes.

We should make a great mistake if we supposed that the progress has been an unceasing forward movement. Quite the contrary, in every aspect of it the life of the early part of the nineteenth century presents the spectacle of a great reaction. The resurgence of old ideas and forces seems almost incredible. In the political world we are wont to attribute this fact to the disillusionment which the French Revolution had wrought, and the suffering which the Napoleonic Empire had entailed. The reaction in the world of thought, and particularly of religious thought, was, moreover, as marked as that in the world of deeds. The Roman Church profited by this swing of the pendulum in the minds of men as much as did the absolute State. Almost the first act of Pius VII. after his return to Rome in 1814, was the revival of the Society of Jesus, which had been after long agony in 1773 dissolved by the papacy itself. ‘Altar and throne’ became the watchword of an ardent attempt at restoration of all of that which millions had given their lives to do away. All too easily, one who writes in sympathy with that which is conventionally called progress may give the impression that our period is one in which movement has been all in one direction. That is far from being true. One whose very ideal of progress is that of movement in directions opposite to those we have described may well say that the nineteenth century has had its gifts for him as well. The life of mankind is too complex that one should write of it with one exclusive standard as to loss and gain. And whatever be one’s standard the facts cannot be ignored.

The France of the thirties and the forties saw a liberal movement within the Roman Church. The names of Lamennais, of Lacordaire, of Montalembert and Ozanam, the title *l’Avenir* occur to men’s minds at once. Perhaps there has never been in France a party more truly Catholic, more devout, refined and tolerant, more fitted to heal the breach between the cultivated and the Church. However, before the Second Empire, an end had been made of that. It cannot be said that the French Church exactly favoured the infallibility. It certainly did not stand against the decree as in the old days it would have done. The decree of infallibility is itself the greatest witness of the steady progress of reaction in the Roman Church. That action, theoretically at least, does away with even that measure of popular constitution in the Church to which the end of the Middle Age had held fast without wavering, which the mightiest of popes had not been able to abolish and the council of Trent had not dared earnestly to debate. Whether the decree of

1870 is viewed in the light of the *Syllabus of Errors* of 1864, and again of the *Encyclical* of 1907, or whether the encyclicals are viewed in the light of the decree, the fact remains that a power has been given to the Curia against what has come to be called Modernism such as Innocent never wielded against the heresies of his day. Meantime, so hostile are exactly those peoples among whom Roman Catholicism has had full sway, that it would almost appear that the hope of the Roman Church is in those countries in which, in the sequence of the Reformation, a religious tolerance obtains, which the Roman Church would have done everything in its power to prevent.

Again, we should deceive ourselves if we supposed that the reaction had been felt only in Roman Catholic lands. A minister of Prussia forbade Kant to speak concerning religion. The Prussia of Frederick William III. and of Frederick William IV. was almost as reactionary as if Metternich had ruled in Berlin as well as in Vienna. The history of the censorship of the press and of the repression of free thought in Germany until the year 1848 is a sad chapter. The ruling influences in the Lutheran Church in that era, practically throughout Germany, were reactionary. The universities did indeed in large measure retain their ancient freedom. But the church in which Hengstenberg could be a leader, and in which staunch seventeenth-century Lutheranism could be effectively sustained, was almost doomed to further that alienation between the life of piety and the life of learning which is so much to be deplored. In the Church the conservatives have to this moment largely triumphed. In the theological faculties of the universities the liberals in the main have held their own. The fact that both Church and faculties are functionaries of the State is often cited as sure in the end to bring about a solution of this unhappy state of things. For such a solution, it must be owned, we wait.

The England of the period after 1815 had indeed no such cause for reaction as obtained in France or even in Germany. The nation having had its Revolution in the seventeenth century escaped that of the eighteenth. Still the country was exhausted in the conflict against Napoleon. Commercial, industrial and social problems agitated it. The Church slumbered. For a time the liberal thought of England found utterance mainly through the poets. By the decade of the thirties movement had begun. The opinions of the Noetics in Oriel College, Oxford, now seem distinctly mild. They were sufficient to awaken Newman and Pusey, Froude, Keble, and the rest. Then followed the most significant ecclesiastical movement which the Church of England in the nineteenth century has seen, the Oxford or Tractarian movement, as it has been called. There was conscious recurrence of a mind like that of Newman to the Catholic position. He had never been able to conceive religion in any other terms than those of dogma, or the Christian assurance on any other basis than that of external authority. Nothing could be franker than the antagonism of the movement, from its inception, to the liberal spirit of the age. By inner logic Newman found himself at last in the Roman Church. Yet the Anglo-Catholic movement is to-day overwhelmingly in the ascendant in the English Church. The Broad Churchmen of the middle of the century have had few successors. It is the High Church which stands over against the great mass of the dissenting churches which, taken in the large, can hardly be said to be theologically more liberal than itself. It is the High Church which has showed Franciscanlike devotion in the problems of social readjustment which England to-day presents. It has shown in some part of its constituency a power of assimilation of new philosophical, critical and scientific views, which makes all comparison of it with the Roman Church misleading. And yet it remains in its own consciousness Catholic to the core.

In America also the vigour of onset of the liberalising forces at the beginning of this century tended to provoke reaction. The alarm with which the defection of so considerable a portion of the Puritan Church was viewed gave coherence to the opposition. There were those who devoutly held that the hope of religion lay in its further liberalisation. Equally there were those who deeply felt that the deliverance lay in resistance to liberalisation. One of the concrete effects of the division of the churches was the separation of the education of the clergy from the universities, the entrusting it to isolated theological schools under denominational control. The system has done less harm than might have been expected. Yet

at present there would appear to be a general movement of recurrence to the elder tradition. The maintenance of the religious life is to some extent a matter of nurture and observances, of religious habit and practice. This truth is one which liberals, in their emphasis upon liberty and the individual, are always in danger of overlooking. The great revivals of religion in this century, like those of the century previous, have been connected with a form of religious thought pronouncedly pietistic. The building up of religious institutions in the new regions of the West, and the participation of the churches of the country in missions, wear predominantly this cast. Antecedently, one might have said that the lack of ecclesiastical cohesion among the Christians of the land, the ease with which a small group might split off for the furtherance of its own particular view, would tend to liberalisation. It is doubtful whether this is true. Isolation is not necessarily a condition of progress. The emphasis upon trivial differences becomes rather a condition of their permanence. The middle of the nineteenth century in the United States was a period of intense denominationalism. That is synonymous with a period of the stagnation of Christian thought. The religion of a people absorbed in the practical is likely to be one which they at least suppose to be a practical religion. In one age the most practical thing will appear to men to be to escape hell, in another to further socialism. The need of adjustment of religion to the great intellectual life of the world comes with contact with that life. What strikes one in the survey of the religious thought of the country, by and large, for a century and a quarter, is not so much that it has been reactionary, as that it has been stationary. Almost every other aspect of the life of our country, including even that of religious life as distinguished from religious thought, has gone ahead by leaps and bounds. This it is which in a measure has created the tension which we feel.

B. THE BACKGROUND

Deism

In England before the end of the Civil War a movement for the rationalisation of religion had begun to make itself felt. It was in full force in the time of the Revolution of 1688. It had not altogether spent itself by the middle of the eighteenth century. The movement has borne the name of Deism. In so far as it had one watchword, this came to be ‘natural religion.’ The antithesis had in mind was that to revealed religion, as this had been set forth in the tradition of the Church, and particularly under the bibliolatry of the Puritans. It is a witness to the liberty of speech enjoyed by Englishmen in that day and to their interest in religion, that such a movement could have arisen largely among laymen who were often men of rank. It is an honour to the English race that, in the period of the rising might of the rational spirit throughout the western world, men should have sought at once to utilise that force for the restatement of religion. Yet one may say quite simply that this undertaking of the deists was premature. The time was not ripe for the endeavour. The rationalist movement itself needed greater breadth and deeper understanding of itself. Above all, it needed the salutary correction of opposing principles before it could avail for this delicate and difficult task. Religion is the most conservative of human interests. Rationalism would be successful in establishing a new interpretation of religion only after it had been successful in many other fields. The arguments of the deists were never successfully refuted. On the contrary, the striking thing is that their opponents, the militant divines and writings of numberless volumes of ‘Evidences for Christianity,’ had come to the same rational basis with the deists. They referred even the most subtle questions to the pure reason, as no one now would do. The deistical movement was not really defeated. It largely compelled its opponents to adopt its methods. It left a deposit which is more nearly rated at its worth at the present than it was in its own time. But it ceased to command confidence, or even interest. Samuel Johnson said, as to the publication of Bolingbroke’s work by his executor, three years after the author’s death: ‘It was a rusty

old blunderbuss, which he need not have been afraid to discharge himself, instead of leaving a half-crown to a Scotchman to let it off after his death.’

It is a great mistake, however, in describing the influence of rationalism upon Christian thought to deal mainly with deism. English deism made itself felt in France, as one may see in the case of Voltaire. Kant was at one time deeply moved by some English writers who would be assigned to this class. In a sense Kant showed traces of the deistical view to the last. The centre of the rationalistic movement had, however, long since passed from England to the Continent. The religious problem was no longer its central problem. We quite fail to appreciate what the nineteenth century owes to the eighteenth and to the rationalist movement in general, unless we view this latter in a far greater way.

Rationalism

In 1784 Kant wrote a tractate entitled, *Was ist Aufklärung?* He said: ‘Aufklärung is the advance of man beyond the stage of voluntary immaturity. By immaturity is meant a man’s inability to use his understanding except under the guidance of another. The immaturity is voluntary when the cause is not want of intelligence but of resolution. *Sapere aude!* “Dare to use thine own understanding,” is therefore the motto of free thought. If it be asked, “Do we live in a free-thinking age?” the answer is, “No, but we live in an age of free thought.” As things are at present, men in general are very far from possessing, or even from being able to acquire, the power of making a sure and right use of their own understanding without the guidance of others. On the other hand, we have clear indications that the field now lies, nevertheless, open before them, to which they can freely make their way and that the hindrances to general freedom of thought are gradually becoming less. And again he says: ‘If we wish to insure the true use of the understanding by a method which is universally valid, we must first critically examine the laws which are involved in the very nature of the understanding itself. For the knowledge of a truth which is valid for everyone is possible only when based on laws which are involved in the nature of the human mind, as such, and have not been imported into it from without through facts of experience, which must always be accidental and conditional.’

There speaks, of course, the prophet of the new age which was to transcend the old rationalist movement. Men had come to harp in complacency upon reason. They had never inquired into the nature and laws of action of the reason itself. Kant, though in fullest sympathy with its fundamental principles, was yet aware of the excesses and weaknesses in which the rationalist movement was running out. No man was ever more truly a child of rationalism. No man has ever written, to whom the human reason was more divine and inviolable. Yet no man ever had greater reserves within himself which rationalism, as it had been, had never touched. It was he, therefore, who could lay the foundations for a new and nobler philosophy for the future. The word *Aufklärung*, which the speech of the Fatherland furnished him, is a better word than ours. It is a better word than the French *l’Illuminisme*, the Enlightenment. Still we are apparently committed to the term Rationalism, although it is not an altogether fortunate designation which the English-speaking race has given to a tendency practically universal in the thinking of Europe, from about 1650 to the beginning of the nineteenth century. Historically, the rationalistic movement was the necessary preliminary for the modern period of European civilization as distinguished from the ecclesiastically and theologically determined culture which had prevailed up to that time. It marks the great cleft between the ancient and mediæval world of culture on the one hand and the modern world on the other. The Reformation had but pushed ajar the door to the modern world and then seemed in surprise and fear about to close it again. The thread of the Renaissance was taken up again only in the Enlightenment. The stream flowed underground which was yet to fertilise the modern world.

We are here mainly concerned to note the breadth and universality of the movement. It was a

transformation of culture, a change in the principles underlying civilisation, in all departments of life. It had indeed, as one of its most general traits, the antagonism to ecclesiastical and theological authority. Whatever it was doing, it was never without a sidelong glance at religion. That was because the alleged divine right of churches and states was the one might which it seemed everywhere necessary to break. The conflict with ecclesiasticism, however, was taken up also by Pietism, the other great spiritual force of the age. This was in spite of the fact that the Pietists' view of religion was the opposite of the rationalist view. Rationalism was characterised by thorough-going antagonism to supernaturalism with all its consequences. This arose from its zeal for the natural and the human, in a day when all men, defenders and assailants of religion alike, accepted the dictum that what was human could not be divine, the divine must necessarily be the opposite of the human. In reality this general trait of opposition to religion deceives us. It is superficial. In large part the rationalists were willing to leave the question of religion on one side if the ecclesiastics would let them alone. This is true in spite of the fact that the pot-house rationalism of Germany and France in the eighteenth century found the main butt of its ridicule in the priesthood and the Church. On its sober side, in the studies of scholars, in the bureaux of statesmen, in the laboratories of discoverers, it found more solid work. It accomplished results which that other trivial aspect must not hide from us.

Troeltsch first in our own day has given us a satisfactory account of the vast achievement of the movement in every department of human life. It annihilated the theological notion of the State. In the period after the Thirty Years' War men began to question what had been the purpose of it all. Diplomacy freed itself from Jesuitical and papal notions. It turned preponderantly to commercial and economic aims. A secular view of the purpose of God in history began to prevail in all classes of society. The Grand Monarque was ready to proclaim the divine right of the State which was himself. Still, not until the period of his dotage did that claim bear any relation to what even he would have called religion. Publicists, both Catholic and Protestant, sought to recur to the *lex naturæ* in contradistinction with the old *lex divina*. The natural rights of man, the rights of the people, the rationally conditioned rights of the State, a natural, prudential, utilitarian morality interested men. One of the consequences of this theory of the State was a complete alteration in the thought of the relation of State and Church. The nature of the Church itself as an empirical institution in the midst of human society was subjected to the same criticism with the State. Men saw the Church in a new light. As the State was viewed as a kind of contract in men's social interest, so the Church was regarded as but a voluntary association to care for their religious interests. It was to be judged according to the practical success with which it performed this function.

Footnote 2:(return)

Troeltsch, Art. 'Aufklärung' in Herzog-Hauck, *Realencylopädie*, 3 Aufl., Bd. ii., s. 225 f.

Then also, in the economic and social field the rational spirit made itself felt. Commerce and the growth of colonies, the extension of the middle class, the redistribution of wealth, the growth of cities, the dependence in relations of trade of one nation upon another, all these things shook the ancient organisation of society. The industrial system grew up upon the basis of a naturalistic theory of all economic relations. Unlimited freedom in labour and in the use of capital were claimed. There came a great revolution in public opinion upon all matters of morals. The ferocity of religious wars, the cruelty of religious controversies, the bigotry of the confessional, these all, which, only a generation earlier, had been taken by long-suffering humanity as if they had been matters of course, were now viewed with contrition by the more exalted spirits and with contempt and embitterment by the rest. Men said, if religion can give us not better morality than this, it is high time we looked to the natural basis of morality. Natural morality came to be the phrase ever on the lips of the leading spirits. Too frequently they had come to look askance at the morality of those who alleged a supernatural sanction for that which they at least enjoined upon others. We come in this field also, as in others, upon the assertion of the human as nobler and more beautiful than that which had by the theologians been alleged to be divine. The assertion came indeed to be made in

ribald and blasphemous forms, but it was not without a great measure of provocation.

Then there was the altered view of nature which came through the scientific discoveries of the age. Bacon, Copernicus, Kepler, Galileo, Gassendi, Newton, are the fathers of the modern sciences. These are the men who brought new worlds to our knowledge and new methods to our use. That the sun does not move about the earth, that the earth is but a speck in space, that heaven cannot be above nor hell beneath, these are thoughts which have consequences. Instead of the old deductive method, that of the mediæval Aristotelianism, which had been worse than fruitless in the study of nature, men now set out with a great enthusiasm to study facts, and to observe their laws. Modern optics, acoustics, chemistry, geology, zoology, psychology and medicine, took their rises within the period of which we speak. The influence was indescribable. Newton might maintain his own simple piety side by side, so to say, with his character, as a scientific man, though even he did not escape the accusation of being a Unitarian. In the resistance which official religion offered at every step to the advance of the sciences, it is small wonder if natures less placid found the maintenance of their ancestral faith too difficult. Natural science was deistic with Locke and Voltaire, it was pantheistic in the antique sense with Shaftesbury, it was pantheistic-mystical with Spinoza, spiritualistic with Descartes, theistic with Leibnitz, materialistic with the men of the Encyclopædia. It was orthodox with nobody. The miracle as traditionally defined became impossible. At all events it became the millstone around the neck of the apologists. The movement went to an extreme. All the evils of excess upon this side from which we since have suffered were forecast. They were in a measure called out by the evils and errors which had so long reigned upon the other side.

Again, in the field of the writing of history and of the critique of ancient literatures, the principles of rational criticism were worked out and applied in all seriousness. Then these maxims began to be applied, sometimes timidly and sometimes in scorn and shallowness, to the sacred history and literature as well. To claim, as the defenders of the faith were fain to do, that this one department of history was exempt, was only to tempt historians to say that this was equivalent to confession that we have not here to do with history at all.

Nor can we overlook the fact that the seventeenth and eighteenth centuries witnessed a great philosophical revival. Here again it is the rationalist principle which is everywhere at work. The observations upon nature, the new feeling concerning man, the vast complex of facts and impulses which we have been able in these few words to suggest, demanded a new philosophical treatment. The philosophy which now took its rise was no longer the servant of theology. It was, at most, the friend, and even possibly the enemy, of theology. Before the end of the rationalist period it was the master of theology, though often wholly indifferent to theology, exactly because of its sense of mastery. The great philosophers of the eighteenth century, Hume, Berkeley, and Kant, belong with a part only of their work and tendency to the rationalist movement. Still their work rested upon that which had already been done by Spinoza and Malebranche, by Hobbes and Leibnitz, by Descartes and Bayle, by Locke and Wolff, by Voltaire and the Encyclopædists. With all of the contrasts among these men there are common elements. There is an ever increasing antipathy to the thought of original sin and of supernatural revelation, there is the confidence of human reason, the trust in the will of man, the enthusiasm for the simple, the natural, the intelligible and practical, the hatred of what was scholastic and, above all, the repudiation of authority.

All these elements led, toward the end of the period, to the effort at the construction of a really rational theology. Leibnitz and Lessing both worked at that problem. However, not until after the labours of Kant was it possible to utilise the results of the rationalist movement for the reconstruction of theology. If evidence for this statement were wanting, it could be abundantly given from the work of Herder. He was younger than Kant, yet the latter seems to have exerted but slight influence upon him. He earnestly desired to reinterpret Christianity in the new light of his time, yet perhaps no part of his work is so futile.

Pietism

Allusion has been made to pietism. We have no need to set forth its own achievements. We must recur to it merely as one of the influences which made the transition from the century of rationalism to bear, in Germany, an aspect different from that which it bore in any other land. Pietism had at first much in common with rationalism. It shared with the latter its opposition to the whole administration of religion established by the State, its antagonism to the social distinctions which prevailed, its individualism, its emphasis upon the practical. It was part of a general religious reaction against ecclesiasticism, as were also Jansenism in France, and Methodism in England, and the Whitefieldian revival in America. But, through the character of Spener, and through the peculiarity of German social relations, it gained an influence over the educated classes, such as Methodism never had in England, nor, on the whole, the Great Awakening in America. In virtue of this, German pietism was able, among influential persons, to present victorious opposition to the merely secular tendencies of the rationalistic movement. In no small measure it breathed into that movement a religious quality which in other lands was utterly lacking. It gave to it an ethical seriousness from which in other places it had too often set itself free.

In England there had followed upon the age of the great religious conflict one of astounding ebb of spiritual interest. Men turned with all energy to the political and economic interests of a wholly modern civilisation. They retained, after a short period of friction, a smug and latitudinarian orthodoxy, which Methodism did little to change. In France not only was the Huguenot Church annihilated, but the Jansenist movement was savagely suppressed. The tyranny of the Bourbon State and the corruption of the Gallican Church which was so deeply identified with it caused the rationalist movement to bear the trait of a passionate opposition to religion. In the time of Pascal, Jansenism had a moment when it bade fair to be to France what pietism was to Germany. Later, in the anguish and isolation of the conflict the movement lost its poise and intellectual quality. In Germany, even after the temporary alliance of pietism and rationalism against the Church had been transcended, and the length and breadth of their mutual antagonism had been revealed, there remained a deep mutual respect and salutary interaction. Obscurantists and sentimentalists might denounce rationalism. Vulgar ranters like Dippel and Barth might defame religion. That had little weight as compared with the fact that Klopstock, Hamann and Herder, Jacobi, Goethe and Jean Paul, had all passed at some time under the influence of pietism. Lessing learned from the Moravians the undogmatic essence of religion. Schleiermacher was bred among the devoted followers of Zinzendorf. Even the radicalism of Kant retained from the teaching of his pietistic youth the stringency of its ethic, the sense of the radical evil of human nature and of the categorical imperative of duty. It would be hard to find anything to surpass his testimony to the purity of character and spirit of his parents, or the beauty of the home life in which he was bred. Such facts as these made themselves felt both in the philosophy and in the poetry of the age. The rationalist movement itself came to have an ethical and spiritual trait. The triviality, the morbidness and superstition of pietism received their just condemnation. But among the leaders of the nation in every walk of life were some who felt the drawing to deal with ethical and religious problems in the untrammelled fashion which the century had taught.

We may be permitted to try to show the meaning of pietism by a concrete example. No one can read the correspondence between the youthful Schleiermacher and his loving but mistaken father, or again, the lifelong correspondence of Schleiermacher with his sister, without receiving, if he has any religion of his own, a touching impression of what the pietistic religion meant. The father had long before, unknown to the son, passed through the torments of the rational assault upon a faith which was sacred to him. He had preached, through years, in the misery of contradiction with himself. He had rescued his drowning soul in the ark of the most intolerant confessional orthodoxy. In the crisis of his son's life he pitiably concealed these facts. They should have been the bond of sympathy. The son, a sorrowful little motherless boy, was sent to the Moravian school at Niesky, and then to Barby. He was to escape the contamination of the universities, and the woes through which his father had passed. Even there the spirit of the age pursued

him. The precocious lad, in his loneliness, raised every question which the race was wrestling with. He long concealed these facts, dreading to wound the man he so revered. Then in a burst of filial candour, he threw himself upon his father's mercy, only to be abused and measurelessly condemned. He had his way. He resorted to Halle, turned his back on sacred things, worked in titanic fashion at everything but the problem of religion. At least he kept his life clean and his soul sensitive among the flagrantly immoral who were all about him, even in the pietists' own university. He laid the foundations for his future philosophical construction. He bathed in the sentiments and sympathies, poetic, artistic and humanitarian, of the romanticist movement. In his early Berlin period he was almost swept from his feet by its flood. He rescued himself, however, by his rationalism and romanticism into a breadth and power of faith which made him the prophet of the new age. By him, for a generation, men like-minded saved their souls. As one reads, one realises that it was the pietists' religion which saved him, and which, in another sense, he saved. His recollections of his instruction among the Herrnhuter are full of beauty and pathos. His sister never advanced a step upon the long road which he travelled. Yet his sympathy with her remained unimpaired. The two poles of the life of the age are visible here. The episode, full of exquisite personal charm, is a veritable miniature of the first fifty years of the movement which we have to record. No one did for England or for France what Schleiermacher had done for the Fatherland.

Æsthetic Idealism

Besides pietism, the Germany of the end of the eighteenth century possessed still another foil and counterpoise to its decadent rationalism. This was the so-called æsthetic-idealistic movement, which shades off into romanticism. The debt of Schleiermacher to that movement has been already hinted at. It was the revolt of those who had this in common with the pietists, that they hated and despised the outworn rationalism. They thought they wanted no religion. It is open to us to say that they misunderstood religion. It was this misunderstanding which Schleiermacher sought to bring home to them. What religion they understood, ecclesiasticism, Roman or Lutheran, or again, the banalities and fanaticisms of middle-class pietism, they despised. Their war with rationalism was not because it had deprived man of religion. It had been equally destructive of another side of the life of feeling, the æsthetic. Their war was not on behalf of the good, it was in the name of the beautiful. Rationalism had starved the soul, it had minimised and derided feeling. It had suppressed emotion. It had been fatal to art. It was barren of poetry. It had had no sympathy with history and no understanding of history. It had reduced everything to the process by which two and two make four. The pietists said that the frenzy for reason had made man oblivious of the element of the divine. The æsthetic idealists said that it had been fatal to the element of the human. From this point of view their movement has been called the new humanism. The glamour of life was gone, they said. Mystery had vanished. And mystery is the womb of every art. Rationalism had been absolutely uncreative, only and always destructive. Rousseau had earlier uttered this wail in France, and had greatly influenced certain minds in Germany. Shelley and Keats were saying something of the sort in England. Even as to Wordsworth, it may be an open question if his religion was not mainly romanticism. All these men used language which had been conventionally associated with religion, to describe this other emotion.

Rationalism had ended in proving deadly to ideals. This was true. But men forgot for the moment how glorious an ideal it had once been to be rational and to assert the rationality of the universe. Still the time had come when, in Germany at all events, the great cry was, 'back to the ideal.' It is curious that men always cry 'back' when they mean 'forward.' For it was not the old idealism, either religious or æsthetic, which they were seeking. It was a new one in which the sober fruits of rationalism should find place. Still, for the moment, as we have seen, the air was full of the cry, 'back to the State by divine right, back to the Church, back to the Middle Age, back to the beauty of classical antiquity.' The poetry, the romance, the artistic criticism of this movement set themselves free at a stroke from theological bondage and from

the externality of conventional ethics. It shook off the dust of the doctrinaires. It ridiculed the petty utilitarianism which had been the vogue. It had such an horizon as men had never dreamed before. It owed that horizon to the rationalism it despised. From its new elevation it surveyed all the great elements of the life of man. It saw morals and religion, language and society, along with art and itself, as the free and unconscious product through the ages, of the vitality of the human spirit. It must be said that it neither solved nor put away the ancient questions. Especially through its one-sided æstheticism it veiled that element of dualism in the world which Kant clearly saw, and we now see again, after a century which has sometimes leaned to easy pantheism. However, it led to a study of the human soul and of all its activities, which came closer to living nature than anything which the world had yet seen.

To this group of æsthetic idealists belong, not to mention lesser names, Lessing and Hamann and Winckelmann, but above all Herder and Goethe. Herder was surely the finest spirit among the elder contemporaries of Goethe. Bitterly hostile to the rationalists, he had been moved by Rousseau to enthusiasm for the free creative life of the human spirit. With Lessing he felt the worth of every art in and for itself, and the greatness of life in its own fulfilment. He sets out from the analysis of the poetic and artistic powers, the appreciation of which seemed to him to be the key to the understanding of the spiritual world. Then first he approaches the analysis of the ethical and religious feeling. All the knowledge and insight thus gained he gathers together into a history of the spiritual life of mankind. This life of the human spirit comes forth everywhere from nature, is bound to nature. It constitutes one whole with a nature which the devout soul calls God, and apprehends within itself as the secret of all that it is and does. Even in the period in which he had become passionately Christian, Herder never was able to attain to a scientific establishing of his Christianity, or to any sense of the specific aim of its development. He felt himself to be separated from Kant by an impassable gulf. All the sharp antinomies among which Kant moved, contrasts of that which is sensuous with that which is reasonable, of experience with pure conception, of substance and form in thought, of nature and freedom, of inclination and duty, seemed to Herder grossly exaggerated, if not absolutely false. Sometimes Herder speaks as if the end of life were simply the happiness which a man gets out of the use of all his powers and out of the mere fact of existence. Deeper is Kant’s contention, that the true aim of life can be only moral culture, even independent of happiness, or rather one must find his noblest happiness in that moral culture.

At a period in his life when Herder had undergone conversion to court orthodoxy at Bückeburg and threatened to throw away that for which his life had stood, he was greatly helped by Goethe. The identification of Herder with Christianity continued to be more deep and direct than that of Goethe ever became, yet Goethe has also his measure of significance for our theme. If he steadied Herder in his religious experience, he steadied others in their poetical emotionalism and artistic sentimentality, which were fast becoming vices of the time. The classic repose of his spirit, his apparently unconscious illustration of the ancient maxim, ‘nothing too much,’ was the more remarkable, because there were few influences in the whole gamut of human life to which he did not sooner or later surrender himself, few experiences which he did not seek, few areas of thought upon which he did not enter. Systems and theories were never much to his mind. A fact, even if it were inexplicable, interested him much more. To the evolution of formal thought in his age he held himself receptive rather than directing. He kept, to the last, his own manner of brooding and creating, within the limits of a poetic impressionableness which instinctively viewed the material world and the life of the soul in substantially similar fashion. There is something almost humorous in the way in which he eagerly appropriated the results of the philosophising of his time, in so far as he could use these to sustain his own positions, and caustically rejected those which he could not thus use. He soon got by heart the negative lessons of Voltaire and found, to use the words which he puts into the mouth of Faust, that while it freed him from his superstitions, at the same time it made the world empty and dismal beyond endurance. In the mechanical philosophy which presented itself in the *Système de la Nature* as a positive substitute for his lost faith, he found only that

which filled his poet’s soul with horror. ‘It appeared to us,’ he says, ‘so grey, so cimmerian and so dead that we shuddered at it as at a ghost. We thought it the very quintessence of old age. All was said to be necessary, and therefore there was no God. Why not a necessity for a God to take its place among the other necessities!’ On the other hand, the ordinary teleological theology, with its external architect of the world and its externally determined designs, could not seem to Goethe more satisfactory than the mechanical philosophy. He joined for a time in Rousseau’s cry for the return to nature. But Goethe was far too well balanced not to perceive that such a cry may be the expression of a very artificial and sophisticated state of mind. It begins indeed in the desire to throw off that which is really oppressive. It ends in a fretful and reckless revolt against the most necessary conditions of human life. Goethe lived long enough to see in France that dissolution of all authority, whether of State or Church, for which Rousseau had pined. He saw it result in the return of a portion of mankind to what we now believe to have been their primitive state, a state in which they were ‘red in tooth and claw.’ It was not that paradisaic state of love and innocence, which, curiously enough, both Rousseau and the theologians seem to have imagined was the primitive state.

The thought of the discipline and renunciation of our lower nature in order to the realisation of a higher nature of mankind is written upon the very face of the second part of *Faust*. Certain passages in *Dichtung* and *Wahrheit* are even more familiar. ‘Our physical as well as our social life, morality, custom, knowledge of the world, philosophy, religion, even many an accidental occurrence in our daily life, all tell us that we must renounce.’ ‘Renunciation, once for all, in view of the eternal,’ that was the lesson which he said made him feel an atmosphere of peace breathed upon him. He perceived the supreme moral prominence of certain Christian ideas, especially that of the atonement as he interpreted it. ‘It is altogether strange to me,’ he writes to Jacobi, ‘that I, an old heathen, should see the cross planted in my own garden, and hear Christ’s blood preached without its offending me.’

Goethe’s quarrel with Christianity was due to two causes. In the first place, it was due to his viewing Christianity as mainly, if not exclusively, a religion of the other world, as it has been called, a religion whose God is not the principle of all life and nature and for which nature and life are not divine. In the second place, it was due to the prominence of the negative or ascetic element in Christianity as commonly presented, to the fact that in that presentation the law of self-sacrifice bore no relation to the law of self-realisation. In both of these respects he would have found himself much more at home with the apprehension of Christianity which we have inherited from the nineteenth century. The programme of charity which he outlines in the *Wanderjahre* as a substitute for religion would be taken to-day, so far as it goes, as a rather moderate expression of the very spirit of the Christian religion.

CHAPTER II. IDEALISTIC PHILOSOPHY

The causes which we have named, religious and æsthetic, as well as purely speculative, led to such a revision of philosophical principles in Germany as took place in no other land. The new idealistic philosophy, as it took shape primarily at the hands of Kant, completed the dissolution of the old rationalism. It laid the foundation for the speculative thought of the western world for the century which was to come. The answers which æstheticism and pietism gave to rationalism were incomplete. They consisted largely in calling attention to that which rationalism had overlooked. Kant's idealism, however, met the intellectual movement on its own grounds. It triumphed over it with its own weapons. The others set feeling over against thought. He taught men a new method in thinking. The others put emotion over against reason. He criticised in drastic fashion the use which had been made of reason. He inquired into the nature of reason. He vindicated the reasonableness of some truths which men had indeed felt to be indefeasibly true, but which they had not been able to establish by reasoning.

KANT

Immanuel Kant was born in 1724 in Königsberg, possibly of remoter Scottish ancestry. His father was a saddler, as Melanchthon's had been an armourer and Wolff's a tanner. His native city with its university was the scene of his whole life and labour. He was never outside of Prussia except for a brief interval when Königsberg belonged to Russia. He was a German professor of the old style. Studying, teaching, writing books, these were his whole existence. He was the fourth of nine children of a devoted pietist household. Two of his sisters served in the houses of friends. The consistorial-rath opened the way to the university. An uncle aided him to publish his first books. His earlier interest was in the natural sciences. He was slow in coming to promotion. Only after 1770 was he full professor of logic and metaphysics. In 1781 he published the first of the books upon which rests his world-wide fame. Nevertheless, he lived to see the triumph of his philosophy in most of the German universities. His subjects are abstruse, his style involved. It never occurred to him to make the treatment of his themes easier by use of the imagination. He had but a modicum of that quality. He was hostile to the pride of intellect often manifested by petty rationalists. He was almost equally hostile to excessive enthusiasm in religion. The note of his life, apart from his intellectual power, was his ethical seriousness. He was in conflict with ecclesiastical personages and out of sympathy with much of institutional religion. None the less, he was in his own way one of the most religious of men. His brief conflict with Wöllner's government was the only instance in which his peace and public honour were disturbed. He never married. He died in Königsberg in 1804. He had been for ten years so much enfeebled that his death was a merciful release.

Kant used the word 'critique' so often that his philosophy has been called the 'critical philosophy.' The word therefore needs an explanation. Kant himself distinguished two types of philosophy, which he called the dogmatic and critical types. The essence of a dogmatic philosophy is that it makes belief to rest upon knowledge. Its endeavour is to demonstrate that which is believed. It brings out as its foil the characteristically sceptical philosophy. This esteems that the proofs advanced in the interest of belief are inadequate. The belief itself is therefore an illusion. The essence of a critical philosophy, on the other hand, consists in this, that it makes a distinction between the functions of knowing and believing. It distinguishes between the perception of that which is in accordance with natural law and the understanding of the moral meaning of things. Kant thus uses his word critique in accordance with the strict etymological meaning of the root. He seeks to make a clear separation between the provinces of belief and knowledge, and thus to find an adjustment of their claims. Of an object of belief we may indeed say that we know it. Yet we must make clear to ourselves that we know it in a different sense from that in

which we know physical fact. Faith, since it does not spring from the pure reason, cannot indeed, as the old dogmatisms, both philosophical and theological, have united in asserting, be demonstrated by the reason. Equally it cannot, as scepticism has declared, be overthrown by the pure reason.

The ancient positive dogmatism had been the idealistic philosophy of Plato and Aristotle. The old negative dogmatism had been the materialism of the Epicureans. To Plato the world was the realisation of ideas. Ideas, spiritual entities, were the counterparts and necessary antecedents of the natural objects and actual facts of life. To the Epicureans, on the other hand, there are only material bodies and natural laws. There are no ideas or purposes. In the footsteps of the former moved all the scholastics of the Middle Age, and again, even Locke and Leibnitz in their so-called 'natural theology.' In the footsteps of the latter moved the men who had made materialism and scepticism to be the dominant philosophy of France in the latter half of the eighteenth century. The aim of Kant was to resolve this age-long contradiction. Free, unprejudiced investigation of the facts and laws of the phenomenal world can never touch the foundations of faith. Natural science can lead in the knowledge only of the realm of the laws of things. It cannot give us the inner moral sense of those things. To speak of the purposes of nature as men had done was absurd. Natural theology, as men had talked of it, was impossible. What science can give is a knowledge of the facts about us in the world, of the growth of the cosmos, of the development of life, of the course of history, all viewed as necessary sequences of cause and effect.

Footnote 3:(return)

Paulsen, *Kant*, a. 2.

On the other hand, with the idealists, Kant is fully persuaded that there is a meaning in things and that we can know it. There is a sense in life. With immediate certainty we set moral good as the absolute aim in life. This is done, however, not through the pure reason or by scientific thinking, but primarily through the will, or as Kant prefers to call it, the practical reason. What is meant by the practical reason is the intelligence, the will and the affections operating together; that is to say, the whole man and not merely his intellect, directed to those problems upon which, in sympathy and moral reaction, the whole man must be directed and upon which the pure reason, the mere faculty of ratiocination, does not adequately operate. In the practical reason the will is the central thing. The will is that faculty of man to which moral magnitudes appeal. It is with moral magnitudes that the will is primarily concerned. The pure reason may operate without the will and the affections. The will, as a source of knowledge, never works without the intelligence and the affections. But it is the will which alone judges according to the predicates good and evil. The pure reason judges according to the predicates true and false. It is the practical reason which ventures the credence that moral worth is the supreme worth in life. It then confirms this ventured credence in a manifold experience that yields a certainty with which no certainty of objects given in the senses is for a moment to be compared. We know that which we have believed. We know it as well as that two and two make four. Still we do not know it in the same way. Nor can we bring knowledge of it to others save through an act of freedom on their part, which is parallel to the original act of freedom on our own part.

How can these two modes of thought stand related the one to the other? Kant's answer is that they correspond to the distinction between two worlds, the world of sense and the transcendental or supersensible world. The pure and the practical reason are the faculties of man for dealing with these two worlds respectively, the phenomenal and the noumenal. The world which is the object of scientific investigation is not the actuality itself. This is true in spite of the fact that to the common man the material and sensible is always, as he would say, the real. On the contrary, in Kant's opinion the material world is only the presentation to our senses of something deeper, of which our senses are no judge. The reality lies behind this sensible presentation and appearance. The world of religious belief is the world of this transcendent reality. The spirit of man, which is not pure reason only, but moral will as well, recognises itself also as part of this reality. It expresses the essence of that mysterious reality in terms of its own

essence. Its own essence as free spirit is the highest aspect of reality of which it is aware. It may be unconscious of the symbolic nature of its language in describing that which is higher than anything which we know, by the highest which we do know. Yet, granting that, and supposing that it is not a contradiction to attempt a description of the transcendent at all, there is no description which carries us so far.

This series of ideas was perhaps that which gave to Kant's philosophy its immediate and immense effect upon the minds of men wearied with the endless strife and insoluble contradiction of the dogmatic and sceptical spirits. We may disagree with much else in the Kantian system. Even here we may say that we have not two reasons, but only two functionings of one. We have not two worlds. The philosophical myth of two worlds has no better standing than the religious myth of two worlds. We have two characteristic aspects of one and the same world. These perfectly interpenetrate the one the other, if we may help ourselves with the language of space. Each is everywhere present. Furthermore, these actions of reason and aspects of world shade into one another by imperceptible degrees. Almost all functionings of reason have something of the qualities of both. However, when all is said, it was of greatest worth to have had these two opposite poles of thought brought clearly to mind. The dogmatists, in the interest of faith, were resisting at every step the progress of the sciences, feeling that that progress was inimical to faith. The devotees of science were saying that its processes were of universal validity, its conclusions irresistible, the gradual dissolution of faith was certain. Kant made plain that neither party had the right to such conclusions. Each was attempting to apply the processes appropriate to one form of rational activity within the sphere which belonged to the other. Nothing but confusion could result. The religious man has no reason to be jealous of the advance of the sciences. The interests of faith itself are furthered by such investigation. Illusions as to fact which have been mistakenly identified with faith are thus done away. Nevertheless, its own eternal right is assured to faith. With it lies the interpretation of the facts of nature and of history, whatever those facts may be found to be. With the practical reason is the interpretation of these facts according to their moral worth, a worth of which the pure reason knows nothing and scientific investigation reveals nothing.

Here was a deliverance not unlike that which the Reformation had brought. The mingling of Aristotelianism and religion in the scholastic theology Luther had assailed. Instead of assent to human dogmas Luther had the immediate assurance of the heart that God was on his side. And what is that but a judgment of the practical reason, the response of the heart in man to the spiritual universe? It is given in experience. It is not mediated by argument. It cannot be destroyed by syllogism. It needs no confirmation from science. It is capable of combination with any of the changing interpretations which science may put upon the outward universe. The Reformation had, however, not held fast to its great truth. It had gone back to the old scholastic position. It had rested faith in an essentially rationalistic manner upon supposed facts in nature and alleged events of history in connection with the revelation. It had thus jeopardised the whole content of faith, should these supposed facts of nature or events in history be at any time disproved. Men had made faith to rest upon statements of Scripture, alleging such and such acts and events. They did not recognise these as the naïve and childlike assumptions concerning nature and history which the authors of Scripture would naturally have. When, therefore, these statements began with the progress of the sciences to be disproved, the defenders of the faith presented always the feeble spectacle of being driven from one form of evidence to another, as the old were in turn destroyed. The assumption was rife at the end of the eighteenth century that Christianity was discredited in the minds of all free and reasonable men. Its tenets were incompatible with that which enlightened men infallibly knew to be true. It could be no long time until the hollowness and sham would be patent to all. Even the interested and the ignorant would be compelled to give it up. Of course, the invincibly devout in every nation felt of instinct that this was not true. They felt that there is an inexpugnable truth of religion. Still that was merely an intuition of their hearts. They were right. But they were unable to prove that they were right, or even to get a hearing with many of the cultivated of their age. To Kant we owe the debt, that he put an end to this state of things. He

made the real evidence for religion that of the moral sense, of the nonscience and hearts of men themselves. The real ground of religious conviction is the religious experience. He thus set free both science and religion from an embarrassment under which both laboured, and by which both had been injured.

Kant parted company with the empirical philosophy which had held that all knowledge arises from without, comes from experienced sensations, is essentially perception. This theory had not been able to explain the fact that human experience always conforms to certain laws. On the other hand, the philosophy of so-called innate ideas had sought to derive all knowledge from the constitution of the mind itself. It left out of consideration the dependence of the mind upon experience. It tended to confound the creations of its own speculation with reality, or rather, to claim correspondence with fact for statements which had no warrant in experience. There was no limit to which this speculative process might not be pushed. By this process the medieval theologians, with all gravity, propounded the most absurd speculations concerning nature. By this process men made the most astonishing declarations upon the basis, as they supposed, of revelation. They made allegations concerning history and the religious experience which the most rudimentary knowledge of history or reflection upon consciousness proved to be quite contrary to fact.

Both empiricism and the theory of innate ideas had agreed in regarding all knowledge as something given, from without or from within. The knowing mind was only a passive recipient of impressions thus imparted to it. It was as wax under the stylus, *tabula rasa*, clean paper waiting to be written upon. Kant departed from this radically. He declared that all cognition rests upon the union of the mind's activity with its receptivity. The material of thought, or at least some of the materials of thought, must be given us in the multiformity of our perceptions, through what we call experience from the outer world. On the other hand, the formation of this material into knowledge is the work of the activity of our own minds. Knowledge is the result of the systematising of experience and of reflection upon it. This activity of the mind takes place always in accordance with the mind's own laws. Kant held them to the absolute dependence of knowledge upon material applied in experience. He compared himself to Copernicus who had taught men that they themselves revolved around a central fact of the universe. They had supposed that the facts revolved about them. The central fact of the intellectual world is experience. This experience seems to be given us in the forms of time and space and cause. These are merely forms of the mind's own activity. It is not possible for us to know 'the thing in itself,' the *Ding an sich* in Kant's phrase, which is the external factor in any sensation or perception. We cannot distinguish that external factor from the contribution to it, as it stands in our perception, which our own minds have made. If we cannot do that even for ourselves, how much less can we do it for others! It is the subject, the thinking being who says 'I,' which, by means of its characteristic and necessary active processes, in the perception of things under the forms of time and space, converts the chaotic material of knowledge into a regular and ordered world of reasoned experience. In this sense the understanding itself imposes laws, if not upon nature, yet, at least, upon nature as we can ever know it. There is thus in Kant's philosophy a sceptical aspect. Knowledge is limited to phenomena. We cannot by pure reason know anything of the world which lies beyond experience. This thought had been put forth by Locke and Berkeley, and by Hume also, in a different way. But with Kant this scepticism was not the gist of his philosophy. It was urged rather as the basis of the unconditioned character which he proposed to assert for the practical reason. Kant's scepticism is therefore very different from that of Hume. It does not militate against the profoundest religious conviction. Yet it prepared the way for some of the just claims of modern agnosticism.

According to Kant, it is as much the province of the practical reason to lay down laws for action as it is the province of pure reason to determine the conditions of thought, though the practical reason can define only the form of action which shall be in the spirit of duty. It cannot present duty to us as an object of desire. Desire can be only a form of self-love. In the end it reckons with the advantage of having done one's duty. It thus becomes selfish and degraded. The identification of duty and interest was particularly

offensive to Kant. He was at war with every form of hedonism. To do one's duty because one expects to reap advantage is not to have done one's duty. The doing of duty in this spirit simply resolves itself into a subtler and more pervasive form of selfishness. He castigates the popular presentation of religion as fostering this same fault. On the other hand, there is a trait of rigorism in Kant, a survival of the ancient dualism, which was not altogether consistent with the implications of his own philosophy. This philosophy afforded, as we have seen, the basis for a monistic view of the universe. But to his mind the natural inclinations of man are opposed to good conscience and sound reason. He had contempt for the shallow optimism of his time, according to which the nature of man was all good, and needed only to be allowed to run its natural course to produce highest ethical results. He does not seem to have penetrated to the root of Rousseau's fallacy, the double sense in which he constantly used the words 'nature' and 'natural.' Otherwise, Kant would have been able to repudiate the preposterous doctrine of Rousseau, without himself falling back upon the doctrine of the radical evil of human nature. In this doctrine he is practically at one with the popular teaching of his own pietistic background, and with Calvinism as it prevailed with many of the religiously-minded of his day. In its extreme statements the latter reminds one of the pagan and oriental dualisms which so long ran parallel to the development of Christian thought and so profoundly influenced it.

Kant's system is not at one with itself at this point. According to him the natural inclinations of men are such as to produce a never-ending struggle between duty and desire. To desire to do a thing made him suspicious that he was not actuated by the pure spirit of duty in doing it. The sense in which man may be in his nature both a child of God, and, at the same time, part of the great complex of nature, was not yet clear either to Kant or to his opponents. His pessimism was a reflection of his moral seriousness. Yet it failed to reckon with that which is yet a glorious fact. One of the chief results of doing one's duty is the gradual escape from the desire to do the contrary. It is the gradual fostering by us, the ultimate dominance in us, of the desire to do that duty. Even to have seen one's duty is the dawning in us of this high desire. In the lowest man there is indeed the superficial desire to indulge his passions. There is also the latent longing to be conformed to the good. There is the sense that he fulfils himself then only when he is obedient to the good. One of the great facts of spiritual experience is this gradual, or even sudden, inversion of standard within us. We do really cease to desire the things which are against right reason and conscience. We come to desire the good, even if it shall cost us pain and sacrifice to do it. Paul could write: 'When I would do good, evil is present with me.' But, in the vividness of his identification of his willing self with his better self against his sinning self, he could also write: 'So then it is no more I that do the sin.' *Das radicale Böse* of human nature is less radical than Kant supposed, and 'the categorical imperative' of duty less externally categorical than he alleged. Still it is the great merit of Kant's philosophy to have brought out with all possible emphasis, not merely as against the optimism of the shallow, but as against the hedonism of soberer people, that our life is a conflict between inclination and duty. The claims of duty are the higher ones. They are mandatory, absolute. We do our duty whether or not we superficially desire to do it. We do our duty whether or not we foresee advantage in having done it. We should do it if we foresaw with clearness disadvantage. We should find our satisfaction in having done it, even at the cost of all our other satisfactions. There is a must which is over and above all our desires. This is what Kant really means by the categorical imperative. Nevertheless, his statement comes in conflict with the principle of freedom, which is one of the most fundamental in his system. The phrases above used only eddy about the one point which is to be held fast. There may be that in the universe which destroys the man who does not conform to it, but in the last analysis he is self-destroyed, that is, he chooses not to conform. If he is saved, it is because he chooses thus to conform. Man would be then most truly man in resisting that which would merely overpower him, even if it were goodness. Of course, there can be no goodness which overpowers. There can be no goodness which is not willed. Nothing can be a motive except through awakening our desire. That which one desires is never wholly external to oneself.

According to Kant, morality becomes religion when that which the former shows to be the end of man is conceived also to be the end of the supreme law-giver, God. Religion is the recognition of our duties as divine commands. The distinction between revealed and natural religion is stated thus: In the former we know a thing to be a divine command before we recognise it as our duty. In the latter we know it to be our duty before we recognise it as a divine command. Religion may be both natural and revealed. Its tenets may be such that man can be conceived as arriving at them by unaided reason. But he would thus have arrived at them at a later period in the evolution of the race. Hence revelation might be salutary or even necessary for certain times and places without being essential at all times or, for that matter, a permanent guarantee of the truth of religion. There is nothing here which is new or original with Kant. This line of reasoning was one by which men since Lessing had helped themselves over certain difficulties. It is cited only to show how Kant, too, failed to transcend his age in some matters, although he so splendidly transcended it in others.

The orthodox had immemorially asserted that revelation imparted information not otherwise attainable, or not then attainable. The rationalists here allege the same. Kant is held fast in this view. Assuredly what revelation imparts is not information of any sort whatsoever, not even information concerning God. What revelation imparts is God himself, through the will and the affection, the practical reason. Revelation is experience, not instruction. The revealers are those who have experienced God, Jesus the foremost among them. They have experienced God, whom then they have manifested as best they could, but far more significantly in what they were than in what they said. There is surely the gravest exaggeration of what is statutory and external in that which Kant says of the relation of ethics and religion. How can we know that to be a command of God, which does not commend itself in our own heart and conscience? The traditionalist would have said, by documents miraculously confirmed. It was not in consonance with his noblest ideas for Kant to say that. On the other hand, that which I perceive to be my duty I, as religious man, feel to be a command of God, whether or not a mandate of God to that effect can be adduced. Whether an alleged revelation from God inculcates such a truth or duty may be incidental. In a sense it is accidental. The content of all historic revelation is conditioned in the circumstances of the man to whom the revelation is addressed. It is clear that the whole matter of revelation is thus apprehended by Kant with more externality than we should have believed. His thought is still essentially archaic and dualistic. He is, therefore, now and then upon the point of denying that such a thing as revelation is possible. The very idea of revelation, in this form, does violence to his fundamental principle of the autonomy of the human reason and will. At many points in his reflection it is transparently clear that nothing can ever come to a man, or be given forth by him, which is not creatively shaped by himself. As regards revelation, however, Kant never frankly took that step. The implications of his own system would have led him to that step. They led to an idea of revelation which was psychologically in harmony with the assumptions of his system, and historically could be conceived as taking place without the interjection of the miraculous in the ordinary sense. If the divine revelation is to be thought as taking place within the human spirit, and in consonance with the laws of all other experience, then the human spirit must itself be conceived as standing in such relation to the divine that the eternal reason may express and reveal itself in the regular course of the mind’s own activity. Then the manifold moral and religious ideals of mankind in all history must take their place as integral factors also in the progress of the divine revelation.

When we come to the more specific topics of his religious teaching, freedom, immortality, God, Kant is prompt to assert that these cannot be objects of theoretical knowledge. Insoluble contradictions arise whenever a proof of them is attempted. If an object of faith could be demonstrated it would cease to be an object of faith. It would have been brought down out of the transcendental world. Were God to us an object among other objects, he would cease to be a God. Were the soul a demonstrable object like any other object, it would cease to be the transcendental aspect of ourselves. Kant makes short work of the so-called proofs for the existence of God which had done duty in the scholastic theology. With subtilty,

sometimes also with bitter irony, he shows that they one and all assume that which they set out to prove. They are theoretically insufficient and practically unnecessary. They have such high-sounding names — the ontological argument, the cosmological, the physico-theological — that almost in spite of ourselves we bring a reverential mood to them. They have been set forth with solemnity by such redoubtable thinkers that there is something almost startling in the way that Kant knocks them about. The fact that the ordinary man among us easily perceives that Kant was right shows only how the climate of the intellectual world has changed. Freedom, immortality, God, are not indeed provable. If given at all, they can be given only in the practical reason. Still they are postulates in the moral order which makes man the citizen of an intelligible world. There can be no 'ought' for a being who is necessitated. We can perceive, and do perceive, that we ought to do a thing. It follows that we can do it. However, the hindrances to the realisation of the moral ideal are such that it cannot be realised in a finite time. Hence the postulate of eternal life for the individual. Finally, reason demands realisation of a supreme good, both a perfect virtue and a corresponding happiness. Man is a final end only as a moral subject. There must be One who is not only a law-giver, but in himself also the realisation of the law of the moral world.

Kant's moral argument thus steps off the line of the others. It is not a proof at all in the sense in which they attempted to be proofs. The existence of God appears as a necessary assumption, if the highest good and value in the world are to be fulfilled. But the conception and possibility of realisation of a highest good is itself something which cannot be concluded with theoretical evidentiality. It is the object of a belief which in entire freedom is directed to that end. Kant lays stress upon the fact that among the practical ideas of reason, that of freedom is the one whose reality admits most nearly of being proved by the laws of pure reason, as well as in conduct and experience. Upon an act of freedom, then, belief rests. 'It is the free holding that to be true, which for the fulfilment of a purpose we find necessary.' Now, as object of this 'free holding something to be true,' he sets forth the conception of the highest good in the world, to be realised through freedom. It is clear that before this argument would prove that a God is necessary to the realisation of the moral order, it would have to be shown that there are no adequate forces immanent within society itself for the establishment and fulfilment of that order. As a matter of fact, reflexion in the nineteenth century, devoted as it has been to the evolution of society, has busied itself with hardly anything more than with the study of those immanent elements which make for morality. It is therefore not an external guarantor of morals, such as Kant thought, which is here given. It is the immanent God who is revealed in the history and life of the race, even as also it is the immanent God who is revealed in the consciousness of the individual soul. Even the moral argument, therefore, in the form in which Kant puts it, sounds remote and strange to us. His reasoning strains and creaks almost as if he were still trying to do that which he had just declared could not be done. What remains of significance for us, is this. All the debate about first causes, absolute beings, and the rest, gives us no God such as our souls need. If a man is to find the witness for soul, immortality and God at all, he must find it within himself and in the spiritual history of his fellows. He must venture, in freedom, the belief in these things, and find their corroboration in the contribution which they make to the solution of the mystery of life. One must venture to win them. One must continue to venture, to keep them. If it were not so, they would not be objects of faith.

The source of the radical evil in man is an intelligible act of human freedom not further to be explained. Moral evil is not, as such, transmitted. Moral qualities are inseparable from the responsibility of the person who commits the deeds. Yet this radical disposition to evil is to be changed into a good one, not altogether by a process of moral reformation. There is such a thing as a fundamental revolution of a man's habit of thought, a conscious and voluntary transference of a man's intention to obey, from the superficial and selfish desires which he has followed, to the deep and spiritual ones which he will henceforth allow. There is an epoch in a man's life when he makes the transition. He probably does it under the spell of personal influence, by the power of example, through the beauty of another personality. To Kant salvation

was character. It was of and in and by character. To no thinker has the moral participation of a man in the regeneration of his own character been more certain and necessary than to Kant. Yet, the change in direction of the will generally comes by an impulse from without. It comes by the impress of a noble personality. It is sustained by enthusiasm for that personality. Kant has therefore a perfectly rational and ethical and vital meaning for the phrase ‘new birth.’

For the purpose of this impulse to goodness, nothing is so effective as the contemplation of an historical example of such surpassing moral grandeur as that which we behold in Jesus. For this reason we may look to Jesus as the ideal of goodness presented to us in flesh and blood. Yet the assertion that Jesus’ historical personality altogether corresponds with the complete and eternal ethical ideal is one which we have no need to make. We do not possess in our own minds the absolute ideal with which in that assertion we compare him.

The ethical ideal of the race is still in process of development. Jesus has been the greatest factor urging forward that development. We ourselves stand at a certain point in that development. We have the ideals which we have because we stand at that point at which we do. The men who come after us will have a worthier ideal than we do. Again, to say that Jesus in his words and conduct expressed in its totality the eternal ethical ideal, would make of his life something different from the real, human life. Every real, human life is lived within certain actual antitheses which call out certain qualities and do not call out others. They demand certain reactions and not others. This is the concrete element without which nothing historical can be conceived. To say that Jesus lived in entire conformity to the ethical ideal so far as we are able to conceive it, and within the circumstances which his own time and place imposed, is the most that we can say. But in any case, Kant insists, the real object of our religious faith is not the historic man, but the ideal of humanity well-pleasing to God. Since this ideal is not of our own creation, but is given us in our super-sensible nature, it may be conceived as the Son of God come down from heaven.

The turn of this last phrase is an absolutely characteristic one, and brings out another quality of Kant’s mind in dealing with the Christian doctrines. They are to him but symbols, forms into which a variety of meanings may be run. He had no great appreciation of the historical element in doctrine. He had no deep sense of the social element and of that for which Christian institutions stand. We may illustrate with that which he says concerning Christ’s vicarious sacrifice. Substitution cannot take place in the moral world. Ethical salvation could not be conferred through such a substitution, even if this could take place. Still, the conception of the vicarious suffering of Christ may be taken as a symbolical expression of the idea that in the pain of self-discipline, of obedience and patience, the new man in us suffers, as it were vicariously, for the old. The atonement is a continual ethical process in the heart of the religious man. It is a grave defect of Kant’s religious philosophy, that it was so absolutely individualistic. Had he realised more deeply than he did the social character of religion and the meaning of these doctrines, not alone as between man and God, but as between man and man, he surely would have drawn nearer to that interpretation of the doctrine of the atonement which has come more and more to prevail. This is the solution which finds in the atonement of Christ the last and most glorious example of a universal law of human life and history. That law is that no redemptive good for men is ever secured without the suffering and sacrifice of those who seek to confer that good upon their fellows. Kant was disposed to regard the traditional forms of Christian doctrine, not as the old rationalism had done, as impositions of a priesthood or inherently absurd. He sought to divest them indeed of that which was speculatively untrue, though he saw in them only symbols of the great moral truths which lie at the heart of religion. The historical spirit of the next fifty years was to teach men a very different way of dealing with these same doctrines.

Kant had said that the primary condition, fundamental not merely to knowledge, but to all connected experience, is the knowing, experiencing, thinking, acting self. It is that which says ‘I,’ the ego, the

permanent subject. But that is not enough. The knowing self demands in turn a knowable world. It must have something outside of itself to which it yet stands related, the object of knowledge. Knowledge is somehow the combination of those two, the result of their co-operation. How have we to think of this co-operation? Both Hume and Berkeley had ended in scepticism as to the reality of knowledge. Hume was in doubt as to the reality of the subject, Berkeley as to that of the object. Kant dissented from both. He vindicated the undoubted reality of the impression which we have concerning a thing. Yet how far that impression is the reproduction of the thing as it is in itself, we can never perfectly know. What we have in our minds is not the object. It is a notion of that object, although we may be assured that we could have no such notion were there no object. Equally, the notion is what it is because the subject is what it is. We can never get outside the processes of our own thought. We cannot know the thing as it is, the *Ding-an-sich*, in Kant's phrase. We know only that there must be a 'thing in itself.'

FICHTE

Fichte asked, Why? Why must there be a *Ding-an-sich*? Why is not that also the result of the activity of the ego? Why is not the ego, the thinking subject, all that is, the creator of the world, according to the laws of thought? If so much is reduced to idea, why not all? This was Fichte's rather forced resolution of the old dualism of thought and thing. It is not the denial of the reality of things, but the assertion that their ideal element, that part of them which is not mere 'thing,' the action and subject of the action, is their underlying reality. According to Kant things exist in a world beyond us. Man has no faculty by which he can penetrate into that world. Still, the farther we follow Kant in his analysis the more does the contribution to knowledge from the side of the mind tend to increase, and the more does the factor in our impressions from the side of things tend to fade away. This basis of impression being wholly unknowable is as good as non-existent for us. Yet it never actually disappears. There would seem to be inevitable a sort of kernel of matter or prick of sense about which all our thoughts are generated. Yet this residue is a vanishing quantity. This seemed to Fichte to be a self-contradiction and a half-way measure. Only two positions appeared to him thorough-going and consequent. Either one posits as fundamental the thing itself, matter, independent of any consciousness of it. So Spinoza had taught. Or else one takes consciousness, the conscious subject, independent of any matter or thing as fundamental. This last Fichte claimed to be the real issue of Kant's thought. He asserts that from the point of view of the thing in itself we can never explain knowledge. We may be as skilful as possible in placing one thing behind another in the relation of cause to effect. It is, however, an unending series. It is like the cosmogony of the Eastern people which fabled that the earth rests upon the back of an elephant. The elephant stands upon a tortoise. The question is, upon what does the tortoise stand? So here, we may say, in the conclusive manner in which men have always said, that God made the world. Yet sooner or later we come to the child's question: Who made God? Fichte rightly replied: 'If God is for us only an object of knowledge, the *Ding-an-sich* at the end of the series, there is no escape from the answer that man, the thinker, in thinking God made him.' All the world, including man, is but the reflexion, the revelation in forms of the finite, of an unceasing action of thought of which the ego is the object. Nothing more paradoxical than this conclusion can be imagined. It seems to make the human subject, the man myself, the creator of the universe, and the universe only that which I happen to think it to be.

This interpretation was at first put upon Fichte's reasoning with such vigour that he was accused of atheism. He was driven from his chair in Jena. Only after several years was he called to a corresponding post in Berlin. Later, in his *Vocation of Man*, he brought his thought to clearness in this form: 'If God be only the object of thought, it remains true that he is then but the creation of man's thought. God is, however, to be understood as subject, as the real subject, the transcendent thinking and knowing subject, indwelling in the world and making the world what it is, indwelling in us and making us what we are. We

ourselves are subjects only in so far as we are parts of God. We think and know only in so far as God thinks and knows and acts and lives in us. The world, including ourselves, is but the reflection of the thought of God, who thus only has existence. Neither the world nor we have existence apart from him.'

Johann Gottlieb Fichte was born at Rammenau in 1762. His father was a ribbon weaver. He came of a family distinguished for piety and uprightness. He studied at Jena, and became an instructor there in 1793. He was at first a devout disciple of Kant, but gradually separated himself from his master. There is a humorous tale as to one of his early books which was, through mistake of the publisher, put forth without the author's name. For a brief time it was hailed as a work of Kant — his *Critique of Revelation*. Fichte was a man of high moral enthusiasm, very uncompromising, unable to put himself in the place of an opponent, in incessant strife. The great work of his Jena period was his *Wissenschaftslehre,* 1794. His popular Works, *Die Bestimmung des Menschen* and *Anweisung zum seligen Leben*, belong to his Berlin period. The disasters of 1806 drove him out of Berlin. Amidst the dangers and discouragements of the next few years he wrote his famous *Reden an die deutsche Nation*. He drew up the plan for the founding of the University of Berlin. In 1810 he was called to be rector of the newly established university. He was, perhaps, the chief adviser of Frederick William III in the laying of the foundations of the university, which was surely a notable venture for those trying years. In the autumn of 1812 and again in 1813, when the hospitals were full of sick and wounded after the Russian and Leipzig campaigns, Fichte and his wife were unceasing in their care of the sufferers. He died of fever contracted in the hospital in January 1814.

According to Fichte, as we have seen, the world of sense is the reflection of our own inner activity. It exists for us as the sphere and material of our duty. The moral order only is divine. We, the finite intelligences, exist only in and through the infinite intelligence. All our life is thus God's life. We are immortal because he is immortal. Our consciousness is his consciousness. Our life and moral force is his, the reflection and manifestation of his being, individuation of the infinite reason which is everywhere present in the finite. In God we see the world also in a new light. There is no longer any nature which is external to ourselves and unrelated to ourselves. There is only God manifesting himself in nature. Even the evil is only a means to good and, therefore, only an apparent evil. We are God's immediate manifestation, being spirit like himself. The world is his mediate manifestation. The world of dead matter, as men have called it, does not exist. God is the reality within the forms of nature and within ourselves, by which alone we have reality. The duty to which a God outside of ourselves could only command us, becomes a privilege to which we need no commandment, but to the fulfilment of which, rather, we are drawn in joy by the forces of our own being. How a man could, even in the immature stages of these thoughts, have been persecuted for atheism, it is not easy to see, although we may admit that his earlier forms of statement were bewildering. When we have his whole thought before us we should say rather that it borders on acosmic pantheism, for which everything is God and the world does not exist.

We have no need to follow Fichte farther. Suffice it to say, with reference to the theory of knowledge, that he had discovered that one could not stand still with Kant. One must either go back toward the position of the old empiricism which assumed the reality of the world exactly as it appeared, or else one must go forward to an idealism more thorough-going than Kant had planned. Of the two paths which, with all the vast advance of the natural sciences, the thought of the nineteenth century might traverse, that of the denial of everything except the mechanism of nature, and that of the assertion that nature is but the organ of spirit and is instinct with reason, Fichte chose the latter and blazed out the path along which all the idealists have followed him. In reference to the philosophy of religion, we must say that, with all the extravagance, the pantheism and mysticism of his phrases, Fichte's great contribution was his breaking down of the old dualism between God and man which was still fundamental to Kant. It was his assertion of the unity of man and God and of the life of God in man. This thought has been appropriated in all of modern theology.

It was the meagreness of Fichte’s treatment of nature which impelled Schelling to what he called his outbreak into reality. Nature will not be dismissed, as simply that which is not I. You cannot say that nature is only the sphere of my self-realisation. Individuals are in their way the children of nature. They are this in respect of their souls as much as of their bodies. Nature was before they were. Nature is, moreover, not alien to intelligence. On the contrary, it is a treasure-house of intelligible forms which demand to be treated as such. It appeared to Schelling, therefore, a truer idealism to work out an intelligible system of nature, exhibiting its essential oneness with personality.

Friedrich Wilhelm Joseph von Schelling was born in 1775 at Leonberg in Württemberg. His father was a clergyman. He was precocious in his intellectual development and much spoiled by vanity. Before he was twenty years old he had published three works upon problems suggested by Fichte. At twenty-three he was extraordinarius at Jena. He had apparently a brilliant career before him. He published his *Erster Entwurf eines Systems der Naturphilosophe*, 1799, and also his *System des transcendentalen Idealismus*, 1800. Even his short residence at Jena was troubled by violent conflicts with his colleagues. It was brought to an end by his marriage with the wife of Augustus von Schlegel, who had been divorced for the purpose. From 1806 to 1841 he lived in Munich in retirement. The long-expected books which were to fulfil his early promise never appeared. Hegel’s stricture was just. Schelling had no taste for the prolonged and intense labour which his brilliant early works marked out. He died in 1854, having reached the age of seventy-nine years, of which at least fifty were as melancholy and fruitless as could well be imagined.

The dominating idea of Schelling’s philosophy of nature may be said to be the exhibition of nature as the progress of intelligence toward consciousness and personality. Nature is the ego in evolution, personality in the making. All natural objects are visible analogues and counterparts of mind. The intelligence which their structure reveals, men had interpreted as residing in the mind of a maker of the world. Nature had been spoken of as if it were a watch. God was its great artificer. No one asserted that its intelligence and power of development lay within itself. On the contrary, nature is always in the process of advance from lower, less highly organised and less intelligible forms, to those which are more highly organised, more nearly the counterpart of the active intelligence in man himself. The personality of man had been viewed as standing over against nature, this last being thought of as static and permanent. On the contrary, the personality of man, with all of its intelligence and free will, is but the climax and fulfilment of a long succession of intelligible forms in nature, passing upward from the inorganic to the organic, from the unconscious to the conscious, from the non-moral to the moral, as these are at last seen in man. Of course, it was the life of organic nature which first suggested this notion to Schelling. An organism is a self-moving, self-producing whole. It is an idea in process of self-realisation. What was observed in the organism was then made by Schelling the root idea of universal nature. Nature is in all its parts living, self-moving along the lines of its development, productivity and product both in one. Empirical science may deal with separate products of nature. It may treat them as objects of analysis and investigation. It may even take the whole of nature as an object. But nature is not mere object. Philosophy has to treat of the inner life which moves the whole of nature as intelligible productivity, as subject, no longer as object. Personality has slowly arisen out of nature. Nature was going through this process of self-development before there were any men to contemplate it. It would go through this process were there no longer men to contemplate it.

Schelling has here rounded out the theory of absolute idealism which Fichte had carried through in a one-sided way. He has given us also a wonderful anticipation of certain modern ideas concerning nature’s preparation for the doctrine of evolution, which was a stroke of genius in its way. He attempted to arrange the realm of unconscious intelligences in an ascending series which should bridge the gulf between the

lowest of natural forms and the fully equipped organism in which self consciousness, with the intellectual, the emotional, and moral life, at last integrated. Inadequate material and a fondness for analogies led Schelling into vagaries in following out this scheme. Nevertheless, it is only in detail that we can look askance at his attempt. In principle our own conception of the universe is the same. It is the dynamic view of nature and an application of the principle of evolution in the widest sense. His errors were those into which a man was bound to fall who undertook to forestall by a sweep of the imagination that which has been the result of the detailed and patient investigation of three generations. What Schelling attempted was to take nature as we know it and to exhibit it as in reality a function of intelligence, pointing, through all the gradations of its varied forms, towards its necessary goal in self-conscious personality. Instead, therefore, of our having in nature and personality two things which cannot be brought together, these become members of one great organism of intelligence of which the immanent God is the source and the sustaining power. These ideas constitute Schelling's contribution to an idealistic and, of course, an essentially monistic view of the universe. The unity of man with God, Fichte had asserted. Schelling set forth the oneness of God and nature, and again of man and nature. The circle was complete.

If we have succeeded in conveying a clear idea of the movement of thought from Kant to Hegel, that idea might be stated thus. There are but three possible objects which can engage the thought of man. These are nature and man and God. There is the universe, of which we become aware through experience from our earliest childhood. Then there is man, the man given in self-consciousness, primarily the man myself. In this sense man seems to stand over against nature. Then, as the third possible object of thought, we have God. Upon the thought of God we usually come from the point of view of the category of cause. God is the name which men give to that which lies behind nature and man as the origin and explanation of both. Plato's chief interest was in man. He talked much concerning a God who was somehow the speculative postulate of the spiritual nature in man. Aristotle began a real observation of nature. But the ancient and, still more, the mediæval study of nature was dominated by abstract and theological assumptions. These prevented any real study of that nature in the midst of which man lives, in reaction against which he develops his powers, and to which, on one whole side of his nature, he belongs. Even in respect of that which men reverently took to be thought concerning God, they seem to have been unaware how much of their material was imaginative and poetic symbolism drawn from the experience of man. The traditional idea of revelation proved a disturbing factor. Assuming that revelation gave information concerning God, and not rather the religious experience of communion with God himself, men accepted statements of the documents of revelation as if they had been definitions graciously given from out the realm of the unseen. In reality, they were but fetches from out the world of the known into the world of the unknown.

The point of interest is this: — In all possible combinations in which, throughout the history of thought, these three objects had been set, the one with the others, they had always remained three objects. There was no essential relation of the one to the other. They were like the points of a triangle of which any one stood over against the other two. God stood over against the man whom he had fashioned, man over against the God to whom he was responsible. The consequences for theology are evident. When men wished to describe, for example, Jesus as the Son of God, they laid emphasis upon every quality which he had, or was supposed to have, which was not common to him with other men. They lost sight of that profound interest of religion which has always claimed that, in some sense, all men are sons of God and Jesus was the son of man. Jesus was then only truly honoured as divine when every trait of his humanity was ignored. Similarly, when men spoke of revelation they laid emphasis upon those particulars in which this supposed method of coming by information was unlike all other methods. Knowledge derived directly from God through revelation was in no sense the parallel of knowledge derived by men in any other way. So also God stood over against nature. God was indeed declared to have made nature. He had, however, but given it, so to say, an original impulse. That impulse also it had in some strange way lost or perverted,

so that the world, though it had been made by God, was not good. For the most part it moved itself, although God's sovereignty was evidenced in that he could still supervene upon it, if he chose. The supernatural was the realm of God. Natural and supernatural were mutually exclusive terms, just as we saw that divine and human were exclusive terms. So also, on the third side of our triangle, man stood over against nature. Nature was to primitive men the realm of caprice, in which they imagined demons, spirits and the like. These were antagonistic to men, as also hostile to God. Then, when with the advance of reflexion these spirits, and equally their counterparts, the good genii and angels, had all died, nature became the realm of iron necessity, of regardless law, of all-destroying force, of cruel and indifferent fate. From this men took refuge in the thought of a compassionate God, though they could not withdraw themselves or those whom they loved from the inexorable laws of nature. They could not see that God always, or even often, intervened on their behalf. It cannot be denied that these ideas prevail to some extent in the popular theology at the present moment. Much of our popular religious language is an inheritance from a time when they universally prevailed. The religious intuition even of psalmists and prophets opposed many of these notions. The pure religious intuition of Jesus opposed almost every one of them. Mystics in every religion have had, at times, insight into an altogether different scheme of things. The philosophy, however, even of the learned, would, in the main, have supported the views above described, from the dawn of reflexion almost to our own time.

It was Kant who first began the resolution of this three-cornered difficulty. When he pointed out that into the world, as we know it, an element of spirit goes, that in it an element of the ideal inheres, he began a movement which has issued in modern monism. He affirmed that that element from my thought which enters into the world, as I know it, may be so great that only just a point of matter and a prick of sense remains. Fichte said: 'Why do we put it all in so perverse a way? Why reduce the world of matter to just a point? Why is it not taken for what it is, and yet understood to be all alive with God and we able to think of it, because we are parts of the great thinker God?' Still Fichte had busied himself almost wholly with consciousness. Schelling endeavoured to correct that. Nature lives and moves in God, just as truly in one way as does man in another. Men arise out of nature. A circle has been drawn through the points of our triangle. Nature and man are in a new and deeper sense revelations of God. In fact, supplementing one another, they constitute the only possible channels for the manifestation of God. It hardly needs to be said that these thoughts are widely appropriated in our modern world. These once novel speculations of the kings of thought have made their way slowly to all strata of society. Remote and difficult in their first expression in the language of the schools, their implications are to-day on everybody's lips. It is this unitary view of the universe which has made difficult the acceptance of a theology, the understandlng of a religion, which are still largely phrased in the language of a philosophy to which these ideas did not belong. There is not an historic creed, there is hardly a greater system of theology, which is not stated in terms of a philosophy and science which no longer reign. Men are asking: 'cannot Christianity be so stated and interpreted that it shall meet the needs of men of the twentieth century, as truly as it met those of men of the first or of the sixteenth?' Hegel, the last of this great group of idealistic philosophers whom we shall name, enthusiastically believed in this new interpretation of the faith which was profoundly dear to him. He made important contribution to that interpretation.

HEGEL

Georg Wilhelm Friedrich Hegel was born in Stuttgart in 1770. His father was in the fiscal service of the King of Württemberg. He studied in Tübingen. He was heavy and slow of development, in striking contrast with Schelling. He served as tutor in Bern and Frankfort, and began to lecture in Jena in 1801. He was much overshadowed by Schelling. The victory of Napoleon at Jena in 1806 closed the university for a time. In 1818 he was called to Fichte's old chair in Berlin. Never on very good terms with the Prussian

Government, he yet showed his large sympathy with life in every way. After 1820 a school of philosophical thinkers began to gather about him. His first great book, his *Phenomenologie des Geistes* 1807 (translated, Baillie, London, 1910), was published at the end of his Jena period. His *Philosophie der Religion* and *Philosophie der Geschichte* were edited after his death. They are mainly in the form which his notes took between 1823 and 1827. He died during an epidemic of cholera in Berlin in 1831.

Besides his deep interest in history the most striking feature of Hegel's preliminary training was his profound study of Christianity. He might almost be said to have turned to philosophy as a means of formulating the ideas which he had conceived concerning the development of the religious consciousness, which seemed to him to have been the bearer of all human culture. No one could fail to see that the idea of the relation of God and man, of which we have been speaking, was bound to make itself felt in the interpretation of the doctrine of the incarnation and of all the dogmas, like that of the trinity, which are connected with it. Characteristically, Hegel had pure joy in the speculative aspects of the problem. If one may speak in all reverence, and, at the same time, not without a shade of humour, Hegel rejoiced to find himself able, as he supposed, to rehabilitate the dogma of the trinity, rationalised in approved fashion. It is as if the dogma had been a revered form or mould, which was for him indeed emptied of its original content. He felt bound to fill it anew. Or to speak more justly, he was really convinced that the new meaning which he poured into the dogma was the true meaning which the Church Fathers had been seeking all the while. In the light of two generations of sober dealing, as historians, with such problems, we can but view his solution in a manner very different from that which he indulged. He was even disposed mildly to censure the professional theologians for leaving the defence of the doctrine of the trinity to the philosophers. There were then, and have since been, defenders of the doctrine who have thought that Hegel tendered them great aid. As a matter of fact, despite his own utter seriousness and reverent desire, his solution was a complete dissolution of the doctrine and of much else besides. His view would have been fatal, not merely to that particular form of orthodox thought, but, what is much more serious, to the religious meaning for which it stood. Sooner or later men have seen that the whole drift of Hegelianism was to transform religion into intellectualism. One might say that it was exactly this which the ancient metaphysicians, in the classic doctrine of the trinity, had done. They had transformed religion into metaphysics. The matter would not have been remedied by having a modern metaphysician do the same thing in another way.

Hegel was weary of Fichte's endless discussion of the ego and Schelling's of the absolute. It was not the abyss of the unknowable from which things said to come, or that into which they go, which interested Hegel. It was their process and progress which we can know. It was that part of their movement which is observable within actual experience, with which he was concerned. Now one of the laws of the movement of all things, he said, is that by which every thought suggests, and every force tends directly to produce, its opposite. Nothing stands alone. Everything exists by the balance and friction of opposing tendencies. We have the universal contrasts of heat and cold, of light and darkness, of inward and outward, of static and dynamic, of yes and no. There are two sides to every case, democratic government and absolutism, freedom of religion and authority, the individualistic and the social principles, a materialistic and a spiritual interpretation of the universe. Only things which are dead have ceased to have this tide and alternation. Christ is for living religion now a man, now God, revelation now natural, now supernatural. Religion in the eternal conflict between reason and faith, morals the struggle of good and evil, God now mysterious and now manifest.

Fichte had said: The essence of the universe is spirit. Hegel said: Yes, but the true notion of spirit is that of the resolution of contradiction, of the exhibition of opposites as held together in their unity. This is the meaning of the trinity. In the trinity we have God who wills to manifest himself, Jesus in whom he is manifest, and the spirit common to them both. God's existence is not static, it is dynamic. It is motion, not rest. God is revealer, recipient, and revelation all in one. The trinity was for Hegel the central doctrine of

Christianity. Popular orthodoxy had drawn near to the assertion of three Gods. The revolt, however, in asserting the unity of God, had made of God a meaningless absolute as foundation of the universe. The orthodox, in respect to the person of Christ, had always indeed asserted in laboured way that Jesus was both God and man. Starting from their own abstract conception of God, and attributing to Jesus the qualities of that abstraction, they had ended in making of the humanity of Jesus a perfectly unreal thing. On the other hand, those who had set out from Jesus's real humanity had been unable to see that he was anything more than a mere man, as their phrase was. On their own assumption of the mutual exclusiveness of the conceptions of God and man, they could not do otherwise.

Hegel saw clearly that God can be known to us only in and through manifestation. We can certainly make no predication as to how God exists, in himself, as men say, and apart from our knowledge. He exists for our knowledge only as manifest in nature and man. Man is for Hegel part of nature and Jesus is the highest point which the nature of God as manifest in man has reached. In this sense Hegel sometimes even calls nature the Son of God, and mankind and Jesus are thought of as parts of this one manifestation of God. If the Scripture asserts, as it seemed to the framers of the creeds to do, that God manifested himself from before all worlds in and to a self-conscious personality like his own, Hegel would answer: But the Scripture is no third source of knowledge, besides nature and man. Scripture is only the record of God's revelation of himself in and to men. If these men framed their profoundest thought in this way, that is only because they lived in an age when men had all their thoughts of this sort in a form which we can historically trace. For Platonists and Neoplatonists, such as the makers of the creeds — and some portions of the Scripture show this influence, as well — the divine, the ideal, was always thought of as eternal. It always existed as pure archetype before it ever existed as historic fact. The rabbins had a speculation to the same effect. The divine which exists must have pre-existed. Jesus as Son of God could not be thought of by the ancient world in any terms but these. The divine was static, changelessly perfect. For the modern man the divinest of all things is the mystery of growth. The perfect man is not at the beginning, but far down the immeasurable series of approaches to perfection. The perfection of other men is the work of still other ages, in which this extraordinary and inexplicable moral magnitude which Jesus is, has had its influence, and conferred upon them power to aid them in the fulfilment of God's intent for themselves, which is like that intent for himself which Jesus has fulfilled.

Surely enough has been said to show that what we have here is only the absorption of even the profoundest religious meanings into the vortex of an all-dissolving metaphysical system. The most obvious meaning of the phrase 'Son of God,' its moral and spiritual, its real religious meaning, is dwelt on, here in Hegel, as little as Hegel claimed that the Nicene trinitarians had dwelt upon it. Nothing marks more clearly the distance we have travelled since Hegel than does the general recognition that his attempted solution does not even lie in the right direction. It is an attempt within the same area as that of the Nicene Council and the creeds, namely, the metaphysical area. What is at stake is not the pre-existence or the two natures. Hegel was right in what he said concerning these. The pre-existence cannot be thought of except as ideal. The two natures we assert for every man, only not in such a manner as to destroy unity in the personality. The heart of the dogma is not in these. It is the oneness of God and man, a moral and spiritual oneness, oneness in conduct and consciousness, the presence and realisation of God, who is spirit, in a real man, the divineness of Jesus, in a sense which sees no meaning any longer in the old debate as between his divinity and his deity.

In the light of the new theory of the universe which we have reviewed, it flashes upon us that both defenders and assailants of the doctrine of the incarnation, in the age-long debate, have proceeded from the assumption that God and man are opposites. Men contended for the divineness of Jesus in terms which by definition shut out his true humanity. They asserted the identity of a real man, a true historic personage, with an abstract notion of God which had actually been framed by the denial of all human qualities. Their opponents with a like helplessness merely reversed the situation. To admit the deity of Jesus would have

been for them, in all candour and clear-sightedness, absolutely impossible, because the admission would have shut out his true humanity. On the old definitions we cannot wonder that the struggle was a bitter one. Each party was on its own terms right. If God is by definition other than man, and man the opposite of God, then it is not surprising that the attempt to say that Jesus of Nazareth was both, remained mysticism to the one and seemed folly to the other.

Now, within the area of the philosophy which begins with Kant this old antinomy has been resolved. An actual circle of clear relations joins the points of the old hopeless triangle. Men are men because of God indwelling in them, working through them. The phrase 'mere man' is seen to be a mere phrase. To say that the Nazarene, in some way not genetically to be explained, but which is hidden within the recesses of his own personality, shows forth in incomparable fulness that relation of God and man which is the ideal for us all, seems only to be saying over again what Jesus said when he proclaimed: 'I and My Father are one.' That Jesus actualised, not absolutely in the sense that he stood out of relation to history, but still perfectly within his relation to history, that which in us and for us is potential, the sonship of God — that seems a very simple and intelligible assertion. It certainly makes a large part of the debate of ages seem remote from us. It brings home to us that we live in a new world.

Interesting and fruitful is Hegel's expansion of the idea of redemption beyond that of the individual to that of the whole humanity, and in every aspect of its life. In my relation to the world are given my duties. The renunciation of outward duty makes the inward life barren. The principle which is to transform the world wears an aspect very different from that of stoicism, of asceticism or even of the individualism which has sought soul-salvation. In the midst of unworthiness and helplessness there springs up the consciousness of reconciliation. Man, with all his imperfections, becomes aware that he is the object of the loving purpose of God. Still this redemption of a man is something which is to be worked out, in the individual life and on the stage of universal history. The first step beyond the individual life is that of the Church. It is from within this community of believers that men, in the rule, receive the impulse to the good. The community is, in its idea, a society in which the conquest of evil is already being achieved, where the individual is spared much bitter conflict and loneliness. Nevertheless, so long as this unity of the life of man with God is realised in the Church alone there remains a false and harmful opposition between the Church and the world. Religion is faced by a hostile power to which its principles have no application. The world is denounced as unholy. With this stigma cast upon it, it may be unholy. Yet the retribution falls also upon the Church, in that it becomes artificial, clerical, pharisaical. The end is never that what have been called the standards of the Church shall prevail. The end is that the Church shall be the shrine and centre of an influence by virtue of which the standard of truth and goodness which naturally belongs to any relation of life shall prevail. The distinction between religion and secular life must be abandoned. Nothing is less sacred than a Church set on its own aggrandisement. The relations of family and of the State, of business and social life, are to be restored to the divineness which belongs to them, or rather, the divineness which is inalienable from them is to be recognised. In the laws and customs of a true State, Christianity first penetrates with its principles the real world. One sees how large a portion of these thoughts have been taken up into the programme of modern social movements. They are the basis of what men call a social theology. A book like Fremantle's *World as the Subject of Redemption* is their thorough-going exposition in the English tongue.

We have no cause to pursue the philosophical movement beyond this point. Its exponents are not without interest. Especially is this true of Schopenhauer. But the deposit from their work is for our particular purpose not great. The wonderful impulse had spent itself. These four brilliant men stand together, almost as much isolated from the generation which followed them as from that which went before. The historian of Christian thought in the nineteenth century cannot overestimate the significance of their personal interest in religion.

CHAPTER III. THEOLOGICAL RECONSTRUCTION

The outstanding trait of Kant's reflection upon religion is its supreme interest in morals and conduct. Metaphysician that he was, Kant saw the evil which intellectualism had done to religion. Religion was a profoundly real thing to him in his own life. Religion is a life. It is a system of thought only because life is a whole. It is a system of thought only in the way of deposit from a vivid and vigorous life. A man normally reflects on the conditions and aims of what he does. Religion is conduct. Ends in character are supreme. Religions and the many interpretations of Christianity have been good or bad, according as they ministered to character. So strong was this ethical trait in Kant that it dwarfed all else. He was not himself a man of great breadth or richness of feeling. He was not a man of imagination. His religion was austere, not to say arid. Hegel was before all things an intellectualist. Speculation was the breath of life to him. He had metaphysical genius. He tended to transform in this direction everything which he touched. Religion is thought. He criticised the rationalist movement from the height of vantage which idealism had reached. But as pure intellectualist he would put most rationalists to shame. We owe to this temperament his zeal for an interpretation of the universe 'all in one piece.' Its highest quality would be its abstract truth. His understanding of religion had the glory and the limitations which attend this view.

SCHLEIERMACHER

Between Kant and Hegel came another, Schleiermacher. He too was no mean philosopher. But he was essentially a theologian, the founder of modern theology. He served in the same faculty with Hegel and was overshadowed by him. His influence upon religious thought was less immediate. It has been more permanent. It was characteristically upon the side which Kant and Hegel had neglected. That was the side of feeling. His theology has been called the theology of feeling. He defined religion as feeling. Christianity is for him a specific feeling. Because he made so much of feeling, his name has been made a theological household word by many who appropriated little else of all he had to teach. His warmth and passion, his enthusiasm for Christ, the central place of Christ in his system, made him loved by many who, had they understood him better, might have loved him less. For his real greatness lay, not in the fact that he possessed these qualities alone, but that he possessed them in a singularly beautiful combination with other qualities. The emphasis is, however, correct. He was the prophet of feeling, as Kant had been of ethical religion and Hegel of the intellectuality of faith. The entire Protestant theology of the nineteenth century has felt his influence. The English-speaking race is almost as much his debtor as is his own. The French Huguenots of the revival felt him to be one of themselves. Even to Amiel and Scherer he was a kindred spirit.

It is a true remark of Dilthey that in unusual degree an understanding of the man's personality and career is necessary to the appreciation of his thought. Friedrich Ernst Daniel Schleiermacher was born in 1768 in Breslau, the son of a chaplain in the Reformed Church. He never connected himself officially with the Lutheran Church. We have alluded to an episode broadly characteristic of his youth. He was tutor in the house of one of the landed nobility of Prussia, curate in a country parish, preacher at the Charité in Berlin in 1795, professor extraordinarius at Halle in 1804, preacher at the Church of the Dreifaltigkeit in Berlin in 1807, professor of theology and organiser of that faculty in the newly-founded University of Berlin in 1810. He never gave up his position as pastor and preacher, maintaining this activity along with his unusual labours as teacher, executive and author. He died in 1834. In his earlier years in Berlin he belonged to the circle of brilliant men and women who made Berlin famous in those years. It was a fashionable society composed of persons more or less of the rationalistic school. Not a few of them, like the Schlegels, were deeply tinged with romanticism. There were also among them Jews of the house of

the elder Mendelssohn. Morally it was a society not altogether above reproach. Its opposition to religion was a by-word. An affection of the susceptible youth for a woman unhappily married brought him to the verge of despair. It was an affection which his passing pride as romanticist would have made him think it prudish to discard, while the deep, underlying elements of his nature made it inconceivable that he should indulge. Only in later years did he heal his wound in a happy married life.

The episode was typical of the experience he was passing through. He understood the public with which his first book dealt. That book bears the striking title, *Reden über die Religion, an die Gebildeten unter ihren Verächtern* (translated, Oman, Oxford, 1893). His public understood him. He could reach them as perhaps no other man could do. If he had ever concealed what religion was to him, he now paid the price. If they had made light of him, he now made war on them. This meed they could hardly withhold from him, that he understood most other things quite as well as they, and religion much better than they. The rhetorical form is a fiction. The addresses were never delivered. Their tension and straining after effect is palpable. They are a cry of pain on the part of one who sees that assailed which is sacred to him, of triumph as he feels himself able to repel the assault, of brooding persuasiveness lest any should fail to be won for his truth. He concedes everything. It is part of his art to go further than his detractors. He is so well versed in his subject that he can do that with consummate mastery, where they are clumsy or dilettante. It is but a pale ghost of religion that he has left. But he has attained his purpose. He has vindicated the place of religion in the life of culture. He has shown the relation of religion to every great thing in civilisation, its affinity with art, its common quality with poetry, its identity with all profound activities of the soul. These all are religion, though their votaries know it not. These are reverence for the highest, dependence on the highest, self-surrender to the highest. No great man ever lived, no great work was ever done, save in an attitude toward the universe, which is identical with that of the religious man toward God. The universe is God. God is the universe. That religionists have obscured this simple truth and denied this grand relation is true, and nothing to the point. The cultivated should be ashamed not to know this. Then, with a sympathy with institutional religion and a knowledge of history in which he stood almost alone, he retracts much that he has yielded, he rebuilds much that he has thrown down, proclaims much which they must now concede. The book was published in 1799. Twenty years later he said sadly that if he were rewriting it, its shafts would be directed against some very different persons, against glib and smug people who boasted the form of godliness, conventional, even fashionable religionists and loveless ecclesiastics. Vast and various influences in the Germany of the first two decades of the century had wrought for the revival of religion. Of those influences, not the least had been that of Schleiermacher's book. Among the greatest had been Schleiermacher himself.

The religion of feeling, as advocated in the *Reden*, had left much on the ethical side to be desired. This defect the author sought to remedy in his *Monologen*, published in 1800. The programme of theological studies for the new University of Berlin, *Kurze Darstellung des Theologischen Studiums*, 1811, shows his theological system already in large part matured. His *Der christliche Glaube*, published in 1821, revised three years before his death in 1834, is his monumental work. His *Ethik*, his lectures upon many subjects, numerous volumes of sermons, all published after his death, witness his versatility. His sermons have the rare note which one finds in Robertson and Brooks.

All of the immediacy of religion, its independence of rational argument, of historical tradition or institutional forms, which was characteristic of Schleiermacher to his latest day, is felt in the *Reden*. By it he thrilled the hearts of men as they have rarely been thrilled. It is not forms and traditions which create religion. It is religion which creates these. They cannot exist without it. It may exist without them, though not so well or so effectively. Religion is the sense of God. That sense we have, though many call it by another name. It would be more true to say that that sense has us. It is inescapable. All who have it are the religious. Those who hold to dogmas, rites, institutions in such a way as to obscure and overlay this sense of God, those who hold those as substitute for that sense, are the nearest to being irreligious. Any form,

the most *outré*, bizarre and unconventional, is good, so only that it helps a man to God. All forms are evil, the most accredited the most evil, if they come between a man and God. The pantheism of the thought of God in all of Schleiermacher's early work is undeniable. He never wholly put it aside. The personality of God seemed to him a limitation. Language is here only symbolical, a mere expression from an environment which we know, flung out into the depths of that we cannot see. If the language of personal relations helps men in living with their truth — well and good. It hinders also. For himself he felt that it hindered more than helped. His definition of religion as the feeling of dependence upon God, is cited as evidence of the effect upon him of his contention against the personalness of God. Religion is also, it is alleged, the sentiment of fellowship with God. Fellowship implies persons. But to no man was the fellowship with the soul of his own soul and of all the universe more real than was that fellowship to Schleiermacher. This was the more true in his maturer years, the years of the magnificent rounding out of his thought. God was to him indeed not 'a man in the next street.' What he says about the problem of the personalness of God is true. We see, perhaps, more clearly than did he that the debate is largely about words. Similarly, we may say that Schleiermacher's passing denial of the immortality of the soul was directed, in the first instance, against the crass, unsocial and immoral view which has disfigured much of the teaching of religion. His contention was directed toward that losing of oneself in God through ideals and service now, which in more modern phrase we call the entrance upon the immortal life here, the being in eternity now. For a soul so disposed, for a life thus inspired, death is but an episode. For himself he rejoices to declare it one to the issue of which he is indifferent. If he may thus live with God now, he cares little whether or not he shall live by and by.

In his *Monologues* Schleiermacher first sets forth his ethical thought. As it is religion that a man feels himself dependent upon God, so is it the beginning of morality that a man feels his dependence upon his fellows and their dependence on him. Slaves of their own time and circumstance, men live out their lives in superficiality and isolation. They are a prey to their own selfishness. They never come into those relations with their fellows in which the moral ideal can be realised. Man in his isolation from his fellows is nothing and accomplishes nothing. The interests of the whole humanity are his private interests. His own happiness and welfare are not possible to be secured save through his co-operation with others, his work and service for others. The happiness and welfare of others not merely react upon his own. They are in a large sense identical with his own. This oneness of a man with all men is the basis of morality, just as the oneness of man with God is the basis of religion. In both cases the oneness exists whether or not we know it. The contradictions and miseries into which immoral or unmoral conduct plunges us, are the witness of the fact that this inviolable unity of a man with humanity is operative, even if he ignores it. Often it is his ignoring of this relation which brings him through misery to consciousness of it. Man as moral being is but an individuation of humanity, just as, again, as religious being he is but an individuation of God. The goal of the moral life is the absorption of self, the elimination of self, which is at the same time the realisation of self, through the life and service for others. The goal of religion is the elimination of self, the swallowing up of self, in the service of God. In truth, the unity of man with man is at bottom only another form of his unity with God, and the service of humanity is the identical service of God. Other so-called services of God are a means to this, or else an illusion. This parallel of religion and morals is to be set over against other passages, easily to be cited, in which Schleiermacher speaks of passivity and contemplation as the means of the realisation of the unity of man and God, as if the elimination of self meant a sort of Nirvana. Schleiermacher was a pantheist and mystic. No philosopher save Kant ever influenced him half so much as did Spinoza. There is something almost oriental in his mood at times. An occasional fragment of description of religion might pass as a better delineation of Buddhism than of Christianity. This universality of his mind is interesting. These elements have not been unattractive to some portions of his following. One wearied with the Philistinism of the modern popular urgency upon practicality turns to Schleiermacher, as indeed sometimes to Spinoza, and says, here is a man who at least

knows what religion is. Yet nothing is further from the truth than to say that Schleiermacher had no sense for the meaning of religion in the outward life and present world.

In the *Reden* Schleiermacher had contended that religion is a condition of devout feeling, specifically the feeling of dependence upon God. This view dominates his treatment of Christianity. It gives him his point of departure. A Christian is possessed of the devout feeling of dependence upon God through Jesus Christ or, as again he phrases it, of dependence upon Christ. Christianity is a positive religion in the sense that it has direct relation to certain facts in the history of the race, most of all to the person of Jesus of Nazareth. But it does not consist in any positive propositions whatsoever. These have arisen in the process of interpretation of the faith. The substance of the faith is the experience of renewal in Christ, of redemption through Christ. This inward experience is neither produced by pure thought nor dependent upon it. Like all other experience it is simply an object to be described and reckoned with. Orthodox dogmatists had held that the content of the Christian faith is a doctrine given in revelation. Schleiermacher held that it is a consciousness inspired primarily by the personality of Jesus. It must be connected with the other data and acta of our consciousness under the general laws of the operation of the mind. Against rationalism and much so-called liberal Christianity, Schleiermacher contended that Christianity is not a new set of propositions periodically brought up to date and proclaimed as if these alone were true. New propositions can have only the same relativity of truth which belonged to the old ones in their day. They may stand between men and religion as seriously as the others had done.

The condition of the heart, which is religion, the experience through Jesus which is Christianity, is primarily an individual matter. But it is not solely such. It is a common experience also. Schleiermacher recognises the common element in the Christian consciousness, the element which shows itself in the Christian experience of all ages, of different races and of countless numbers of men. By this recognition of the Christian Church in its deep and spiritual sense, Schleiermacher hopes to escape the vagaries and eccentricities, and again the narrowness and bigotries of pure individualism. No liberal theologian until Schleiermacher had had any similar sense of the meaning of the Christian Church, and of the privilege and duty of Christian thought to contribute to the welfare of that body of men believing in God and following Christ which is meant by the Church. This is in marked contrast with the individualism of Kant. Of course, Schleiermacher would never have recognised as the Church that part of humanity which is held together by adherence to particular dogmas, since, for him, Christianity is not dogma. Still less could he recognise as the Church that part of mankind which is held together by a common tradition of worship, or by a given theory of organisation, since these also are historical and incidental. He meant by the Church that part of humanity, in all places and at all times, which has been held together by the common possession of the Christian consciousness and the Christian experience. The outline of this experience, the content of this consciousness, can never be so defined as to make it legislatively operative. If it were so defined we should have dogma and not Christianity. Nevertheless, it may be practically potent. The degree in which a given man may justly identify his own consciousness and experience with that of the Christian world is problematical. In Schleiermacher's own case, the identification of some of his contentions as, for example, the thought that God is not personal with the great Christian consciousness of the past, is more than problematical. To this Schleiermacher would reply that if these contentions were true, they would become the possession of spiritual Christendom with the lapse of time. Advance always originated with one or a few. If, however, in the end, a given portion found no place in the consciousness of generation truly evidencing their Christian life, that position would be adjudged an idiosyncrasy, a negligible quantity. This view of Schleiermacher's as to the Church is suggestive. It is the undertone of a view which widely prevails in our own time. It is somewhat difficult of practical combination with the traditional marks of the churches, as these have been inherited even in Protestantism from the Catholic age.

In a very real sense Jesus occupied the central place in Schleiermacher's system. The centralness of Jesus Christ he himself was never weary of emphasising. It became in the next generation a favorite

phrase of some who followed Schleiermacher's pure and bounteous spirit afar off. Too much of a mystic to assert that it is through Jesus alone that we know God, he yet accords to Jesus an absolutely unique place in revelation. It is through the character and personality of Jesus that the change in the character of man, which is redemption, is marshalled and sustained. Redemption is a man's being brought out of the condition in which all higher self consciousness was dimmed and enfeebled, into one in which this higher consciousness is vivid and strong and the power of self-determination toward the good has been restored. Salvation is thus moral and spiritual, present as well as future. It is possible in the future only because actual in the present. It is the reconstruction of a man's nature and life by the action of the spirit of God, conjointly with that of man's own free spirit.

It is intelligible in Schleiermacher's context that Jesus should be spoken of as the sole redeemer of men, their only hope, and that the Christian's dependence upon him should be described as absolute. As a matter of fact, however, the idea of dependence upon Christ alone has been often, indeed, one may say generally, associated with a conception of salvation widely different from that of Schleiermacher. It has been oftenest associated with the notion of something purely external, forensic, even magical. It is connected, even down to our own time, with reliance upon the blood of Christ, almost as if this were externally applied. It has postulated a propitiatory sacrifice, a vicarious atonement, a completed transaction, something which was laid up for all and waiting to be availed of by some. Now every external, forensic, magical notion of salvation, as something purchased for us, imputed to us, conferred upon us, would have been utterly impossible to Schleiermacher. It is within the soul of man that redemption takes place. Conferment from the side of God and Christ, or from God through Christ, can be nothing more, as also it can be nothing less, than the imparting of wisdom and grace and spiritual power from the personality of Jesus, which a man then freely takes up within himself and gives forth as from himself. The Christian consciousness contains, along with the sense of dependence upon Jesus, the sense of moral alliance and spiritual sympathy with him, of a free relation of the will of man to the will of God as revealed in Jesus. The will of man is set upon the reproduction within himself, so far as possible, of the consciousness, experience and character of Jesus.

The sin from which man is to be delivered is described by Schleiermacher thus: It is the dominance of the lower nature in us, of the sense-consciousness. It is the determination of our course of life by the senses. This preponderance of the senses over the consciousness of God is the secret of unhappiness, of the feeling of defeat and misery in men, of the need of salvation. One has to read Schleiermacher's phrase, 'the senses' here, as we read Paul's phrase, 'the flesh.' On the other hand, the preponderance of the consciousness of God, the willing obedience to it in every act of life, becomes to us the secret of strength and of blessedness in life. This is the special experience of the Christian. It is the effect of the impulse and influence of Christ. We receive this impulse in a manner wholly consistent with the laws of our psychological and moral being. We carry forward this impulse with varying fortunes and by free will. It comes to us, however, from without and from above, through one who was indeed true man, but who is also, in a manner not further explicable, to be identified with the moral ideal of humanity. This identification of Jesus with the moral ideal is complete and unquestioning with Schleiermacher. It is visible in the interchangeable use of the titles Jesus and Christ. Our saving consciousness of God could proceed from the person of Jesus only if that consciousness were actually present in Jesus in an absolute measure. Ideal and person in him perfectly coincide.

As typical and ideal man, according to Schleiermacher, Jesus was distinguished from all other founders of religions. These come before us as men chosen from the number of their fellows, receiving, quite as much for themselves as for others, that which they received from God. It is nowhere implied that Jesus himself was in need of redemption, but rather that he alone possessed from earliest years the fulness of redemptive power. He was distinguished from other men by his absolute moral perfection. This excluded not merely actual sin, but all possibility of sin and, accordingly, all real moral struggle. This perfection

was characterised also by his freedom from error. He never originated an erroneous notion nor adopted one from others as a conviction of his own. In this respect his person was a moral miracle in the midst of the common life of our humanity, of an order to be explained only by a new spiritually creative act of God. On the other hand, Schleiermacher says squarely that the absence of the natural paternal participation in the origin of the physical life of Jesus, according to the account in the first and third Gospels, would add nothing to the moral miracle if it could be proved and detract nothing if it should be taken away. Singular is this ability on the part of Schleiermacher to believe in the moral miracle, not upon its own terms, of which we shall speak later, but upon terms upon which the outward and physical miracle, commonly so-called, had become, we need not say incredible, but unnecessary to Schleiermacher himself. Singular is this whole part of Schleiermacher's construction, with its lapse into abstraction of the familiar sort, of which, in general, the working of his mind had been so free. For surely what we here have is abstraction. It is an undissolved fragment of metaphysical theology. It is impossible of combination with the historical. It is wholly unnecessary for the religious view of salvation which Schleiermacher had distinctly taken. It is surprising how slow men have been to learn that the absolute cannot be historic nor the historic absolute.

Surely the claim that Jesus was free from error in intellectual conception is unnecessary, from the point of view of the saving influence upon character which Schleiermacher had asserted. It is in contradiction with the view of revelation to which Schleiermacher had already advanced. It is to be accounted for only from the point of view of the mistaken assumption that the divine, even in manifestation, must be perfect, in the sense of that which is static and not of that which is dynamic. The assertion is not sustained from the Gospel itself. It reduces many aspects of the life of Jesus to mere semblance. That also which is claimed in regard to the abstract impossibility of sin upon the part of Jesus is in hopeless contradiction with that which Schleiermacher had said as to the normal and actual development of Jesus, in moral as also in all other ways. Such development is impossible without struggle. Struggle is not real when failure is impossible. So far as we know, it is in struggle only that character is made. Even as to the actual commission of sin on Jesus' part, the assertion of the abstract necessity of his sinlessness, for the work of moral redemption, goes beyond anything which we know. The question of the sinlessness of Jesus is not an *a priori* question. To say that he was by conception free from sin is to beg the question. We thus form a conception and then read the Gospels to find evidence to sustain it. To say that he did, though tempted in all points like as we are, yet so conduct himself in the mystery of life as to remain unstained, is indeed to allege that he achieved that which, so far us we know, is without parallel in the history of the race. But it is to leave him true man, and so the moral redeemer of men who would be true. To say that, if he were true man, he must have sinned, is again to beg the question. Let us repeat that the question is one of evidence. To say that he was, though true man, so far as we have any evidence in fact, free from sin, is only to say that his humanity was uniquely penetrated by the spirit of God for the purposes of the life which he had to live. That heart-broken recollection of his own sin which one hears in *The Scarlet Letter*, giving power to the preacher who would reach men in their sins, has not the remotest parallel in any reminiscence of Jesus which we possess. There is every evidence of the purity of Jesus' consciousness. There is no evidence of the consciousness of sin. There is a passage in the *Discourses*, in which Schleiermacher himself declared that the identification of the fundamental idea of religion with the historical fact in which that religion had its rise, was a mistake. Surely it is exactly this mistake which Schleiermacher has here made.

It will be evident from all that has been said that to Schleiermacher the Scripture was not the foundation of faith. As such it was almost universally regarded in his time. The New Testament, he declared, is itself but a product of the Christian consciousness. It is a record of the Christian experience of the men of the earlier time. To us it is a means of grace because it is the vivid and original register of that experience. The Scriptures can be regarded as the work of the Holy Spirit only in so far as this was

this common spirit of the early Church. This spirit has borne witness to Christ in these writings not essentially otherwise than in later writings, only more at first hand, more under the impression of intercourse with Jesus. Least of all may we base the authority of Scripture upon a theory of inspiration such as that generally current in Schleiermacher's time. It is the personality of Jesus which is the inspiration of the New Testament. Christian faith, including the faith in the Scriptures, can rest only upon the total impression of the character of Jesus.

In the same manner Schleiermacher speaks of miracles. These cannot be regarded in the conventional manner as supports of religion, for the simplest of all reasons. They presuppose religion and faith and must be understood by means of those. The accounts of external miracles contained in the Gospels are matters for unhesitating criticism. The Christian finds, for moral reasons and because of the response of his own heart, the highest revelation of God in Jesus Christ. Extraordinary events may be expected in Jesus' career. Yet these can be called miracles only relatively, as containing something extraordinary for contemporary knowledge. They may remain to us events wholly inexplicable, illustrating a law higher than any which we yet know. Therewith they are not taken out of the realm of the orderly phenomena of nature. In other words, the notion of the miraculous is purely subjective. What is a miracle for one age may be no miracle in the view of the next. Whatever the deeds of Jesus may have been, however inexplicable all ages may find them, we can but regard them as merely natural consequences of the personality of Jesus, unique because he was unique. 'In the interests of religion the necessity can never arise of regarding an event as taken out of its connection with nature, in consequence of its dependence upon God.'

It is not possible within the compass of this book to do more than deal with typical and representative persons. Schleiermacher was epoch-making. He gathered in himself the creative impulses of the preceding period. The characteristic theological tendencies of the two succeeding generations may be traced back to him. Many men worked in seriousness upon the theological problem. No one of them marks an era again until we come to Ritschl. The theologians of the interval between Schleiermacher and Ritschl have been divided into three groups. The first group is of distinctly philosophical tendency. The influence of Hegel was felt upon them all. To this group belong Schweitzer, Biedermann, Lipsius, and Pfleiderer. The influence of Hegel was greatest upon Biedermann, least upon Lipsius. An estimate of the influence of Schleiermacher would reverse that order. Especially did Lipsius seek to lay at the foundation of his work that exact psychological study of the phenomena of religion which Schleiermacher had declared requisite. It is possible that Lipsius will more nearly come to his own when the enthusiasm for Ritschl has waned. The second group of Schleiermacher's followers took the direction opposite to that which we have named. They were the confessional theologians. Hoffmann shows himself learned, acute and full of power. One does not see, however, why his method should not prove anything which any confession ever claimed. He sets out from Schleiermacher's declaration concerning the content of the Christian consciousness. In Hoffmann's own devout consciousness there had been response, since his childhood, to every item which the creed alleged. Therefore these items must have objective truth. One is reminded of an English parallel in Newman's *Grammar of Assent*. Yet another group, that of the so-called mediating theologians, contains some well-known names. Here belong Nitzsch, Rothe, Müller, Dorner. The name had originally described the effort to find, in the Union, common ground between Lutherans and Reformed. In the fact that it made the creeds of little importance and fell back on Schleiermacher's emphasis upon feeling, the movement came to have the character also of an attempt to find a middle way between confessionalists and rationalists. Its representatives had often the kind of breadth of sympathy which goes with lack of insight, rather than that breadth of sympathy which is due to the possession of insight. Yet Rothe rises to real distinction, especially in his forecast of the social interpretation of religion. With the men of this group arose a speculation concerning the person of Christ which for a time had some currency. It was called the theory of the kenosis. Jesus is spoken of in a famous passage of the

letter to the Philippians; as having emptied himself of divine qualities that he might be found in fashion as a man. In this speculation the divine attributes were divided into two classes. Of the one class it was held Christ had emptied himself in becoming flesh, or at least he had them in abeyance. He had them, but did not use them. What we have here is but a despairing effort to be just to Jesus' humanity and yet to assert his deity in the ancient metaphysical terms. It is but saying yes and no in the same breath. Biedermann said sadly of the speculation that it represented the kenosis, not of the divine nature, but of the human understanding.

RITSCHL AND THE RITSCHLIANS

If any man in the department of theology in the latter half of the nineteenth century attained a position such as to entitle him to be compared with Schleiermacher, it was Ritschl. He was long the most conspicuous figure in any chair of dogmatic theology in Germany. He established a school of theological thinkers in a sense in which Schleiermacher never desired to gain a following. He exerted ecclesiastical influence of a kind which Schleiermacher never sought. He was involved in controversy in a degree to which the life of Schleiermacher presents no parallel. He was not a preacher, he was no philosopher. He was not a man of Schleiermacher's breadth of interest. His intellectual history presents more than one breach within itself, as that of Schleiermacher presented none, despite the wide arc which he traversed. Of Ritschl, as of Schleiermacher, it may be said that he exerted a great influence over many who have only in part agreed with him.

Albrecht Ritschl was born in 1822 in Berlin, the son of a bishop in the Lutheran Church. He was educated at Bonn and at Tübingen. He established himself at Bonn, where, in 1853, he became professor extraordinarius and in 1860 ordinaries. In 1864 he was called to Göttingen. In 1874 he became consistorialrath in the new Prussian establishment for the Hanoverian Church. He died in 1888. These are the simple outward facts of a somewhat stormy professional career. There was pietistic influence in Ritschl's ancestry, as also in Schleiermacher's. Ritschl had, however, reacted violently against it. His attitude was that of repudiation of everything mystical. He had strong aversion to the type of piety which rested its assurance solely upon inward experience. This aversion is one root of the historic positivism which makes him, at the last, assert the worthlessness of all supposed revelations outside of the Bible and of all supposed Christian experience apart from the influence of the historical Christ. He began his career under the influence of Hegel. He came to the position in which he felt that the sole hope for theology was in the elimination from it of all metaphysical elements. He felt that none of his predecessors had carried out Schleiermacher's dictum, that religion is not thought, but religious thought only one of the functions of religion. Yet, of course, he was not able to discuss fundamental theological questions without philosophical basis, particularly an explicit theory of knowledge. His theory of knowledge he had derived eclectically and somewhat eccentrically, from Lotze and Kant. To this day not all, either of his friends or foes, are quite certain what it was. It is open to doubt whether Ritschl really arrived at his theory of cognition and then made it one of the bases of his theology. It is conceivable that he made his theology and then propounded his theory of cognition in its defence. In a word, the basis of distinction between religious and scientific knowledge is not to be sought in its object. It is to be found in the sphere of the subject, in the difference of attitude of the subject toward the object. Religion is concerned with what he calls *Werthurtheile*, judgments of value, considerations of our relation to the world, which are of moment solely in accordance with their value in awakening feelings of pleasure or of pain. The thought of God, for example, must be treated solely as a judgment of value. It is a conception which is of worth for the attainment of good, for our spiritual peace and victory over the world. What God is in himself we cannot know, an existential Judgment we cannot form without going over to the metaphysicians. What God is to us we can know simply as religious men and solely upon the basis of religious experience. God is holy

love. That is a religious value-judgment. But what sort of a being God must be in order that we may assign to him these attributes, we cannot say without leaving the basis of experience. This is pragmatism indeed. It opens up boundless possibilities of subjectivism in a man who was apparently only too matter-of-fact.

There was a time in his career when Ritschl was popular with both conservatives and liberals. There were long years in which he was bitterly denounced by both. Yet there was something in the man and in his teaching which went beyond all the antagonisms of the schools. There can be no doubt that it was the intention of Ritschl to build his theology solely upon the gospel of Jesus Christ. The joy and confidence with which this theology could be preached, Ritschl awakened in his pupils in a degree which had not been equalled by any theologian since Schleiermacher himself. Numbers who, in the time of philosophical and scientific uncertainty, had lost their courage, regained it in contact with his confident and deeply religious spirit. A wholesome nature, eminently objective in temper, concentrated with all his force upon his task, of rare dialectical gifts, he had a great sense of humour and occasionally also the faculty of bitterly sarcastic speech. His very figure radiated the delight of conflict as he walked the Göttingen wall.

A devoted pupil, writing immediately after Ritschl's death, used concerning Schleiermacher a phrase which we may transfer to Ritschl himself. 'One wonders whether such a theology ever existed as a connected whole, except in the mind of its originator. Neither by those about him, nor by those after him, has it been reproduced in its entirety or free from glaring contradictions.' It was not free from contradictions in Ritschl's own mind. His pupils divided his inheritance among them. Each appropriated that which accorded with his own way of looking at things and viewed the remainder as something which might be left out of the account. It is long since one could properly speak of a Ritschlian school. It will be long until we shall cease to reckon with a Ritschlian influence. He did yeoman service in breaking down the high Lutheran confessionalism which had been the order of the day. In his recognition of the excesses of the Tübingen school all would now agree. In his feeling against mere sentimentalities of piety many sympathise. In his emphasis upon the ethical and practical, in his urgency upon the actual problem of a man's vocation in the world, he meets in striking manner the temper of our age. In his emphasis upon the social factor in religion, he represents a popular phase of thought. With all of this, it is strange to find a man of so much learning who had so little sympathy with the comparative study of religions, who was such a dogmatist on behalf of his own inadequate notion of revelation, the logical effect of whose teaching concerning the Church would be the revival of an institutionalism and externalism such as Protestantism has hardly known.

Since Schleiermacher the German theologians had made the problem of the person of Christ the centre of discussion. In the same period the problem of the person of Christ had been the central point of debate in America. Here, as there, all the other points arranged themselves about this one. The new movement which went out from Ritschl took as its centre the work of Christ in redemption. This is obvious from the very title of Ritschl's great book, *Die Christliche Lehre von der Rechtfertigung und Versöhnung*. Of this work the first edition of the third and significant volume was published in 1874. Before that time the formal treatises on theology had followed a traditional order of topics. It had been assumed as self-evident that one should speak of a person before one talked of his work. It did not occur to the theologians that in the case of the divine person, at all events, we can securely say that we know something as to his work. Much concerning his person must remain a mystery to us, exactly because he is divine. Our safest course, therefore, would be to infer the unknown qualities of his person from the known traits of his work. Certainly this would be true as to the work of God in nature. This was not the way, however, in which the minds of theologians worked. The habit of dealing with conceptions as if they were facts had too deep hold upon them. So long as men believed in revelation as giving them, not primarily God and the transcendental world itself, but information about God and the transcendental, they naturally held that they knew as much of the persons of God and Christ as of their works.

Schleiermacher had opened men's eyes to the fact that the great work of Christ in redemption is an inward one, an ethical and spiritual work, the transformation of character. He had said, not merely that the transformation of man's character follows upon the work of redemption. It is the work of redemption. The primary witness to the work of Christ is, therefore, in the facts of consciousness and history. These are capable of empirical scrutiny. They demand psychological investigation. When thus investigated they yield our primary material for any assertion we may make concerning God. Above all, it is the nature of Jesus, as learned on the evidence of his work in the hearts of men, which is our great revelation and source of inference concerning the nature of God. Instead of saying in the famous phrase, that the Christians think of Christ as God, we say that we are able to think of God, as a religious magnitude, in no other terms than in those of his manifestation and redemptive activity in Jesus.

None since Kant, except extreme confessionalists, and those in diminishing degree, have held that the great effect of the work of Christ was upon the mind and attitude of God. Less and less have men thought of justification as forensic and judicial, a declaring sinners righteous in the eye of the divine law, the attribution of Christ's righteousness to men, so far at least as to relieve these last of penalty. This was the Anselmic scheme. Indeed, it had been Tertullian's. Less and less have men thought of reconciliation as that of an angry God to men, more and more as of alienated men with God. The phrases of the orthodoxy of the seventeenth century, Lutheran as well as Calvinistic, survive. More and more new meaning, not always consistent, is injected into them. No one would deny that the loftiest moral enthusiasm, the noblest sense of duty, animated the hearts of many who thought in the terms of Calvinism. The delineation of God as unreconciled, of the work and sufferings of Christ as a substitution, of salvation as a conferment, caused gratitude, tender devotion, heroic allegiance in some. It worked revulsion in others. It was protested against most radically by Kant, as indeed it had been condemned by many before him. For Kant the renovation of character was the essential salvation. Yet the development of his doctrine was deficient through the individualistic form which it took. Salvation was essentially a change in the individual mind, brought about through the practical reason, and having its ideal in Jesus. Yet for Kant our salvation had no closer relation to the historic revelation in Jesus. Furthermore, so much was this change an individual issue that we may say that the actualisation of redemption would be the same for a given man, were he the only man in the universe. To hold fast to the ethical idealism of Kant, and to overcome its subjectivity and individualism, was the problem.

The reference to experience which underlies all that was said above was particularly congruous with the mood of an age grown weary of Hegelianism and much impressed with the value of the empirical method in all the sciences. Another great contention of our age is for the recognition of the value of what is social. Its emphasis is upon that which binds men together. Salvation is not normally achieved except in the life of a man among and for his fellows. It is by doing one's duty that one becomes good. One is saved, not in order to become a citizen of heaven by and by, but in order to be an active citizen of a kingdom of real human goodness here and now. In reality no man is being saved, except as he does actively and devotedly belong to that kingdom. The individual would hardly be in God's eyes worth the saving, except in order that he might be the instrumentality of the realisation of the kingdom. Those are ideas which it is possible to exaggerate in statement or, at least, to set forth in all the isolation of their quality as half-truths. But it is hardly possible to exaggerate their significance as a reversal of the immemorial one-sidedness, inadequacy, and artificiality both of the official statement and of the popular apprehension of Christianity. These ideas appeal to men in our time. They are popular because men think them already. Men are pleased, even when somewhat incredulous, to learn that Christianity will bear this social interpretation. Most Christians are in our time overwhelmingly convinced that in this direction lies the interpretation which Christianity must bear, if it is to do the work and meet the needs of the age. Its consonance with some of the truths underlying socialism may account, in a measure, for the influence which the Ritschlian theology has had.

As was indicated, Ritschl's epoch-making book bears the title, *The Christian Doctrine of Justification and Reconciliation*. The book might be described in the language of the schools as a monograph upon one great dogma of the Christian faith, around which, as the author treats it, all the other doctrines are arranged. The familiar topic of justification, of which Luther made so much, was thus given again the central place. What the book really offered was something quite different from this. It was a complete system of theology, but it differed from the traditional systems of theology. These had followed helplessly a logical scheme which begins with God as he is in himself and apart from any knowledge which we have of him. They then slowly proceeded to man and sin and redemption, one empirical object and two concrete experiences which we may know something about. Ritschl reversed the process. He aimed to begin with certain facts of life. Such facts are sin and the consciousness of forgiveness, awareness of restoration to the will and power of goodness, the gift of love and of a spirit which can feel itself victorious even in the midst of ills in life, confidence that this life is not all. These phrases, taken together, would describe the consciousness of salvation. This consciousness of sin and salvation is a fact in individual men. It has evidently been a fact in the life of masses of men for many generations. The facts have thus a psychology and a history from which reflection on the phenomenon of faith must take its departure. There is no reason why, upon this basis, and until it departs from the scientific methods which are given with the nature of its object, theology should not be as truly a science as is any other known among men.

This science starts with man, who in the object of many other sciences. It confines itself to man in this one aspect of his relation to moral life and to the transcendent meaning of the universe. It notes the fact that men, when awakened, usually have the sense of not being in harmony with the life of the universe or on the way to realisation of its meaning. It notes the fact that many men have had the consciousness of progressive restoration to that harmony. It inquires as to the process of that restoration. It asks as to the power of it. It discovers that that power is a personal one. Men have believed that this power has been exerted over them, either in personal contact, or across the ages and through generations of believers, by one Jesus, whom they call Saviour. They have believed that it was God who through Jesus saved them. Jesus' consciousness thus became to them a revelation of God. The thought leads on to the consideration of that which a saved man does, or ought to do, in the life of the world and among his fellows, of the institution in which this attitude of mind is cherished and of the sum total of human institutions and relations of which the saved life should be the inward force. There is room even for a clause in which to compress the little that we know of anything beyond this life. We have written in unconventional words. There is no one place, either in Ritschl's work or elsewhere, where this grand and simple scheme stands together in one context. This is unfortunate. Were this the case, even wayfaring men might have understood somewhat better than they have what Ritschl was aiming at.

It is a still greater pity that the execution of the scheme should have left so much to be desired. That this execution would prove difficult needs hardly to be said. That it could never be the work of one man is certainly true. To have had so great an insight is title enough to fame. Ritschl falls off from his endeavour as often as did Schleiermacher — more often and with less excuse. The might of the past is great. The lumber which he meekly carries along with him is surprising, as one feels his lack of meekness in the handling of the lumber which he recognised as such. The putting of new wine into old bottles is so often reprobated by Ritschl that the reader is justly surprised when he nevertheless recognises the bottles. The system is not 'all of one piece' — distinctly not. There are places where the rent is certainly made worse by the old cloth on the new garment. The work taken as a whole is so bewildering that one finds himself asking, 'What is Ritschl's method?' If what is meant is not a question of detail, but of the total apprehension of the problem to be solved, the apprehension which we strove to outline above, then Ritschl's courageous and complete inversion of the ancient method, his demand that we proceed from the known to the unknown, is a contribution so great that all shortcomings in the execution of it are

insignificant. His first volume deals with the history of the doctrine of justification, beginning with Anselm and Abelard. In it Ritschl's eminent qualities as historian come out. In it also his prejudices have their play. The second volume deals with the Biblical foundations for the doctrine. Ritschl was bred in the Tübingen school. Yet here is much forced exegesis. Ritschl's positivistic view of the Scripture and of the whole question of revelation, was not congruous with his well-learned biblical criticism. The third volume is the constructive one. It is of immeasurably greater value than the other two. It is this third volume which has frequently been translated.

In respect of his contention against metaphysics it is hardly necessary that we should go into detail. With his empirical and psychological point of departure, given above, most men will find themselves in entire sympathy. The confusion of religion, which is an experience, with dogma which is reasoning about it, and the acceptance of statements in Scripture which are metaphysical in nature, as if they were religious truths — these two things have, in time past, prevented many earnest thinkers from following the true road. When it comes to the constructive portion of his work, it is, of course, impossible for Ritschl to build without the theoretical supports which philosophy gives, or to follow up certain of the characteristic magnitudes of religion without following them into the realm of metaphysics, to which, quite as truly as to that of religion, they belong. It would be unjust to Ritschl to suppose that these facts were hidden from him.

As to his attitude toward mysticism, there is a word to say. In the long history of religious thought those who have revolted against metaphysical interpretation, orthodox or unorthodox, have usually taken refuge in mysticism. Hither the prophet Augustine takes refuge when he would flee the ecclesiastic Augustine, himself. The Brethren of the Free Spirit, Tauler, à Kempis, Suso, the author of the *Theologia Germanica*, Molinos, Madame Gayon, illustrate the thing we mean. Ritschl had seen much of mysticism in pietist circles. He knew the history of the movement well. What impressed his sane mind was the fact that unhealthy minds have often claimed, as their revelation from God, an experience which might, with more truth, be assigned to almost any other source. He desired to cut off the possibility of what seemed to him often a tragic delusion. The margin of any mystical movement stretches out toward monstrosities and absurdities. For that matter, what prevents a Buddhist from declaring his thoughts and feelings to be Christianity? Indeed, Ritschl asks, why is not Buddhism as good as such Christianity? He is, therefore, suspicious of revelations which have nothing by which they can be measured and checked.

The claim of mystics that they came, in communion with God, to the point where they have no need of Christ, seemed to him impious. There is no way of knowing that we are in fellowship with God, except by comparing what we feel that this fellowship has given us, with that which we historically learn that the fellowship with God gave to Christ. This is the sense and this the connexion in which Ritschl says that we cannot come to God save in and through the historic Christ as he is given us in the Gospels. The inner life, at least, which is there depicted for us is, in this outward and authoritative sense, our norm and guide.

Large difficulties loom upon the horizon of this positivistic insistence upon history. Can we know the inner life of Christ well enough to use it thus as test in every, or even in any case? Does not the use of such a test, or of any test in this external way, take us out of the realm of the religion of the spirit? Men once said that the Church was their guide. Others said the Scripture was their guide. Now, in the sense of the outwardness of its authority, we repudiate even this. It rings devoutly if we say Christ is our guide. Yet, as Ritschl describes this guidance, in the exigency of his contention against mysticism, have we anything different? What becomes of Confucianists and Shintoists, who have never heard of the historic Christ? And all the while we have the sense of a query in our minds. Is it open to any man to repudiate mysticism absolutely and with contumely, and then leave us to discover that he does not mean mysticism as historians of every faith have understood it, but only the margin of evil which is apparently inseparable from it? That margin of evil others see and deplore. Against it other remedies have been suggested, as, for example, intelligence. Some would feel that in Ritschl's remedy the loss is greater than the gain.

This historical character of revelation is so truly one of the fountain heads of the theology which takes its rise in Ritschl, that it deserves to be considered somewhat more at length. The Ritschlian movement has engaged a generation of more or less notable thinkers in the period since Ritschl's death. These have dissented at many points from Ritschl's views, diverged from his path and marked out courses of their own. We shall do well in the remainder of this chapter to attempt the delineation in terms, not exclusively of Ritschl, but of that which may with some laxity be styled Ritschlianism. The value judgments of religion indicate only the subjective form of religious knowledge, as the Ritschlians understand it. Faith, however, does not invent its own contents. Historical facts, composing the revelation, actually exist, quite independent of the use which the believer makes of them. No group of thinkers have more truly sought to draw near to the person of the historic Jesus. The historical person, Jesus of Nazareth, is the divine revelation. That sums up this aspect of the Ritschlian position. Some negative consequences of this position we have already noted. Let us turn to its positive significance.

Herrmann is the one of the Ritschlians who has dealt with this matter not only with great clearness, but also with deep Christian feeling in his *Verkehr des Christen mit Gott*, 1886, and notably in his address, *Der Begriff der Offenbarung*, 1887. If the motive of religion were an intellectual curiosity, a verbal communication would suffice. As it is a practical necessity, this must be met by actual impulse in life. That passing out of the unhappiness of sin, into the peace and larger life which is salvation, does indeed imply the movement of God's spirit on our hearts, in conversion and thereafter. This is essentially mediated to us through the Scriptures, especially through those of the New Testament, because the New Testament contains the record of the personality of Jesus. In that our personality is filled with the spirit which breathes in him, our salvation is achieved. The image of Jesus which we receive acts upon us as something indubitably real. It vindicates itself as real, in that it takes hold upon our manhood. Of course, this assumes that the Church has been right in accepting the Gospels as historical. Herrmann candidly faces this question. Not every word or deed, he says, which is recorded concerning Jesus, belongs to this central and dynamic revelation of which we speak. We do not help men to see Jesus in a saving way if, on the strength of accounts in the New Testament, we insist concerning Jesus that he was born of a virgin, that he raised the dead, that he himself rose from the dead. We should not put these things before men with the declaration that they must assent to them. We must not try to persuade ourselves that that which acted upon the disciples as indubitably real must of necessity act similarly upon us. We are to allow ourselves to be seized and uplifted by that which, in our position, touches us as indubitably real. This is, in the first place, the moral character of Jesus. It is his inner life which, on the testimony of the disciples, meets us as something real and active in the world, as truly now as then. What are some facts of this inner life? The Jesus of the New Testament shows a firmness of religious conviction, a clearness of moral judgment, a purity and force of will, such as are not found united in any other figure in history. We have the image of a man who is conscious that he does not fall short of the ideal for which he offers himself. It is this consciousness which is yet united in him with the most perfect humility. He lives out his life and faces death in a confidence and independence which have never been approached. He has confidence that he can lift men to such a height that they also will partake with him in the highest good, through their full surrender to God and their life of love for their fellows.

It is clear that Herrmann aims to bring to the front only those elements in the life of Jesus which are likely to prove most effectual in meeting the need and winning the faith of the men of our age. He would cast into the background those elements which are likely to awaken doubt and to hinder the approach of men's souls to God. For Herrmann himself the virgin birth has the significance that the spiritual life of Jesus did not proceed from the sinful race. But Herrmann admits that a man could hold even that without needing to allege that the physical life of Jesus did not come into being in the ordinary way. The distinction between the inner and outward life of Jesus, and the declaration that belief in the former alone is necessary, has the result of thus ridding us of questions which can scarcely fail to be present to the mind

of every modern man. Yet it would be unjust to imply that this is the purpose. Quite the contrary, the distinction is logical for this theology. Redemption is an affair of the inner life of a man. It is the force of the inner life of the Redeemer which avails for it. It is from the belief that such an inner and spiritual life was once realised here on earth, that our own faith gathers strength, and gets guidance in the conflict for the salvation of our souls. The belief in the historicity of such an inner life is necessary. So Harnack also declares in his *Wesen des Christenthums*, 1900. It is noteworthy that in this connexion neither of these writers advances to a form of speculation concerning the exalted Christ, which in recent years has had some currency. According to this doctrine, there is ascribed to the risen and ascended Jesus an existence with God which is thought of in terms different from those which we associate with the idea of immortality. In other words, this continued existence of Christ as God is a counterpart of that existence before the incarnation, which the doctrine of the pre-existence alleged. But surely this speculation can have no better standing than that of the pre-existence.

Sin in the language of religion is defection from the law of God. It is the transgression of the divine command. In what measure, therefore, the life of man can be thought of as sinful, depends upon his knowledge of the will of God. In Scripture, as in the legends of the early history of the race, this knowledge stands in intimate connexion with the witness to a primitive revelation. This thought has had a curious history. The ideas of mankind concerning God and his will have grown and changed as much as have any other ideas. The rudimentary idea of the good is probably of social origin. It first emerges in the conflict of men one with another. As the personalised ideal of conduct, the god then reacts upon conduct, as the conduct reacts upon the notion of the god. Only slowly has the ideal of the good been clarified. Only slowly have the gods been ethicised. ‘An honest God is the noblest work of man.’ The moralising and spiritualising of the idea of Jahve lies right upon the face of the Old Testament. The ascent of man on his ethical and spiritual side is as certain as is that on his physical side. Long struggle upward through ignorance, weakness, sin, gradual elevating of the standard of what ought to he, growingly successful effort to conform to that standard — this is what the history of the race has seen.

Athwart this lies the traditional dogma. The dogma took up into itself a legend of the childhood of the world. It elaborated that which in Genesis is vague and poetic into a vast scheme which has passed as a sacred philosophy of history. It postulated an original revelation. It affirmed the created state of man as one of holiness before a fall. To the framers of the dogma, if sin is the transgression of God’s will, then it must be in light of a revelation of that will. In the Scriptures we have vague intimations concerning God’s will, growingly clearer knowledge of that will, evolving through history to Jesus. In the dogma we have this grand assumption of a paradisaic state of perfectness in which the will of God was from the beginning perfectly known.

In the Platonic, as in the rabbinic, speculation the idea must precede the fact. Every step of progress is a defection from that idea. The dogma suffers from an insoluble contradiction within itself. It aims to give us the point of departure by which we are to recognise the nature of sin. At the same moment it would describe the perfection of man at which God has willed that by age-long struggle he should arrive. Now, if we place this perfection at the beginning of human history, before all human self-determination, we divest it of ethical quality. Whatever else it may be, it is not character. On the other hand, if we would make this perfection really that of moral character, then we cannot place it at the beginning of human history, but far down the course of the evolution of the higher human traits, of the consciousness of sin and of the struggle for redemption. It is not revelation from God, but naïve imagination, later giving place to adventurous speculation concerning the origin of the universe, which we have in the doctrine of the primeval perfection of man. We do not really make earnest with our Christian claim that in Jesus we have our paramount revelation, until we admit this. It is through Jesus, and not from Adam that we know sin.

So we might go on to say that the dogma of inherited guilt is a contradiction in terms. Disadvantage may be inherited, weakness, proclivity to sin, but not guilt, not sin in the sense of that which entails guilt. What

entails guilt is action counter to the will of God which we know. That is always the act of the individual man myself. It cannot by any possibility be the act of another. It may be the consequence of the sins of my ancestors that I do moral evil without knowing it to be such. Even my fellows view this as a mitigation, if not as an exculpation. The very same act, however, which up to this point has been only an occasion for pity, becomes sin and entails guilt, when it passes through my own mind and will as a defection from a will of God in which I believe, and as a righteousness which I refuse. The confusion of guilt and sin in order to the inclusion of all under the need of salvation, as in the Augustinian scheme, ended in bewilderment and stultification of the moral sense. It caused men to despair of themselves and gravely to misrepresent God. It is no wonder if in the age of rationalism this dogma was largely done away with. The religious sense of sin was declared to be an hallucination. Nothing is more evident in the rationalist theology than its lack of the sense of sin. This alone is sufficient explanation of the impotency and inadequacy of that theology. Kant's doctrine of radical evil testifies to his deep sense that the rationalists were wrong. He could see also the impossibility of the ancient view. But he had no substitute. Hegel, much as he prided himself upon the restoration of dogma, viewed evil as only relative, good in the making. Schleiermacher made a beginning of construing the thought of sin from the point of view of the Christian consciousness. Ritschl was the first consistently to carry out Schleiermacher's idea, placing the Christian consciousness in the centre and claiming that the revelation of the righteousness of God and of the perfection of man is in Jesus. All men being sinners, there is a vast solidarity, which he describes as the Kingdom of Evil and sets over against the Kingdom of God, yet not so that the freedom or responsibility of man is impaired. God forgives all sin save that of wilful resistance to the spirit of the good. That is, Ritschl regards all sin, short of this last, as mainly ignorance and weakness. It is from Ritschl, and more particularly from Kaftan, that the phrases have been mainly taken which served as introduction to this paragraph.

For the work of God through Christ, in the salvation of men from the guilt and power of sin, various terms have been used. Different aspects of the work have been described by different names. Redemption, regeneration, justification, reconciliation and election or predestination — these are the familiar words. This is the order in which the conceptions stand, if we take them as they occur in consciousness. Election then means nothing more than the ultimate reference to God of the mystery of an experience in which the believer already rejoices. On the other hand, in the dogma the order is reversed. Election must come first, since it is the decree of God upon which all depends. Redemption and reconciliation have, in Christian doctrine, been traditionally regarded as completed transactions, waiting indeed to be applied to the individual or appropriated by him through faith, but of themselves without relation to faith. Reconciliation was long thought of as that of an angry God to man. Especially was this last the characteristic view of the West, where juristic notions prevailed. Origen talked of a right of the devil over the soul of man until bought off by the sacrifice of Christ. This is pure paganism, of course. The doctrine of Anselm marks a great advance. It runs somewhat thus: The divine honour is offended in the sin of man. Satisfaction corresponding to the greatness of the guilt must be rendered. Man is under obligation to render this satisfaction; yet he is unable so to do. A sin against God is an infinite offence. It demands an infinite satisfaction. Man can render no satisfaction which is not finite. The way out of this dilemma is the incarnation of the divine Logos. For the god-man, as man, is entitled to bring this satisfaction for men. On the other hand, as God he is able so to do. In his death this satisfaction is embodied. He gave his life freely. God having received satisfaction through him demands nothing more from us.

Abelard had, almost at the same time with Anselm, interpreted the death of Christ in far different fashion. It was a revelation of the love of God which wins men to love in turn. This notion of Abelard was far too subtle. The crass objective dogma of Anselm prevailed. The death of Christ was a sacrifice. The purpose was the propitiation of an angry God. The effect was that, on the side of God, a hindrance to man's salvation was removed. The doctrine accurately reflects the feudal ideas of the time which

produced it. In Grotius was done away the notion of private right, which lies at the basis of the theory of Anselm. That of public duty took its place. A sovereign need not stand upon his offended honour, as in Anselm's thought. Still, he cannot, like a private citizen, freely forgive. He must maintain the dignity of his office, in order not to demoralise the world. The sufferings of Christ did not effect a necessary private satisfaction. They were an example which satisfied the moral order of the world. Apart from this change, the conception remains the same.

As Kaftan argues, we can escape the dreadful externality and artificiality of this scheme, only as redemption and regeneration are brought back to their primary place in consciousness. These are the initial experiences in which we become aware of God's work through Christ in us and for us. The reconciliation is of us. The redemption is from our sins. The regeneration is to a new moral life. Through the influence of Jesus, reconciled on our part to God and believing in His unchanging love to us, we are translated into God's kingdom and live for the eternal in our present existence. Redemption is indeed the work of God through Christ, but it has intelligible parallel in the awakening of the life of the mind, or again of the spirit of self-sacrifice, through the personal influence of the wise and good. Salvation begins in such an awakening through the personal influence of the wisest and best. It is transformation of our personality through the personality of Jesus, by the personal God of truth, of goodness and of love. All that which God through Jesus has done for us is futile, save as we make the actualisation of our deliverance from sin our continuous and unceasing task. When this connexion of thought is broken through, we transfer the whole matter of salvation from the inner to the outer world and make of it a transaction independent of the moral life of man.

Justification and reconciliation also are primarily acts and gifts of God. Justification is a forensic act. The sense is not that in justification we are made just. We are, so to say, temporarily thus regarded, not that leniency may become the occasion of a new offence, but that in grateful love we may make it the starting point of a new life. We must justify our justification. It is easy to see the objections to such a course on the part of a civil judge. He must consider the rights of others. It was this which brought Grotius and the rest, with the New England theologians down to Park, to feel that forgiveness could not be quite free. If we acknowledge that this symbolism of God as judge or sovereign is all symbolism, mere figure of speech, not fact at all, then that objection — and much else — falls away. If we assert that another figure of speech, that of God as Father, more perfectly suggests the relation of God and man, then forgiveness may be free. Then justification and forgiveness are only two words for one and the same idea. Then the nightmare of a God who would forgive and cannot, of a God who will forgive but may not justify until something further happens, is all done away. Then the relation of the death of Jesus to the forgiveness of our sins cannot be other than the relation of his life to that forgiveness. Both the one and the other are a revelation of the forgiving love of God. We may say that in his death the whole meaning of his life was gathered. We may say that his death was the consummation of his life, that without it his life would not have been what it is. This is, however, very far from being the ordinary statement of the relation of Jesus' death, either to his own life or to the forgiveness of our sins.

The doctrinal tradition made much also of the deliverance from punishment which follows after the forgiveness of sin. In fact, in many forms of the dogma, it has been the escape from punishment which was chiefly had in mind. Along with the forensic notion of salvation we largely or wholly discard the notion of punishment. We retain only the sense that the consequence of continuing in sin is to become more sinful. God himself is powerless to prevent that. Punishment is immanent, vital, necessary. The penalty is gradually taken away if the sin itself is taken away — not otherwise. It returns with the sin, it continues in the sin, it is inseparable from the sin. Punishment is no longer the right word. Reward is not the true description of that growing better which is the consequence of being good. Reward or punishment as *quid pro quo*, as arbitrary assignments, as external equivalents, do not so much as belong to the world of ideas

in which we move. For this view the idea that God laid upon Jesus penalties due to us, fades into thin air. Jesus could by no possibility have met the punishment of sin, except he himself had been a sinner. Then he must have met the punishment of his own sin and not that of others. That portion which one may gladly bear of the consequences of another's sin may rightfully be called by almost any other name. It cannot be called punishment since punishment is immanent. Even eternal death is not a judicial assignment for our obstinate sinfulness. Eternal death is the obstinate sinfulness, and the sinfulness the death.

It must be evident that reconciliation can have, in this scheme, no meaning save that man's being reconciled to God. Jesus reveals a God who has no need to be reconciled to us. The alienation is not on the side of God. That, being alienated from God, man may imagine that God is hostile to him, is only the working of a familiar law of the human mind. The fiction of an angry God is the most awful survival among us of primitive paganism. That which Jesus by his revelation of God brought to pass was a true 'at-one-ment,' a causing of God and man to be at one again. To the word atonement, as currently pronounced, and as, until a half century ago, almost universally apprehended, the notion of that which is sacrificial attached. To the life and death of Jesus, as revelation of God and Saviour of men, we can no longer attach any sacrificial meaning whatsoever. There is indeed the perfectly general sense in which so beautiful a life and so heroic a death were, of course, a grand exemplification of self-sacrifice. Yet this is a sense so different from the other and in itself so obvious, that one hesitates to use the same word in the immediate context with that other, lest it should appear that the intention was to obscure rather than to make clear the meaning. For atonement in a sense different from that of reconciliation, we have no significance whatever. Reconciliation and atonement describe one and the same fact. In the dogma the words were as far as possible from being synonyms. They referred to two facts, the one of which was the means and essential prerequisite of the other. The vicarious sacrifice was the antecedent condition of the reconciling of God. In our thought it is not a reconciliation of God which is aimed at. No sacrifice is necessary. No sacrifice such as that postulated is possible. Of the reconciliation of man to God the only condition is the revelation of the love of God in the life and death of Jesus and the obedient acceptance of that revelation on the part of men.

CHAPTER IV. THE CRITICAL AND HISTORICAL MOVEMENT

It has been said that in Christian times the relation of philosophy and religion may be determined by the attitude of reason toward a single matter, namely, the churchly doctrine of revelation. There are three possible relations of reason to this doctrine. First, it may be affirmed that the content of religion and theology is matter communicated to man in extraordinary fashion, truth otherwise unattainable, on which it is beyond the competence of reason to sit in judgment. We have then the two spheres arbitrarily separated. As regards their relation, theology is at first supreme. Reason is the handmaiden of faith. It is occupied in applying the principles which it receives at the hands of theology. These are the so-called Ages of Faith. Notably was this the attitude of the Middle Age. But in the long run either authoritative revelation, thus conceived, must extinguish reason altogether, or else reason must claim the whole man. After all, it is in virtue of his having some reason that man is the subject of revelation. He is continually asked to exercise his reason upon certain parts of the revelation, even by those who maintain that he must do so only within limits. It is only because there in a certain reasonableness in the conceptions of revealed religion that man has ever been able to make them his own or to find in them meaning and edification. This external relation of reason to revelation cannot continue. Nor can the encroachments of reason be met by temporary distinctions such as that between the natural and the supernatural. The antithesis to the natural is not the supernatural, but the unnatural. The antithesis to reason is not faith, but irrationality. The antithesis to human truth is not the divine truth. It is falsehood.

Footnote 4:(return)

Seth Pringle-Pattison, *The Philosophical Radicals*, .

When men have made this discovery, a revulsion carries their minds to the second position of which we spoke. This is, namely, the position of extreme denial. It is an attitude of negation toward revelation, such as prevailed in the barren and trivial rationalism of the end of the eighteenth century. The reason having been long repressed revenges itself, usurping everything. The explanation of the rise of positive religion and of the claim of revelation is sought in the hypothesis of deceit, of ambitious priestcraft and incurable credulity. The religion of those who thus argue, in so far as they claim any religion, is merely the current morality. Their explanation of the religion of others is that it is merely the current morality plus certain unprovable assumptions. Indeed, they may think it to be but the obstinate adherence to these assumptions minus the current morality. It is impossible that this shallow view should prevail. To overcome it, however, there is need of a philosophy which shall give not less, but greater scope to reason and at the same time an inward meaning to revelation.

This brings us to the third possible position, to which the best thinkers of the nineteenth century have advanced. So long as deistic views of the relation of God to man and the world held the field, revelation meant something interjected *ab extra* into the established order of things. The popular theology which so abhorred deism was yet essentially deistic in its notion of God and of his separation from the world. Men did not perceive that by thus separating God from the world they set up alongside of him a sphere and an activity to which his relations were transient and accidental. No wonder that other men, finding their satisfying activity within the sphere which was thus separated from God, came to think of this absentee God as an appendage to the scheme of things. But if man himself be inexplicable, save as sharing in the wider life of universal reason, if the process of history be realised as but the working out of an inherent divine purpose, the manifestation of an indwelling divine force, then revelation denotes no longer an interference with that evolution. It is a factor in that evolution. It is but the normal relation of the immanent spirit of God to the children of men at the crises of their fate. Then revelation is an experience of men precisely in the line and according to the method of all their nobler experiences. It is itself reasonable and

moral. Inspiration is the normal and continuous effect of the contact of the God who is spirit with man who is spirit too. The relation is never broken. But there are times in which it has been more particularly felt. There have been personalities to whom in eminent degree this depth of communion with God has been vouchsafed. To such persons and eras the religious sense of mankind, by a true instinct, has tended to restrict the words 'revelation' and 'inspiration.' This restriction, however, signifies the separation of the grand experience from the ordinary, only in degree and not in kind. Such an experience was that of prophets and law-givers under the ancient covenant. Such an experience, in immeasurably greater degree, was that of Jesus himself. Such a turning-point in the life of the race was the advent of Christianity. The world has not been wrong in calling the documents of these revelations sacred books and in attributing to them divine authority. It has been largely wrong *in the manner in which it construed their authority*. It has been wholly wrong in imagining that the documents themselves were the revelation. They are merely the record *of a personal communion with the transcendent*. It was Lessing who first cast these fertile ideas into the soil of modern thought. They were never heartily taken up by Kant. One can think, however, with what enthusiasm men recurred to them after their postulates had been verified and the idea of God, of man and of the world which they implied, had been confirmed by Fichte and Schelling.

In the philosophical movement, the outline of which we have suggested, what one may call the *nidus* of a new faith in Scripture had been prepared. The quality had been forecast which the Scripture must be found to possess, if it were to retain its character as document of revelation. In those very same years the great movement of biblical criticism was gathering force which, in the course of the nineteenth century, was to prove by stringent literary and historical methods, what qualities the documents which we know as Scripture do possess. It was to prove in the most objective fashion that the Scripture does not possess those qualities which men had long assigned to it. It was to prove that, as a matter of fact, the literature does possess the qualities which the philosophic forecast, above hinted, required. It was thus actually to restore the Bible to an age in which many reasonable men had lost their faith in it. It was to give a genetic reconstruction of the literature and show the progress of the history which the Scripture enshrines. After a contest in which the very foundations of faith seemed to be removed, it was to afford a basis for a belief in Scripture and revelation as positive and secure as any which men ever enjoyed, with the advantage that it is a foundation upon which the modern man can and does securely build. The synchronism of the two endeavours is remarkable. The convergence upon one point, of studies starting, so to say, from opposite poles and having no apparent interest in common, is instructive. It is an illustration of that which Comte said, that all the great intellectual movements of a given time are but the manifestation of a common impulse, which pervades and possesses the minds of the men of that time.

The attempt to rationalise the narrative of Scripture was no new one. It grew in intensity in the early years of the nineteenth century. The conflict which was presently precipitated concerned primarily the Gospels. It was natural that it should do so. These contain the most important Scripture narrative, that of the life of Jesus. Strauss had in good faith turned his attention to the Gospels, precisely because he felt their central importance. His generation was to learn that they presented also the greatest difficulties. The old rationalistic interpretation had started from the assumption that what we have in the gospel narrative is fact. Yet, of course, for the rationalists, the facts must be natural. They had the appearance of being supernatural only through the erroneous judgment of the narrators. It was for the interpreter to reduce everything which is related to its simple, natural cause. The water at Cana was certainly not turned into wine. It must have been brought by Jesus as a present and opened thus in jest. Jesus was, of course, begotten in the natural manner. A simple maiden must have been deceived. The execution of this task of the rationalising of the narratives by one Dr. Paulus, was the *reductio ad absurdum* of the claim. The most spiritual of the narratives, the finest flower of religious poetry, was thus turned into the meanest and most trivial incident without any religious significance whatsoever. The obtuseness of the procedure was exceeded only by its vulgarity.

On the other hand, as Pfleiderer has said, we must remember the difficulty which beset the men of that age. Their general culture made it difficult for them to accept the miraculous element in the gospel narrative as it stood. Yet their theory of Scripture gave them no notion as to any other way in which the narratives might be understood. The men had never asked themselves how the narratives arose. In the preface to his *Leben Jesu*, Strauss said: ‘Orthodox and rationalists alike proceed from the false assumption that we have always in the Gospels testimony, sometimes even that of eye-witnesses, to fact. They are, therefore, reduced to asking themselves what can have been the real and natural fact which is here witnessed to in such extraordinary way. We have to realise,’ Strauss proceeds, ‘that the narrators testify sometimes, not to outward facts, but to ideas, often most poetical and beautiful ideas, constructions which even eye-witnesses had unconsciously put upon facts, imagination concerning them, reflexions upon them, reflexions and imaginings such as were natural to the time and at the author’s level of culture. What we have here is not falsehood, not misrepresentation of the truth. It is a plastic, naïve, and, at the same time, often most profound apprehension of truth, within the area of religious feeling and poetic insight. It results in narrative, legendary, mythical in nature, illustrative often of spiritual truth in a manner more perfect than any hard, prosaic statement could achieve.’ Before Strauss men had appreciated that particular episodes, like the virgin birth and the bodily resurrection, might have some such explanation as this. No one had ever undertaken to apply this method consistently, from one end to the other of the gospel narrative. What was of more significance, no one had clearly defined the conception of legend. Strauss was sure that in the application of this notion to certain portions of the Scripture no irreverence was shown. No moral taint was involved. Nothing which could detract from the reverence in which we hold the Scripture was implied. Rather, in his view, the history of Jesus is more wonderful than ever, when some, at least, of its elements are viewed in this way, when they are seen as the product of the poetic spirit, working all unconsciously at a certain level of culture and under the impulse of a great enthusiasm.

There is no doubt that Strauss, who was at that time an earnest Christian, felt the relief from certain difficulties in the biography of Jesus which this theory affords. He put it forth in all sincerity as affording to others like relief. He said that while rationalists and supernaturalists alike, by their methods, sacrificed the divine content of the story and clung only to its form, his hypothesis sacrificed the historicity of the narrative form, but kept the eternal and spiritual truth. In his opinion, the lapse of a single generation was enough to give room for this process of the growth of the legendary elements which have found place in the written Gospels which we have. Ideas entertained by primitive Christians relative to their lost Master, have been, all unwittingly, transformed into facts and woven into the tale of his career. The legends of a people are in their basal elements never the work of a single individual. They are never intentionally produced. The imperceptible growth of a joint creative work of this kind was possible, however, only on the supposition that oral tradition was, for a time, the means of transmission of the reminiscences of Jesus. Strauss’ explanation of his theory has been given above, to some extent in his own words. We may see how he understood himself. We may appreciate also the genuineness of the religious spirit of his work. At the same time the thorough-going way in which he applied his principle, the relentless march of his argument, the character of his results, must sometimes have been startling even to himself. They certainly startled others. The effect of his work was instantaneous and immense. It was not at all the effect which he anticipated. The issue of the furious controversy which broke out was disastrous both to Strauss’ professional career and to his whole temperament and character.

David Friedrich Strauss was born in 1808 in Ludwigsburg in Württemberg. He studied in Tübingen and in Berlin. He became an instructor in the theological faculty in Tübingen in 1832. He published his *Leben Jesu* in 1835. He was almost at once removed from his portion. In 1836 he withdrew altogether from the professorial career. His answer to his critics, written in 1837, was in bitter tone. More conciliatory was

his book, *Über Vergängliches und Bleibendes im Christenthum*, published in 1839. Indeed there were some concessions in the third edition of his *Leben Jesu* in 1838, but these were all repudiated in 1840. His *Leben Jesu für das deutsche Volk*, published in 1866 was the effort to popularise that which he had done. It is, however, in point of method, superior to his earlier work, Comments were met with even greater bitterness. Finally, not long before his death in 1874, he published *Der Alte und der Neue Glaube*, in which he definitely broke with Christianity altogether and went over to materialism and pessimism.

Pfleiderer, who had personal acquaintance with Strauss and held him in regard, once wrote: 'Strauss' error did not lie in his regarding some of the gospel stories as legends, and some of the narratives of the miraculous as symbols of ideal truths. So far Strauss was right. The contribution which he made is one which we have all appropriated and built upon. His error lay in his looking for those religious truths which are thus symbolised, outside of religion itself, in adventurous metaphysical speculations. He did not seek them in the facts of the devout heart and moral will, as these are illustrated in the actual life of Jesus.' If Strauss, after the disintegration in criticism of certain elements in the biography of Jesus, had given us a positive picture of Jesus as the ideal of religious character and ethical force, his work would indeed have been attacked. But it would have outlived the attack and conferred a very great benefit. It conferred a great benefit as it was, although not the benefit which Strauss supposed. The benefit which it really conferred was in its critical method, and not at all in its results.

Of the mass of polemic and apologetic literature which Strauss' *Leben Jesu* called forth, little is at this distance worth the mentioning. Ullmann, who was far more appreciative than most of his adversaries, points out the real weakness of Strauss' work. That weakness lay in the failure to draw any distinction between the historical and the mythical. He threatened to dissolve the whole history into myth. He had no sense for the ethical element in the personality and teaching of Jesus nor of the creative force which this must have exerted. Ullmann says with cogency that, according to Strauss, the Church created its Christ virtually out of pure imagination. But we are then left with the query: What created the Church? To this query Strauss has absolutely no answer to give. The answer is, says Ullmann, that the ethical personality of Jesus created the Church. This ethical personality is thus a supreme historic fact and a sublime historic cause, to which we must endeavour to penetrate, if need be through the veil of legend. The old rationalists had made themselves ridiculous by their effort to explain everything in some natural way. Strauss and his followers often appeared frivolous, since, according to them, there was little left to be explained. If a portion of the narrative presented a difficulty, it was declared mythical. What was needed was such a discrimination between the legendary and historical elements in the Gospels as could be reached only by patient, painstaking study of the actual historical quality and standing of the documents. No adequate study of this kind had ever been undertaken. Strauss did not undertake it, nor even perceive that it was to be undertaken. There had been many men of vast learning in textual and philological criticism. Here, however, a new sort of critique was applied to a problem which had but just now been revealed in all its length and breadth. The establishing of the principles of this historical criticism — the so-called Higher Criticism — was the herculean task of the generation following Strauss. To the development of that science another Tübingen professor, Baur, made permanent contribution. With Strauss himself, sadder than the ruin of his career, was the tragedy of the uprooting of his faith. This tragedy followed in many places in the wake of the recognition of Strauss' fatal half-truth.

BAUR

Baur, Strauss' own teacher in Tübingen, afterward famous as biblical critic and church-historian, said of Strauss' book, that through it was revealed in startling fashion to that generation of scholars, how little real knowledge they had of the problem which the Gospels present. To Baur it was clear that if advance was to be made beyond Strauss' negative results, the criticism of the gospel history must wait upon an

adequate criticism of the documents which are our sources for that history. Strauss' failure had brought home to the minds of men the fact that there were certain preliminary studies which must needs be taken up. Meantime the other work must wait. As one surveys the literature of the next thirty years this fact stands out. Many apologetic lives of Jesus had to be written in reply to Strauss. But they are almost completely negligible. No constructive work was done in this field until nearly a generation had passed.

Since all history, said Baur, before it reaches us must pass through the medium of a narrator, our first question as to the gospel history is not, what objective reality can be accorded to the narrative itself. There is a previous question. This concerns the relation of the narrative to the narrator. It might be very difficult for us to make up our minds as to what it was that, in a given case, the witness saw. We have not material for such a judgment. We have probably much evidence, up and down his writings, as to what sort of man the witness was, in what manner he would be likely to see anything and with what personal equation he would relate that which he saw. Baur would seem to have been the first vigorously and consistently to apply this principle to the gospel narratives. Before we can penetrate deeply into the meaning of an author we must know, if we may, his purpose in writing. Every author belongs to the time in which he lives. The greater the importance of his subject for the parties and struggles of his day, the safer is the assumption that both he and his work will bear the impress of these struggles. He will represent the interests of one or another of the parties. His work will have a tendency of some kind. This was one of Baur's oft-used words — the tendency of a writer and of his work. We must ascertain that tendency. The explanation of many things both in the form and substance of a writing would be given could we but know that. The letters of Paul, for example, are written in palpable advocacy of opinions which were bitterly opposed by other apostles. The biographies of Jesus suggest that they also represent, the one this tendency, the other that. We have no cause to assert that this trait of which we speak implies conscious distortion of the facts which the author would relate. The simple-minded are generally those least aware of the bias in the working of their own minds. It is obvious that until we have reckoned with such elements as these, we cannot truly judge of that which the Gospels say. To the elaboration of the principles of this historical criticism Baur gave the labour of his life. His biblical work alone would have been epoch-making.

Ferdinand Christian Baur was born in 1793 in Schmieden, near Stuttgart. He became a professor in Tübingen in 1826 and died there in 1860. He was an ardent disciple of Hegel. His greatest work was surely in the field of the history of dogma. His works, *Die Christliche Lehre von der Vereöhnung*, 1838, *Die Christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes*, 1841-1843, his *Lehrbuch der Christlichen Dogmengeschichte*, 1847, together constitute a contribution to which Harnack's work in our own time alone furnishes a parallel. Baur had begun his thorough biblical studies before the publication of Strauss' book. The direction of those studies was more than ever confirmed by his insight of the shortcomings of Strauss' work. Very characteristically also he had begun his investigations, not at the most difficult point, that of the Gospels, as Strauss had done, but at the easiest point, the Epistles of Paul. As early as 1831 he had published a tractate, *Die Christus-Partei in der Corinthischen Gemeinde*. In that book he had delineated the bitter contest between Paul and the Judaising element in the Apostolic Church which opposed Paul whithersoever he went. In 1835 his disquisition, *Die sogenannten Pastoral-Briefe*, appeared. In the teachings of these letters he discovered the antithesis to the gnostic heresies of the second century. He thought also that the stage of organisation of the Church which they imply, accorded better with this supposition than with that of their apostolic authorship. The same general theme is treated in a much larger way in Baur's *Paulus, der Apostel Jesu Christi*, in 1845. Here the results of his study of the book of the Acts are combined with those of his inquiries as to the Pauline Epistles. In the history of the apostolic age men had been accustomed to see the evidence only of peace and harmony. Baur sought to show that the period had been one of fierce struggle, between the narrow Judaic and legalistic form of faith in the Messiah and that conception, introduced by Paul, of a world-religion free from the law. Out of

this conflict, which lasted a hundred and fifty years, went forth the Catholic Church. The monuments of this struggle and witnesses of this process of growth are the New Testament writings, most of which were produced in the second century. The only documents which we have which were written before A.D. 70, were the four great Epistles of Paul, those to the Galatians, to the Romans, and to the Corinthians, together with the Apocalypse.

Many details in Baur's view are now seen to have been overstated and others false. Yet this was the first time that a true historical method had been applied to the New Testament literature as a whole. Baur's contribution lay in the originality of his conception of Christianity, in his emphasis upon Paul, in his realisation of the magnitude of the struggle which Paul inaugurated against Jewish prejudices in the primitive Church. In his idea, the issue of that struggle was, on the one hand, the freeing of Christianity from Judaism and on the other, the developing of Christian thought into a system of dogma and of the scattered Christian communities into an organised Church. The Fourth Gospel contains, according to Baur, a Christian gnosis parallel to the gnosis which was more and more repudiated by the Church as heresy. The Logos, the divine principle of life and light, appears bodily in the phenomenal world in the person of Jesus. It enters into conflict with the darkness and evil of the world. This speculation is but thinly clothed in the form of a biography of Jesus. That an account completely dominated by speculative motives gives but slight guarantee of historical truth, was for Baur self-evident. The author remains unknown, the age uncertain. The book, however, can hardly have appeared before the time of the Montanist movement, that is, toward the end of the second century. Scholars now rate far more highly than did Baur the element of genuine Johannine tradition which may lie behind the Fourth Gospel and account for its name. They do not find traces of Montanism or of paschal controversies. But the main contention stands. The Fourth Gospel represents the beginning of elaborate reflexion upon the life and work of Jesus. It is what it is because of the fusion of the ethical and spiritual content of the revelation in the personality of Jesus, with metaphysical abstractions and philosophical interpretation.

Baur was by no means so fortunate in the solution which he offered of the problem which the synoptic Gospels present. His opinions are of no interest except as showing that he too worked diligently upon a question which for a long time seemed only to grow in complexity and which has busied scholars practically from Baur's day to our own. His zeal here also to discover dogmatic purposes led him astray. The *Tendenzkritik* had its own tendencies. The chief was to exaggeration and one-sidedness. Baur had the kind of ear which hears grass grow. There is much overstrained acumen. Many radically false conclusions are reached by prejudiced operation with an historical formula, which in the last analysis is that of Hegel. Everything is to be explained on the principle of antithesis. Again, the assumption of conscious purpose in everything which men do or write is a grave exaggeration. It is often in contradiction of that wonderful unconsciousness with which men and institutions move to the fulfilment of a purpose for the good, the purpose of God, into which their own life is grandly taken up. To make each phase of such a movement the contribution of some one man's scheme or endeavour is, as was once said, to make God act like a professor.

The method of this book is that it seeks to deal only with men who have inaugurated movements, or marked some turning-point in their course which has proved of more than usual significance. The compass of the book demands such a limitation. But by this method whole chapters in the life of learning are passed over, in which the substance of achievement has been the carrying out of a plan of which we have been able to note only the inception. There is a sense in which the carrying out of a plan is both more difficult and more worthy than the mere setting it in motion. When one thinks of the labour and patience which have been expended, for example, upon the problem of the Gospels in the past seventy years, those truths come home to us. When one reminds himself of the hypotheses which have been made but to be abandoned, which have yet had the value that they at least indicated the area within which solutions do not

lie, — when one thinks of the wellnigh immeasurable toil by which we have been led to large results which now seem secure, one is made to realise that the conditions of the advance of science are, for theologians, not different from those which obtain for scholars who, in any other field, would establish truth and lead men. In a general way, however, it may be said that the course of opinion in these two generations, in reference to such questions as those of the dates and authorship of the New Testament writings, has been one of rather noteworthy retrogression from many of the Tübingen positions. Harnack's *Geschichte der altchristlichen Literatur*, 1893, and his *Chronologie der altchristlichen Literatur*, 1897, present a marked contrast to Baur's scheme.

THE CANON

The minds of New Testament scholars in the last generation have been engaged with a question which, in its full significance, was hardly present to the attention of Baur's school. It is the question of the New Testament as a whole. It is the question as to the time and manner and motives of the gathering together of the separate writings into a canon of Scripture which, despite the diversity of its elements, exerted its influence as a unit and to which an authority was ascribed, which the particular writings cannot originally have had. When and how did the Christians come to have a sacred book which they placed on an equality with the Old Testament, which last they had taken over from the synagogue? How did they choose the writings which were to belong to this new collection? Why did they reject books which we know were read for edification in the early churches? Deeper even than the question of the growth of the collection is that of the growth of the apprehension concerning it. This apprehension of these twenty-seven different writings as constituting the sole document of Christian revelation, given by the Holy Spirit, the identical holy book of the Christian Church, gave to the book a significance altogether different from that which its constituent elements must have had for men to whom they had appeared as but the natural literary deposit of the religious movement of the apostolic age. This apprehension took possession of the mind of the Christian community. It was made the subject of deliverances by councils of the Church. How did this great transformation take place? Was it an isolated achievement, or was it part of a general movement? Did not this development of life in the Christian communities which gave them a New Testament belong to an evolution which gave them also the so-called Apostles' Creed and a monarchical organisation of the Church and the beginnings of a ritual of worship?

It is clear that we have here a question of greatest moment. With the rise of this idea of the canon, with the assigning to this body of literature the character of Scripture, we have the beginning of the larger mastery which the New Testament has exerted over the minds and life of men. Compared with this question, investigations as to the authorship and as to the time, place and circumstance of the production of particular books, came, for the time, to occupy a secondary rank. As they have emerged again, they wear a new aspect and are approached in a different spirit. The writings are revealed as belonging to a far larger context, that of the whole body of the Christian literature of the age. It in no way follows from that which we have said that the body of documents, which ultimately found themselves together in the New Testament, have not a unity other than the outward one which was by consensus of opinion or conciliar decree imposed upon them. They do represent, in the large and in varying degrees, an inward and spiritual unity. There was an inspiration of the main body of these writings, the outward condition of which, at all events, was the nearness of their writers to Jesus or to his eye-witnesses, and the consequence of which was the unique relation which the more important of these documents historically bore to the formation of the Christian Church. There was a heaven which lay about the infancy of Christianity which only slowly faded into the common light of day. That heaven was the spirit of the Master himself. The chief of these writings do centrally enshrine the first pure illumination of that spirit. But the churchmen who made the canon and the Fathers who argued about it very often gave mistaken

reasons for facts in respect of which they nevertheless were right. They gave what they considered sound external reasons. They alleged apostolic authorship. They should have been content with internal evidence and spiritual effectiveness. The apostles had come, in the mind of the early Church, to occupy a place of unique distinction. Writings long enshrined in affection for their potent influence, but whose origin had not been much considered, were now assigned to apostles, that they might have authority and distinction. The theory of the canon came after the fact. The theory was often wrong. The canon had been, in the main and in its inward principle, soundly constituted. Modern critics reversed the process. They began where the Church Fathers left off. They tore down first that which had been last built up. Modern criticism, too, passed through a period in which points like those of authorship and date of Gospels and Epistles seemed the only ones to be considered. The results being here often negative, complete disintegration of the canon seemed threatened, through discovery of errors in the processes by which the canon had been outwardly built up. Men realise now that that was a mistake.

Two things have been gained in this discussion. There is first the recognition that the canon is a growth. The holy book and the conception of its holiness, as well, were evolved. Christianity was not primarily a book-religion save in the sense that almost all Christians revered the Old Testament. Other writings than those which we esteem canonical were long used in churches. Some of those afterward canonical were not used in all the churches. In similar fashion we have learned that identical statements of faith were not current in the earliest churches. Nor was there one uniform system of organisation and government. There was a time concerning which we cannot accurately use the word Church. There were churches, very simple, worshipping communities. But the Church, as outward magnitude, as triumphant organisation, grew. So there were many creeds or, at least, informally accredited and current beginnings of doctrine. By and by there was a formally accepted creed. So there were first dearly loved memorials of Jesus and letters of apostolic men. Only by and by was there a New Testament. The first gain is the recognition of this state of things. The second follows. It is the recognition that, despite a sense in which this literature is unique, there is also a sense in which it is but a part of the whole body of early Christian literature. From the exact and exhaustive study of the early Christian literature as a whole, we are to expect a clearer understanding and a juster estimate of the canonical part of it. It is not easy to say to whom we have to ascribe the discovery and elaboration of these truths. The historians of dogma have done much for this body of opinion. The historians of Christian literature have perhaps done more. Students of institutions and of the canon law have had their share. Baur had more than an inkling of the true state of things. But by far the most conspicuous teacher of our generation, in two at least of these particular fields, has been Harnack. In his lifelong labour upon the sources of Christian history, he had come upon this question of the canon again and again. In his *Lehrbuch der Dogmengeschichte*, 1887-1890, 4te. Aufl., 1910, the view of the canon, which was given above, is absolutely fundamental. In his *Geschichte der altchristlichen Literatur bis Eusebius*, 1893, and *Chronologic der allchristlichen Literatur*, 1897-1904, the evidence is offered in rich detail. It was in his tractate, *Das Neue Testament um das Jahr* 200, 1889, that he contended for the later date against Zahn, who had urged that the outline of the New Testament was established and the conception of it as Scripture present, by the end of the first century. Harnack argues that the decision practically shaped itself between the time of Justin Martyr, c. A.D. 150, and that of Irenæus, c. A.D. 180. The studies of the last twenty years have more and more confirmed this view.

LIFE OF JESUS

We said that the work of Strauss revealed nothing so clearly as the ignorance of his time concerning the documents of the early Christian movement. The labours of Baur and of his followers were directed toward overcoming this difficulty. Suddenly the public interest was stirred, and the earlier excitement recalled by the publication of a new life of Jesus. The author was a Frenchman, Ernest Renan, at one time

a candidate for the priesthood in the Roman Church. He was a man of learning and literary skill, who made his *Vie de Jésus*, which appeared in 1863, the starting-point for a series of historical works under the general title, *Les Origines de Christianisme*. In the next year appeared Strauss' popular work, *Leben Jesu für das deutsche Volk*. In 1864 was published also Weizsäcker's contribution to the life of Christ, his *Untersuchungen über die evangelische Geschichte*. To the same year belonged Schenkel's *Charakterbild Jesu*. In the years from 1867-1872 appeared Keim's *Geschichte Jesu von Nazara*. There is something very striking in this recurrence to the topic. After ail, this was the point for the sake of which those laborious investigations had been undertaken. This was and is the theme of undying religious interest, the character and career of the Nazarene. Renan's philosophical studies had been mainly in English, studies of Locke and Hume. But Herder also had been his beloved guide. For his biblical and oriental studies he had turned almost exclusively to the Germans. There is a deep religious spirit in the work of the period of his conflict with the Church. The enthusiasm for Christ sustained him in his struggle. Of the days before he withdrew from the Church he wrote: 'For two months I was a Protestant like a professor in Halle or Tübingen.' French was at that time a language much better known in the world at large, particularly the English-speaking world, than was German. Renan's book had great art and charm. It took a place almost at once as a bit of world-literature. The number of editions in French and of translations into other languages is amazing. Beyond question, the critical position was made known through Renan to multitudes who would never have been reached by the German works which were really Renan's authorities. It is idle to say with Pfleiderer that it is a pity that, having possessed so much learning, Renan had not possessed more. That is not quite the point. The book has much breadth and solidity of learning. Yet Renan has scarcely the historian's quality. His work is a work of art. It has the halo of romance. Imagination and poetical feeling make it in a measure what it is.

Renan was born in 1823 in Treguier in Brittany. He set out for the priesthood, but turned aside to the study of oriental languages and history. He made long sojourn in the East. He spoke of Palestine as having been to him a fifth Gospel. He became Professor of Hebrew in the *College de France*. He was suspended from his office in 1863, and permitted to read again only in 1871. He had formally separated himself from the Roman Church in 1845. He was a member of the Academy. His diction is unsurpassed. He died in 1894. In his own phrase, he sought to bring Jesus forth from the darkness of dogma into the midst of the life of his people. He paints him first as an idyllic national leader, then as a struggling and erring hero, always aiming at the highest, but doomed to tragic failure through the resistance offered by reality to his ideal. He calls the traditional Christ an abstract being who never was alive. He would bring the marvellous human figure before our eyes. He heightens the brilliancy of his delineation by the deep shadows of mistakes and indiscretion upon Jesus' part. In some respects an epic or an historical romance, without teaching us history in detail, may yet enable us by means of the artist's intuition to realise an event or period, or make presentation to ourselves of a personality, better than the scant records acknowledged by the strict historian could ever do.

Our materials for a real biography of Jesus are inadequate. This was the fact which, by all these biographies of Jesus, was brought home to men's minds. Keim's book, the most learned of those mentioned, is hardly more than a vast collection of material for the history of Jesus' age, which has now been largely superseded by Schürer's *Geschichte des Judischen Volkes im Zeitalier Jesu Christi*, 2 Bde., 1886-1890. There have been again, since the decade of the sixties, periods of approach to the great problem. Weiss and Beyschlag published at the end of the eighties lives of Jesus which, especially the former, are noteworthy in their treatment of the critical material. They do not for a moment face the question of the person of Christ. The same remark might be made, almost without exception, as to those lives of Jesus which have appeared in numbers in England and America. The best books of recent years are Albert Reville's *Jesus de Nazareth*, 1897, and Oscar Holtzmann's *Leben Jesu*, 1901. So great are the difficulties and in such disheartening fashion are they urged from all sides, that one cannot withhold

enthusiastic recognition of the service which Holtzmann particularly has here rendered, in a calm, objective, and withal deeply devout handling of his theme. Meantime new questions have arisen, questions of the relation of Jesus to Messianism, like those touched upon by Wrede in his *Das Messias Geheimniss in den Evangelien*, 1901, and questions as to the eschatological trait in Jesus' own teaching. Schweitzer's book, *Von Reimarus zu Wrede: eine Geschichte der Leben Jesu-Forschung*, 1906, not merely sets forth this deeply interesting chapter in the history of the thought of modern men, but has also serious interpretative value in itself. For English readers Sanday's *Life of Christ in Recent Research*, 1907, follows the descriptive aspect, at least, of the same purpose with Schweitzer's book, covering, however, only the last twenty years.

It is characteristic that Ritschl, notwithstanding his emphasis upon the historical Jesus, asserted the impossibility of a biography of Jesus. The understanding of Jesus is through faith. For Wrede, on the other hand, such a biography is impossible because of the nature of our sources. Not alone are they scant, but they are not biographical. They are apologetic, propagandist, interested in everything except those problems which a biographer must raise. The last few years have even conjured up the question whether Jesus ever lived. One may say with all simplicity, that the question has, of course, as much rightfulness as has any other question any man could raise. The somewhat extended discussion has, however, done nothing to make evident how it could arise, save in minds unfamiliar with the materials and unskilled in historical research. The conditions which beset us when we ask for a biography of Jesus that shall answer scientific requirement are not essentially different from those which meet us in the case of any other personage equally remote in point of time, and equally woven about — if any such have been — by the love and devotion of men. Bousset's little book, *Was Wissen wir von Jesus?* 1904, convinces a quiet mind that we know a good deal. Qualities in the personality of Jesus obviously worked in transcendent measure to call out devotion. No understanding of history is adequate which has no place for the unfathomed in personality. Exactly because we ourselves share this devotion, we could earnestly wish that the situation as to the biography of Jesus were other than it is.

THE OLD TESTAMENT

We have spoken thus far as if the whole biblical-critical problem had been that of the New Testament. In reality the same impulses which had opened up that question to the minds of men had set them working upon the problem of the Old Testament as well. We have seen how the Christians made for themselves a canon of the New Testament. By the force of that conception of the canon, and through the belief that, almost in a literal sense, God was the author of the whole book, the obvious differences among the writings had been obscured. Men forgot the evolution through which the writings had passed. The same thing had happened for the Old Testament in the Jewish synagogues and for the rabbis before the Christian movement. When the Christians took over the Old Testament they took it over in this sense. It was a closed book wherein all appreciation of the long road which the religion of Israel had traversed in its evolution had been lost. The relation of the old covenant to the new was obscured. The Old Testament became a Christian book. Not merely were the Christian facts prophesied in the Old Testament, but its doctrines also were implied. Almost down to modern times texts have been drawn indifferently from either Testament to prove doctrine and sustain theology. Moses and Jesus, prophets and Paul, are cited to support an argument, without any sense of difference. What we have said is hardly more true of Augustine or Anselm than of the classic Puritan divines. This was the state of things which the critics faced.

The Old Testament critical movement is a parallel at all points of the one which we have described in reference to the New. Of course, elder scholars, even Spinoza, had raised the question as to the Mosaic authorship of certain portions of the Pentateuch. Roman Catholic scholars in the seventeenth century, for whom the stringent theory of inspiration had less significance than for Protestants, had set forth views

which showed an awakening to the real condition. Yet, at the beginning of the nineteenth century, no one would have forecast a revolution in opinion which would recognise the legendary quality of considerable portions of the Pentateuch and historical books, which would leave but little that is of undisputed Mosaic authorship, which would place the prophets before the law, which would concede the growth of the Jewish canon, which would perceive the relation of Judaism to the religions of the other Semite peoples and would seek to establish the true relation of Judaism to Christianity.

In the year 1835, the same year in which Strauss' *Leben Jesu* saw the light, Wilhelm Vatke published his *Religion des Alten Testaments*. Vatke was born in 1806, began to teach in Berlin in 1830, was professor extraordinarius there in 1837 and died in 1882, not yet holding a full professorship. His book was obscurely written and scholastic. Public attention was largely occupied by the conflict which Strauss' work had caused. Reuss in Strassburg was working on the same lines, but published the main body of his results much later.

The truth for which these scholars and others like them argued, worked its way slowly by force of its own merit. Perhaps it was due to this fact that the development of Old Testament critical views was subject to a fluctuation less marked than that which characterised the case of the New Testament. It is not necessary to describe the earlier stages of the discussion in Vatke's own terms. To his honour be it said that the views which he thus early enunciated were in no small degree identical with those which were in masterful fashion substantiated in Holland by Kuenen about 1870, in Germany by Wellhausen after 1878, and made known to English readers by Robertson Smith In 1881.

Budde has shown in his *Kanon des Alten Testaments*, 1900, that the Old Testament which lies before us finished and complete, assumed its present form only as the result of the growth of several centuries. At the beginning of this process of the canonisation stands that strange event, the sudden appearance of a holy book of the law under King Josiah, in 621 B.C. The end of the process, through the decisions of the scribes, falls after the destruction of Jerusalem, possibly even in the second century. Lagarde seems to have proved that the rabbis of the second century succeeded in destroying all copies of the Scripture which differed from the standard then set up. This state of things has enormously increased a difficulty which was already great enough, that of the detection and separation of the various elements of which many of the books in this ancient literature are made up. Certain books of the New Testament also present the problem of the discrimination of elements of different ages, which have been wrought together into the documents as we now have them, in a way that almost defies our skill to disengage. The synoptic Gospels are, of course, the great example. The book of the Acts presents a problem of the same kind. But the Pentateuch, or rather Hexateuch, the historical books in less degree, the writings even of some of the prophets, the codes which formulate the law and ritual, are composites which have been whole centuries in the making and remaking. There was no such thing as right of authorship in ancient Israel, little of it in the ancient world at all. What was once written was popular or priestly property. Histories were newly narrated, laws enlarged and rearranged, prophecies attributed to conspicuous persons. All this took place not in deliberate intention to pervert historic truth, but because there was no interest in historic truth and no conception of it. The rewriting of a nation's history from the point of view of its priesthood bore, to the ancient Israelite, beyond question, an aspect altogether different from that which the same transaction would bear to us. The difficulty of the separation of these materials, great in any case, is enhanced by the fact alluded to, that we have none but internal evidence. The success of the achievement, and the unanimity attained with reference to the most significant questions, is one of the marvels of the life of learning of our age.

In the Jewish tradition it had been assumed that the Mosaic law was written down in the wilderness. Then, in the times of the Judges and of the Kings, the historical books took shape, with David's Psalms and the wise words of Solomon. At the end of the period of the Kings we have the prophetic literature and finally Ezra and Nehemiah. De Wette had disputed this order, but Wellhausen in his *Prolegomena zur*

Geshichte Israels, 1883, may be said to have proved that this view was no longer tenable. Men ask, could the law, or even any greater part of it, have been given to nomads in the wilderness? Do not all parts of it assume a settled state of society and an agricultural life? Do the historical books from Judges to the II. Kings know anything about the law? Are the practices of worship which they imply consonant with the supposition that the law was in force? How is it that that law appears both under Josiah and again under Ezra, as something new, thus far unknown, and yet as ruling the religious life of the people from that day forth? It seems impossible to escape the conclusion that only after Josiah's reformation, more completely after the restoration under Ezra, did the religion of the law exist. The centralisation of worship at one point, such as the book of Deuteronomy demands, seems to have been the thing achieved by the reform under Josiah. The establishment of the priestly hierarchy such as the code ordains was the issue of the religious revolution wrought in Ezra's time. To put it differently, the so-called *Book of the Covenant, the nucleus of the law-giving*, itself implies the multiplicity of the places of worship. Deuteronomy demands the centralisation of the worship as something which is yet to take place. The priestly Code declares that the limitation of worship to one place was a fact already in the time of the journeys of Israel in the wilderness. It is assumed that the Hebrews in the time of Moses shared the almost universal worship of the stars. Moses may indeed have concluded a covenant between his people and Jahve, their God, hallowing the judicial and moral life of the people, bringing these into relation to the divine will. Jahve was a holy God whose will was to guide the people coming up out of the degradation of nature-worship. That part of the people held to the old nature-worship is evident in the time of Elijah. The history of Israel is not that of defection from a pure revelation. It is the history of a gradual attainment of purer revelation, of enlargement in the application of it, of discovery of new principles contained in it. It is the history also of the decline of spiritual religion. The zeal of the prophets against the ceremonial worship shows that. Their protest reveals at that early date the beginning of that antithesis which had become so sharp in Jesus' time.

This determination of the relative positions of law and prophets was the first step in the reconstruction of the history, both of the nation of Israel and of its literature. At the beginning, as in every literature, are songs of war and victory, of praise and grief, hymns, even riddles and phrases of magic. Everywhere poetry precedes prose. Then come myths relating to the worship and tales of the fathers and heroes. Elements of both these sorts are embedded in the simple chronicles which began now to be written, primitive historical works, such as those of the Jahvist and Elohist, of the narrators of the deeds of the judges and of David and of Saul. Perhaps at this point belong the earliest attempts at fixing the tradition of family and clan rights, and of the regulation of personal conduct, as in the Book of the Covenant. Then comes the great outburst of the prophetic spirit, the preaching of an age of great religious revival. Then follows the law, with its minute regulation of all details of life upon which would depend the favour of the God who had brought punishment upon the people in the exile. The prophecy runs on into apocalyptic like that of the book of Daniel. The contact with the outside world makes possible a phase of literature such as that to which the books of Job and Ecclesiastes belong. The deepening of the inner life gave the world the lyric of the Psalms, some of which are credibly assigned to a period so late as that of the Maccabees.

In this which has been said of the literature we have the clue also for the reconstruction of the nation's history. The naïve assumption in the writing of all history had once been that one must begin with the beginning. But to Wellhausen, Stade, Eduard Meyer and Kittel and Cornill, it has been clear that the history of the earliest times is the most uncertain. It is the least adapted to furnish a secure point of departure for historical inquiry. There exist for it usually no contemporary authorities, or only such as are of problematical worth. This earliest period constitutes a problem, the solution of which, so far as any solution is possible, can be hoped for only through approach from the side of ascertained facts. We must start from a period which is historically known. For the history of the Hebrews, this is the time of the first

prophets of whom we have written records, or from whom we have written prophecies. We get from these, as also from the earliest direct attempts at history writing, only that conception of Israel's pre-historic life which was entertained in prophetic circles in the eighth century. We learn the heroic legends in the interpretation which the prophets put upon them. We have still to seek to interpret them for ourselves. We must begin in the middle and work both backward and forward. Such a view of the history of Israel affords every opportunity for the connecting of the history and religion of Israel with those of the other Semite stocks. Some of these have in recent years been discovered to offer extraordinary parallels to that which the Old Testament relates.

THE HISTORY OF DOCTRINE

When speaking of Baur's contribution to New Testament criticism, we alluded to his historical works. He was in a distinct sense a reformer of the method of the writing of church history. To us the notions of the historical and of that which is genetic are identical. Of course, naïve religious chronicles do not meet that test. A glance at the histories produced by the age of rationalism will show that these also fall short of it. The perception of the relativity of institutions like the papacy is here wholly wanting. Men and things are brought summarily to the bar of the wisdom of the author's year of grace. They are approved or condemned by this criterion. For Baur, all things had come to pass in the process of the great life of the world. There must have been a rationale of their becoming. It is for the historian with sympathy and imagination to find out what their inherent reason was. One other thing distinguishes Baur as church historian from his predecessors. He realised that before one can delineate one must investigate. One must go to the sources. One must estimate the value of those sources. One must have ground in the sources for every judgment. Baur was himself a great investigator. Yet the movement for the investigation of the sources of biblical and ecclesiastical history which his generation initialed has gone on to such achievements that, in some respects, we can but view the foundations of Baur's own work as precarious, the results at which he arrived as unwarranted. New documents have come to light since his day. Forgeries have been proved to be such, The whole state of learning as to the literature of the Christian origins has been vastly changed. There is still another other thing to say concerning Baur. He was a Hegelian. He has the disposition always to interpret the movements of the religious spirit in the sense of philosophical ideas. He frankly says that without speculation every historical investigation remains but a play upon the surface of things. Baur's fault was that in his search for, or rather in his confident discovery of, the great connecting forces of history, the biographical element, the significance of personality, threatened altogether to disappear. The force in the history was the absolute, the immanent divine will. The method everywhere was that of advance by contrasts and antagonisms. One gets an impression, for example, that the Nicene dogma became what it did by the might of the idea, that it could not by any possibility have had any other issue.

The foil to much of this in Baur's own age was represented in the work of Neander, a converted Jew, professor of church history in Berlin, who exerted great influence upon a generation of English and American scholars. He was not an investigator of sources. He had no talent for the task. He was a delineator, one of the last of the great painters of history, if one may so describe the type. He had imagination, sympathy, a devout spirit. His great trait was his insight into personality. He wrote history with the biographical interest. He almost resolves history into a series of biographical types. He has too little sense for the connexion of things, for the laws of the evolution of the religious spirit. The great dramatic elements tend to disappear behind the emotions of individuals. The old delineators were before the age of investigation. Since that impulse became masterful, some historians have been completely absorbed in the effort to make contribution to this investigation. Others, with a sense of the impossibility of mastering the results of investigation in all fields, have lost the zeal for the writing of church history on

a great scale. They have contented themselves with producing monographs upon some particular subject, in which, at the most, they may hope to embody all that is known as to some specific question.

We spoke above of the new conception of the relation of the canonical literature of the New Testament to the extracanonical. We alluded to the new sense of the continuity of the history of the apostolic churches with that of the Church of the succeeding age. The influence of these ideas has been to set all problems here involved in a new light. Until 1886 it might have been said with truth that we had no good history of the apostolic age. In that year Weizsäcker's book, *Das Apostolische Zeitalter der Christlichen Kirche*, admirably filled the place. A part of the problem of the historian of the apostolic age is difficult for the same reason which was given when we were speaking of the biography of Jesus. Our materials are inadequate. First with the beginning of the activities of Paul have we sources of the first rank. The relation of statements in the Pauline letters to data in the book of the Acts was one of the earliest problems which the Tübingen school set itself. An attempt to write the biography of Paul reminds us sharply of our limitations. We know almost nothing of Paul prior to his conversion, or subsequent to the enigmatical breaking off of the account of the beginnings of his work at Rome. Harnack's *Mission und Ausbreitung des Christenthums*, 1902 (translated, Moffatt, 1908), takes up the work of Paul's successors in that cardinal activity. It offers, strange as it may seem, the first discussion of the dissemination of Christianity which has dealt adequately with the sources. It gives also a picture of the world into which the Christian movement went. It emphasises anew the truth which has for a generation past grown in men's apprehension that there is no possibility of understanding Christianity, except against the background of the religious life and thought of the world into which it came. Christianity had vital relation, at every step of its progress, to the religious movements and impulses of the ancient world, especially in those centres of civilisation which Paul singled out for his endeavour and which remained the centres of the Christian growth. It was an age which has often been summarily described as corrupt. Despite its corruption, or possibly because it was corrupt, it gives evidence, however, of religious stirring, of strong ethical reaction, of spiritual endeavour rarely paralleled. In the Roman Empire everything travelled. Religions travelled. In the centres of civilisation there was scarcely a faith of mankind which had not its votaries.

It was an age of religious syncretism, of hospitality to diverse religious ideas, of the commingling of those ideas. These things facilitated the progress of Christianity. They made certain that if the Christian movement had in it the divine vitality which men claimed, it would one day conquer the world. Equally, they made certain that, as the very condition of this conquest, Christianity would be itself transformed. This it is which has happened in the evolution of Christianity from its very earliest stages and in all phases of its life. Of any given rite, opinion or institution, of the many which have passed for almost two millenniums unchallenged under the Christian name, men about us are now asking: But how much of it is Christian? In what measure have we to think of it as derived from some other source, and representing the accommodation and assimilation of Christianity to its environment in process of its work? What is Christianity? Not unnaturally the ancient Church looked with satisfaction upon the great change which passed over Christianity when Constantine suddenly made that which had been the faith of a despised and persecuted sect, the religion of the world. The Fathers can have thought thus only because their minds rested upon that which was outward and spectacular. Not unnaturally the metamorphosis in the inward nature of Christianity which had taken place a century and a quarter earlier was hidden from their eyes. In truth, by that earlier and subtler transformation Christianity had passed permanently beyond the stage in which it had been preponderantly a moral and spiritual enthusiasm, with its centre and authority in the person of Jesus. It became a system and an institution, with a canon of New Testament Scripture, a monarchical organisation and a rule of faith which was formulated in the Apostles' Creed.

To Baur the truth as to the conflict of Paul with the Judaisers had meant much. He thought, therefore, with reference to the rise of priesthood and ritual among the Christians, to the emphasis on Scripture in the fashion of the scribes, to the insistence upon rules and dogmas after the manner of the Pharisees, that

they were but the evidence of the decline and defeat of Paul’s free spirit and of the resurgence of Judaism in Christianity. He sought to explain the rise of the episcopal organisation by the example of the synagogue. Ritschl in his *Entstehung der alt-catholischen Kirche*, 1857, had seen that Baur’s theory could not be true. Christianity did not fall back into Judaism. It went forward to embrace the Hellenic and Roman world. The institutions, dogmas, practices of that which, after A.D. 200, may with propriety be called the Catholic Church, are the fruit of that embrace. There was here a falling off from primitive and spiritual Christianity. But it was not a falling back into Judaism. There were priests and scribes and Pharisees with other names elsewhere. The phenomenon of the waning of the original enthusiasm of a period of religious revelation has been a frequent one. Christianity on a grand scale illustrated this phenomenon anew. Harnack has elaborated this thesis with unexampled brilliancy and power. He has supported it with a learning in which he has no rival and with a religious interest which not even hostile critics would deny. The phrase, ‘the Hellenisation of Christianity,’ might almost be taken as the motto of the work to which he owes his fame.

HARNACK

Adolf Harnack was born in 1851 in Dorpat, in one of the Baltic provinces of Russia. His father, Theodosius Harnack, was professor of pastoral theology in the University of Dorpat. Harnack studied in Leipzig and began to teach there in 1874. He was called to the chair of church history in Giessen in 1879. In 1886 he removed to Marburg and in 1889 to Berlin. Harnack’s earlier published work was almost entirely in the field of the study of the sources and materials of early church history. His first book, published in 1873, was an inquiry as to the sources for the history of Gnosticism. His *Patrum Apostolicorum Opera*, 1876, prepared by him jointly with von Gehhardt and Zahn, was in a way only a forecast of the great collection, *Texte und Untersuchungen zur Geschickte der alt-christlichen Literatur*, begun in 1882, upon which numbers of scholars have worked together with him. The collection has already more than thirty-five volumes. In his own two works, *Die Geschichte der alt-christlichen Literatur bis Eusebius*, 1893, and *Die Chronologie der alt-christlichen Literatur bis Eusebius*, 1897, are deposited the results of his reflexion on the mass of this material. His *Beitrage zur Einleitung in das Neue Testament*, 1906, etc., should not be overlooked. He has had the good fortune to be among those who have discovered manuscripts of importance. He has had to do with the Prussian Academy’s edition of the Greek Fathers. A list of his published works, which was prepared in connexion with the celebration of his sixtieth birthday in 1911, bears witness to his amazing diligence and fertility. He was for thirty-five years associated with Schurer in the publication of the *Theologische Literaturzeitung*. He has filled important posts in the Church and under the government. To this must be added an activity as a teacher which has placed a whole generation of students from every portion of the world under undying obligation. One speaks with reserve of the living, but surely no man of our generation has done more to make the history of which we write.

Harnack’s epoch-making work was his *Lehrbuch der Dogmengeschichte*, 1886-88, fourth edition, 1910. The book met, almost from the moment of its appearance, with the realisation of the magnitude of that which had been achieved. It rested upon a fresh and independent study of the sources. It departed from the mechanism which had made the old treatises upon the history of doctrine formal and lifeless. Harnack realised to the full how many influences other than theological had had part in the development of doctrine. He recognised the reaction of modes of life and practice, and of external circumstances on the history of thought. His history of doctrine has thus a breadth and human quality never before attained. Philosophy, worship, morals, the development of Church government and of the canon, the common interests and passions of the age and those of the individual participants, are all made tributary to his delineation.

Harnack cannot share Baur's view that the triumph of the Logos-Christology at Nicæa and Chalcedon was inevitable. A certain historic naturalness of the movement he would concede, the world on which Christianity entered being what it was. He is aware, however, that many elements other than Christian have entered into the development. He has phrased his apprehension thus. That Hellenisation of Christianity which Gnosticism represented, and against which, in this, its acute form, the Church contended was, after all, the same thing which, by slower process and more unconsciously, befell the Church itself. That pure moral enthusiasm and inspiration which had been the gist of the Christian movement, in its endeavour to appropriate the world, had been appropriated by the world in far greater measure than its adherents knew. It had taken up its mission to change the world. It had dreamed that while changing the world it had itself remained unchanged. The world was changed, the world of life, of feeling and of thought. But Christianity was also changed. It had conquered the world. It had no perception of the fact that it illustrated the old law that the conquered give laws to the conquerors. It had fused the ancient culture with the flame of its inspiration. It did not appreciate the degree in which the elements of that ancient culture now coloured its far-shining flame. It had been a maker of history. Meantime it had been unmade and remade by its own history. It confidently carried back its canon, dogma, organisation, to Christ and the apostles. It did not realise that the very fact that it could find these things natural and declare them ancient, proved with conclusiveness that it had itself departed from the standard of Christ and the apostles. It esteemed that these were its defences against the world. It little dreamed that they were, by their very existence, the evidence of the fact that the Church had not defended itself against the world. Its dogma was the Hellenisation of its thought. Its organisation was the Romanising of its life. Its canon and ritual were the externalising, and conventionalising of its spirit and enthusiasm. These are positive and constructive statements of Harnack's main position.

When, however, they are turned about and stated negatively, these statements all convey, more or less, the impression that the advance of Christianity had been its destruction, and the evolution of dogma had been a defection from Christ. This is the aspect of the contention which gave hostile critics opportunity to say that we have before us the history of the loss of Christianity. Harnack himself has many sentences which superficially will bear that construction. Hatch had said in his brilliant book, *The Influence of Greek Ideas and Usages upon the Christian Church*, 1891, that the domestication of Greek philosophy in the Church signified a defection from the Sermon on the Mount. The centre of gravity of the Gospel was changed from life to doctrine, from morals to metaphysics, from goodness to orthodoxy. The change was portentous. The aspect of pessimism is, however, removed when one recognises the inevitableness of some such process, if Christianity was ever to wield an influence in the world at all. Again, one must consider that the process of the recovery of pure Christianity must begin at exactly this point, namely, with the recognition of how much in current Christianity is extraneous. It must begin with the sloughing off of these extraneous elements, with the recovery of the sense for that which original Christianity was. Such a recovery would be the setting free again of the power of the religion itself.

The constant touchstone and point of reference for every stage of the history of the Church must be the gospel of Jesus. But what was the gospel of Jesus? In what way did the very earliest Christians apprehend that gospel? This question is far more difficult for us to answer than it was for those to whom the New Testament was a closed body of literature, externally differentiated from all other, and with a miraculous inspiration extending uniformly to every phrase in any book. These men would have said that they had but to find the proper combination of the sacred phrases. But we acknowledge that the central inspiration was the personality of Jesus. The books possess this inspiration in varying degree. Certain of the books have distinctly begun the fusion of Christian with other elements. They themselves represent the first stages of the history of doctrine. We acknowledge that those utterances of Jesus which have been preserved for us, shaped themselves by the antitheses in which Jesus stood. There is much about them that is palpably incidental, practically relevant and unquestionably only relative. In a large sense, much of the

meaning of the gospel has to be gathered out of the evidence of the operation of its spirit in subsequent ages of the Christian Church, and from remoter aspects of the influence of Jesus on the world. Thus the very conception of the gospel of Jesus becomes inevitably more or less subjective. It becomes an ideal construction. The identification of this ideal with the original gospel proclamation becomes precarious. We seem to move in a circle. We derive the ideal from the history, and then judge the history by the ideal.

Is there any escape from this situation, short of the return to the authority of Church or Scripture in the ancient sense? Furthermore, even the men to whom the gospel was in the strictest sense a letter, identified the gospel with their own private interpretation of this letter. Certainly the followers of Ritschl who will acknowledge no traits of the gospel save those of which they find direct witness in the Gospels, thus ignore that the Gospels are themselves interpretations. This undue stress upon the documents which we are fortunate enough to possess, makes us forget the limitations of these documents. We tend thus to exaggerate that which must be only incidental, as, for example, the Jewish element, in the teaching of Jesus. We thus underrate phases of Jesus' teaching which, no doubt, a man like Paul would have apprehended better than did the evangelists themselves. In truth, in Harnack's own delineation of the teaching of Jesus, those elements of it which found their way to expression in Paul, or again in the fourth Gospel, are rather underrated than overstated, in the author's anxiety to exclude elements which are acknowledged to be interpretative in their nature. We are driven, in some measure, to seek to find out what the gospel was from the way in which the earliest Christians took it up. We return ever afresh to questions nearly unanswerable from the materials at hand. What was the central principle in the shaping of the earliest stages of the new community, both as to its thought and life? Was it the longing for the coming of the Kingdom of God, the striving after the righteousness of the Sermon on the Mount? Or was it the faith of the Messiah, the reverence for the Messiah, directed to the person of Jesus? What word dominated the preaching? Was it that the Kingdom of God was near, that the Son of Man would come? Or was it that in Jesus Messiah has come? What was the demand upon the hearer? Was it, Repent, or was it, Believe on the Lord Jesus, or was it both, and which had the greater emphasis? Was the name of Jesus used in the formulas of worship before the time of Paul? What do we know about prayer in the name of Jesus, or baptism in that name, or miracles in the name of Jesus, or of the Lord's Supper and the conception of the Lord as present with his disciples in the rite? Was this revering of Jesus, which was fast moving toward a worship of him, the inner motive force of the whole construction of the dogma of his person and of the trinity?

In the second volume Harnack treats of the development primarily of the Christological and trinitarian dogma, from the fourth to the seventh centuries. The dramatic interest of the narrative exceeds anything which has been written on this theme. A debate which to most modern men is remote and abstruse almost to the point of unintelligibility, and of which many of the external aspects are disheartening in the extreme, is here brought before us in something of the reasonableness which it must have had for those who took part in it. Tertullian shaped the problem and established the nomenclature for the Christological solution which the Orient two hundred years later made its own. It was he who, from the point of view of the Jurist, rather than of the philosopher, gave the words 'person' and 'substance,' which continually occur in this discussion, the meaning which in the Nicene Creed they bear. Most brilliant is Harnack's characterisation of Arius and Athanasius. In Arius the notion of the Son of God is altogether done away. Only the name remains. The victory of Arianism would have resolved Christianity into cosmology and formal ethics. It would have destroyed it as religion. Yet the perverse situation into which the long and fierce controversy had drifted cannot be better illustrated than by one undisputed fact. Athanasius, who assured for Christianity its character as a religion of the living communion of God with man, is yet the theologian in whose Christology almost every possible trace of the recollection of the historic Jesus has disappeared. The purpose of the redemption is to bring men into community of life with God. But Athanasius apprehended this redemption as a conferment, from without and from above, of a divine

nature. He subordinated everything to this idea. The whole narrative concerning Jesus falls under the interpretation that the only quality requisite for the Redeemer in his work was the possession in all fulness of the divine nature. His incarnation, his manifestation in real human life, held fast to in word, is reduced to a mere semblance. Salvation is not an ethical process, but a miraculous endowment. The Christ, who was God, lifts men up to godhood. They become God. These phrases are of course capable of ethical and intelligible meaning. The development of the doctrine, however, threw the emphasis upon the metaphysical and miraculous aspects of the work. It gloried in the fact that the presence of divine and human, two natures in one person forever, was unintelligible. In the end it came to pass that the enthusiastic assent to that which defied explanation became the very mark of a humble and submissive faith. One reads the so-called Athanasian Creed, and hears the ring of its determination to exact assent. It had long since been clear to these Catholics and churchmen that, with the mere authority of Scripture, it was not possible to defend Christianity against the heretics. The heresies read their heresies out of the Bible. The orthodox read orthodoxy from the same page. Marcion had proved that, in the very days when the canon took its shape. There must be an authority to define the interpretation of the Scripture. Those who would share the benefits which the Church dispensed must assent unconditionally to the terms of membership.

All these questions were veiled for the early Christians behind the question of the kind of Christ in whom their hearts believed. With all that we have said about the reprehensible admixture of the metaphysical element in the dogma, with all the accusation which we bring concerning acute or gradual Hellenisation, secularisation and defection from the Christ, we ought not to hide from ourselves that in this gigantic struggle there were real religious interests at stake, and that for the men of both parties. Dimly, or perhaps vividly, the man of either party felt that the conception of the Christ which he was fighting for was congruous with the conception of religion which he had, or felt that he must have. It is this religious issue, everywhere present, which gives dignity to a struggle which otherwise does often sadly lack it. There are two religious views of the person of Christ which have stood, from the beginning, the one over against the other. The one saw in Jesus of Nazareth a man, distinguished by his special calling as the Messianic King, endued with special powers, lifted above all men ever known, yet a man, completely subject to God in faith, obedience and prayer. This view is surely sustained by many of Jesus' own words and deeds. It shines through the testimony of the men who followed him. Even the belief in his resurrection and his second coming did not altogether do away with it. The other view saw in him a new God who, descending from God, brought mysterious powers for the redemption of mankind into the world, and after short obscuring of his glory, returned to the abode of God, where he had been before. From this belief come all the hymns and prayers to Jesus as to God, all miracles and exorcisms in his name.

Footnote 5:(return)

Wernle, *Einfzhrung in das Theologische Studium*, 1908, v. 204.

In the long run, the simpler view did not maintain itself. If false gods and demons were expelled, it was the God Jesus who expelled them. The more modest faith believed that in the man Jesus, being such an one as he was, men had received the greatest gift which the love of God had to bestow. In turn the believer felt the assurance that he also was a child of God, and in the spirit of Jesus was to realise that sonship. Syncretist religions suggested other thoughts. We see that already even in the synoptic tradition the calling upon the name of Jesus had found place. One wonders whether that first apprehension ever stood alone in its purity. The Gentile Churches founded by Paul, at all events, had no such simple trust. Equally, the second form of faith seems never to have been able to stand alone in its peculiar quality. Some of the gnostic sects had it. Marcion again is our example. The new God Jesus had nothing to do with the cruel God of the Old Testament. He supplanted the old God and became the only God. In the Church the new God, come down from heaven, must be set in relation with the long-known God of Israel. No

less, must he stand in relation to the simple hero of the Gospels with his human traits. The problem of theological reflexion was to find the right middle course, to keep the divine Christ in harmony, on the one side, with monotheism, and on the other, with the picture which the Gospels gave. Belief knew nothing of these contradictions. The same simple soul thanked God for Jesus with his sorrows and his sympathy, as man's guide and helper, and again prayed to Jesus because he seemed too wonderful to be a man. The same kind of faith achieves the same wondering and touching combination to-day, after two thousand years. With thought comes trouble. Reflexion wears itself out upon the insoluble difficulty, the impossible combination, the flat contradiction, which the two views present, so soon as they are clearly seen.

In the earliest Christian writings the fruit of this reflexion lies before us in this form: — The Creator of worlds, the mediator, the lord of angels and demons, the Logos which was God and is our Saviour, was yet a humble son of man, undergoing suffering and death, having laid aside his divine glory. This picture is made with materials which the canonical writings themselves afford. Theological study had henceforth nothing to do but to avoid extremes and seek to make this image, which reflexion upon two polar opposites had yielded, as nearly thinkable as possible. It has been said that the trinitarian doctrine is not in the New Testament, that it was later elaborated by a different kind of mind. This is not true. But the inference is precisely the contrary of that which defenders of the dogma would formerly have drawn from this concession. The same kind of mind, or rather the same two kinds of mind, are at work in the New Testament. Both of the religious elements above suggested are in the Gospels and Epistles. The New Testament presents attempts at their combination. Either form may be found in the literature of the later age. If we ask ourselves, What is that in Jesus which gives us the sense of redemption, surely we should answer, It is his glad and confident resting in the love of God the Father. It is his courage, his faith in men, which becomes our faith in ourselves. It is his wonderful mingling of purity and love of righteousness with love of those who have sinned. You may find this in the ancient literature, as the Fathers describe that to which their souls cling. But this is not the point of view from which the dogma is organised. The Nicene Christology is not to be understood from this approach. The cry of a dying civilisation after power and light and life, the feeling that these might come to it, streaming down as it were, from above, as a physical, a mechanical, a magical deliverance, this is the frame within which is set what is here said of the help and redemption wrought by Christ. The resurrection and the incarnation are the points at which this streaming in of the divine light and power upon a darkened world is felt.

That religion seemed the highest, that interpretation of Christianity the truest, the absolute one, which could boast that it possessed the power of the Almighty through his physical union with men. He who contended that Jesus was God, contended therewith for a power which could come upon men and make them in some sense one with God. This is the view which has been almost exclusively held in the Greek Church. It is the view which has run under and through and around the other conception in the Roman and Protestant Churches. The sense that salvation is inward, moral, spiritual, has rarely indeed been absent from Christendom. It would be preposterous to allege that it had. Yet this sense has been overlaid and underrun and shot through with that other and disparate idea of salvation, as of a pure bestowment, something achieved apart from us, or, if one may so say, some alteration of ourselves upon other than moral and spiritual terms. The conception of the person Christ shows the same uncertainty. Or rather, with a given view of the nature of religion and salvation, the corresponding view of Christ is certain. In the age-long and world-wide contest over the trinitarian formula, with all that is saddening in the struggle and all that was misleading in the issue, it is because we see men struggling to come into the clear as to these two meanings of religion, that the contest has such absorbing interest. Men have been right in declining to call that religion in which a man saves himself. They have been wrong in esteeming that they were then only saved of God or Christ when they were saved by an obviously external process. Even this antinomy is softened when one no longer holds that God and men are mutually exclusive conceptions. It is God working within us who saves, the God who in Jesus worked such a wonder of righteousness and love as

else the world has never seen.

CHAPTER V. THE CONTRIBUTION OF THE NATURAL AND SOCIAL SCIENCES

By the middle of the nineteenth century the empirical sciences had undergone vast expansion in the study of detail and in the discovery of principles. Men felt the necessity of some adequate discussion of the relation of these sciences one to another and of their unity. There was need of the organisation of the mass of knowledge, largely new and ever increasing, which the sciences furnished. It lay in the logic of the case that some of these attempts should advance the bold claim to deal with all knowledge whatsoever and to offer a theory of the universe as a whole. Religion, both in its mythological and in its theological stages, had offered a theory of the universe as a whole. The great metaphysical systems had offered theories of the universe as a whole. Both had professed to include all facts. Notoriously both theology and metaphysics had dealt in most inadequate fashion with the material world, in the study of which the sciences were now achieving great results. Indeed, the methods current and authoritative with theologians and metaphysicians had actually prevented study of the physical universe. Both of these had invaded areas of fact to which their methods had no application and uttered dicta which had no relation to truth. The very life of the sciences depended upon deliverance from this bondage. The record of that deliverance is one of the most dramatic chapters in the history of thought. Could one be surprised if, in the resentment which long oppression had engendered and in the joy which overwhelming victory had brought, scientific men now invaded the fields of their opponents? They repaid their enemies in their own coin. There was with some a disposition to deny that there exists an area of knowledge to which the methods of metaphysicians and theologians might apply. This was Comte’s contention. Others conceded that there might be such an area, but claimed that we can have no knowledge of it. Even the theologians, after their first shock, were disposed to concede that, concerning the magnitudes in which they were most interested, as for example, God and soul, we have no knowledge of the sort which the method of the physical sciences would give. They fell back upon Kant’s distinction of the two reasons and two worlds. They exaggerated the sharpness of that distinction. They learned that the claim of agnosticism was capable of being viewed as a line of defence, behind which the transcendental magnitudes might be secure. Indeed, if one may take Spencer as an example, it is not certain that this was not the intent of some of the scientists in their strong assertion of agnosticism. Spencer’s later work reveals that he had no disposition to deny that there are foundations for belief in a world lying behind the phenomenal, and from which the latter gets its meaning.

Meantime, after positivism was buried and agnosticism dead, a thing was achieved for which Comte himself laid the foundation and in which Spencer as he grew older was ever more deeply interested. This was the great development of the social sciences. Every aspect of the life of man, including religion itself, has been drawn within the area of the social sciences. To all these subjects, including religion, there have been applied empirical methods which have the closest analogy with those which have reigned in the physical sciences. Psychology has been made a science of experiment, and the psychology of religion has been given a place within the area of its observations and generalizations. The ethical, and again the religious consciousness has been subjected to the same kind of investigation to which all other aspects of consciousness are subjected. Effort has been made to ascertain and classify the phenomena of the religious life of the race in all lands and in all ages. A science of religions is taking its place among the other sciences. It is as purely an inductive science as is any other. The history of religions and the philosophy of religion are being rewritten from this point of view.

In the first lines of this chapter we spoke of the empirical sciences, meaning the sciences of the material world. It is clear, however, that the sciences of mind, of morals and of religion have now become

empirical sciences. They have their basis in experience, the experience of individuals and the experience of masses of men, of ages of observable human life. They all proceed by the method of observation and inference, of hypothesis and verification. There is a unity of method as between the natural and social and psychical sciences, the reach of which is startling to reflect upon. Indeed, the physiological aspects of psychology, the investigations of the relation of adolescence to conversion, suggest that the distinction between the physical and the psychical is a vanishing distinction. Science comes nearer to offering an interpretation of the universe as a whole than the opening paragraphs of this chapter would imply. But it does so by including religion, not by excluding it. No one would any longer think of citing Kant's distinction of two reasons and two worlds in the sense of establishing a city of refuge into which the persecuted might flee. Kant rendered incomparable service by making clear two poles of thought. Yet we must realise how the space between is filled with the gradations of an absolute continuity of activity. Man has but one reason. This may conceivably operate upon appropriate material in one or the other of these polar fashions. It does operate in infinite variations of degree, in unity with itself, after both fashions, at all times and upon all materials.

Positivism was a system. Agnosticism was at least a phase of thought. The broadening of the conception of science and the invasion of every area of life by a science thus broadly conceived, has been an influence less tangible than those others but not, therefore, less effective. Positivism was bitterly hostile to Christianity, though, in the mind of Comte himself and of a few others, it produced a curious substitute, possessing many of the marks of Roman Catholicism. The name 'agnostic' was so loosely used that one must say that the contention was hostile to religion in the minds of some and not of others. The new movement for an inclusive science is not hostile to religion. Yet it will transform current conceptions of religion as those others never did. In proportion as it is scientific, it cannot be hostile. It may at most be indifferent. Nevertheless, in the long run, few will choose the theme of religion for the scientific labour of life who have not some interest in religion. Men of these three classes have accepted the doctrine of evolution. Comte thought he had discovered it. Spencer and those for whom we have taken him as type, did service in the elaboration of it. To the men of our third group, the truth of evolution seems no longer debatable. Here too, in the word 'evolution,' we have a term which has been used with laxity. It corresponds to a notion which has only gradually been evolved. Its implications were at first by no means understood. It was associated with a mechanical view of the universe which was diametrically opposed to its truth. Still, there could not be a doubt that the doctrine contravened those ideas as to the origin of the world, and more particularly of man, of the relations of species, and especially of the human species to other forms of animal life, which had immemorially prevailed in Christian circles and which had the witness of the Scriptures on their behalf. If we were to attempt, with acknowledged latitude, to name a book whose import might be said to be cardinal for the whole movement treated of in this chapter, that book would be Darwin's *Origin of Species*, which was published in 1859.

Long before Darwin the creation legend had been recognised as such. The astronomy of the seventeenth century had removed the earth from its central position. The geology of the eighteenth had shown how long must have been the ages of the laying down of the earth's strata. The question of the descent of man, however, brought home the significance of evolution for religion more forcibly than any other aspect of the debate had done. There were scientific men of distinction who were not convinced of the truth of the evolutionary hypothesis. To most Christian men the theory seemed to leave no unique distinction or spiritual quality for man. It seemed to render impossible faith in the Scriptures as revelation. To many it seemed that the whole issue as between a spiritual and a purely materialistic view of the universe was involved. Particularly was this true of the English-speaking peoples.

One other factor in the transformation of the Christian view needs to be dwelt upon. It is less theoretical than those upon which we have dwelt. It is the influence of socialism, taking that word in its largest sense. An industrial civilisation has developed both the good and the evil of individualism in

incredible degree. The unity of society which the feudal system and the Church gave to Europe in the Middle Age had been destroyed. The individualism and democracy which were essential to Protestantism notoriously aided the civil and social revolution, but the centrifugal forces were too great. Initiative has been wonderful, but cohesion is lacking. Democracy is yet far from being realised. The civil liberations which were the great crises of the western world from 1640 to 1830 appear now to many as deprived of their fruit. Governments undertake on behalf of subjects that which formerly no government would have dreamed of doing. The demand is that the Church, too, become a factor in the furtherance of the outward and present welfare of mankind. If that meant the call to love and charity it would be an old refrain. That is exactly what it does not mean. It means the attack upon evils which make charity necessary. It means the taking up into the idealisation of religion the endeavour to redress all wrongs, to do away with all evils, to confer all goods, to create a new world and not, as heretofore, mainly at least, a new soul in the midst of the old world. No one can deny either the magnitude of the evils which it is sought to remedy, or the greatness of the goal which is thus set before religion. The volume of religious and Christian literature devoted to these social questions is immense. It is revolutionary in its effect. For, after all, the very gist of religion has been held to be that it deals primarily with the inner life and the transcendent world. That it has dealt with the problem of the inner life and transcendent world in such a manner as to retard, or even only not to further, the other aspects of man's life is indeed a grave indictment. That it should, however, see ends in the outer life and present world as ends fully sufficient in themselves, that it should cease to set these in the light of the eternal, is that it should cease to be religion. The physical and social sciences have given to men an outward setting in the world, a basis of power and happiness such as men never have enjoyed. Yet the tragic failure of our civilisation to give to vast multitudes that power and happiness, is the proof that something more than the outward basis is needed. The success of our civilisation is its failure.

This is by no means a recurrence to the old antithesis of religion and civilisation, as if these were contradictory elements. On the contrary, it is but to show that the present world of religion and of economics are not two worlds, but merely different aspects of the same world. Therewith it is not alleged that religion has not a specific contribution to make.

POSITIVISM

The permanent influence of that phase of thought which called itself Positivism has not been great. But a school of thought which numbered among its adherents such men and women as John Stuart Mill, George Henry Lewes, George Eliot, Frederic Harrison, and Matthew Arnold, cannot be said to have been without significance. A book upon the translation of which Harriet Martinean worked with sustained enthusiasm cannot be dismissed as if it were merely a curiosity. Comte's work, *Coura de Philosophie Positive*, appeared between the years 1830 and 1842. Littré was his chief French interpreter. But the history of the positivist movement belongs to the history of English philosophical and religious thought, rather than to that of France.

Comte was born at Montpellier in 1798, of a family of intense Roman Catholic piety. He showed at school a precocity which might bear comparison with Mill's. Expelled from school, cast off by his parents, dismissed by the elder Casimir Perier, whose secretary he had been, he eked out a living by tutoring in mathematics. Friends of his philosophy rallied to his support. He never occupied a post comparable with his genius. He was unhappy in his marriage. He passed through a period of mental aberration, due, perhaps, to the strain under which he worked. He did not regain his liberty without an experience which embittered him against the Church. During the fourteen years of the production of his book he cut himself off from any reading save that of current scientific discovery. He came under the influence of Madame Vaux, whom, after her death, he idolised even more than before. For the problem

which, in the earlier portion of his work, he set himself, that namely, of the organising of the sciences into a compact body of doctrine, he possessed extraordinary gifts. Later, he took on rather the air of a high priest of humanity, legislating concerning a new religion. It is but fair to say that at this point Littré and many others parted company with Comte. He developed a habit and practice ascetic in its rigour and mystic in its devotion to the positivists' religion — the worship of humanity. He was the friend and counsellor of working-men and agitators, of little children, of the poor and miserable. He ended his rather pathetic and turbulent career in 1857, gathering a few disciples about his bed as he remembered that Socrates had done.

Comte begins with the natural sciences and postulates the doctrine of evolution. To the definition of this doctrine he makes some interesting approaches. The discussion of the order and arrangement of the various sciences and of their characteristic differences is wonderful in its insight and suggestiveness. He asserts that in the study of nature we are concerned solely with the facts before us and the relations which connect those facts. We have nothing to do with the supposed essence or hidden nature and meaning of those facts. Facts and the invariable laws which govern them are the only legitimate objects of pursuit. Comte infers that because we can know, in this sense, only phenomena and their relations, we should in consequence guard against illusions which creep in again if we so much as use the words principle, or cause, or will, or force. By phenomena must be understood objects of perception, to the exclusion, for example, of psychological changes reputed to be known in self-consciousness. That there is no knowledge but of the physical, that there is no knowing except by perception — this is ever reiterated as self-evident. Even psychology, resting as it does largely upon the observation of the self by the self, must be illusive. Physiology, or even phrenology, with the value of which Comte was much impressed, must take its place. Every object of knowledge is other than the knowing subject. Whatever else the mind knows, it can never know itself. By invincible necessity the human mind can observe all phenomena except its own. Commenting upon this, James Martineau observed: 'We have had in the history of thought numerous forms of idealism which construed all outward phenomena as mere appearances within the mind. We have hitherto had no strictly corresponding materialism, which claimed certainty for the outer world precisely because it was foreign to ourselves.' Man is the highest product of nature, the highest stage of nature's most mature and complex form. Man as individual is nothing more. Physiology gives us not merely his external constitution and one set of relations. It is the whole science of man. There is no study of mind in which its actions and states can be contemplated apart from the physical basis in conjunction with which mind exists.

Thus far man has been treated only biologically, as individual. We must advance to man in society. Almost one half of Comte's bulky work is devoted to this side of the inquiry. Social phenomena are a class complex beyond any which have yet been investigated. So much is this the case and so difficult is the problem presented, that Comte felt constrained in some degree to change his method. We proceed from experience, from data in fact, as before. But the facts are not mere illustrations of the so called laws of individual human nature. Social facts are the results also of situations which represent the accumulated influence of past generations. In this, as against Bentham, for example, with his endless recurrence to human nature, as he called it, Comte was right. Comte thus first gave the study of history its place in sociology. In this study of history and sociology, the collective phenomena are more accessible to us and better known by us, than are the parts of which they are composed. We therefore proceed here from the general to the particular, not from the particular to the general, as in research of the kinds previously named. The state of every part of the social organisation is ultimately connected with the contemporaneous state of all the other parts. Philosophy, science, the fine arts, commerce, navigation, government, are all in close mutual dependence. When any considerable change takes place in one, we may know that a parallel change has preceded or will follow in the others. The progress of society is not the aggregate of partial changes, but the product of a single impulse acting through all the partial agencies.

It can therefore be most easily traced by studying all together. These are the main principles of sociological investigation as set forth by Comte, some of them as they have been phrased by Mill.

The most sweeping exemplification of the axiom last alluded to, as to parallel changes, is Comte's so-called law of the three states of civilisation. Under this law, he asserts, the whole historical evolution can be summed up. It is as certain as the law of gravitation. Everything in human society has passed, as has the individual man, through the theological and then through the metaphysical stage, and so arrives at the positive stage. In this last stage of thought nothing either of superstition or of speculation will survive. Theology and metaphysics Comte repeatedly characterises as the two successive stages of nescience, unavoidable as preludes to science. Equally unavoidable is it that science shall ultimately prevail in their place. The advance of science having once begun, there is no possibility but that it will ultimately possess itself of all. One hears the echo of this confidence in Haeckel also. There is a persistence about the denial of any knowledge whatsoever that goes beyond external facts, which ill comports with the pretensions of positivism to be a philosophy. For its final claim is not that it is content to rest in experimental science. On the contrary, it would transform this science into a homogeneous doctrine which is able to explain everything in the universe. This is but a *tour de force*. The promise is fulfilled through the denial of the reality of everything which science cannot explain. Comte was never willing to face the fact that the very existence of knowledge has a noumenal as well as a phenomenal side. The reasonableness of the universe is certainly a conception which we bring to the observation of nature. If we did not thus bring it with us, no mere observation of nature would ever give it to us. It is impossible for science to get rid of the conception of force, and ultimately of cause. There can be no phenomenon which is not a manifestation of something. The very nomenclature falls into hopeless confusion without these conceptions. Yet the moment we touch them we transcend science and pass into the realm of philosophy. It is mere juggling with words to say that our science has now become a philosophy.

The adjective 'positive' contains the same fallacy. Apparently Comte meant by the choice of it to convey the sense that he would limit research to phenomena in their orders of resemblance, co-existence and succession. But to call the inquiry into phenomena positive, in the sense that it alone deals with reality, to imply that the inquiry into causes deals with that which has no reality, is to beg the question. This is not a premise with which he may set out in the evolution of his system.

Comte denied the accusation of materialism and atheism. He did the first only by changing the meaning of the term materialism. Materialism the world has supposed to be the view of man's condition and destiny which makes these to begin and end in nature. That certainly was Comte's view. The accusation of atheism also he avoids by a mere play on words. He is not without a God. Humanity is God. Mankind is the positivist's Supreme. Altruism takes the place of devotion. The devotion so long wasted upon a mere creature of the imagination, to whom it could do no good, he would now give to men who sorely need it and can obviously profit by it. Surely the antithesis between nature and the supernatural, in the form in which Comte argues against it, is now abandoned by thoughtful people. Equally the antithesis of altruism to the service of God is perverse. It arouses one's pity that Comte should not have seen how, in true religion these two things coalesce.

Moreover, this deification of mankind, in so far as it is not a sounding phrase, is an absurdity. When Comte says, for example, that the authority of humanity must take the place of that of God, he has recognised that religion must have authority. Indeed, the whole social order must have authority. However, this is not for him, as we are accustomed to say, the authority of the truth and of the right. There is no such abstraction as the truth, coming to various manifestations. There is no such thing as right, apart from relatively right concrete measures. There is no larger being indwelling in men. Society, humanity in its collective capacity, must, if need be, override the individual. Yet Comte despises the mere rule of majorities. The majority which he would have rule is that of those who have the scientific mind. We may admit that in this he aims at the supremacy of truth. But, in fact, he prepares the way for a doctrinaire

tyranny which, of all forms of government, might easily turn out to be the worst which a long-suffering humanity has yet endured.

In the end, we are told, love is to take the place of force. Humanity is present to us first in our mothers, wives and daughters. For these it is present in their fathers, husbands, sons. From this primary circle love widens and worship extends as hearts enlarge. It is the prayer to humanity which first rises above the mere selfishness of the sort to get something out of God. Remembrance in the hearts of those who loved us and owe something to us is the only worthy form of immortality. Clearly it is only the caricature of prayer or of the desire of immortality which rises before Comte's mind as the thing to be escaped. For this caricature religious men, both Catholic and Protestant, without doubt, gave him cause. There were to be seven sacraments, corresponding to seven significant epochs in a man's career. There were to be priests for the performance of these sacraments and for the inculcation of the doctrines of positivism. There were to be temples of humanity, affording opportunity for and reminder of this worship. In each temple there was to be set up the symbol of the positivist religion, a woman of thirty years with her little son in her arms. Littré spoke bitterly of the positivist religion as a lapse of the author into his old aberration. This religion was certainly regarded as negligible by many to whom his system as a whole meant a great deal. At least, it is an interesting example, as is also his transformation of science into a philosophy, of the resurgence of valid elements in life, even in the case of a man who has made it his boast to do away with them.

NATURALISM AND AGNOSTICISM

We may take Spencer as representative of a group of men who, after the middle of the nineteenth century, laboured enthusiastically to set forth evolutionary and naturalistic theories of the universe. These theories had also, for the most part, the common trait that they professed agnosticism as to all that lay beyond the reach of the natural-scientific methods, in which the authors were adept. Both Ward and Boutroux accept Spencer as such a type. Agnosticism for obvious reasons could be no system. Naturalism is a tendency in interpretation of the universe which has many ramifications. There is no intention of making the reference to one man's work do more than serve as introduction to the field.

Spencer was eager in denial that he had been influenced by Comte. Yet there is a certain reminder of Comte in Spencer's monumental endeavour to systematise the whole mass of modern scientific knowledge, under the general title of 'A Synthetic Philosophy.' He would show the unity of the sciences and their common principles or, rather, the one great common principle which they all illustrate, the doctrine of evolution, as this had taken shape since the time of Darwin. Since 1904 we have an autobiography of Herbert Spencer, which, to be sure, seems largely to have been written prior to 1889. The book is interesting, as well in the light which it throws upon the expansion of the sciences and the development of the doctrine of evolution in those years, as in the revelation of the personal traits of the man himself. Concerning these Tolstoi wrote to a friend, apropos of a gift of the book: 'In autobiographies the most important psychological phenomena are often revealed quite independently of the author's will.'

Spencer was born in 1820 in Derby, the son of a schoolmaster. He came of Nonconformist ancestry of most marked individuality. His early education was irregular and inadequate. Before he reached the age of seventeen his reading had been immense. He worked with an engineer in the period of the building of the railways in the Midlands. He always retained his interest in inventions. He wrote for the newspapers and magazines and definitely launched upon a literary career. At the age of thirty he published his first book, on *Social Statics*. He made friends among the most notable men and women of his age. So early as 1855 he was the victim of a disease of the heart which never left him. It was on his recovery from his first grave attack that he shaped the plan which henceforth held him, of organising the modern sciences and incorporating them into what he called a synthetic philosophy. There was immense increase in actual

knowledge and in the power of his reflection on that knowledge, as the years went by. A generation elapsed between the publication of his *First Principles* and the conclusion of his more formal literary labours. There is something captivating about a man's life, the energy of which remains so little impaired that he esteems it better to write a new book, covering some untouched portion of his scheme, than to give to an earlier volume the revision which in the light of his matured convictions it may need. His philosophical limitations he never transcended. He does not so naïvely offer a substitute for philosophy as does Comte. But he was no master in philosophy. There is a reflexion of the consciousness of this fact in his agnosticism.

That the effort of the agnostic contention has been great, and on the whole salutary, few would deny. Spencer's own later work shows that his declaration, that the absolute which lies behind the universe is unknowable, is to be taken with considerable qualification. It is only a relative unknowableness which he predicates. Moreover, before Spencer's death, the doctrine of evolution had made itself profoundly felt in the discussion of all aspects of life, including that of religion. There seemed no longer any reason for the barrier between science and religion which Spencer had once thought requisite.

The epithet agnostic, as applied to a certain attitude of scientific mind, is just, as over against excessive claims to valid knowledge made, now by theology and now by speculative philosophy. It is hardly descriptive in any absolute sense. Spencer had coined the rather fortunate illustration which describes science as a gradually increasing sphere, such that every addition to its surface does but bring us into more extensive contact with surrounding nescience. Even upon this illustration Ward has commented that the metaphor is misleading. The continent of our knowledge is not merely bounded by an ocean of ignorance. It is intersected and cut up by straits and seas of ignorance. The author of *Ecce Coelum* has declared: 'Things die out under the microscope into the same unfathomed and, so far as we can see, unfathomable mystery, into which they die off beyond the range of our most powerful telescope.' This sense of the circumambient unknown has become cardinal with the best spirits of the age. Men have a more rigorous sense of what constitutes knowledge.

They have reckoned more strictly with the methods by which alone secure and solid knowledge may be attained. They have undisguised scepticism as to alleged knowledge not arrived at in those ways. It was the working of these motives which gave to the labours of the middle of the nineteenth century so prevailingly the aspect of denial, the character which Carlyle described as an everlasting No. This was but a preparatory stage, a retrogression for a new and firmer advance.

In the sense of the recognition of our ignorance and of a becoming modesty of affirmation, over against the mystery into which all our thought runs out, we cannot reject the correction which agnosticism has administered. It is a fact which has had disastrous consequences, that precisely the department of thought, namely the religious, which one might suppose would most have reminded men of the outlying mystery, that phase of life whose very atmosphere is mystery, has most often been guilty of arrant dogmatism. It has been thus guilty upon the basis of the claim that it possessed a revelation. It has allowed itself unlimited licence of affirmation concerning the most remote and difficult matters. It has alleged miraculously communicated information concerning those matters. It has clothed with a divine authoritativeness, overriding the mature reflexion and laborious investigation of learned men, that which was, after all, nothing but the innocent imaginings of the childhood of the race. In this good sense of a parallel to that agnosticism which scientists profess for themselves within their own appointed realm, there is a religious agnosticism which is one of the best fruits of the labour of the age. It is not that religious men have abandoned the thought of revelation. They apprehended more justly the nature of revelation. They confess that there is much ignorance which revelation does not mitigate. *Exeunt omnia in mysterium*. They are prepared to say concerning many of the dicta of religiosity, that they cannot affirm their truth. They are prepared to say concerning the experience of God and the soul, that they know these with an indefeasible certitude. This just and wholesome attitude toward religious truth is only a corollary of the attitude which

science has taught us toward all truth whatsoever.

The strictly philosophic term phenomenon, to which science has taken so kindly, is in itself an explicit avowal of something beyond the phenomenal. Spencer is careful to insist upon this relation of the phenomenal to the noumenal. His *Synthetic Philosophy* opens with an exposition of this non-relative or absolute, without which the relative itself becomes contradictory. It is an essential part of Spencer's doctrine to maintain that our consciousness of the absolute, indefinite as it is, is positive and not negative. 'Though the absolute cannot in any manner or degree be known, in the strict sense of knowing, yet we find that its positive existence is a necessary datum of consciousness. The belief which this datum of consciousness constitutes has a higher warrant than any other belief whatsoever.' In short, the absolute or noumenal, according to Spencer, though not known as the phenomenal or relative is known, is so far from being for knowledge a pure blank, that the phenomenal, which is said to be known, is in the strict sense inconceivable without it. This actuality behind appearances, without which appearances are unthinkable, is by Spencer identified with that ultimate verity upon which religion ever insists. Religion itself is a phenomenon, and the source and secret of most complex and interesting phenomena. It has always been of the greatest importance in the history of mankind. It has been able to hold its own in face of the attacks of science. It must contain an element of truth. All religions, however, assert that their God is for us not altogether cognisable, that God is a great mystery. The higher their rank, the more do they acknowledge this. It is by the flippant invasion of this mystery that the popular religiosity offends. It talks of God as if he were a man in the next street. It does not distinguish between merely imaginative fetches into the truth, and presumably accurate definition of that truth. Equally, the attempts which are logically possible at metaphysical solutions of the problem, namely, theism, pantheism, and atheism, if they are consistently carried out, assert, each of them, more than we know and are involved in contradiction with themselves. But the results of modern physics and chemistry reveal, as the constant element in all phenomena, force. This manifests itself in various forms which are interchangeable, while amid all these changes the force remains the same. This latter must be regarded as the reality, and basis of all that is relative and phenomenal. The entire universe is to be explained from the movements of this absolute force. The phenomena of nature and of mental life come under the same general laws of matter, motion, and force.

Spencer's doctrine, as here stated, is not adequate to account for the world of mental life or adapted to serve as the basis of a reconciliation of science and religion. It does not carry us beyond materialism. Spencer's real intention was directed to something higher than that. If the absolute is to be conceived at all, it is as a necessary correlative of our self-consciousness. If we get the idea of force from the experience of our own power of volition, is it not natural to think of mind-force as the prius of physical force, and not the reverse? Accordingly, the absolute force, basis of all specific forces, would be mind and will. The doctrine of evolution would harmonise perfectly with these inferences. But it would have to become idealistic evolution, as in Schelling, instead of materialistic, as in Comte. We are obliged, Spencer owns, to refer the phenomenal world of law and order to a first cause. He says that this first cause is incomprehensible. Yet he further says, when the question of attributing personality to this first cause is raised, that the choice is not between personality and something lower. It is between personality and something higher. To this may belong a mode of being as much transcending intelligence and will as these transcend mechanical motion. It is strange, he says, that men should suppose the highest worship to lie in assimilating the object of worship to themselves. And yet, again, in one of the latest of his works he writes: 'Unexpected as it will be to most of my readers, I must assert that the power which manifests itself in consciousness is but a differently conditioned form of the power which manifests itself beyond consciousness. The conception to which the exploration of nature everywhere tends is much less that of a universe of dead matter than that of a universe everywhere alive.'

Similar is the issue in the reflexion of Huxley. Agnosticism had at first been asserted in relation to the spiritual and the teleological. It ended in fastening upon the material and mechanical. After all, says

Huxley, in one of his essays:— ‘What do we know of this terrible matter, except as a name for an unknown and hypothetical cause of states of our own consciousness? Again, what do we know of that spirit over whose threatened extinction by matter so great lamentation has now arisen, except that it is also a name for an unknown and hypothetical cause of states of our consciousness?’ He concedes that matter is inconceivable apart from mind, but that mind is not inconceivable apart from matter. He concedes that the conception of universal and necessary law is an ideal. It is an invention of the mind’s own devising. It is not a physical fact. In brief, taking agnostic naturalism just as it seemed disposed a generation ago to present itself, it now appears as if it had been turned exactly inside out. Instead of the physical world being primary and fundamental and the mental world secondary, if not altogether problematical, the precise converse is true.

Nature, as science regards it, may be described as a system whose parts, be they simple or complex, are wholly governed by universal laws. Knowledge of these laws is an indispensable condition of that control of nature upon which human welfare in so large degree depends. But this reign of law is an hypothesis. It is not an axiom which it would be absurd to deny. It is not an obvious fact, thrust upon us whether we will or no. Experiences are possible without the conception of law and order. The fruit of experience in knowledge is not possible without it. That is only to say that the reason why we assume that nature is a connected system of uniform laws, lies in the fact that we ourselves are self-conscious personalities. When the naturalists say that the notion of cause is a fetish, an anthropomorphic superstition which we must eliminate, we have to answer: ‘from the realm of empirical science perhaps, but not from experience as a whole.’ Indeed, a glance at the history, and particularly at the popular literature, of science affords the interesting spectacle of the rise of an hallucination, the growth of a habit of mythological speech, which is truly surprising. We begin to hear of self-existent laws which reign supreme and bind nature fast in fact. By this learned substitution for God, it was once confidently assumed that the race was to emerge from mythical dawn and metaphysical shadows into the noon-day of positive knowledge. Rather, it would appear that at this point a part of the human race plunged into a new era of myth-making and fetish worship — the homage to the fetish of law. Even the great minds do not altogether escape. ‘Fact I know and law I know,’ says Huxley, with a faint suggestion of sacred rhetoric. But surely we do not know law in the same sense in which we know fact. If there are no causes among our facts, then we do not know anything about the laws. If we do know laws it is because we assume causes. If, in the language of rational beings, laws of nature are to be spoken of as self-existent and independent of the phenomena which they are said to govern, such language must be merely analogous to the manner in which we often speak of the civil law. We say the law does that which we know the executive does. But the thorough-going naturalist cast off these implications as the last rags of a creed outworn. Physicists were fond of talking of the movement of molecules, just as the ancient astrologers imagined that the planets had souls and guided their own courses. We had supposed that this was anthropomorphism. In truth, this would-be scientific mode of speech is as anthropomorphic as is the cosmogony of Hesiod, only on a smaller scale. Primitive religion ascribed life to everything of which it talked. Polytheism in religion and independent forces and self-existent laws in science are thus upon a par. The gods many and lords many, so amenable to concrete presentation in poetry and art, have given place to one Supreme Being. So also light, heat, and other natural agencies, palpable and ready to hand for the explanation of everything, in the myth-making period of science which living men can still remember, have by this time paled. They have become simply various manifestations of one underlying spiritual energy, which is indeed beyond our perception. When Comte said that the universe could not rest upon will, because then it would be arbitrary, incalculable, subject to caprice, one feels the humour and pathos of it. Comte’s experience with will, his own and that of others, had evidently been too largely of that sad sort. Real freedom consists in conformity to what ought to be. In God, whom we conceive as perfect, this conformity is complete. With us it remains an ideal. Were we the creatures of a blind mechanical necessity there could be no talk of

ideal standards and no meaning in reason at all.

Footnote 6:(return)

Ward, *Naturalism and Agnosticism*, vol. ii. .

EVOLUTION

In the progress of the thought of the generation, say, from 1870 to the present day, the conception of evolution has been much changed. The doctrine of evolution has itself been largely evolved within that period. The application of it has become familiar in fields of which there was at first no thought. The bearing of the acceptance of it upon religion has been seen to be quite different from that which was at first supposed. The advocacy of the doctrine was at first associated with the claims of naturalism or positivism. Wider applications of the doctrine and deeper insight into its meaning have done away with this misunderstanding. Evolution, as originally understood, was as far as possible from suggesting anything mechanical. By the term was meant primarily the gradual unfolding of a living germ from its embryonic beginning to its mature and final stage. This adult form was regarded not merely as the goal actually reached through successive stages of growth. It was conceived as the end aimed at, and achieved through the force of some vital or ideal principle shaping the plastic material and directing the process of growth. In short, evolution implied ideal ends controlling physical means. Yet we find with Spencer, as prevailingly also with others in the study of the natural sciences, the ideas of end and of cause looked at askance. They are regarded an outside the pale of the natural sciences. In a very definite sense that is true. The logical consequence of this admission should be merely the recognition that the idea of evolution as developed in the natural sciences cannot be the whole idea.

The entire history of anything, Spencer tells us, must include its appearance out of the imperceptible, and its disappearance again into the imperceptible. Be it a single object, or the whole universe, an account which begins with it in a concrete form, or leaves off with its concrete form, is incomplete. He uses a familiar instance, that of a cloud appearing when vapour drifts over a cold mountain top, and again disappearing when it emerges into warmer air. The cloud emerges from the imperceptible as heat is dissipated. It is dissolved again as heat is absorbed and the watery particles evaporate. Spencer esteems this an analogue of the appearance of the universe itself, according to the nebular hypothesis. Yet assuredly, as the cloud presupposes vapours which had previously condensed, and the vapour clouds that had previously evaporated, and as clouds dissolve in one place even at the moment that they are forming in another, so we are told of nebulæ which are in every phase of advance or of decline. To ask which was first, solid masses or nebulous haze, is much like recurring to the riddle of the hen and the egg. Still, we are told, we have but to extend our thought beyond this emergence and subsidence of sidereal systems, of continents, nations, men, to find a permanent totality made up of transient individuals in every stage of change. The physical assumption with which Spencer sets out is that the mass of the universe and its energy are fixed in quantity. All the phenomena of evolution are included in the conservation of this matter and force.

Besides the criticism which was offered above, that the mere law of the persistence of force does not initiate our series, there is a further objection. Even within the series, once it has been started, this law of the persistence of force is solely a quantitative law. When energy is transformed there is an equivalence between the new form and the old. Of the reasons for the direction evolution takes, for the permanence of that direction once it has been taken, so that the sequence of forms is a progression, the explication of a latent nature — of all this, the mere law of the persistence of force gives us no explanation whatever. The change at random from one form of manifestation to another might be a striking illustration of the law of the persistence of force, but it would be the contradiction of evolution. The very notion of evolution is that

of the sequence of forms, so that something is expressed or achieved. That achievement implies more than the mere force. Or rather, it involves a quality of the force with which the language of mechanism does not reckon. It assumes the idea which gives direction to the force, an ideal quality of the force.

Unquestionably that which men sought to be rid of was the idea of purpose in nature, in the old sense of design in the mind of God, external to the material universe, of force exerted upon nature from without, so as to cause nature to conform to the design of its 'Great Original,' in Addison's high phrase. In this effort, however, the reducing of all to mere force and permutation of force, not merely explains nothing, but contradicts facts which stare us in the face. It deprives evolution of the quality which makes it evolution. To put in this incongruous quality at the beginning, because we find it necessary at the end, is, to say the least, naïve. To deny that we have put it in, to insist that in the marvellous sequence we have only an illustration of mechanism and of conservation of force, is perverse. We passed through an era in which some said that they did not believe in God; everything was accounted for by evolution. In so far as they meant that they did not believe in the God of deism and of much traditional theology, they did not stand alone in this claim. In so far as they meant by evolution mere mechanism, they explained nothing and destroyed the notion of evolution besides. In so far as they meant more than mere mechanism, they lapsed into the company of the scientific myth-makers to whom we alluded above. They attributed to their abstraction, evolution, qualities which other people found in the forms of the universe viewed as the manifestation of an immanent God. Only by so doing were they able to ascribe to evolution that which other people describe as the work of God. At this level the controversy becomes one simply about words.

Of course, the great illumination as to the meaning of evolution has come with its application to many fields besides the physical. Darwin was certainly the great inaugurator of the evolutionary movement in England. Still, Darwin's problem was strictly limited. The impression is widespread that the biological evolutionary theories were first developed, and furnished the basis for the others. Yet both Hegel and Comte, not to speak of Schelling, were far more interested in the intellectual and historical, the ethical and social aspects of the question. Both Hegel and Comte were, whether rightly or wrongly, rather contemptuous of the appeal to biology and organic life. Both had the sense that they used a great figure of speech when they spoke of society as an organism, and compared the working of institutions to biological functions. This is indeed the question. It is a question over which Spencer sets himself lightly. He passes back and forth between organic evolution and the ethical, economic, and social movements which are described by the same term, as if we were in possession of a perfectly safe analogy, or rather as if we were assured of an identical principle. Much that is already archaic in Spencer's economic and social, his historical and ethical, not to say his religious, chapters is due to the influence of this fact. Of his own mind it was true that he had come to the doctrine of evolution from the physical side. He brought to his other subjects a more or less developed method of operating with the conception. He never fully realised how new subjects would alter the method and transform the conception. Spencerian evolution is an assertion of the all-sufficiency of natural law. The authority of conscience is but the experience of law-abiding and dutiful generations flowing in our veins. The public weal has hold over us, because the happiness and misery of past ages are inherited by us.

It marked a great departure when Huxley began vigorously to dissent from these views. According to him evolutionary science has done nothing for ethics. Men become ethical only as they set themselves against the principles embodied in the evolutionary process of the world. Evolution is the struggle for existence. It is preposterous to say that man became good by succeeding in the struggle for existence. Instead of the old single movement, as in Spencer, straight from the nebula to the saint, Huxley has place for suffering. Suffering is most intense in man precisely under conditions most essential to the evolution of his nobler powers. The loss of ease or money may be gain in character. The cosmical process is not only full of pain. It is full of mercilessness and of wickedness. Good has been evolved, but so has evil. The

fittest may have survived. There is no guarantee that they are the best. The continual struggle against our fellows poisons our higher life. It will hardly do to say with Huxley that the ethical struggle is the reverse of the cosmical process. Nevertheless, we have here a most interesting transformation in thought.

These ideas and principles, as is well known, were elaborated and advanced upon in a very popular book, Drummond's *Ascent of Man*, 1894. Even the title was a happy and suggestive one. Struggle for life is a fact, but it is not the whole fact. It is balanced by the struggle for the life of others. This latter reaches far down into the levels of what we call brute life. Its divinest reach is only the fulfilment of the real nature of humanity. It is the living with men which develops the moral in man. The prolongation of infancy in the higher species has had to do with the development of moral nature. So only that we hold a sufficiently deep view of reason, provided we see clearly that reason transforms, perfects, makes new what we inherit from the beast, we need not fear for morality, though it should universally be taught that morality came into being by the slow and gradual fashioning of brute impulse.

Benjamin Kidd in his *Social Evolution*, 1895, has reverted again to extreme Darwinism in morals and sociology. The law is that of unceasing struggle. Reason does not teach us to moderate the struggle. It but sharpens the conflict. All religions are præter-rational, Christianity most of all, in being the most altruistic. Kidd, not without reason, comments bitterly upon Spencer's Utopia, the passage of militarism into industrialism. The struggle in industrialism is fiercer than ever. Reason affects the animal nature of man for the worse. Clearly conscious of what he is doing, man objects to sacrificing himself for his family or tribe. Instinct might lead an ape to do that. Intelligence warns a man against it. Reason is cruel beyond anything dreamed of in the beast. That portion of the community which loves to hear the abuse of reason, rejoiced to hear this phrase. They rejoiced when they heard that religion was the only remedy, and that religion was ultra-rational, contra-rational, supernatural, in this new sense. How one comes by it, or how one can rationally justify the yielding of allegiance to it, is not clear. One must indeed have the will to believe if one believes on these terms.

These again are but examples. They convey but a superficial impression of the effort to apply the conception of evolution to the moral and religious life of man. All this has taken place, of course, in a far larger setting that of the endeavour to elaborate the evolutionary view of politics and of the state, of economics and of trade, of social life and institutions, of culture and civilisation in every aspect. This elaboration and reiteration of the doctrine of evolution sometimes wearies us. It is but the unwearied following of the main clue to the riddle of the universe which the age has given us. It is nothing more and nothing less than the endeavour to apprehend the ideal life, no longer as something held out to us, set up before us, but also as something working within us, realising itself through us and among us. To deny the affinity of this with religion would be fatuous and also futile. Temporarily, at least, and to many interests of religion, it would be fatal.

MIRACLES

It must be evident that the total view of the universe which the acceptance of the doctrine of evolution implies, has had effect in the diminution of the acuteness of the question concerning miracles. It certainly gives to that question a new form. A philosophy which asserts the constant presence of God in nature and the whole life of the world, a criticism which has given us a truer notion of the documents which record the biblical miracles, the reverent sense of ignorance which our increasing knowledge affords, have tended to diminish the dogmatism of men on either side of the debate. The contention on behalf of the miracle, in the traditional sense of the word, once seemed the bulwark of positive religion, the distinction between the man who was satisfied with a naturalistic explanation of the universe and one whose devout soul asked for something more. On the other hand, the contention against the miracle appeared to be a necessary corollary of the notion of a law and order which are inviolable throughout the universe.

Furthermore, many men have come of themselves to the conclusion for which Schleiermacher long ago contended. Whatever may be theoretically determined concerning miracles, yet the miracle can never again be regarded as among the foundations of faith. This is for the simplest of reasons. The belief in a miracle presupposes faith. It is the faith which sustains the miracle, and not the miracle the faith. Jesus is to men the incomparable moral and spiritual magnitude which he is, not on the evidence of some unparalleled things physical which it is alleged he did. Quite the contrary, it is the immediate impression of the moral and spiritual wonder which Jesus is, that prepares what credence we can gather for the wonders which it is declared he did. This is a transfer of emphasis, a redistribution of weight in the structure of our thought, the relief of which many appreciate who have not reasoned the matter through for themselves.

Schleiermacher had said, and Herrmann and others repeat the thought, that, as the Christian faith finds in Christ the highest revelation, miracles may reasonably be expected of him. Nevertheless, he adds, these deeds can be called miracles or esteemed extraordinary, only as containing something which was beyond contemporary knowledge of the regular and orderly connexion between physical and spiritual life. Therewith, it must be evident, that the notion of the miraculous is fundamentally changed. So it comes to pass that we have a book like Mackintosh's *Natural History of the Christian Religion*, 1894, whose avowed purpose is to do away with the miraculous altogether. Of course, the author means the traditional notion of the miraculous, according to which it is the essence of arbitrariness and the negation of law. It is not that he has less sense for the divine life of the world, or for the quality of Christianity as revelation. On the other hand, we have a book like Percy Gardner's *Exploratio Evangelica*, 1899. With the most searching criticism of the narratives of some miracles, there is reverent confession, on the author's part, that he is baffled by the reports of others. There is recognition of unknown possibilities in the case of a character like that of Jesus. It is not that Gardner has a less stringent sense of fact and of the inexorableness of law than has Mackintosh or an ardent physicist. The problem is reduced to that of the choice of expression. We are not able to withhold a justification of the scholar who declares: We must not say that we believe in the miraculous. This language is sure to be appropriated by those who still take their departure from the old dualism, now hopelessly obsolete, for which a breach of the law of nature was the crowning evidence of the love of God. On the other hand, the assertion that we do not believe in the miraculous will easily be taken by some to mean the denial of the whole sense of the nearness and power and love of God, and of the unimagined possibilities of such a moral nature as was that of Christ. It is to be repeated that we have here a mere difference as to terms. The debate is no longer about ideas.

The traditional notion of the miracle arose out of the confusion of two series of ideas which, in the last analysis, have nothing to do with each other. On the one hand, there is the conception of law and order, of cause and effect, of the unbroken connexion of nature. On the other hand is the thought of the divine purpose in the life of the world and of the individual. By the aid of that first sequence of thoughts we find ourselves in the universe and interpret the world of fact to ourselves. Yet in the other sequence lies the essence of religion. The two sequences may perfectly well coexist in the same mind. Out of the attempt to combine them nothing clear or satisfying can issue. If one should be, to-day, brought face to face with a fact which was alleged to be a miracle, his instinctive effort would be, nevertheless, to seek to find its cause, to establish for it a connexion in the natural order. In the ancient world men did not argue thus, nor in the modern world until less than two hundred years ago. The presumption of the order of nature had not assumed for them the proportions which it has for us. For us it is overwhelming, self-evident. Therewith is not involved that we lack belief in a divine purpose for the world and for the individual life.

We do not deny that there are laws of nature of which we have no experience, facts which we do not understand, events which, if they should occur, would stand before us as unique. Still, the decisive thing is, that in face of such an event, instead of viewing it quite simply as a divine intervention, as men used to do, we, with equal simplicity and no less devoutness, conceive that same event as only an illustration of a

connexion in nature which we do not understand. There is no inherent reason why we may not understand it. When we do understand it, there will be nothing more about it that is conceivably miraculous. There will be then no longer a unique quality attaching to the event. Therewith ends the possible significance of such an event as proof of divine intervention for our especial help. We have but a connexion in nature such that, whether understood or not, if it were to recur, the event would recur.

The miracles which are related in the Scripture may be divided for our consideration into three classes. To the first class belong most of those which are related in the Old Testament, but some also which are conspicuous in the New Testament. They are, in some cases, the poetical and imaginative representation of the profoundest religious ideas. So soon as one openly concedes this, when there is no longer any necessity either to attack or to defend the miracle in question, one is in a position to acknowledge how deep and wonderful the thoughts often are and how beautiful the form in which they are conveyed. It is through imagination and symbolism that we are able to convey the subtlest meanings which we have. Still more was this the case with men of an earlier age. In the second place, the narratives of miracles are, some of them, of such a sort that we may say that an event or circumstance in nature has been obviously apprehended in naïve fashion. This by no means forbids us to interpret that same event in quite a different way. The men of former time, exactly in proportion as they had less sense of the order of nature than have we, so were they also far readier to assume the immediate forthputting of the power of God. This was true not merely of the uneducated. It is difficult, or even impossible, for us to find out what the event was. Fact and apprehension are inextricably interwoven. That which really happened is concealed from us by the tale which had intended to reveal it. In the third place, there are many cases in the history of Jesus, and some in that of the apostles and prophets, in which that which is related moves in the borderland between body and soul, spirit and matter, the region of the influence of will, one’s own or that of another, over physical conditions. Concerning such cases we are disposed, far more than were men even a few years ago, to concede that there is much that is by no means yet investigated, and the soundest judgment we can form is far from being sure. Even if we recognise to the full the lamentable resurgence of outworn superstitions and stupidities, which again pass current among us for an unhappy moment, if we detect the questionable or manifestly evil consequences of certain uses made or alleged of psychic influence, yet still we are not always in a position to say, with certainty, what is true in tales of healing which we hear in our own day. There are certain of the statements concerning Jesus’ healing power and action which are absolutely baffling. They can be eliminated from the narrative only by a procedure which might just as well eliminate the narrative. In many of the narratives there may be much that is true. In some all may be as related. In Jesus’ time, on the witness of the Scripture itself, it was assumed as something no one questioned, that miraculous deeds were performed, not alone by Jesus and the apostles, but by many others, and not always even by the good. Such deeds were performed through the power of evil spirits as well as by the power of God. To imagine that the working of miracles proved that Jesus came from God, is the most patent importation of a modern apologetic notion into the area of ancient thought. We must remember that Jesus himself laid no great weight upon the miracles which we assume that he believed he wrought, and some of which we may believe that he did work. Many he performed with hesitation and desired so far as possible to conceal.

Even if we were in a position at one point or another in the life of Jesus to defend the traditional assumptions concerning the miraculous, yet it must be evident how opposed it is to right reason, to lay stress on the abstract necessity of belief in the miraculous. The traditional conception of the miraculous is done away for us. This is not at all by the fact that we are in a position to say with Matthew Arnold: ‘The trouble with miracles is that they never happen.’ We do not know enough to say that. To stake all on the assertion of the impossibility of so-called miracles is as foolish as to stake much on the affirmation of their actuality. The connexion of nature is only an induction. This can never be complete. The real question is both more complex and also more simple. The question is whether, even if an event, the most

unparalleled of those related in the Gospels or outside of them, should be proved before our very eyes to have taken place, the question is whether we should believe it to have been a miracle in the traditional sense, an event in which the actual — not the known, but the possible — order of nature had been broken through, and in the old sense, God had arbitrarily supervened.

Allowed that the event were, in our own experience and in the known experience of the race, unparalleled, yet it would never occur to us to suppose but that there was a law of this case, also, a connexion in nature in which, as work of God, it occurred, and in which, if the conditions were repeated, it would recur. We should unceasingly endeavour through observation, reflexion, and new knowledge, to show how we might subordinate this event in the connexion of nature which we assume. We should feel that we knew more, and not less, of God, if we should succeed. And if our effort should prove altogether futile, we should be no less sure that such natural connexion exists. This is because nature is for us the revelation of the divine. The divine, we assume, has a natural order of working. Its inviolability is the divinest thing about it. It is through this sequence of ideas that we are in a position to deny, not facts which may be inexplicable, but the traditional conception of the miracle. For surely no one needs to be told that this is not the conception of the miracle which has existed in the minds of the devout, and equally of the undevout, from the beginning of thought until the present day.

However, there is nothing in all of this which hinders us from believing with a full heart in the love and grace and care of God, in his holy and redeeming purpose for mankind and for the individual. It is true that this belief cannot any longer retain its naïve and childish form. It is true that it demands of a man far more of moral force, of ethical and spiritual mastery, of insight and firm will, to sustain the belief in the purpose of God for himself and for all men, when a man believes that he sees and feels God only in and through nature and history, through personal consciousness and the personal consciousness of Jesus. It is true that it has, apparently, been easier for men to think of God as outside and above his world, and of themselves as separated from their fellows by his special providence. It is more difficult, through glad and intelligent subjection to all laws of nature and of history, to achieve the education of one's spirit, to make good one's inner deliverance from the world, to aid others in the same struggle and to set them on their way to God. Men grow uncertain within themselves, because they say that traditional religion has apprehended the matter in a different way. This is true. It is also misleading. Whatever miracles Jesus may have performed, no one can say that he performed them to make life easier for himself, to escape the common lot, to avoid struggle, to evade suffering and disgraceful death. On the contrary, in genuine human self-distrust, but also in genuine heroism, he gave himself to his vocation, accepting all that went therewith, and finished the work of God which he had made his own. This is the more wonderful because it lay so much nearer to him than it can lie to us, to pray for special evidence of the love of God and to set his faith on the receiving of it. He had not the conception of the relation of God to nature and history which we have.

We may well view the modern tendency to belief in healings through prayer, suggestion and faith, as an intelligible, an interesting, and in part, a touching manifestation. Of course there is mingled with it much dense ignorance, some superstition and even deception. Yet behind such a phenomenon there is meaning. Men of this mind make earnest with the thought that God cares for them. Without that thought there is no religion. They have been taught to find the evidence of God's love and care in the unusual. They are quite logical. It has been a weak point of the traditional belief that men have said that in the time of Christ there were miracles, but since that time, no more. Why not, if we can only in spirit come near to Christ and God? They are quite logical also in that they have repudiated modern science. To be sure, no inconsiderable part of them use the word science continually.

But the very esoteric quality of their science is that it means something which no one else ever understood that it meant. In reality their breach with science is more radical than their breach with Christianity. They feel the contradiction in which most men are bound fast, who will let science have its

way, up to a certain point, but who beyond that, would retain the miracle. Dimly the former appreciate that this position is impossible. They leave it to other men to become altogether scientific if they wish. For themselves they prefer to remain religious. What a revival of ancient superstitions they have brought to pass, is obvious. Still we shall never get beyond such adventurous and preposterous endeavours to rescue that which is inestimably precious in religion, until the false antithesis between reason and faith, the lying contradiction between the providence of God and the order of nature, is overcome. Some science mankind apparently must have. Altogether without religion the majority, it would seem, will never be. How these are related, the one to the other, not every one sees. Many attempt their admixture in unhappy ways. They might try letting them stand in peace as complement and supplement the one to the other. Still better, they may perhaps some day see how each penetrates, permeates and glorifies the other.

THE SOCIAL SCIENCES

We said that the last generation had been characterised by an unexampled concentration of intellectual interest upon problems presented by the social sciences. With this has gone an unrivalled earnestness in the interpretation of religion as a social force. The great religious enthusiasm has been that of the application of Christianity to the social aspects of life. This effort has furnished most of the watchwords of religious teaching. It has laid vigorous, not to say violent, hands on religious institutions. It has given a new perspective to effort and a new impulse to devotion. The revival of religion in our age has taken this direction, with an exclusiveness which has had both good and evil consequences. Yet, before all, it should be made clear that it constitutes a religious revival. Some are deploring the prostrate condition of spiritual interests. If one judged only by conventional standards, they have much evidence upon their side. Some are seeking to galvanise religious life by recurrence to evangelistic methods successfully operative half a century ago. The outstanding fact is that the age shows immense religious vitality, so soon as one concedes that it must be allowed to show its vitality in its own way. It is the age of the social question. One must be ignorant indeed of the activity of the churches and of the productivity of religious thinkers, if he does not own that in Christian circles also no questions are so rife as these. Whether the panaceas have been all wise or profitable may be questioned. Whether the interest has not been even excessive and one-sided, whether the accusation has not been occasionally unjust and the self-accusation morbid, these are questions which it might be possible in some quarters to ask. This is, however, only another form of proof of what we say. The religious interest in social questions has not been aroused primarily by intellectual and scientific impulses, nor fostered mainly by doctrinaire discussion. On the contrary, the initiative has been from the practical side. It has been a question of life and service. If anything, one often misses the scientific note in the flood of semi-religious literature relating to this theme, the realisation that, to do well, it is often profitable to think. Yet there is effort to mediate the best results of social-scientific thinking, through clerical education and directly to the laity. On the other hand, a deep sense of ethical and spiritual responsibility is prevalent among thinkers upon social topics.

Often indeed has the quality of Christianity been observed which is here exemplified. Each succeeding age has read into Christ’s teachings, or drawn out from his example, the special meaning which that generation, or that social level, or that individual man had need to draw. To them in their enthusiasm it has often seemed as if this were the only lesson reasonable men could draw. Nothing could be more enlightening than is reflexion upon this reading of the ever-changing ideals of man’s life into Christianity, or of Christianity into the ever-advancing ideals of man’s life. This chameleonlike quality of Christianity is the farthest possible remove from the changelessness which men love to attribute to religion. It is the most wonderful quality which Christianity possesses. It is precisely because of the recognition of this capacity for change that one may safely argue the continuance of Christianity in the world. Yet also because of this recognition, one is put upon his guard against joining too easily in the clamour that a past

apprehension of religion was altogether wrong, or that a new and urgent one, in its exclusive emphasis and its entirety, is right. Our age is haunted by the sense of terrific social and economic inequalities which prevail. It has set its heart upon the elimination of those inequalities. It is an age whose disrespect for religion is in some part due to the fact that religion has not done away with these inequalities. It is an age which is immediately interested in an interpretation of religion which will make central the contention that, before all things else, these inequalities must be done away. If religion can be made a means of every man's getting his share of the blessings of this world, well and good. If not, there are many men and women to whom religion seems utterly meaningless.

This sentence hardly overstates the case. It is the challenge of the age to religion to do something which the age profoundly needs, and which religion under its age-long dominant apprehension has not conspicuously done, nor even on a great scale attempted. It is the challenge to religion to undertake a work of surpassing grandeur — nothing less than the actualisation of the whole ideal of the life of man. Religious men respond with the quickened and conscientious conviction, not indeed that they have laid too great an emphasis upon the spiritual, but that under a dualistic conception of God and man and world, they have never sufficiently realised that the spiritual is to be realised in the material, the ideal in and not apart from the actual, the eternal in and not after the temporal. Yet with that oscillatory quality which belongs to human movements, especially where old wrongs and errors have come deeply to be felt, a part of the literature of the contention shows marked tendency to extremes. A religion in the body must become a religion of the body. A Christianity of the social state runs risk of being apprehended as merely one more means for compassing outward and material ends. Religion does stand for the inner life and the transcendent world, only not an inner life through the neglect of the outer, or a transcendent world in some far-off star or after an æon or two. There might be meaning in the argument that, exactly because so many other forces in our age do make for the realisation of the outer life and present world with an effectiveness and success which no previous age has ever dreamed, there is the more reason, and not the less, why religion should still be religion. Exactly this is the contention of Eueken in one of the most significant contributions of recent years to the philosophy of religion, his *Wahrheitsgehalt der Religion*, 1901, transl. Jones, 1911. The very source and cause of the sure recovery of religion in our age will be the experience of the futility, the bankruptcy, of a civilisation without faith. No nobler argument has been heard in our time for the spiritual meaning of religion, with the fullest recognition of all its other meanings.

The modern emphasis on the social aspects of religion may be said to have been first clearly expressed in Seeley's *Ecce Homo*, 1867. The pith of the book is in this phrase: 'To reorganise society and to bind the members of it together by the closest ties was the business of Jesus' life.' Allusion has been made to Fremantle's *The World as the Subject of Redemption*, 1885. Worthy of note is also Fairbairn's *Religion in History and Modern Life*, 1894; pre-eminently so is Bosanquet's *The Civilisation of Christendom*, 1893. Westcott's *Incarnation and Common Life*, 1893, contains utterances of weight. Peabody, in his book, *Jesus Christ and the Social Question*, 1905, has given, on the whole, the best résumé of the discussion. He conveys incidentally an impression of the body of literature produced in recent years, in which it is assumed, sometimes with embitterment, that the centre of gravity of Christianity is outside the Church. Sell, in the very title of his illuminating little book, *Christenthum und Weltgeschichte seit der Reformation: das Christenthum in seiner Entwickelung über die Kirche hinaus*, 1910, records an impression, which is widespread and true, that the characteristic mark of modern Christianity is that it has transcended the organs and agencies officially created for it. It has become non-ecclesiastical, if not actually hostile to the Church. It has permeated the world in unexpected fashion and does the deeds of Christianity, though rather eager to avoid the name. The anti-clericalism of the Latin countries is not unintelligible, the anti-ecclesiasticism of the Teutonic not without a cause. German socialism, ever since Karl Marx, has been fundamentally antagonistic to any religion whatsoever. It is purely secularist in tone.

This is also a strained situation, liable to become perverse. That part of the Christian Church which understands itself, rejoices in nothing so much as in the fact that the spirit of Christ is so widely disseminated, his influence felt by many who do not know what influence it is which they feel, his work done by vast numbers who would never call themselves his workers. That part of the Church is not therewith convinced but that there is need of the Church as institution, and of those who are consciously disciples of Jesus in the world.

By far the largest question, however, which is raised in this connexion, is one different from any thus far intimated. It is, perhaps, the last question one would have expected the literature of the social movement to raise. It is, namely, the question of the individual. Ever since the middle of the eighteenth century a sort of universalistic optimism, to which the individual is sacrificed, has obtained. Within the period of which this book treats the world has won an enlargement of horizon of which it never dreamed. It has gained a forecast of the future of culture and civilisation which is beyond imagination. The access of comfort makes men at home in the world as they never were at home. There has been set a value on this life which life never had before. The succession of discoveries and applications of discovery makes it seem as if there were to be no end in this direction. From Rousseau to Spencer men have elaborated the view that the historical process cannot really issue in anything else than in ever higher stages of perfection and of happiness. They postulate a continuous enhancement of energy and a steady perfecting of intellectual and moral quality. As the goal of evolution appears an ideal condition which is either indefinitely remote, that is, which gives room for the bliss of infinite progress in its direction, or else a definitely attainable condition, which would have within itself the conditions of perpetuity.

The resistlessness with which this new view of the life of civilisation has won acknowledgment from men of all classes is amazing. It rests upon a belief in the self-sufficiency and the all-sufficiency of the life of this world, of the bearings of which it may be assumed that few of its votaries are aware. In reality this view cannot by any possibility be described as the result of knowledge. On the contrary, it is a venture of faith. It is the peculiar, the very characteristic and suggestive form which the faith of our age takes. Men believe in this indefinite progress of the world and of mankind, because without postulating such progress they do not see how they can assume the absolute worth of an activity which is yet the only thing which has any interest to most of them. Under this view one can assign to the individual life a definite significance, only upon the supposition that the individual is the organ of realisation of a part of this progress of mankind. All happiness and suffering, all changes in knowledge and manner of conduct, are supposed to have no worth each for itself or for the sake of the individual, but only for their relation to the movement as a whole. Surely this is an illusion. Exactly that in which the characteristic quality of the world and of life is found, the individual personalities, the single generations, the concrete events — these lose, in this view, their own particular worth. What can possibly be the worth of a whole of which the parts have no worth? We have here but a parallel on a huge scale of that deadly trait in our own private lives, according to which it makes no difference what we are doing, so only that we are doing, or whither we are going, so only that we cease not to go, or what our noise is all about, so only that there be no end of the noise. Certainly no one can establish the value of the evolutionary process in and of itself.

If the movement as a whole has no definite end that has absolute worth, then it has no worth except as the stages, the individual factors included in it, attain to something within themselves which is of increasing worth. If the movement achieves this, then it has worth, not otherwise. We may illustrate this question by asking ourselves concerning the existence and significance of suffering and of the evil and of the bad which are in the world, in their relation to this tendency to indefinite progress which is supposed to be inherent in civilisation. On this theory we have to say that the suffering of the individual is necessary for the development and perfecting of the whole. As over against the whole the individual has no right to make demands as to welfare or happiness. The bad also becomes only relative. In the movement taken as a whole, it is probably unavoidable. In any case it is negligible, since the movement is irresistible. All

ethical values are absorbed in the dynamic ones, all personal values in the collective ones. Surely the sole intelligent question about any civilisation is, what sort of men does it produce. If it produces worthless individuals, it is so far forth a worthless civilisation. If it has sacrificed many worthy men in order to produce this ignoble result, then it is more obviously ignoble than ever.

Furthermore, this notion of an inherent necessity and an irresistible tendency to progress is a chimera. The progress of mankind is a task. It is something to which the worthy human spirit is called upon to make contribution. The unworthy never hear the call. Progress is not a natural necessity. It is an ethical obligation. It is a task which has been fulfilled by previous generations in varying degrees of perfectness. It will be participated in by succeeding generations with varying degrees of wisdom and success. But as to there being anything autonomous about it, this is sheer hallucination, myth-making again, on the part of those who boast that they despise the myth, miracle-mongering on the part of those who have abjured the miracle, nonsense on the part of those who boast that they alone are sane. There is no ultimate source of civilisation but the individual, as there is also no issue of civilisation but in individuals. Men, characters, personalities, are the makers of it. Men are the product which is made. The higher stages and achievements of the life of society have come to pass always and only upon condition that single personalities have recognised the problem, seen their individual duty and known how to inspire others with enthusiasm. Periods of decline are always those in which this personal element cannot make itself felt. Democracies and periods of the intensity of emphasis upon the social movement, tend directly to the depression and suppression of personality. Such reflexions will have served their purpose if they give us some clear sense of what we have to understand as the effect of the social movement on religion. They may give also some forecast of the effect of real religion on the social movement. For religion is the relation of God and personality. It can be social only in the sense that society, in all its normal relations, is the sphere within which that relation of God and personality is to be wrought out.

Siebeck, *Religionsphilosophie*, 1893, s. 407.

CHAPTER VI. THE ENGLISH-SPEAKING PEOPLES: ACTION AND REACTION

In those aspects of our subject with which we have thus far dealt, leadership has been largely with the Germans. Effort was indeed made in the chapter on the sciences to illustrate the progress of thought by reference to British writers. In this department the original and creative contribution of British authors was great. There were, however, also in the earlier portion of the nineteenth century movements of religious thought in Great Britain and America related to some of those which we have previously considered. Moreover, one of the most influential movements of English religious thought, the so-called Oxford Movement, with the Anglo-Catholic revival which it introduced, was of a reactionary tendency. It has seemed, therefore, feasible to append to this chapter that which we must briefly say concerning the general movement of reaction which marked the century. This reactionary movement has indeed everywhere run parallel to the one which we have endeavoured to record. It has often with vigour run counter to our movement. It has revealed the working of earnest and sometimes anxious minds in directions opposed to those which we have been studying. No one can fail to be aware that there has been a great Catholic revival in the nineteenth century. That revival has had place in the Roman Catholic countries of the Continent as well. It was in order to include the privilege of reference to these aspects of our subject that this chapter was given a double title. Yet in no country has the nineteenth century so favourably altered the position of the Roman Catholic Church as in England. In no country has a Church which has been esteemed to be Protestant been so much influenced by Catholic ideas. This again is a reason for including our reference to the reaction here.

According to Pfleiderer, a new movement in philosophy may be said to have begun in Great Britain in the year 1825, with the publication of Coleridge's *Aids to Reflection*. In Coleridge's *Confessions of an Enquiring Spirit*, published six years after his death in 1834, we have a suggestion of the biblical-critical movement which was beginning to shape itself in Germany. In the same years we have evidence in the works of Erskine and the early writings of Campbell, that in Scotland theologians were thinking on Schleiermacher's lines. In those same years books of more or less marked rationalistic tendency were put forth by the Oriel School. Finally, with Pusey's *Assize Sermon*, in 1833, Newman felt that the movement later to be called Tractarian had begun. We shall not be wrong, therefore, in saying that the decade following 1825 saw the beginnings in Britain of more formal reflexion upon all the aspects of the theme with which we are concerned.

What went before that, however, in the way of liberal religious thinking, though informal in its nature, should not be ignored. It was the work of the poets of the end of the eighteenth and of the beginning of the nineteenth centuries. The culmination of the great revolt against the traditional in state and society and against the conventional in religion, had been voiced in Britain largely by the poets. So vigorous was this utterance and so effective, that some have spoken of the contribution of the English poets to the theological reconstruction. It is certain that the utterances of the poets tended greatly to the dissemination of the new ideas. There was in Great Britain no such unity as we have observed among the Germans, either of the movement as a whole or in its various parts. There was a consecution nothing less than marvellous in the work of the philosophers from Kant to Hegel. There was a theological sequence from Schleiermacher to Ritschl. There was an unceasing critical advance from the days of Strauss. There was nothing resembling this in the work of the English-speaking people. The contributions were for a long time only sporadic. The movement had no inclusiveness. There was no aspect of a solid front in the advance. In the department of the sciences only was the situation different. In a way, therefore, it will be necessary in this chapter merely to single out individuals, to note points of conflict, one and another, all

along the great line of advance. Or, to put it differently, it will be possible to pursue a chronological arrangement which would have been bewildering in our study heretofore. With the one great division between the progressive spirits and the men of the reaction, it will be possible to speak of philosophers, critics and theologians together, among their own contemporaries, and so to follow the century as it advances.

In the closing years of the eighteenth century in England what claimed to be a rational supernaturalism prevailed. Men sought to combine faith in revealed religion with the empirical philosophy of Locke. They conceived God and his relation to the world under deistical forms. The educated often lacked in singular degree all deeper religious feeling. They were averse to mysticism and spurned enthusiasm. Utilitarian considerations, which formed the practical side of the empirical philosophy, played a prominent part also in orthodox belief. The theory of the universe which obtained among the religious is seen at its worst in some of the volumes of the Warburton Lectures, and at its best perhaps in Butler's *Analogy of Natural and Revealed Religion*. The character and views of the clergy and of the ruling class among the laity of the Church of England, early in the nineteenth century, are pictured with love and humour in Trollope's novels. They form the background in many of George Eliot's books, where, in more mordant manner, both their strength and weaknesses are shown. Even the remarks which introduce Dean Church's *Oxford Movement*, 1891, in which the churchly element is dealt with in deep affection, give anything but an inspiring view.

The contrast with this would-be rational and unemotional religious respectability of the upper classes was furnished, for masses of the people, in the quickening of the consciousness of sin and grace after the manner of the Methodists. But the Methodism of the earlier age had as good as no intellectual relations whatsoever. The Wesleys and Whitefield had indeed influenced a considerable portion of the Anglican communion. Their pietistic trait, combined, for the most part, with a Calvinism which Wesley abhorred and an old-fashioned low church feeling with which also Wesley had no sympathy, shows itself in the so-called evangelical party which was strong before 1830. This evangelical movement in the Church of England manifested deep religious feeling, it put forth zealous philanthropic effort, it had among its representatives men and women of great beauty of personal character and piety. Yet it was completely cut off from any living relation to the thought of the age. There was among its representatives no spirit of theological inquiry. There was, if anything, less probability of theological reconstruction, from this quarter, than from the circles of the older German pietism, with which this English evangelicalism of the time of the later Georges had not a little in common. There had been a great enthusiasm for humanity at the opening of the period of the French Revolution, but the excesses and atrocities of the Revolution had profoundly shocked the English mind. There was abroad something of the same sense for the return to nature, and of the greatness of man, which moved Schiller and Goethe. The exponents of it were, however, almost exclusively the poets, Wordsworth, Shelley, Keats and Byron. There was nothing which combined these various elements as parts of a great whole. Britain had stood outside the area of the Revolution, and yet had put forth stupendous efforts, ultimately successful, to make an end of the revolutionary era and of the Napoleonic despotism. This tended perhaps to give to Britons some natural satisfaction in the British Constitution and the established Church which flourished under it. Finally, while men on the Continent were devising holy alliances and other chimeras of the sort, England was precipitated into the earlier acute stages of the industrial revolution in which she has led the European nations and still leads. This fact explains a certain preoccupation of the British mind with questions remote from theological reconstruction or religious speculation.

THE POETS

It may now sound like a contradiction if we assert that the years from 1780 to 1830 constitute the era of

the noblest English poetry since the times of great Elizabeth. The social direction of the new theology of the present day, with its cry against every kind of injustice, with its claim of an equal opportunity for a happy life for every man — this was the forecast of Cowper, as it had been of Blake. To Blake all outward infallible authority of books or churches was iniquitous. He was at daggers drawn with every doctrine which set limit to the freedom of all men to love God, or which could doubt that God had loved all men. Jesus alone had seen the true thing. God was a father, every man his child. Long before 1789, Burns was filled with the new ideas of the freedom and brotherhood of man, with zeal for the overthrow of unjust privilege. He had spoken in imperishable words of the holiness of the common life. He had come into contact with the most dreadful consequences of Calvinism. He has pilloried these mercilessly in his 'Holy Tulzie' and in his 'Holy Willie's Prayer.' Such poems must have shaken Calvinism more than a thousand liberal sermons could have done. What Coleridge might have done in this field, had he not so early turned to prose, it is not easy to say. The verse of his early days rests upon the conviction, fundamental to his later philosophy, that all the new ideas concerning men and the world are a revelation of God. Wordsworth seems never consciously to have broken with the current theology. His view of the natural glory and goodness of humanity, especially among the poor and simple, has not much relation to that theology. His view of nature, not as created of God. in the conventional sense, but as itself filled with God, of God as conscious of himself at every point of nature's being, has still less. Man and nature are but different manifestations of the one soul of all. Byron's contribution to Christian thought, we need hardly say, was of a negative sort. It was destructive rather than constructive. Among the conventions and hypocrisies of society there were none which he more utterly despised than those of religion and the Church as he saw these. There is something volcanic, Voltairean in his outbreaks. But there is a difference. Both Voltaire and Byron knew that they had not the current religion. Voltaire thought, nevertheless, that he had a religion. Posterity has esteemed that he had little. Byron thought he had none. Posterity has felt that he had much. His attack was made in a reckless bitterness which lessened its effect. Yet the truth of many things which he said is now overwhelmingly obvious. Shelley began with being what he called an atheist. He ended with being what we call an agnostic, whose pure poetic spirit carried him far into the realm of the highest idealism. The existence of a conscious will within the universe is not quite thinkable. Yet immortal love pervades the whole. Immortality is improbable, but his highest flights continually imply it. He is sure that when any theology violates the primary human affections, it tramples into the dust all thoughts and feelings by which men may become good. The men who, about 1840, stood paralysed between what Strauss later called 'the old faith and the new,' or, as Arnold phrased it, were 'between two worlds, one dead, the other powerless to be born,' found their inmost thoughts written broad for them in Arthur Clough. From the time of the opening of Tennyson's work, the poets, not by destruction but by construction, not in opposition to religion but in harmony with it, have built up new doctrines of God and man and aided incalculably in preparing the way for a new and nobler theology. In the latter part of the nineteenth century there was perhaps no one man in England who did more to read all of the vast advance of knowledge in the light of higher faith, and to fill such a faith with the spirit of the glad advance of knowledge, than did Browning. Even Arnold has voiced in his poetry not a little of the noblest conviction of the age. And what shall one say of Mrs. Browning, of the Rossettis and William Morris, of Emerson and Lowell, of Lanier and Whitman, who have spoken, often with consummate power and beauty, that which one never says at all without faith and rarely says well without art?

COLERIDGE

Samuel Taylor Coleridge was born in 1772 at his father's vicarage, Ottery St. Mary's, Devonshire. He was the tenth child of his parents, weak in frame, always suffering much. He was a student at Christ's Hospital, London, where he was properly bullied, then at Jesus College, Cambridge, where he did not

take his degree. For some happy years he lived in the Lake region and was the friend of Wordsworth and Southey. He studied in Göttingen, a thing almost unheard of in his time. The years 1798 to 1813 were indeed spent in utter misery, through the opium habit which he had contracted while seeking relief from rheumatic pain. He wrote and taught and talked in Highgate from 1814 to 1834. He had planned great works which never took shape. For a brief period he severed his connexion with the English Church, coming under Unitarian influence. He then reverted to the relation in which his ecclesiastical instincts were satisfied. We read his *Aids to Reflection* and his *Confessions of an Enquiring Spirit*, and wonder how they can ever have exerted a great influence. Nevertheless, they were fresh and stimulating in their time. That Coleridge was a power, we have testimony from men differing among themselves so widely as do Hare, Sterling, Newman and John Stuart Mill. He was a master of style. He had insight and breadth. Tulloch says of the *Aids*, that it is a book which none but a thinker upon divine things will ever like. Not all even of these have liked it. Inexcusably fragmentary it sometimes seems. One is fain to ask: What right has any man to publish a scrap-book of his musings? Coleridge had the ambition to lay anew the foundations of spiritual philosophy. The *Aids* were but of the nature of prolegomena. For substance his philosophy went back to Locke and Hume and to the Cambridge Platonists. He had learned of Kant and Schleiermacher as well. He was no metaphysician, but a keen interpreter of spiritual facts, who himself had been quickened by a particularly painful experience. He saw in Christianity, rightly conceived, at once the true explanation of our spiritual being and the remedy for its disorder. The evangelical tradition brought religion to a man from without. It took no account of man’s spiritual constitution, beyond the fact that he was a sinner and in danger of hell. Coleridge set out, not from sin alone, but from the whole deep basis of spiritual capacity and responsibility upon which sin rests. He asserts experience. We are as sure of the capacity for the good and of the experience of the good as we can be of the evil. The case is similar as to the truth. There are aspects of truth which transcend our powers. We use words without meaning when we talk of the plans of a being who is neither an object for our senses nor a part of our self-consciousness. All truth must be capable of being rendered into words conformable to reason. Theologians had declared their doctrines true or false without reference to the subjective standard of judgment. Coleridge contended that faith must rest not merely upon objective data, but upon inward experience. The authority of Scripture is in its truthfulness, its answer to the highest aspirations of the human reason and the most urgent necessities of the moral life. The doctrine of an atonement is intelligible only in so far as it too comes within the range of spiritual experience. The apostolic language took colour from the traditions concerning sacrifice. Much has been taken by the Church as literal dogmatic statement which should be taken as more figure of speech, borrowed from Jewish sources.

Coleridge feared that his thoughts concerning Scripture might, if published, do more harm than good. They were printed first in 1840. Their writing goes back into the period long before the conflict raised by Strauss. There is not much here that one might not have learned from Herder and Lessing. Utterances of Whately and Arnold showed that minds in England were waking. But Coleridge’s utterances rest consistently upon the philosophy of religion and theory of dogma which have been above implied. They are more significant than are mere flashes of generous insight, like those of the men named. The notion of verbal inspiration or infallible dictation of the Holy Scriptures could not possibly survive after the modern spirit of historical inquiry had made itself felt. The rabbinical idea was bound to disappear. A truer sense of the conditions attending the origins and progress of civilisation and of the immaturities through which religious as well as moral and social ideas advance, brought of necessity a changed idea of the nature of Scripture and revelation. Its literature must be read as literature, its history as history. For the answer in our hearts to the spirit in the Book, Coleridge used the phrase: ‘It finds me.’ ‘Whatever finds me bears witness to itself that it has proceeded from the Holy Ghost. In the Bible there is more that finds me than in all the other books which I have read.’ Still, there is much in the Bible that does not find me. It is full of contradictions, both moral and historical. Are we to regard these as all equally inspired?

The Scripture itself does not claim that. Besides, what good would it do us to claim that the original documents were inerrant, unless we could claim also that they had been inerrantly transmitted? Apparently Coleridge thought that no one would ever claim that. Coleridge wrote also concerning the Church. His volume on *The Constitution of Church and State* appeared in 1830. It is the least satisfactory of his works. The vacillation of Coleridge's own course showed that upon this point his mind was never clear. Arnold also, though in a somewhat different way, was zealous for the theory that Church and State are really identical, the Church being merely the State in its educational and religious aspect and organisation. If Thomas Arnold's moral earnestness and his generous spirit could not save this theory from being chimerical, no better result was to be expected from Coleridge.

THE ORIEL SCHOOL

It has often happened in the history of the English universities that a given college has become, through its body of tutors and students, through its common-room talk and literary work, the centre, for the time, of a movement of thought which gives leadership to the college. In this manner it has been customary to speak of the group of men who, before the rise of the Oxford Movement, gathered at Oriel College, as the Oriel School. Newman and Keble were both Oriel tutors. The Oriel men were of distinctly liberal tendency. There were men of note among them. There was Whately, Archbishop of Dublin after 1831, and Copleston, from whom both Keble and Newman owned that they learned much. There was Arnold, subsequently Headmaster of Rugby. There was Hampden, Professor of Divinity after 1836. The school was called from its liberalism the Noetic school. Whether this epithet contained more of satire or of complacency it is difficult to say. These men arrested attention and filled some of the older academic and ecclesiastical heads with alarm. Without disrespect one may say that it is difficult now to understand the commotion which they made. Arnold had a truly beautiful character. What he might have done as Professor of Ecclesiastical History in Oxford was never revealed, for he died in 1842. Whately, viewed as a noetic, appears commonplace.

Perhaps the only one of the group upon whom we need dwell was Hampden. In his Bampton Lectures of 1832, under the title of *The Scholastic Philosophy considered in its Relation to Christian Theology*, he assailed what had long been the very bulwark of traditionalism. His idea was to show how the vast fabric of scholastic theology had grown up, particularly what contributions had been made to it in the Middle Age. The traditional dogma is a structure reared upon the logical terminology of the patristic and mediæval schools. It has little foundation in Scripture and no response in the religious consciousness. We have here the application, within set limits, of the thesis which Harnack in our own time has applied in a universal way. Hampden's opponents were not wrong in saying that his method would dissolve, not merely that particular system of theology, but all creeds and theologies whatsoever. Patristic, mediæval Catholic theology and scholastic Protestantism, no less, would go down before it. A pamphlet attributed to Newman, published in 1836, precipitated a discussion which, for bitterness, has rarely been surpassed in the melancholy history of theological dispute. The excitement went to almost unheard of lengths. In the controversy the Archbishop, Dr. Howley, made but a poor figure. The Duke of Wellington did not add to his fame. Wilberforce and Newman never cleared themselves of the suspicion of indirectness. This was, however, after the opening of the Oxford Movement.

ERSKINE AND CAMPBELL

The period from 1820 to 1850 was one of religious and intellectual activity in Scotland as well. Tulloch depicts with a Scotsman's patriotism the movement which centres about the names of Erskine and Campbell. Pfleiderer also judges that their contribution was as significant as any made to dogmatic

theology in Great Britain in the nineteenth century. They achieved the same reconstruction of the doctrine of salvation which had been effected by Kant and Schleiermacher. At their hands the doctrine was rescued from that forensic externality into which Calvinism had degenerated. It was given again its quality of ethical inwardness, and based directly upon religious experience. High Lutheranism had issued in the same externality in Germany before Kant and Schleiermacher, and the New England theology before Channing and Bushnell. The merits of Christ achieved an external salvation, of which a man became participant practically upon condition of assent to certain propositions. Similarly, in the Catholic revival, salvation was conceived as an external and future good, of which a man became participant through the sacraments applied to him by priests in apostolical succession. In point of externality there was not much to choose between views which were felt to be radically opposed the one to the other.

Erskine was not a man theologically educated. He led a peculiarly secluded life. He was an advocate by profession, but, withdrawing from that career, virtually gave himself up to meditation. Campbell was a minister of the Established Church of Scotland in a remote village, Row, upon the Gare Loch. When he was convicted of heresy and driven from the ministry, he also devoted himself to study and authorship. Both men seem to have come to their results largely from the application of their own sound religious sense to the Scriptures. That the Scottish Church should have rejected the truth for which these men contended was the heaviest blow which it could have inflicted on itself. Thereby it arrested its own healthy development. It perpetuated its traditional view, somewhat as New England orthodoxy was given a new lease of life through the partisanship which the Unitarian schism engendered. The matter was not mended at the time of the great rupture of the Scottish Church in 1843. That body which broke away from the Establishment, and achieved a purely ecclesiastical control of its own clergy, won, indeed, by this means the name of the Free Church, though, in point of theological opinion, it was far from representing the more free and progressive element. Tulloch pays a beautiful tribute to the character of Erskine, whom he knew. Quiet, brooding, introspective, he read his Bible and his own soul, and with singular purity of intuition generalised from his own experience. Therewith is described, however, both the power and the limitation of his work. His first book was entitled *Remarks on the Internal Evidence for the Truth of Revealed Religion*, 1820. The title itself is suggestive of the revolution through which the mind both of Erskine and of his age was passing. His book, *The Unconditional Freeness of the Gospel*, appeared in 1828; *The Brazen Serpent* in 1831. Men have confounded forgiveness and pardon. They have made pardon equivalent to salvation. But salvation is character. Forgiveness is only one of the means of it. Salvation is not a future good. It is a present fellowship with God. It is sanctification of character by means of our labour and God's love. The fall was the rise of the spirit of freedom. Fallen man can never be saved except through glad surrender of his childish independence to the truth and goodness of God. Yet that surrender is the preservation and enlargement of our independence. It is the secret of true self-realisation. The sufferings of Christ reveal God's holy love. It is not as if God's love had been purchased by the sufferings of his Son. On the contrary, it is man who needs to believe in God's love, and so be reconciled to the God whom he has feared and hated. Christ overcomes sin by obediently enduring the suffering which sin naturally entails. He endures it in pure love of his brethren. Man must overcome sin in the same way.

Campbell published, so late as 1856, his great work *The Nature of the Atonement and its Relation to the Remission of Sins and Eternal Life*. It was the matured result of the reflections of a quarter of a century, spent partly in enforced retirement after 1831. Campbell maintains unequivocally that the sacrifice of Christ cannot be understood as a punishment due to man's sin, meted out to Christ in man's stead. Viewed retrospectively, Christ's work in the atonement is but the highest example of a law otherwise universally operative. No man can work redemption for his fellows except by entering into their condition, as if everything in that condition were his own, though much of it may be in no sense his due. It is freely borne by him because of his identification of himself with them. Campbell lingers in the

myth of Christ's being the federal head of the humanity. There is something pathetic in the struggle of his mind to save phrases and the paraphernalia of an ancient view which, however, his fundamental principle rendered obsolete, He struggles to save the word satisfaction, though it means nothing in his system save that God is satisfied as he contemplates the character of Christ. Prospectively considered, the sacrifice of Christ effects salvation by its moral power over men in example and inspiration. Vicarious sacrifice, the result of which was merely imputed, would leave the sinner just where he was before. It is an empty fiction. But the spectacle of suffering freely undertaken for our sakes discovers the treasures of the divine image in man. The love of God and a man's own resolve make him in the end, in fact, that which he has always been in capacity and destiny, a child of God, possessed of the secret of a growing righteousness, which is itself salvation.

MAURICE

Scottish books seem to have been but little read in England in that day. It was Maurice who first made the substance of Campbell's teaching known in England. Frederick Denison Maurice was the son of a Unitarian minister, educated at Trinity College, Cambridge, at a time when it was impossible for a Nonconformist to obtain a degree. He was ordained a priest of the Church of England in 1834, even suffering himself to be baptised again. He was chaplain of Lincoln's Inn and Professor of Theology in King's College, London. After 1866 he was Professor of Moral Philosophy in Cambridge, though his life-work was over. At the heart of Maurice's theology lies the contention to which he gave the name of universal redemption. Christ's work is for every man. Every man is indeed in Christ. Man's unhappiness lies only in the fact that he will not own this fact and live accordingly. Man as man is the child of God. He cannot undo that fact or alter that relation if he would. He does not need to become a child of God, as the phrase has been. He needs only to recognise that he already is such a child. He can never cease to bear this relationship. He can only refuse to fulfil it. With other words Erskine and Coleridge and Schleiermacher had said this same thing.

For the rest, one may speak briefly of Maurice. He was animated by the strongest desire for Church unity, but at the back of his mind lay a conception of the Church and an insistence upon uniformity which made unity impossible. In the light of his own inheritance his ecclesiastical positivism seems strange. Perhaps it was the course of his experience which made this irrational positivism natural. Few men in his generation suffered greater persecutions under the unwarranted supposition on the part of contemporaries that he had a liberal mind. In reality, few men in his generation had less of a quality which, had he possessed it, would have given him peace and joy even in the midst of his persecutions. The casual remark above made concerning Campbell is true in enhanced degree of Maurice. A large part of the industry of a very industrious life was devoted to the effort to convince others and himself that those few really wonderful glimpses of spiritual truth which he had, had no disastrous consequences for an inherited system of thought in which they certainly did not take their rise. His name was connected with the social enthusiasm that inaugurated a new movement in England which will claim attention in another paragraph.

CHANNING

Allusion has been made to a revision of traditional theology which took place in America also, upon the same general lines which we have seen in Schleiermacher and in Campbell. The typical figure here, the protagonist of the movement, is William Ellery Channing. It may be doubted whether there has ever been a civilisation more completely controlled by its Church and ministers, or a culture more entirely dominated by theology, than were those of New England until the middle of the eighteenth century. There had been indeed a marked decline in religious life. The history of the Great Awakening shows that. Remonstrances

against the Great Awakening show also how men's minds were moving away from the theory of the universe which the theology of that movement implied. One cannot say that in the preaching of Hopkins there is an appreciable relaxation of the Edwardsian scheme. Interestingly enough, it was in Newport that Channing was born and with Hopkins that he associated until the time of his licensure to preach in 1802. Many thought that Channing would stand with the most stringent of the orthodox. Deism and rationalism had made themselves felt in America after the Revolution. Channing, during his years in Harvard College, can hardly have failed to come into contact with the criticism of religion from this side. There is no such clear influence of current rationalism upon Channing as, for example, upon Schleiermacher. Yet here in the West, which most Europeans thought of as a wilderness, circumstances brought about the launching of this man upon the career of a liberal religious thinker, when as yet Schleiermacher had hardly advanced beyond the position of the *Discourses*, when Erskine had not yet written a line and Campbell was still a child. Channing became minister of the Federal Street Church in Boston in 1803. The appointment of Ware as Hollis Professor of Divinity in Harvard College took place in 1805. That appointment was the first clear indication of the liberal party's strength. Channing's Baltimore Address was delivered in 1819. He died in 1847.

In the schism among the Congregational Churches in New England, which before 1819 apparently had come to be regarded by both parties as remediless, Channing took the side of the opposition to Calvinistic orthodoxy. He developed qualities as controversialist and leader which the gentler aspect of his early years had hardly led men to suspect. This American liberal movement had been referred to by Belsham as related to English Unitarianism. After 1815, in this country, by its opponents at least, the movement was consistently called Unitarian. Channing did with zeal contend against the traditional doctrine of the atonement and of the trinity. On the other hand, he saw in Christ the perfect revelation of God to humanity and at the same time the ideal of humanity. He believed in Jesus' sinlessness and in his miracles, especially in his resurrection. The keynote of Channing's character and convictions is found in his sense of the inherent greatness of man. Of this feeling his entire system is but the unfolding. It was early and deliberately adopted by him as a fundamental faith. It remained the immovable centre of his reverence and trust amid all the inroads of doubt and sorrow. Political interest was as natural to Channing's earlier manhood as it had been to Fichte in the emergency of the Fatherland. Similarly, in the later years of his life, when evils connected with slavery had made themselves felt, his participation in the abolitionist agitation showed the same enthusiasm and practical bent. He had his dream of communism, his perception of the evils of our industrial system, his contempt for charity in place of economic remedy. All was for man, all rested upon supreme faith in man. That man is endowed with knowledge of the right and with the power to realise it, was a fundamental maxim. Hence arose Channing's assertion of free-will. The denial of free-will renders the sentiment of duty but illusory. In the conscience there is both a revelation and a type of God. Its suggestions, by the very authority they carry with them, declare themselves to be God's law. God, concurring with our highest nature, present in its action, can be thought of only after the pattern which he gives us in ourselves. Whatever revelation God makes of himself, he must deal with us as with free beings living under natural laws. Revelation must be merely supplementary to those laws. Everything arbitrary and magical, everything which despairs of us or insults us as moral agents, everything which does not address itself to us through reason and conscience, must be excluded from the intercourse between God and man. What the doctrines of salvation and atonement, of the person of Christ and of the influence of the Holy Spirit, as construed from this centre would be, may without difficulty be surmised. The whole of Channing's teaching is bathed in an atmosphere of the reverent love of God which is the very source of his enthusiasm for man.

BUSHNELL

A very different man was Horace Bushnell, born in the year of Channing's licensure, 1802. He was not bred under the influence of the strict Calvinism of his day. His father was an Arminian. Edwards had made Arminians detested in New England. His mother had been reared in the Episcopal Church. She was of Huguenot origin. When about seventeen, while tending a carding-machine, he wrote a paper in which he endeavoured to bring Calvinism into logical coherence and, in the interest of sound reason, to correct St. Paul's willingness to be accursed for the sake of his brethren. He graduated from Yale College in 1827. He taught there while studying law after 1829. He describes himself at this period as sound in ethics and sceptical in religion, the soundness of his morals being due to nature and training, the scepticism, to the theology in which he was involved. His law studies were complete, yet he turned to the ministry. He had been born on the orthodox side of the great contention in which Channing was a leader of the liberals in the days of which we speak. He never saw any reason to change this relation. His clerical colleagues, for half a life-time, sought to change it for him. In 1833 he was ordained and installed as minister of the North Church in Hartford, a pastorate which he never left. The process of disintegration of the orthodox body was continuing. There was almost as much rancour between the old and the new orthodoxy as between orthodox and Unitarians themselves. Almost before his career was well begun an incurable disease fastened itself upon him. Not much later, all the severity of theological strife befell him. Between these two we have to think of him doing his work and keeping his sense of humour.

His earliest book of consequence was on *Christian Nurture*, published in 1846. Consistent Calvinism presupposes in its converts mature years. Even an adult must pass through waters deep for him. He is not a sinful child of the Father. He is a being totally depraved and damned to everlasting punishment. God becomes his Father only after he is redeemed. The revivalists' theory Bushnell bitterly opposed. It made of religion a transcendental matter which belonged on the outside of life, a kind of miraculous epidemic. He repudiated the prevailing individualism. He anticipated much that is now being said concerning heredity, environment and subconsciousness. He revived the sense of the Church in which Puritanism had been so sadly lacking. The book is a classic, one of the rich treasures which the nineteenth century offers to the twentieth.

Bushnell, so far as one can judge, had no knowledge of Kant. He is, nevertheless, dealing with Kant's own problem, of the theory of knowledge, in his rather diffuse 'Dissertation on Language,' which is prefixed to the volume which bears the title *God in Christ*, 1849. He was following his living principle, the reference of doctrine to conscience. God must be a 'right God.' Dogma must make no assertion concerning God which will not stand this test. Not alone does the dogma make such assertions. The Scripture makes them as well. How can this be? What is the relation of language to thought and of thought to fact? How can the language of Scripture be explained, and yet the reality of the revelation not be explained away? There is a touching interest which attaches to this Hartford minister, working out, alone and clumsily, a problem the solution of which the greatest minds of the age had been gradually bringing to perfection for three-quarters of a century.

In the year 1848 Bushnell was invited to give addresses at the Commencements of three divinity schools: that at Harvard, then unqualifiedly Unitarian; that at Andover, where the battle with Unitarianism had been fought; and that at Yale, where Bushnell had been trained. The address at Cambridge was on the subject of *the Atonement*; the one at New Haven on *the Divinity of Christ*, including Bushnell's doctrine of the trinity; the one at Andover on *Dogma and Spirit*, a plea for the cessation of strife. He says squarely of the old school theories of the atonement, which represent Christ as suffering the penalty of the law in our stead: 'They are capable, one and all of them, of no light in which they do not offend some right sentiment of our moral being. If the great Redeemer, in the excess of his goodness, consents to receive the penal woes of the world in his person, and if that offer is accepted, what does it signify, save that God will have his modicum of suffering somehow; and if he lets the guilty go he will yet satisfy himself out of the innocent?' The vicariousness of love, the identification of the sufferer with the sinner, in the sense that

the Saviour is involved by his desire to help us in the woes which naturally follow sin, this Bushnell mightily affirmed. Yet there is no pretence that he used vicariousness or satisfaction in the same sense in which his adversaries did. He is magnificently free from all such indirection. In the New Haven address there is this same combination of fire and light. The chief theological value of the doctrine of the trinity, as maintained by the New England Calvinistic teachers, had been to furnish the *dramatis personæ* for the doctrine of the atonement. In the speculation as to the negotiation of this substitutionary transaction, the language of the theologians had degenerated into stark tritheism. Edwards, describing the councils of the trinity, spoke of the three persons as 'they.' Bushnell saw that any proper view of the unity of God made the forensic idea of the atonement incredible. He sought to replace the ontological notion of the trinity by that of a trinity of revelation, which held for him the practical truths by which his faith was nourished, and yet avoided the contradictions which the other doctrine presented both to reason and faith. Bushnell would have been far from claiming that he was the first to make this fight. The American Unitarians had been making it for more than a generation. The Unitarian protest was wholesome. It was magnificent. It was providential, but it paused in negation. It never advanced to construction. Bushnell's significance is not that he fought this battle, but that he fought it from the ranks of the orthodox Church. He fought it with a personal equipment which Channing had not had. He was decades later in his work. He took up the central religious problem when Channing's successors were following either Emerson or Parker.

The Andover address consisted in the statement of Bushnell's views of the causes which had led to the schism in the New England Church. A single quotation may give the key-note of the discourse:— 'We had on our side an article of the creed which asserted a metaphysical trinity. That made the assertion of the metaphysical unity inevitable and desirable. We had theories of atonement, of depravity, of original sin, which required the appearance of antagonistic theories. On our side, theological culture was so limited that we took what was really only our own opinion for the unalterable truth of God. On the other side, it was so limited that men, perceiving the insufficiency of dogma, took the opposite contention with the same seriousness and totality of conviction. They asserted liberty, as indeed they must, to vindicate their revolt. They produced, meantime, the most intensely human and, in that sense, the most intensely opinionated religion ever invented.'

THE CATHOLIC REVIVAL

The Oxford Movement has been spoken of as a reaction against the so-called Oriel Movement, a conservative tendency over against an intellectualist and progressive one. In a measure the personal animosities within the Oxford circle may be accounted for in this way. The Tractarian Movement, however, which issued, on the one hand, in the going over of Newman to the Church of Rome and, on the other, in a great revival of Catholic principles within the Anglican Church itself, stands in a far larger setting. It was not merely an English or insular movement. It was a wave from a continental flood. On its own showing it was not merely an ecclesiastical movement. It had political and social aims as well. There was a universal European reaction against the Enlightenment and the Revolution. That reaction was not simple, but complex. It was a revolt of the conservative spirit from the new ideals which had been suddenly translated into portentous realities. It was marked everywhere by hatred of the eighteenth century with all its ways and works. On the one side we have the revolutionary thesis, the rights of man, the authority of reason, the watchwords liberty, equality, fraternity. On the other side stood forth those who were prepared to assert the meaning of community, the continuity of history, spiritual as well as civil authority as the basis of order, and order as the condition of the highest good. In literature the tendency appears as romanticism, in politics as legitimism, in religion as ultramontanism. Le Maistre with his *L'Eglise gallicane du Pape*; Chateaubriand with his *Génie du Christianisme*; Lamennais with his *Essai sur l'Indifference en Matière, de Religion*, were, from 1820 to 1860, the exponents of a view which has

had prodigious consequences for France and Italy. The romantic movement arose outside of Catholicism. It was impersonated in Herder. Friedrich Schlegel, Werner and others went over to the Roman Church. The political reaction was specifically Latin and Catholic. In the lurid light of anarchy Rome seemed to have a mission again. Divine right in the State must be restored through the Church. The Catholic apologetic saw the Revolution as only the logical conclusion of the premises of the Reformation. The religious revolt of the sixteenth century, the philosophical revolt of the seventeenth, the political revolt of the eighteenth, the social revolt of the nineteenth, are all parts of one dreadful sequence. As the Church lifted up the world after the first flood of the barbarians, so must she again lift up the world after the devastations made by the more terrible barbarians of the eighteenth century. England had indeed stood a little outside of the cyclone which had devastated the world from Coronna to Moscow and from the Channel to the Pyramids, but she had been exhausted in putting down the revolution. Only God's goodness had preserved England. The logic of Puritanism would have been the same. Indeed, in England the State was weaker and worse than were the states upon the Continent. For since 1688 it had been a popular and constitutional monarchy. In Frederick William's phrase, its sovereign took his crown from the gutter. The Church was through and through Erastian, a creature of the State. Bishops were made by party representatives. Acts like the Reform Bills, the course of the Government in the matter of the Irish Church, were steps which would surely bring England to the pass which France had reached in 1789. The source of such acts was wrong. It was with the people. It was in men, not in God. It was in reason, not in authority. It would be difficult to overstate the strength of this reactionary sentiment in important circles in England at the end of the third decade of the nineteenth century.

THE OXFORD MOVEMENT

In so far as that complex of causes just alluded to made of the Oxford Movement or the Catholic revival a movement of life, ecclesiastical, social and political as well, its history falls outside the purpose of this book. We proposed to deal with the history of thought. Reactionary movements have frequently got on without much thought. They have left little deposit of their own in the realm of ideas. Their avowed principle has been that of recurrence to that which has already been thought, of fidelity to ideas which have long prevailed. This is the reason why the conservatives have not a large place in such a sketch as this. It is not that their writings have not often been full of high learning and of the subtlest of reasoning. It is only that the ideas about which they reason do not belong to the history of the nineteenth century. They belong, on the earnest contention of the conservatives themselves — those of Protestants, to the history of the Reformation — and of Catholics, both Anglican and Roman, to the history of the early or mediæval Church.

Nevertheless, when with passionate conviction a great man, taking the reactionary course, thinks the problem through again from his own point of view, then we have a real phenomenon in the history of contemporary thought. When such an one wrestles before God to give reason to himself and to his fellows for the faith that is in him, then the reactionary's reasoning is as imposing and suggestive as is any other. He leaves in his work an intellectual deposit which must be considered. He makes a contribution which must be reckoned with, even more seriously, perhaps, by those who dissent from it than by those who may agree with it. Such deposit Newman and the Tractarian movement certainly did make. They offered a rationale of the reaction. They gave to the Catholic revival a standing in the world of ideas, not merely in the world of action. Whether their reasoning has weight to-day, is a question upon which opinion is divided. Yet Newman and his compeers, by their character and standing, by their distinctively English qualities and by the road of reason which they took in the defence of Catholic principles, made Catholicism English again, in a sense in which it had not been English for three hundred years. Yet though Newman brought to the Roman Church in England, on his conversion to it, a prestige and qualities which

in that communion were unequalled, he was never *persona grata* in that Church. Outwardly the Roman Catholic revival in England was not in large measure due to Newman and his arguments. It was due far more to men like Wiseman and Manning, who were not men of argument but of deeds.

NEWMAN

John Henry Newman was born in 1801, the son of a London banker. His mother was of Huguenot descent. He came under Calvinistic influence. Through study especially, of Romaine *On Faith* he became the subject of an inward conversion, of which in 1864 he wrote: 'I am still more certain of it than that I have hands and feet.' Thomas Scott, the evangelical, moved him. Before he was sixteen he made a collection of Scripture texts in proof of the doctrine of the trinity. From Newton *On the Prophecies* he learned to identify the Pope with anti-Christ — a doctrine by which, he adds, his imagination was stained up to the year 1843. In his *Apologia*, 1865, he declares: 'From the age of fifteen, dogma has been a fundamental principle of my religion. I cannot enter into the idea of any other sort of religion.' At the age of twenty-one, two years after he had taken his degree, he came under very different influences. He passed from Trinity College to a fellowship in Oriel. To use his own phrase, he drifted in the direction of liberalism. He was touched by Whately. He was too logical, and also too dogmatic, to be satisfied with Whately's position. Of the years from 1823 to 1827 Mozley says: 'Probably no one who then knew Newman could have told which way he would go. It is not certain that he himself knew.' Francis W. Newman, Newman's brother, who later became a Unitarian, remembering his own years of stress, speaks with embitterment of his elder brother, who was profoundly uncongenial to him.

The year 1827, in which Keble's *Christian Year* was published, saw another change in Newman's views. Illness and bereavement came to him with awakening effect. He made the acquaintance of Hurrell Froude. Froude brought Newman and Keble together. Henceforth Newman bore no more traces either of evangelicalism or of liberalism. Of Froude it is difficult to speak with confidence. His brother, James Anthony Froude, the historian, author of the *Nemesis of Faith*, 1848, says that he was gifted, brilliant, enthusiastic. Newman speaks of him with almost boundless praise. Two volumes of his sermons, published after his death in 1836, make the impression neither of learning nor judgment. Clearly he had charm. Possibly he talked himself into a common-room reputation. Newman says: 'Froude made me look with admiration toward the Church of Rome.' Keble never had felt the liberalism through which Newman had passed. Cradled as the Church of England had been in Puritanism, the latter was to him simply evil. Opinions differing from his own were not simply mistaken, they were sinful. He conceived no religious truth outside the Church of England. In the *Christian Year* one perceives an influence which Newman strongly felt. It was that of the idea of the sacramental significance of all natural objects or events. Pusey became professor of Hebrew in 1830. He lent the movement academic standing, which the others could not give. He had been in Germany, and had published an *Inquiry into the Rationalist Character of German Theology*, 1825. He hardly did more than expose the ignorance of Rose. He was himself denounced as a German rationalist who dared to speak of a new era in theology. Pusey, mourning the defection of Newman, whom he deeply loved, gathered in 1846 the forces of the Anglo-Catholics and continued in some sense a leader to the end of his long life in 1882.

The course of political events was fretting the Conservatives intolerably. The agitation for the Reform Bill was taking shape. Sir Robert Peel, the member for Oxford, had introduced a Bill for the emancipation of the Roman Catholics. There was violent commotion in Oxford. Keble and Newman strenuously opposed the measure. In 1830 there was revolution in France. In England the Whigs had come into power. Newman's mind was excited in the last degree. 'The vital question,' he says, 'is this, how are we to keep the Church of England from being liberalised?' At the end of 1832 Newman and Froude went abroad together. On this journey, as he lay becalmed in the straits of Bonifacio, he wrote his immortal

hymn, ‘Lead, Kindly Light.’ He came home assured that he had a work to do. Keble’s Assize Sermon on the *National Apostasy*, preached in July 1833, on the Sunday after Newman’s return to Oxford, kindled the conflagration which had been long preparing. Newman conceived the idea of the *Tracts for the Times* as a means of expressing the feelings and propagating the opinions which deeply moved him. ‘From the first,’ he says, ‘my battle was with liberalism. By liberalism I mean the anti-dogmatic principle. Secondly, my aim was the assertion of the visible Church with sacraments and rites and definite religious teaching on the foundation of dogma; and thirdly, the assertion of the Anglican Church as opposed to the Church of Rome.’ Newman grew greatly in personal influence. His afternoon sermons at St. Mary’s exerted spiritual power. They deserved so to do. Here he was at his best. All of his strength and little of his weakness shows. His insight, his subtility, his pathos, his love of souls, his marvellous play of dramatic as well as of spiritual faculty, are in evidence. Keble and Pusey were busying themselves with the historical aspects of the question. Pusey began the *Library of the Fathers*, the most elaborate literary monument of the movement. Nothing could be more amazing than the uncritical quality of the whole performance. The first check to the movement came in 1838, when the Bishop of Oxford animadverted upon the *Tracts*. Newman professed his willingness to stop them. The Bishop did not insist. Newman’s own thought moved rapidly onward in the only course which was still open to it.

Newman had been bred in the deepest reverence for Scripture. In a sense that reverence never left him, though it changed its form. He saw that it was absurd to appeal to the Bible in the old way as an infallible source of doctrine. How could truth be infallibly conveyed in defective and fallible expressions? Newman’s own studies in criticism, by no means profound, led him to this correct conclusion. This was the end for him of evangelical Protestantism. The recourse was then to the infallible Church. Infallible guide and authority one must have. Without these there can be no religion. To trust to reason and conscience as conveying something of the light of God is impossible. To wait in patience and to labour in fortitude for the increase of that light is unendurable. One must have certainty. There can be no certainty by the processes of the mind from within. This can come only by miraculous certification from without.

According to Newman the authority of the Church should never have been impaired in the Reformation. Or rather, in his view of that movement, this authority, for truly Christian men, had never been impaired. The intellect is aggressive, capricious, untrustworthy. Its action in religious matters is corrosive, dissolving, sceptical. ‘Man’s energy of intellect must be smitten hard and thrown back by infallible authority, if religion is to be saved at all.’ Newman’s philosophy was utterly sceptical, although, unlike most absolute philosophical sceptics, he had a deep religious experience. The most complete secularist, in his negation of religion, does not differ from Newman in his low opinion of the value of the surmises of the mind as to the transcendental meaning of life and the world. He differs from Newman only in lacking that which to Newman was the most indefeasible thing which he had at all, namely, religious experience. Newman was the child of his age, though no one ever abused more fiercely the age of which he was the child. He supposed that he believed in religion on the basis of authority. Quite the contrary, he believed in religion because he had religion or, as he says, in a magnificent passage in one of his parochial sermons, because religion had him. His scepticism forbade him to recognise that this was the basis of his belief. His diremption of human nature was absolute. The soul was of God. The mind was of the devil. He dare not trust his own intellect concerning this inestimable treasure of his experience. He dare not trust intellect at all. He knew not whither it might lead him. The mind cannot be broken to the belief of a power above it. It must have its stiff neck bent to recognise its Creator.

His whole book, *The Grammar of Assent*, 1870, is pervaded by the intensest philosophical scepticism. Scepticism supplies its motives, determines its problems, necessitates its distinctions, rules over the succession and gradation of its arguments. The whole aim of the work is to withdraw religion and the proofs of it, from the region of reason into the realm of conscience and imagination, where the arguments which reign may satisfy personal experience without alleging objective validity or being able to bear the

criticism which tests it. Again, he is the perverse, unconscious child of the age which he curses. Had not Kant and Schleiermacher, Coleridge and Channing sought, does not Ritschl seek, to remove religion from the realm of metaphysics and to bring it within the realm of experience? They had, however, pursued the same end by different means. One is reminded of that saying of Gretchen concerning Mephistopheles: ‘He says the same thing with the pastor, only in different words.’ Newman says the same words, but means a different thing.

Assuming the reduction of religion to experience, in which Kant and Schleiermacher would have agreed, and asserting the worthlessness of mentality, which they would have denied, we are not surprised to hear Newman say that without Catholicism doubt is invincible. ‘The Church’s infallibility is the provision adopted by the mercy of the Creator to preserve religion in the world. Outside the Catholic Church all things tend to atheism. The Catholic Church is the one face to face antagonist, able to withstand and baffle the fierce energy of passion and the all-dissolving scepticism of the mind. I am a Catholic by virtue of my belief in God. If I should be asked why I believe in God, I should answer, because I believe in myself. I find it impossible to believe in myself, without believing also in the existence of him who lives as a personal, all-seeing, all-judging being in my conscience.’ These passages are mainly taken from the *Apologia*, written long after Newman had gone over to the Roman Church. They perfectly describe the attitude of his mind toward the Anglican Church, so long as he believed this, and not the Roman, to be the true Church. He had once thought that a man could hold a position midway between the Protestantism which he repudiated and the Romanism which he still resisted. He stayed in the *via media* so long as he could. But in 1839 he began to have doubts about the Anglican order of succession. The catholicity of Rome began to overshadow the apostolicity of Anglicanism. The Anglican formularies cannot be at variance with the teachings of the authoritative and universal Church. This is the problem which the last of the *Tracts*, *Tract Ninety*, sets itself. It is one of those which Newman wrote. One must find the sense of the Roman Church in the Thirty-Nine Articles. This tract is prefaced by an extraordinary disquisition upon reserve in the communication of religious knowledge. God’s revelations of himself to mankind have always been a kind of veil. Truth is the reward of holiness. The Fathers were holy men. Therefore what the Fathers said must be true. The principle of reserve the Articles illustrate. They do not mean what they say. They were written in an uncatholic age, that is, in the age of the Reformation. They were written by Catholic men. Else how can the Church of England be now a Catholic Church? Through their reserve they were acceptable in an uncatholic age. They cannot be uncatholic in spirit, else how should they be identical in meaning with the great Catholic creeds? Then follows an exposition of every important article of the thirty-nine, an effort to interpret each in the sense of the Roman Catholic Church of to-day. Four tutors published a protest against the tract. Formal censure was passed upon it. It was now evident to Newman that his place in the leadership of the Oxford Movement was gone. From this time, the spring of 1841, he says he was on his deathbed as regards the Church of England. He withdrew to Littlemore and established a brotherhood there. In the autumn of 1843 he resigned the parochial charge of St. Mary’s at Oxford. On the 9th of October 1845 he was formally admitted to the Roman Church. On the 6th of October Ernest Renan had formally severed his connexion with that Church.

It is a strange thing that in his *Essay on the Development of Christian Doctrine*, written in 1845, Newman himself should have advanced substantially Hampden’s contention. Here are written many things concerning the development of doctrine which commend themselves to minds conversant with the application of historical criticism to the whole dogmatic structure of the Christian ages. The purpose is with Newman entirely polemical, the issue exactly that which one would not have foreseen. Precisely because the development of doctrine is so obvious, because no historical point can be found at which the growth of doctrine ceased and the rule of faith was once for all settled, therefore an infallible authority outside of the development must have existed from the beginning, to provide a means of distinguishing true development from false. This infallible guide is, of course, the Church. It seems incredible that

Newman could escape applying to the Church the same argument which he had so skilfully applied to Scripture and dogmatic history. Similar is the case with the argument of the *Grammar of Assent*. ‘No man is certain of a truth who can endure the thought of its contrary.’ If the reason why I cannot endure the thought of the contradictory of a belief which I have made my own, is that so to think brings me pain and darkness, this does not prove my truth. If my belief ever had its origin in reason, it must be ever refutable by reason. It is not corroborated by the fact that I do not wish to see anything that would refute it. This last fact may be in the highest degree an act of arbitrariness. To make the impossibility of thinking the opposite, the test of truth, and then to shut one’s eyes to those evidences which might compel one to think the opposite, is the essence of irrationality. One attains by this method indefinite assertiveness, but not certainty. Newman lived in some seclusion in the Oratory of St. Philip Neri in Birmingham for many years. A few distinguished men, and a number of his followers, in all not more than a hundred and fifty, went over to the Roman Church after him. The defection was never so great as, in the first shock, it was supposed that it would be. The outward influence of Newman upon the Anglican Church then ceased. But the ideas which he put forth have certainly been of great influence in that Church to this day. Most men know the portrait of the great cardinal, the wide forehead, ploughed deep with horizontal furrows, the pale cheek, down which ‘long lines of shadow slope, which years and anxious thought and suffering give.’ One looks into the wonderful face of those last days — Newman lived to his ninetieth year — and wonders if he found in the infallible Church the peace which he so earnestly sought.

Fairbairn, *Catholicism, Roman and Anglican*, .

MODERNISM

It was said that the Oxford Movement furnished the rationale of the reaction. Many causes, of course, combine to make the situation of the Roman Church and the status of religion in the Latin countries of the Continent the lamentable one that it is. That position is worst in those countries where the Roman Church has most nearly had free play. The alienation both of the intellectual and civil life from organised religion is grave. That the Roman Church occupies in England to-day a position more favourable than in almost any nation on the Continent, and better than it occupied in England at the beginning of the nineteenth century, is due in large measure to the general influence of the movement with which we have been dealing. The Anglican Church was at the beginning of the nineteenth century preponderantly evangelical, low-church and conscious of itself as Protestant. At the beginning of the twentieth it is dominantly ritualistic and disposed to minimise its relation to the Reformation. This resurgence of Catholic principles is another effect of the movement of which we speak. Other factors must have wrought for this result besides the body of arguments which Newman and his compeers offered. The argument itself, the mere intellectual factor, is not adequate. There is an inherent contradiction in the effort to ground in reason an authority which is to take the place of reason. Yet round and round this circle all the labours of John Henry Newman go. Cardinal Manning felt this. The victory of the Church was not to be won by argument. It is well known that Newman opposed the decree of infallibility. It cannot be said that upon this point his arguments had great weight. If one assumes that truth comes to us externally through representatives of God, and if the truth is that which they assert, then in the last analysis what they assert is truth. If one has given in to such authority because one distrusts his reason, then it is querulous to complain that the deliverances of authority do not comport with reason. There may be, of course, the greatest interest in the struggle as to the instance in which this authority is to be lodged. This interest attaches to the age-long struggle between Pope and Council. It attaches to the dramatic struggle of Döllinger, Dupanloup, Lord Acton and the rest, in 1870. Once the Church has spoken there is, for the advocate of authoritative religion, no logic but to submit.

Similarly as to the *Encyclical* and *Syllabus of Errors* of 1864, which forecast the present conflict concerning Modernism. The *Syllabus* had a different atmosphere from that which any Englishman in the sixties would have given it. Had not Newman, however, made passionate warfare on the liberalism of the modern world? Was it not merely a question of degrees? Was Gladstone's attitude intelligible? The contrast of two principles in life and religion, the principles of authority and of the spirit, is being brought home to men's consciousness as it has never been before. One reads *Il Santo* and learns concerning the death of Fogazzaro, one looks into the literature relating to Tyrrell, one sees the fate of Loisy, comparing the really majestic achievement in his works and the spirit of his *Simple Reflections* with the *Encyclical Pascendi*, 1907. One understands why these men have done what they could to remain within the Roman Church. One recalls the attitude of Döllinger to the inauguration of the Old Catholic Movement, reflects upon the relative futility of the Old Catholic Church, and upon the position of Hyacinthe Loyson. One appreciates the feeling of these men that it is impossible, from without, to influence as they would the Church which they have loved. The present difficulty of influencing it from within seems almost insuperable. The history of Modernism as an effective contention in the world of Christian thought seems scarcely begun. The opposition to Modernism is not yet a part of the history of thought.

ROBERTSON

In no life are reflected more perfectly the spiritual conflicts of the fifth decade of the nineteenth century than in that of Frederick W. Robertson. No mind worked itself more triumphantly out of these difficulties. Descended from a family of Scottish soldiers, evangelical in piety, a student in Oxford in 1837, repelled by the Oxford Movement, he undertook his ministry under a morbid sense of responsibility. He reacted violently against his evangelicalism. He travelled abroad, read enormously, was plunged into an agony which threatened mentally to undo him. He took his charge at Brighton in 1847, still only thirty-one years old, and at once shone forth in the splendour of his genius. A martyr to disease and petty persecution, dying at thirty-seven, he yet left the impress of one of the greatest preachers whom the Church of England has produced. He left no formal literary work such as he had designed. Of his sermons we have almost none from his own manuscripts. Yet his influence is to-day almost as intense as when the sermons were delivered. It is, before all, the wealth and depth of his thought, the reality of the content of the sermons, which commands admiration. They are a classic refutation of the remark that one cannot preach theology. Out of them, even in their fragmentary state, a well-articulated system might be made. He brought to his age the living message of a man upon whom the best light of his age had shone.

PHILLIPS BROOKS

Something of the same sort may be said concerning Phillips Brooks. He inherited on his father's side the sober rationalism and the humane and secular interest of the earlier Unitarianism, on his mother's side the intensity of evangelical pietism with the Calvinistic form of thought. The conflict of these opposing tendencies in New England was at that time so great that Brooks's parents sought refuge with the low-church element in the Episcopal Church. Brooks's education at Harvard College, where he took his degree in 1855, as also at Alexandria, and still more, his reading and experience, made him sympathetic with that which, in England in those years, was called the Broad Church party. He was deeply influenced by Campbell and Maurice. Later well known in England, he was the compeer of the best spirits of his generation there. Deepened by the experience of the great war, he held in succession two pulpits of large influence, dying as Bishop of Massachusetts in 1893. There is a theological note about his preaching, as in the case of Robertson. Often it is the same note. Brooks had passed through no such crisis as had

Robertson. He had flowered into the greatness of rational belief. His sermons are a contribution to the thinking of his age. We have much finished material of this kind from his own hand, and a book or two besides. His service through many years as preacher to his university was of inestimable worth. The presentation of ever-advancing thought to a great public constituency is one of the most difficult of tasks. It is also one of the most necessary. The fusion of such thoughtfulness with spiritual impulse has rarely been more perfectly achieved than in the preaching of Phillips Brooks.

THE BROAD CHURCH

We have used the phrase, the Broad Church party. Stanley had employed the adjective to describe the real character of the English Church, over against the antithesis of the Low Church and the High. The designation adhered to a group of which Stanley was himself a type. They were not bound together in a party. They had no ecclesiastical end in view. They were of a common spirit. It was not the spirit of evangelicalism. Still less was it that of the Tractarians. It was that which Robertson had manifested. It aimed to hold the faith with an open mind in all the intellectual movement of the age. Maurice should be enumerated here, with reservations. Kingsley beyond question belonged to this group. There was great ardour among them for the improvement of social conditions, a sense of the social mission of Christianity. There grew up what was called a Christian Socialist movement, which, however, never attained or sought a political standing. The Broad Church movement seemed, at one time, assured of ascendancy in the Church of England. Its aims appeared congruous with the spirit of the times. Yet Dean Fremantle esteems himself perhaps the last survivor of an illustrious company.

The men who in 1860 published the volume known as *Essays and Reviews* would be classed with the Broad Church. In its authorship were associated seven scholars, mostly Oxford men. Some one described *Essays and Reviews* as the *Tract Ninety* of the Broad Church. It stirred public sentiment and brought the authors into conflict with authority in a somewhat similar way. The living antagonism of the Broad Church was surely with the Tractarians rather than with the evangelicals. Yet the most significant of the essays, those on miracles and on prophecy, touched opinions common to both these groups. Jowett, later Master of Balliol, contributed an essay on the ‘Interpretation of Scripture.’ It hardly belongs to Jowett’s best work. Yet the controversy then precipitated may have had to do with Jowett’s adherence to Platonic studies instead of his devoting himself to theology. The most decisive of the papers was that of Baden Powell on the ‘Study of the Evidences of Christianity.’ It was mainly a discussion of the miracle. It was radical and conclusive. The essay closes with an allusion to Darwin’s *Origin of Species*, which had then just appeared. Baden Powell died shortly after its publication. The fight came on Rowland Williams’s paper upon Bunson’s *Biblical Researches*. It was really upon the prophecies and their use in ‘Christian Evidences.’ Baron Bunsen was not a great archæologist, but he brought to the attention of English readers that which was being done in Germany in this field. Williams used the archæological material to rectify the current theological notions concerning ancient history. A certain type of English mind has always shown zeal for the interpretation of prophecy. Williams’s thesis, briefly put, was this: the Bible does not always give the history of the past with accuracy; it does not give the history of the future at all; prophecy means spiritual teaching, not secular prognostication. A reader of our day may naturally feel that Wilson, with his paper on the ‘National Church,’ made the greatest contribution. He built indeed upon Coleridge, but he had a larger horizon. He knew the arguments of the great Frenchmen of his day and of their English imitators who, in Benn’s phrase, narrowed and perverted the ideal of a world-wide humanity into that of a Church founded on dogmas and administered by clericals. Wilson argued that in Jesus’ teaching the basis of the religious community is ethical. The Church is but the instrument for carrying out the will of God as manifest in the moral law. The realisation of the will of God must extend beyond the limits of the Church’s activity, however widely these are drawn. There arose a violent agitation. Williams and Wilson were

prosecuted. The case was tried in the Court of Arches. Williams was defended by no less a person than Fitzjames Stephen. The two divines were sentenced to a year's suspension. This decision was reversed by the Lord Chancellor. Fitzjames Stephen had argued that if the men most interested in the church, namely, its clergy, are the only men who may be punished for serious discussion of the facts and truths of religion, then respect on the part of the world for the Church is at an end. By this discussion the English clergy, even if Anglo-Catholic, are in a very different position from the Roman priests, over whom encyclicals, even if not executed, are always suspended.

Similar was the issue in the case of Colenso, Bishop of Natal. Equipped mainly with Cambridge mathematics added to purest self-devotion, he had been sent out as a missionary bishop. In the process of the translation of the Pentateuch for his Zulus, he had come to reflect upon the problem which the Old Testament presents. In a manner which is altogether marvellous he worked out critical conclusions parallel to those of Old Testament scholars on the Continent. He was never really an expert, but in his main contention he was right. He adhered to his opinion despite severe pressure and was not removed from the episcopate. With such guarantees it would be strange indeed if we could not say that biblical studies entered in Great Britain, as also in America, on a development in which scholars of these nations are not behind the best scholars of the world. The trials for heresy of Robertson Smith in Edinburgh and of Dr. Briggs in New York have now little living interest. Yet biblical studies in Scotland and America were incalculably furthered by those discussions. The publication of a book like *Supernatural Religion*, 1872, illustrates a proclivity not uncommon in self-conscious liberal circles, for taking up a contention just when those who made it and have lived with it have decided to lay it down. However, the names of Hatch and Lightfoot alone, not to mention the living, are sufficient to warrant the assertions above made.

More than once in these chapters we have spoken of the service rendered to the progress of Christian thought by the criticism and interpretation of religion at the hands of literary men. That country and age may be esteemed fortunate in which religion occupies a place such that it compels the attention of men of genius. In the history of culture this has by no means always been the case. That these men do not always speak the language of edification is of minor consequence. What is of infinite worth is that the largest minds of the generation shall engage themselves with the topic of religion. A history of thought concerning Christianity cannot but reckon with the opinions, for example, of Carlyle, of Emerson, of Matthew Arnold — to mention only types.

CARLYLE

Carlyle has pictured for us his early home at Ecclefechan on the Border; his father, a stone mason of the highest character; his mother with her frugal, pious ways; the minister, from whom he learned Latin, 'the priestliest man I ever beheld in any ecclesiastical guise.' The picture of his mother never faded from his memory. Carlyle was destined for the Church. Such had been his mother's prayer. He took his arts course in Edinburgh. In the university, he says, 'there was much talk about progress of the species, dark ages, and the like, but the hungry young looked to their spiritual nurses and were bidden to eat the east wind.' He entered Divinity Hall, but already, in 1816, prohibitive doubts had arisen in his mind. Irving sought to help him. Irving was not the man for the task. The Christianity of the Church had become intellectually incredible to Carlyle. For a time he was acutely miserable, bordering upon despair. He has described his spiritual deliverance: 'Precisely that befel me which the Methodists call their conversion, the deliverance of their souls from the devil and the pit. There burst forth a sacred flame of joy in me.' With *Sartor Resartus* his message to the world began. It was printed in *Fraser's Magazine* in 1833, but not published separately until 1838. His difficulty in finding a publisher embittered him. Style had something to do with this, the newness of his message had more. Then for twenty years he poured forth his message. Never did

a man carry such a pair of eyes into the great world of London or set a more peremptory mark upon its notabilities. His best work was done before 1851. His later years were darkened with much misery of body. No one can allege that he ever had a happy mind.

He was a true prophet, but, Elijah-like, he seemed to himself to be alone. His derision of the current religion seems sometimes needless. Yet even that has the grand note of sincerity. What he desired he in no small measure achieved — that his readers should be arrested and feel themselves face to face with reality. His startling intuition, his intellectual uprightness, his grasp upon things as they are, his passion for what ought to be, made a great impression upon his age. It was in itself a religious influence. Here was a mind of giant force, of sternest truthfulness. His untruths were those of exaggeration. His injustices were those of prejudice. He invested many questions of a social and moral, of a political and religious sort with a nobler meaning than they had had before. His *French Revolution*, his papers on *Chartism*, his unceasing comment on the troubled life of the years from 1830 to 1865, are of highest moment for our understanding of the growth of that social feeling in the midst of which we live and work. In his brooding sympathy with the downtrodden he was a great inaugurator of the social movement. He felt the curse of an aristocratic society, yet no one has told us with more drastic truthfulness the evils of our democratic institutions. His word was a great corrective for much 'rose-water' optimism which prevailed in his day. The note of hope is, however, often lacking. The mythology of an absentee God had faded from him. Yet the God who was clear to his mature consciousness, clear as the sun in the heavens, was a God over the world, to judge it inexorably. Again, it is not difficult to accumulate evidence in his words which looks toward pantheism; but what one may call the religious benefit of pantheism, the sense that God is in his world, Carlyle often loses.

Materialism is to-day so deeply discredited that we find it difficult to realise that sixty years ago the problem wore a different look. Carlyle was never weary of pouring out the vials of his contempt on 'mud-philosophies' and exalting the spirit as against matter. Never was a man more opposed to the idea of a godless world, in which man is his own chief end, and his sensual pleasures the main aims of his existence. His insight into the consequences of our commercialism and luxury and absorption in the outward never fails. Man is God's son, but the effort to realise that sonship in the joy and trust of a devout heart and in the humble round of daily life sometimes seems to him cant or superstition. The humble life of godliness made an unspeakable appeal to him. He had known those who lived that life. His love for them was imperishable. Yet he had so recoiled from the superstitions and hypocrisies of others, the Eternal in his majesty was so ineffable, all effort to approach him so unworthy, that almost instinctively he would call upon the man who made the effort, to desist. So magnificent, all his life long, had been his protest against the credulity and stupidity of men, against beliefs which assert the impossible and blink the facts, that, for himself, the great objects of faith were held fast to, so to say, in their naked verity, with a giant's strength. They were half-querulously denied all garment and embodiment, lest he also should be found credulous and self-deceived. From this titan labouring at the foundations of the world, this Samson pulling down temples of the Philistines on his head, this cyclops heaving hills at ships as they pass by, it seems a long way to Emerson. Yet Emerson was Carlyle's friend.

EMERSON

Arnold said in one of his American addresses: 'Besides these voices — Newman, Carlyle, Goethe — there came to us in the Oxford of my youth a voice also from this side of the Atlantic, a clear and pure voice which, for my ear at any rate, brought a strain as new and moving and unforgetable as those others. Lowell has described the apparition of Emerson to your young generation here. He was your Newman, your man of soul and genius, speaking to your bodily ears, a present object for your heart and

imagination.’ Then he quotes as one of the most memorable passages in English speech: ‘Trust thyself. Accept the place which the divine providence has found for you, the society of your contemporaries, the connection of events. Great men have always done so, confiding themselves childlike to the genius of their age, betraying a perception which was stirring in their hearts, working through their hands, dominating their whole being.’ Arnold speaks of Carlyle’s grim insistence upon labour and righteousness but of his scorn of happiness, and then says: ‘But Emerson taught happiness in labour, in righteousness and veracity. In all the life of the spirit, happiness and eternal hope, that was Emerson’s gospel. By his conviction that in the life of the spirit is happiness, by his hope and expectation that this life of the spirit will more and more be understood and will prevail, by this Emerson was great.’

Seven of Emerson’s ancestors were ministers of New England churches. He inherited qualities of self-reliance, love of liberty, strenuous virtue, sincerity, sobriety and fearless loyalty to ideals. The form of his ideals was modified by the glow of transcendentalism which passed over parts of New England in the second quarter of the nineteenth century, but the spirit in which Emerson conceived the laws of life, reverenced them and lived them, was the Puritan spirit, only elevated, enlarged and beautified by the poetic temperament. Taking his degree from Harvard in 1821, despising school teaching, stirred by the passion for spiritual leadership, the ministry seemed to offer the fairest field for its satisfaction. In 1825 he entered the Divinity School in Harvard to prepare himself for the Unitarian ministry. In 1829 he became associate minister of the Second Unitarian Church in Boston. He arrived at the conviction that the Lord’s Supper was not intended by Jesus to be a permanent sacrament. He found his congregation, not unnaturally, reluctant to agree with him. He therefore retired from the pastoral office. He was always a preacher, though of a singular order. His task was to befriend and guide the inner life of man. The influences of this period in his life have been enumerated as the liberating philosophy of Coleridge, the mystical vision of Swedenborg, the intimate poetry of Wordsworth, the stimulating essays of Carlyle. His address before the graduating class of the Divinity School at Cambridge in 1838 was an impassioned protest against what he called the defects of historical Christianity, its undue reliance upon the personal authority of Jesus, its failure to explore the moral nature of man. He made a daring plea for absolute self-reliance and new inspiration in religion: ‘In the soul let redemption be sought. Refuse the good models, even those which are sacred in the imagination of men. Cast conformity behind you. Acquaint men at first hand with deity.’ He never could have been the power he was by the force of his negations. His power lay in the wealth, the variety, the beauty and insight with which he set forth the positive side of his doctrine of the greatness of man, of the presence of God in man, of the divineness of life, of God’s judgment and mercy in the order of the world. One sees both the power and the limitation of Emerson’s religious teaching. At the root of it lay a real philosophy. He could not philosophise. He was always passing from the principle to its application. He could not systematise. He speaks of his ‘formidable tendency to the lapidary style.’ Granting that one finds his philosophy in fragments, just as one finds his interpretation of religion in flashes of marvellous insight, both are worth searching for, and either, in Coleridge’s phrase, finds us, whether we search for it or not.

ARNOLD

What shall we say of Matthew Arnold himself? Without doubt the twenty years by which Arnold was Newman’s junior at Oxford made a great difference in the intellectual atmosphere of that place, and of the English world of letters, at the time when Arnold’s mind was maturing. He was not too late to feel the spell of Newman. His mind was hardly one to appreciate the whole force of that spell. He was at Oxford too early for the full understanding of the limits within which alone the scientific conception of the world can be said to be true. Arnold often boasted that he was no metaphysician. He really need never have mentioned the fact. The assumption that whatever is true can be verified in the sense of the precise kind of

verification which science implies is a very serious mistake. Yet his whole intellectual strength was devoted to the sustaining, one cannot say exactly the cause of religion, but certainly that of noble conduct, and to the assertion of the elation of duty and the joy of righteousness. With all the scorn that Arnold pours upon the trust which we place in God's love, he yet holds to the conviction that 'the power without ourselves which makes for righteousness' is one upon which we may in rapture rely.

Arnold had convinced himself that in an ago such as ours, which will take nothing for granted, but must verify everything, Christianity, in the old form of authoritative belief in supernatural beings and miraculous events, is no longer tenable. We must confine ourselves to such ethical truths as can be verified by experience. We must reject everything which goes beyond these. Religion has no more to do with supernatural dogma than with metaphysical philosophy. It has nothing to do with either. It has to do with conduct. It is folly to make religion depend upon the conviction of the existence of an intelligent and moral governor of the universe, as the theologians have done. For the object of faith in the ethical sense Arnold coined the phrase: 'The Eternal not ourselves which makes for righteousness.' So soon as we go beyond this, we enter upon the region of fanciful anthropomorphism, of extra belief, *aberglaube*, which always revenges itself. These are the main contentions of his book, *Literature and Dogma*, 1875.

One feels the value of Arnold's recall to the sense of the literary character of the Scriptural documents, as urged in his book, *Saint Paul and Protestantism*, 1870, and again to the sense of the influence which the imagination of mankind has had upon religion. One feels the truth of his assertion of our ignorance. One feels Arnold's own deep earnestness. It was his concern that reason and the will of God should prevail. Though he was primarily a literary man, yet his great interest was in religion. One feels so sincerely that his main conclusion is sound, that it is the more trying that his statement of it should be often so perverse and his method of sustaining it so precarious. It is quite certain that the idea of the Eternal not ourselves which makes for righteousness is far from being the clear idea which Arnold claims. It is far from being an idea derived from experience or verifiable in experience, in the sense which he asserts. It seems positively incredible that Arnold did not know that with this conception he passed the boundary of the realm of science and entered the realm of metaphysics, which he so abhorred.

He was the eldest son of Thomas Arnold of Rugby. He was educated at Winchester and Rugby and at Balliol College. He was Professor of Poetry in Oxford from 1857 to 1867. He was an inspector of schools. The years of his best literary labour were much taken up in ways which were wasteful of his rare powers. He came by literary intuition to an idea of Scripture which others had built up from the point of view of a theory of knowledge and by investigation of the facts. He is the helpless personification of a view of the relation of science and religion which has absolutely passed away. Yet Arnold died only in 1888. How much a distinguished inheritance may mean is gathered from the fact that a grand-daughter of Thomas Arnold and niece of Matthew Arnold, Mrs. Humphry Ward, in her novels, has dealt largely with problems of religious life, and more particularly of religious thoughtfulness. She has done for her generation, in her measure, that which George Eliot did for hers.

MARTINEAU

As the chapter and the book draw to their close we can think of no man whose life more nearly spanned the century, or whose work touched more fruitfully almost every aspect of Christian thoughtfulness than did that of James Martineau. We can think of no man who gathered into himself more fully the significant theological tendencies of the age, or whose utterance entitles him to be listened to more reverently as seer and saint. He was born in 1805. He was bred as an engineer. He fulfilled for years the calling of minister and preacher. He gradually exchanged this for the activity of a professor. He was a religious philosopher in the old sense, but he was also a critic and historian. His position with reference to the New Testament was partly antiquated before his *Seat of Authority in Religion*, 1890, made its appearance. Evolutionism

never became with him a coherent and consistent assumption. Ethics never altogether got rid of the innate ideas. The social movement left him almost untouched. Yet, despite all this, he was in some sense a representative progressive theologian of the century.

There is a parallel between Newman and Martineau. Both busied themselves with the problem of authority. Criticism had been fatal to the apprehension which both had inherited concerning the authority of Scripture. From that point onward they took divergent courses. The arguments which touched the infallible and oracular authority of Scripture, for Newman established that of the Church; for Martineau they had destroyed that of the Church four hundred years ago. Martineau's sense, even of the authority of Jesus, reverent as it is, is yet no pietistic and mystical view. The authority of Jesus is that of the truth which he speaks, of the goodness which dwells in him, of God himself and God alone. A real interest in the sciences and true learning in some of them made Martineau able to write that wonderful chapter in his *Seat of Authority*, which he entitled 'God in Nature.' Newman could see in nature, at most a sacramental suggestion, a symbol of transcendental truth.

The Martineaus came of old Huguenot stock, which in England belonged to the liberal Presbyterianism out of which much of British Unitarianism came. The righteousness of a persecuted race had left an austere impress upon their domestic and social life. Intellectually they inherited the advanced liberalism of their day. Harriet Martineau's earlier piety had been of the most fervent sort. She reacted violently against it in later years. She had little of the politic temper and gentleness of her brother. She described one of her own later works as the last word of philosophic atheism. James was, and always remained, of deepest sensitiveness and reverence and of a gentleness which stood in high contrast with his powers of conflict, if necessity arose. Out of Martineau's years as preacher in Liverpool and London came two books of rare devotional quality, *Endeavours after the Christian Life*, 1843 and 1847, and *Hours of Thought on Sacred Things*, 1873 and 1879. Almost all his life he was identified with Manchester College, as a student when the college was located at York, as a teacher when it returned to Manchester and again when it was removed to London. With its removal to Oxford, accomplished in 1889, he had not fully sympathised. He believed that the university itself must some day do justice to the education of men for the ministry in other churches than the Anglican. He was eighty years old when he published his *Types of Ethical Theory*, eighty-two when he gave to the world his *Study of Religion*, eighty-five when his *Seat of Authority* saw the light. The effect of this postponement of publication was not wholly good. The books represented marvellous learning and ripeness of reflection. But they belong to a period anterior to the dates they bear upon their title-pages. Martineau's education and his early professional experience put him in touch with the advancing sciences. In the days when most men of progressive spirit were carried off their feet, when materialism was flaunted in men's faces and the defence of religion was largely in the hands of those who knew nothing of the sciences, Martineau was not moved. He saw the end from the beginning. There is nothing finer in his latest work than his early essays— 'Nature and God,' 'Science, Nescience and Faith,' and 'Religion as affected by Modern Materialism.' He died in 1900 in his ninety-fifth year.

It is difficult to speak of the living in these pages. Personal relations enforce reserve and brevity. Nevertheless, no one can think of Manchester College and Martineau without being reminded of Mansfield College and of Fairbairn, a Scotchman, but of the Independent Church. He also was both teacher and preacher all his days, leader of the movement which brought Mansfield College from Birmingham to Oxford, by the confession both of Anglicans and of Non-conformists the most learned man in his subjects in the Oxford of his time, an historian, touched by the social enthusiasm, but a religious philosopher, *par excellence*. His *Religion and Modern Life*, 1894, his *Catholicism, Roman and Anglican*, 1899, his *Place of Christ in Modern Theology*, 1893, his *Philosophy of the Christian Religion*, 1902, and his *Studies in Religion and Theology*, 1910, indicate the wideness of his sympathies and the scope of the application, of his powers. If imitation is homage, grateful acknowledgment is here

made of rich spoil taken from his books.

Philosophy took a new turn in Britain after the middle of the decade of the sixties. It began to be conceded that Locke and Hume were dead. Had Mill really appreciated that fact he might have been a philosopher more fruitful and influential than he was. Sir William Hamilton was dead. Mansel's endeavour, out of agnosticism to conjure the most absurdly positivistic faith, had left thinking men more exposed to scepticism, if possible, than they had been before. When Hegel was thought in Germany to be obsolete, and everywhere the cry was 'back to Kant,' some Scotch and English scholars, the two Cairds and Seth Pringle-Pattison, with Thomas Hill Green, made a modified Hegelianism current in Great Britain. They led by this path in the introduction of their countrymen to later German idealism. By this introduction philosophy in both Britain and America has greatly gained. Despite these facts, John Caird's *Introduction to the Philosophy of Religion*, 1880, is still only a religious philosophy. It is not a philosophy of religion. His *Fundamental Ideas of Christianity*, 1896, hardly escapes the old antitheses among which theological discussion moved, say, thirty years ago. Edward Caird's *Critical Philosophy of Kant*, 1889, and especially his *Evolution of Religion*, 1892, marked the coming change more definitely than did any of the labours of his brother. Thomas Hill Green gave great promise in his *Introduction to Hume*, 1885, his *Prolegomena to Ethics*, 1883, and still more in essays and papers scattered through the volumes edited by Nettleship after Green's death. His contribution to religious discussion was such as to make his untimely end to be deeply deplored. Seth Pringle-Pattison's early work, *The Development from Kant to Hegel*, 1881, still has great worth. His *Hegelianism and Personality*, 1893, deals with one aspect of the topic which needs ever again to be explored, because of the psychological basis which in religious discussion is now assumed.

JAMES

The greatest contribution of America to religious discussion in recent years is surely William James's *Varieties of Religious Experience*, 1902. The book is unreservedly acknowledged in Britain, and in Germany as well, to be the best which we yet have upon the psychology of religion. Not only so, it gives a new intimation as to what psychology of religion means. It blazes a path along which investigators are eagerly following. Boyce, in his Phi Beta Kappa address at Harvard in 1911, declared James to be the third representative philosopher whom America has produced. He had the form of philosophy as Emerson never had. He could realise whither he was going, as Emerson in his intuitiveness never did. He criticised the dominant monism in most pregnant way. He recurred to the problems which dualism owned but could not solve. We cannot call the new scheme dualism. The world does not go back. Yet James made an over-confident generation feel that the centuries to which dualism had seemed reasonable were not so completely without intelligence as has been supposed by some. No philosophy may claim completeness as an interpretation of the universe. No more conclusive proof of this judgment could be asked than is given quite unintentionally in Haeckel's *Weltrãthsel*.

At no point is this recall more earnest than in James's dealing with the antithesis of good and evil. The reaction of the mind of the race, and primarily of individuals, upon the fact of evil, men's consciousness of evil in themselves, their desire to be rid of it, their belief that there is a deliverance from it and that they have found that deliverance, is for James the point of departure for the study of the actual phenomena and the active principle of religion. The truest psychological and philosophical instinct of the ago thus sets the experience of conversion in the centre of discussion. Apparently most men have, at some time and in some way, the consciousness of a capacity for God which is unfulfilled, of a relation to God unrealised, which is broken and resumed, or yet to be resumed. They have the sense that their own effort must contribute to this recovery. They have the sense also that something without themselves empowers them to attempt this recovery and to persevere in the attempt. The psychology of religion is thus put in the

forefront. The vast masses of material of this sort which the religious world, both past and present, possesses, have been either actually unexplored, or else set forth in ways which distorted and obscured the facts. The experience is the fact. The best science the world knows is now to deal with it as it would deal with any other fact. This is the epoch-making thing, the contribution to method in James's book. James was born in New York in 1842, the son of a Swedenborgian theologian. He took his medical degree at Harvard in 1870. He began to lecture there in anatomy in 1872 and became Professor of Philosophy in 1885. He was a Gifford and a Hibbert Lecturer. He died in 1910.

When James's thesis shall have been fully worked out, much supposed investigation of primitive religions, which is really nothing but imagination concerning primitive religions, will be shown in its true worthlessness. We know very little about primitive man. What we learn as to primitive man, on the side of his religion, we must learn in part from the psychology of the matured and civilised, the present living, thinking, feeling man in contact with his religion. Matured religion is not to be judged by the primitive, but the reverse. The real study of the history of religions, the study of the objective phenomena, from earliest to latest times, has its place. But the history of religions is perverted when it takes for fact in the life of primitive man that which never existed save in the imagination of twentieth century students. Early Christianity, on its inner and spiritual side, is to be judged by later Christianity, by present Christianity, by the Christian experience which we see and know to-day, and not conversely, as men have always claimed. The modern man is not to be converted after the pattern which it is alleged that his grandfather followed. For, first, there is the question as to whether his grandfather did conform to this pattern. And beyond that, it is safer to try to understand the experience of the grandfather, whom we do not know, by the psychology and experience of the grandson, whom we do know, with, of course, a judicious admixture of knowledge of the history of the nineteenth century, which would occasion characteristic differences. The modern saint is not asked to be a saint like Francis. In the first place, how do we know what Francis was like? In the second place, the experience of Francis may be most easily understood by the aid of modern experience of true revolt from worldliness and of consecration to self-sacrifice, as these exist among us, with, of course, the proper background furnished by the history of the thirteenth century. Souls are one. Our souls may be, at least in some measure, known to ourselves. Even the souls of some of our fellows may be measurably known to us. What are the facts of the religious experience? How do souls react in face of the eternal? The experience of religion, the experience of the fatherhood of God, of the sonship of man, of the moving of the spirit, is surely one experience. How did even Christ's great soul react, experience, work, will, and suffer? By what possible means can we ever know how he reacted, worked, willed, suffered? In the literature we learn only how men thought that he reacted. We must inquire of our own souls. To be sure, Christ belonged to the first century, and we live in the twentieth. It is possible for us to learn something of the first century and of the concrete outward conditions which caused his life to take the shape which it did. We learn this by strict historical research. Assuredly the supreme measure in which the spirit of all truth and goodness once took possession of the Nazarene, remains to us a mystery unfathomed and unfathomable. Dwelling in Jesus, that spirit made through him a revelation of the divine such as the world has never seen. Yet that mystery leads forth along the path of that which is intelligible. And, in another sense, even such religious experience as we ourselves may have, poor though it be and sadly limited, leads back into the same mystery.

It was with this contention that religion is a fact of the inner life of man, that it is to be understood through consciousness, that it is essentially and absolutely reasonable and yet belongs to the transcendental world, it was with this contention that, in the person of Immanuel Kant, the history of modern religious thought began. It is with this contention, in one of its newest and most far-reaching applications in the work of William James, that this history continues. For no one can think of the number of questions which recent years have raised, without realising that this history is by no means concluded. It is conceivable that the changes which the twentieth century will bring may be as noteworthy as those

which the nineteenth century has seen. At least we may be grateful that so great and sure a foundation has been laid.

NOTE ON THE REFUTATION OF IDEALISM

PREFACE

This book is an attempt to think out the nature and tenability of Kant's Transcendental Idealism, an attempt animated by the conviction that even the elucidation of Kant's meaning, apart from any criticism, is impossible without a discussion on their own merits of the main issues which he raises.

My obligations are many and great: to Caird's *Critical Philosophy of Kant* and to the translations of Meiklejohn, Max Müller, and Professor Mahaffy; to Mr. J. A. Smith, Fellow of Balliol College, and to Mr. H. W. B. Joseph, Fellow of New College, for what I have learned from them in discussion; to Mr. A. J. Jenkinson, Fellow of Brasenose College, for reading and commenting on the first half of the MS.; to Mr. H. H. Joachim, Fellow of Merton College, for making many important suggestions, especially with regard to matters of translation; to Mr. Joseph, for reading the whole of the proofs and for making many valuable corrections; and, above all, to my wife for constant and unfailing help throughout, and to Professor Cook Wilson, to have been whose pupil I count the greatest of philosophical good fortunes. Some years ago it was my privilege to be a member of a class with which Professor Cook Wilson read a portion of Kant's *Critique of Pure Reason*, and subsequently I have had the advantage of discussing with him several of the more important passages. I am especially indebted to him in my discussion of the following topics: the distinction between the Sensibility and the Understanding (p-31, 146-9, 162-6), the term 'form of perception' (p, 40, 133 fin.-135), the *Metaphysical Exposition of Space* (p-8), Inner Sense (Ch. V, and p-9), the *Metaphysical Deduction of the Categories* (p-53), Kant's account of 'the reference of representations to an object' (p-86), an implication of perspective (), the impossibility of a 'theory' of knowledge (), and the points considered, p med.-202 med., 214 med.-215 med., and 218. The views expressed in the pages referred to originated from Professor Cook Wilson, though it must not be assumed that he would accept them in the form in which they are there stated.

CHAPTER I. THE PROBLEM OF THE CRITIQUE

The problem of the *Critique* may be stated in outline and approximately in Kant's own words as follows.

Human reason is called upon to consider certain questions, which it cannot decline, as they are presented by its own nature, but which it cannot answer. These questions relate to God, freedom of the will, and immortality. And the name for the subject which has to deal with these questions is metaphysics. At one time metaphysics was regarded as the queen of all the sciences, and the importance of its aim justified the title. At first the subject, propounding as it did a dogmatic system, exercised a despotic sway. But its subsequent failure brought it into disrepute. It has constantly been compelled to retrace its steps; there has been fundamental disagreement among philosophers, and no philosopher has successfully refuted his critics. Consequently the current attitude to the subject is one of weariness and indifference. Yet humanity cannot really be indifferent to such problems; even those who profess indifference inevitably make metaphysical assertions; and the current attitude is a sign not of levity but of a refusal to put up with the illusory knowledge offered by contemporary philosophy. Now the objects of metaphysics, God, freedom, and immortality, are not objects of experience in the sense in which a tree or a stone is an object of experience. Hence our views about them cannot be due to experience; they must somehow be apprehended by pure reason, i. e. by thinking and without appeal to experience. Moreover, it is in fact by thinking that men have always tried to solve the problems concerning God, freedom, and immortality. What, then, is the cause of the unsatisfactory treatment of these problems and men's consequent indifference? It must, in some way, lie in a failure to attain the sure scientific method, and really consists in the neglect of an inquiry which should be a preliminary to all others in metaphysics. Men ought to have begun with a critical investigation of pure reason itself. Reason should have examined its own nature, to ascertain in general the extent to which it is capable of attaining knowledge without the aid of experience. This examination will decide whether reason is able to deal with the problems of God, freedom, and immortality at all; and without it no discussion of these problems will have a solid foundation. It is this preliminary investigation which the *Critique of Pure Reason* proposes to undertake. Its aim is to answer the question, 'How far can reason go, without the material presented and the aid furnished by experience?' and the result furnishes the solution, or at least the key to the solution, of all metaphysical problems.

Kant's problem, then, is similar to Locke's. Locke states that his purpose is to inquire into the original, certainty, and extent of human knowledge; and he says, "If, by this inquiry into the nature of the understanding I can discover the powers thereof; how far they reach, to what things they are in any degree proportionate, and where they fail us; I suppose it may be of use to prevail with the busy mind of man, to be more cautious in meddling with things exceeding its comprehension; to stop when it is at the utmost extent of its tether; and to sit down in a quiet ignorance of those things, which, upon examination, are found to be beyond the reach of our capacities." Thus, to use Dr. Caird's analogy, the task which both Locke and Kant set themselves resembled that of investigating a telescope, before turning it upon the stars, to determine its competence for the work.

The above outline of Kant's problem is of course only an outline. Its definite formulation is expressed in the well-known question, 'How are *a priori* synthetic judgements possible?' To determine the meaning of this question it is necessary to begin with some consideration of the terms '*a priori*' and 'synthetic'.

While there is no difficulty in determining what Kant would have recognized as an *a priori* judgement, there is difficulty in determining what he meant by calling such a judgement *a priori*. The general account is given in the first two sections of the Introduction. An *a priori* judgement is introduced as something opposed to an *a posteriori* judgement, or a judgement which has its source in experience. Instances of the

latter would be ‘This body is heavy’, and ‘This body is hot’. The point of the word ‘experience’ is that there is direct apprehension of some individual, e. g. an individual body. To say that a judgement has its source in experience is of course to imply a distinction between the judgement and experience, and the word ‘source’ may be taken to mean that the judgement depends for its validity upon the experience of the individual thing to which the judgement relates. An *a priori* judgement, then, as first described, is simply a judgement which is not *a posteriori*. It is independent of all experience; in other words, its validity does not depend on the experience of individual things. It might be illustrated by the judgement that all three-sided figures must have three angles. So far, then, no positive meaning has been given to *a priori*.

Kant then proceeds, not as we should expect, to state the positive meaning of *a priori*; but to give tests for what is *a priori*. Since a test implies a distinction between itself and what is tested, it is implied that the meaning of *a priori* is already known.

The tests given are necessity and strict universality. Since judgements which are necessary and strictly universal cannot be based on experience, their existence is said to indicate another source of knowledge. And Kant gives as illustrations, (1) any proposition in mathematics, and (2) the proposition ‘Every change must have a cause’.

So far Kant has said nothing which determines the positive meaning of *a priori*. A clue is, however, to be found in two subsequent phrases. He says that we may content ourselves with having established as a fact the pure use of our faculty of knowledge. And he adds that not only in judgements, but even in conceptions, is an *a priori* origin manifest. The second statement seems to make the *a priori* character of a judgement consist in its origin. As this origin cannot be experience, it must, as the first statement implies, lie in our faculty of knowledge. Kant’s point is that the existence of universal and necessary judgements shows that we must possess a faculty of knowledge capable of yielding knowledge without appeal to experience. The term *a priori*, then, has some reference to the existence of this faculty; in other words, it gives expression to a doctrine of ‘innate ideas’. Perhaps, however, it is hardly fair to press the phrase ‘*test* of *a priori* judgements’. If so, it may be said that on the whole, by *a priori* judgements Kant really means judgements which are universal and necessary, and that he regards them as implying a faculty which gives us knowledge without appeal to experience.

We may now turn to the term ‘synthetic judgement’. Kant distinguishes analytic and synthetic judgements thus. In any judgement the predicate B either belongs to the subject A, as something contained (though covertly) in the conception A, or lies completely outside the conception A, although it stands in relation to it. In the former case the judgement is called analytic, in the latter synthetic. ‘All bodies are extended’ is an analytic judgement; ‘All bodies are heavy’ is synthetic. It immediately follows that only synthetic judgements extend our knowledge; for in making an analytic judgement we are only clearing up our conception of the subject. This process yields no new knowledge, for it only gives us a clearer view of what we know already. Further, all judgements based on experience are synthetic, for it would be absurd to base an analytical judgement on experience, when to make the judgement we need not go beyond our own conceptions. On the other hand, *a priori* judgements are sometimes analytic and sometimes synthetic. For, besides analytical judgements, all judgements in mathematics and certain judgements which underlie physics are asserted independently of experience, and they are synthetic.

Here Kant is obviously right in vindicating the synthetic character of mathematical judgements. In the arithmetical judgement $7 + 5 = 12$, the thought of certain units as a group of twelve is no mere repetition of the thought of them as a group of five added to a group of seven. Though the same units are referred to, they are regarded differently. Thus the thought of them as twelve means either that we think of them as formed by adding one unit to a group of eleven, or that we think of them as formed by adding two units to a group of ten, and so on. And the assertion is that the same units, which can be grouped in one way, can also be grouped in another. Similarly, Kant is right in pointing out that the geometrical judgement, ‘A straight line between two points is the shortest,’ is synthetic, on the ground that the conception of

straightness is purely qualitative, while the conception of shortest distance implies the thought of quantity.

It should now be an easy matter to understand the problem expressed by the question, ‘How are *a priori* synthetic judgements possible?’ Its substance may be stated thus. The existence of *a posteriori* synthetic judgements presents no difficulty. For experience is equivalent to perception, and, as we suppose, in perception we are confronted with reality, and apprehend it as it is. If I am asked, ‘How do I know that my pen is black or my chair hard?’ I answer that it is because I see or feel it to be so. In such cases, then, when my assertion is challenged, I appeal to my experience or perception of the reality to which the assertion relates. My appeal raises no difficulty because it conforms to the universal belief that if judgements are to rank as knowledge, they must be made to conform to the nature of things, and that the conformity is established by appeal to actual experience of the things. But do *a priori* synthetic judgements satisfy this condition? Apparently not. For when I assert that every straight line is the shortest way between its extremities, I have not had, and never can have, experience of all possible straight lines. How then can I be sure that all cases will conform to my judgement? In fact, how can I anticipate my experience at all? How can I make an assertion about any individual until I have had actual experience of it? In an *a priori* synthetic judgement the mind in some way, in virtue of its own powers and independently of experience, makes an assertion to which it claims that reality must conform. Yet why should reality conform? *A priori* judgements of the other kind, viz. analytic judgements, offer no difficulty, since they are at bottom tautologies, and consequently denial of them is self-contradictory and meaningless. But there is difficulty where a judgement asserts that a term B is connected with another term A, B being neither identical with nor a part of A. In this case there is no contradiction in asserting that A is not B, and it would seem that only experience can determine whether all A is or is not B. Otherwise we are presupposing that things must conform to our ideas about them. Now metaphysics claims to make *a priori* synthetic judgements, for it does not base its results on any appeal to experience. Hence, before we enter upon metaphysics, we really ought to investigate our right to make *a priori* synthetic judgements at all. Therein, in fact, lies the importance to metaphysics of the existence of such judgements in mathematics and physics. For it shows that the difficulty is not peculiar to metaphysics, but is a general one shared by other subjects; and the existence of such judgements in mathematics is specially important because there their validity or certainty has never been questioned. The success of mathematics shows that at any rate under certain conditions *a priori* synthetic judgements are valid, and if we can determine these conditions, we shall be able to decide whether such judgements are possible in metaphysics. In this way we shall be able to settle a disputed case of their validity by examination of an undisputed case. The general problem, however, is simply to show what it is which makes *a priori* synthetic judgements as such possible; and there will be three cases, those of mathematics, of physics, and of metaphysics.

The outline of the solution of this problem is contained in the Preface to the Second Edition. There Kant urges that the key is to be found by consideration of mathematics and physics. If the question be raised as to what it is that has enabled these subjects to advance, in both cases the answer will be found to lie in a change of method. “Since the earliest times to which the history of human reason reaches, mathematics has, among that wonderful nation the Greeks, followed the safe road of a science. Still it is not to be supposed that it was as easy for this science to strike into, or rather to construct for itself, that royal road, as it was for logic, in which reason has only to do with itself. On the contrary, I believe that it must have remained long in the stage of groping (chiefly among the Egyptians), and that this change is to be ascribed to a *revolution*, due to the happy thought of one man, through whose experiment the path to be followed was rendered unmistakable for future generations, and the certain way of a science was entered upon and sketched out once for all.... A new light shone upon the first man (Thales, or whatever may have been his name) who demonstrated the properties of the isosceles triangle; for he found that he ought not to investigate that which he saw in the figure or even the mere conception of the same, and learn its properties from this, but that he ought to produce the figure by virtue of that which he himself had thought

into it *a priori* in accordance with conceptions and had represented (by means of a construction), and that in order to know something with certainty *a priori* he must not attribute to the figure any property other than that which necessarily follows from that which he has himself introduced into the figure, in accordance with his conception."

Here Kant's point is as follows. Geometry remained barren so long as men confined themselves either to the empirical study of individual figures, of which the properties were to be discovered by observation, or to the consideration of the mere conception of various kinds of figure, e. g. of an isosceles triangle. In order to advance, men had in some sense to produce the figure through their own activity, and in the act of constructing it to recognize that certain features were necessitated by those features which they had given to the figure in constructing it. Thus men had to make a triangle by drawing three straight lines so as to enclose a space, and then to recognize that three angles must have been made by the same process. In this way the mind discovered a general rule, which must apply to all cases, because the mind itself had determined the nature of the cases. A property B follows from a nature A; all instances of A must possess the property B, because they have solely that nature A which the mind has given them and whatever is involved in A. The mind's own rule holds good in all cases, because the mind has itself determined the nature of the cases.

Kant's statements about physics, though not the same, are analogous. Experiment, he holds, is only fruitful when reason does not follow nature in a passive spirit, but compels nature to answer its own questions. Thus, when Torricelli made an experiment to ascertain whether a certain column of air would sustain a given weight, he had previously calculated that the quantity of air was just sufficient to balance the weight, and the significance of the experiment lay in his expectation that nature would conform to his calculations and in the vindication of this expectation. Reason, Kant says, must approach nature not as a pupil but as a judge, and this attitude forms the condition of progress in physics.

The examples of mathematics and physics suggest, according to Kant, that metaphysics may require a similar revolution of standpoint, the lack of which will account for its past failure. An attempt should therefore be made to introduce such a change into metaphysics. The change is this. Hitherto it has been assumed that our knowledge must conform to objects. This assumption is the real cause of the failure to extend our knowledge *a priori*, for it limits thought to the analysis of conceptions, which can only yield tautological judgements. Let us therefore try the effect of assuming that objects must conform to our knowledge. Herein lies the Copernican revolution. We find that this reversal of the ordinary view of the relation of objects to the mind enables us for the first time to understand the possibility of *a priori* synthetic judgements, and even to demonstrate certain laws which lie at the basis of nature, e. g. the law of causality. It is true that the reversal also involves the surprising consequence that our faculty of knowledge is incapable of dealing with the objects of metaphysics proper, viz. God, freedom, and immortality, for the assumption limits our knowledge to objects of possible experience. But this very consequence, viz. the impossibility of metaphysics, serves to test and vindicate the assumption. For the view that our knowledge conforms to objects as things in themselves leads us into an insoluble contradiction when we go on, as we must, to seek for the unconditioned; while the assumption that objects must, as phenomena, conform to our way of representing them, removes the contradiction. Further, though the assumption leads to the denial of speculative knowledge in the sphere of metaphysics, it is still possible that reason in its practical aspect may step in to fill the gap. And the negative result of the assumption may even have a positive value. For if, as is the case, the moral reason, or reason in its practical aspect, involves certain postulates concerning God, freedom, and immortality, which are rejected by the speculative reason, it is important to be able to show that these objects fall beyond the scope of the speculative reason. And if we call reliance on these postulates, as being presuppositions of morality, faith, we may say that knowledge must be abolished to make room for faith.

This answer to the main problem, given in outline in the Preface, is undeniably plausible. Yet

examination of it suggests two criticisms which affect Kant's general position.

In the first place, the parallel of mathematics which suggests the 'Copernican' revolution does not really lead to the results which Kant supposes. Advance in mathematics is due to the adoption not of any conscious assumption but of a certain procedure, viz. that by which we draw a figure and thereby see the necessity of certain relations within it. To preserve the parallel, the revolution in metaphysics should have consisted in the adoption of a similar procedure, and advance should have been made dependent on the application of an at least quasi-mathematical method to the objects of metaphysics. Moreover, since these objects are God, freedom, and immortality, the conclusion should have been that we ought to study God, freedom, and immortality by somehow constructing them in perception and thereby gaining insight into the necessity of certain relations. Success or failure in metaphysics would therefore consist simply in success or failure to see the necessity of the relations involved. Kant, however, makes the condition of advance in metaphysics consist in the adoption not of a method of procedure but of an assumption, viz. that objects conform to the mind. And it is impossible to see how this assumption can assist what, on Kant's theory, it ought to have assisted, viz. the study of God, freedom, and immortality, or indeed the study of anything. In geometry we presuppose that individual objects conform to the universal rules of relation which we discover. Now suppose we describe a geometrical judgement, e. g. that two straight lines cannot enclose a space, as a mental law, because we are bound to think it true. Then we may state the presupposition by saying that objects, e. g. individual pairs of straight lines, must conform to such a mental law. But the explicit recognition of this presupposition and the conscious assertion of it in no way assist the solution of particular geometrical problems. The presupposition is really a condition of geometrical thinking at all. Without it there is no geometrical thinking, and the recognition of it places us in no better position for the study of geometrical problems. Similarly, if we wish to think out the nature of God, freedom, and immortality, we are not assisted by assuming that these objects must conform to the laws of our thinking. We must presuppose this conformity if we are to think at all, and consciousness of the presupposition puts us in no better position. What is needed is an insight similar to that which we have in geometry, i. e. an insight into the necessity of the relations under consideration such as would enable us to see, for example, that being a man, as such, involves living for ever.

Kant has been led into the mistake by a momentary change in the meaning given to 'metaphysics'. For the moment he is thinking of metaphysics, not as the inquiry concerned with God, freedom, and immortality, but as the inquiry which has to deal with the problem as to how we can know *a priori*. This problem is assisted, at any rate prima facie, by the assumption that things must conform to the mind. And this assumption can be said to be suggested by mathematics, inasmuch as the mathematician presupposes that particular objects must correspond to the general rules discovered by the mind. From this point of view Kant's only mistake, if the parallelism is to be maintained, is that he takes for an assumption which enables the mathematician to advance a metaphysical presupposition of the advance, on which the mathematician never reflects, and awareness of which would in no way assist his mathematics.

In the second place the 'Copernican' revolution is not strictly the revolution which Kant supposes it to be. He speaks as though his aim is precisely to reverse the ordinary view of the relation of the mind to objects. Instead of the mind being conceived as having to conform to objects, objects are to be conceived as having to conform to the mind. But if we consider Kant's real position, we see that these views are only verbally contrary, since the word object refers to something different in each case. On the ordinary view objects are something outside the mind, in the sense of independent of it, and the ideas, which must conform to objects, are something within the mind, in the sense of dependent upon it. The conformity then is of something within the mind to something outside it. Again, the conformity means that one of the terms, viz. the object, exists first and that then the other term, the idea, is fitted to or made to correspond to it. Hence the real contrary of this view is that ideas, within the mind, exist first and that objects outside the mind, coming into existence afterwards, must adapt themselves to the ideas. This of course strikes us as

absurd, because we always think of the existence of the object as the presupposition of the existence of the knowledge of it; we do not think the existence of the knowledge as the presupposition of the existence of the object. Hence Kant only succeeds in stating the contrary of the ordinary view with any plausibility, because in doing so he makes the term object refer to something which like 'knowledge' is within the mind. His position is that objects within the mind must conform to our general ways of knowing. For Kant, therefore, the conformity is not between something within and something without the mind, but between two realities within the mind, viz. the individual object, as object of perception, i. e. a phenomenon, and our general ways of perceiving and thinking. But this view is only verbally the contrary of the ordinary view, and consequently Kant does not succeed in reversing the ordinary view that we know objects independent of or outside the mind, by bringing our ideas into conformity with them. In fact, his conclusion is that we do not know this object, i. e. the thing in itself, at all. Hence his real position should be stated by saying not that the ordinary view puts the conformity between mind and things in the wrong way, but that we ought not to speak of conformity at all. For the thing in itself being unknowable, our ideas can never be made to conform to it. Kant then only reaches a conclusion which is apparently the reverse of the ordinary view by substituting another object for the thing in itself, viz. the phenomenon or appearance of the thing in itself to us.

Further, this second line of criticism, if followed out, will be found to affect his statement of the problem as well as that of its solution. It will be seen that the problem is mis-stated, and that the solution offered presupposes it to be mis-stated. His statement of the problem takes the form of raising a difficulty which the existence of *a priori* knowledge presents to the ordinary view, according to which objects are independent of the mind, and ideas must be brought into conformity with them. In a synthetic *a priori* judgement we claim to discover the nature of certain objects by an act of our thinking, and independently of actual experience of them. Hence if a supporter of the ordinary view is asked to justify the conformity of this judgement or idea with the objects to which it relates, he can give no answer. The judgement having *ex hypothesi* been made without reference to the objects, the belief that the objects must conform to it is the merely arbitrary supposition that a reality independent of the mind must conform to the mind's ideas. But Kant, in thus confining the difficulty to *a priori* judgements, implies that empirical judgements present no difficulty to the ordinary view; since they rest upon actual experience of the objects concerned, they are conformed to the objects by the very process through which they arise. He thereby fails to notice that empirical judgements present a precisely parallel difficulty. It can only be supposed that the conformity of empirical judgements to their objects is guaranteed by the experience upon which they rest, if it be assumed that in experience we apprehend objects as they are. But our experience or perception of individual objects is just as much mental as the thinking which originates *a priori* judgements. If we can question the truth of our thinking, we can likewise question the truth of our perception. If we can ask whether our ideas must correspond to their objects, we can likewise ask whether our perceptions must correspond to them. The problem relates solely to the correspondence between something within the mind and something outside it; it applies equally to perceiving and thinking, and concerns all judgements alike, empirical as well as *a priori*. Kant, therefore, has no right to imply that empirical judgements raise no problem, if he finds difficulty in *a priori* judgements. He is only able to draw a distinction between them, because, without being aware that he is doing so, he takes account of the relation of the object to the subject in the case of an *a priori* judgement, while in the case of an empirical judgement he ignores it. In other words, in dealing with the general connexion between the qualities of an object, he takes into account the fact that we are thinking it, but, in dealing with the perception of the coexistence of particular qualities of an object, he ignores the fact that we are perceiving it. Further, that the real problem concerns all synthetic judgements alike is shown by the solution which he eventually reaches. His conclusion turns out to be that while both empirical and *a priori* judgements are valid of phenomena, they are not valid of things in themselves; i. e. that of things in themselves we know nothing at all, not even their particular

qualities. Since, then, his conclusion is that even empirical judgements are not valid of things in themselves, it shows that the problem cannot be confined to *a priori* judgements, and therefore constitutes an implicit criticism of his statement of the problem.

Must there not, however, be some problem peculiar to *a priori* judgements? Otherwise why should Kant have been led to suppose that his problem concerned them only? Further consideration will show that there is such a problem, and that it was only owing to the mistake indicated that Kant treated this problem as identical with that of which he actually offered a solution. In the universal judgements of mathematics we apprehend, as we think, general rules of connexion which must apply to all possible cases. Such judgements, then, presuppose a conformity between the connexions which we discover and all possible instances. Now Kant's treatment of this conformity as a conformity between our ideas and things has two implications. In the first place, it implies, as has been pointed out, that relation to the subject, as thinking, is taken into account in the case of the universal connexion, and that relation to the subject, as perceiving, is ignored in the case of the individual thing. In the second place, it implies that what is related to the subject as the object of its thought must be subjective or mental; that because we have to think the general connexion, the connexion is only our own idea, the conformity of things to which may be questioned. But the treatment, to be consistent, should take account of relation to the subject in both cases or in neither. If the former alternative be accepted, then the subjective character attributed by Kant in virtue of this relation to what is object of thought, and equally attributable to what is object of perception, reduces the problem to that of the conformity in general of all ideas, including perceptions, within the mind to things outside it; and this problem does not relate specially to *a priori* judgements. To discover the problem which relates specially to them, the other alternative must be accepted, that of ignoring relation to the subject in both cases. The problem then becomes 'What renders possible or is presupposed by the conformity of individual things to certain laws of connexion?' And, inasmuch as to deny the conformity is really to deny that there are laws of connexion, the problem reduces itself to the question, 'What is the presupposition of the existence of definite laws of connexion in the world?' And the only answer possible is that reality is a system or a whole of connected parts, in other words, that nature is uniform. Thus it turns out that the problem relates to the uniformity of nature, and that the question 'How are *a priori* synthetic judgements possible?' has in reality nothing to do with the problem of the relation of reality to the knowing subject, but is concerned solely with the nature of reality.

Further, it is important to see that the alternative of ignoring relation to the subject is the right one, not only from the point of view of the problem peculiar to *a priori* judgements, but also from the point of view of the nature of knowledge in general. Perceiving and thinking alike presuppose that reality is immediately object of the mind, and that the act of apprehension in no way affects or enters into the nature of what we apprehend about reality. If, for instance, I assert on the strength of perception that this table is round, I imply that I see the table, and that the shape which I judge it to have is not affected by the fact that I am perceiving it; for I mean that the table really is round. If some one then convinces me that I have made a mistake owing to an effect of foreshortening, and that the table is really oval, I amend my assertion, not by saying that the table is round but only to my apprehension, but by saying that it looks round. Thereby I cease to predicate roundness of the table altogether; for I mean that while it still looks round, it is not really so. The case of universal judgements is similar. The statement that a straight line is the shortest distance between its extremities means that it really is so. The fact is presupposed to be in no way altered by our having apprehended it. Moreover, reality is here just as much implied to be directly object of the mind as it is in the case of the singular judgement. Making the judgement consists, as we say, in *seeing* the connexion between the direction between two points and the shortest distance between them. The connexion of real characteristics is implied to be directly object of thought. Thus both perceiving and thinking presuppose that the reality to which they relate is directly object of the mind, and that the character of it which we apprehend in the resulting judgement is not affected or altered by the fact that we

have had to perceive or conceive the reality.

Kant in the formulation of his problem implicitly admits this presupposition in the case of perception. He implies that empirical judgements involve no difficulty, because they rest upon the perception or experience of the objects to which they relate. On the other hand, he does not admit the presupposition in the case of conception, for he implies that in *a priori* judgements we are not confronted with reality but are confined to our own ideas. Hence we ought to ask why Kant is led to adopt an attitude in the latter case which he does not adopt in the former. The answer appears to be twofold. In the first place, there is an inveterate tendency to think of universals, and therefore of the connexions between them, as being not objective realities but mere ideas. In other words, we tend to adopt the conceptualist attitude, which regards individuals as the only reality, and universals as mental fictions. In consequence, we are apt to think that while in perception, which is of the individual, we are confronted by reality, in universal judgements, in which we apprehend connexions between universals, we have before us mere ideas. Kant may fairly be supposed to have been unconsciously under the influence of this tendency. In the second place, we apprehend a universal connexion by the operation of thinking. Thinking is essentially an activity; and since activity in the ordinary sense in which we oppose action to knowledge originates something, we tend to think of the activity of thinking as also originating something, viz. that which is our object when we think. Hence, since we think of what is real as independent of us and therefore as something which we may discover but can in no sense make, we tend to think of the object of thought as only an idea. On the other hand, what is ordinarily called perception, though it involves the activity of thinking, also involves an element in respect of which we are passive. This is the fact pointed to by Kant's phrase 'objects are *given* in perception'. In virtue of this passive element we are inclined to think that in perception we simply stand before the reality in a passive attitude. The reality perceived is thought to be, so to say, there, existing independently of us; relation to the subject is unnoticed because of our apparently wholly passive attitude. At times, and especially when he is thinking of the understanding as a faculty of spontaneity, Kant seems to have been under the influence of this second tendency.

The preceding summary of the problem of the *Critique* represents the account given in the two Prefaces and the Introduction. According to this account, the problem arises from the unquestioned existence of *a priori* knowledge in mathematics and physics and the problematic existence of such knowledge in metaphysics, and Kant's aim is to determine the range within which *a priori* knowledge is possible. Thus the problem is introduced as relating to *a priori* knowledge as such, no distinction being drawn between its character in different cases. Nevertheless the actual discussion of the problem in the body of the *Critique* implies a fundamental distinction between the nature of *a priori* knowledge in mathematics and its nature in physics, and in order that a complete view of the problem may be given, this distinction must be stated.

The 'Copernican' revolution was brought about by consideration of the facts of mathematics. Kant accepted as an absolute starting-point the existence in mathematics of true universal and necessary judgements. He then asked, 'What follows as to the nature of the objects known in mathematics from the fact that we really know them?' Further, in his answer he accepted a distinction which he never examined or even questioned, viz. the distinction between things in themselves and phenomena. This distinction assumed, Kant inferred from the truth of mathematics that things in space and time are only phenomena. According to him mathematicians are able to make the true judgements that they do make only because they deal with phenomena. Thus Kant in no way sought to *prove* the truth of mathematics. On the contrary, he argued from the truth of mathematics to the nature of the world which we thereby know. The phenomenal character of the world being thus established, he was able to reverse the argument and to regard the phenomenal character of the world as *explaining* the validity of mathematical judgements. They are valid, because they relate to phenomena. And the consideration which led Kant to take mathematics as his starting-point seems to have been the self-evidence of mathematical judgements. As

we directly apprehend their necessity, they admit of no reasonable doubt.

On the other hand, the general principles underlying physics, e. g. that every change must have a cause, or that in all change the quantum of matter is constant, appeared to Kant in a different light. Though certainly not based on experience, they did not seem to him self-evident. Hence, in the case of these principles, he sought to give what he did not seek to give in the case of mathematical judgements, viz. a proof of their truth. The nerve of the proof lies in the contention that these principles are involved not merely in any general judgement in physics, e. g. 'All bodies are heavy,' but even in any singular judgement, e. g. 'This body is heavy,' and that the validity of singular judgements is universally conceded. Thus here the fact upon which he takes his stand is not the admitted truth of the universal judgements under consideration, but the admitted truth of any singular judgement in physics. His treatment, then, of the universal judgements of mathematics and that of the principles underlying physics are distinguished by the fact that, while he accepts the former as needing no proof, he seeks to prove the latter from the admitted validity of singular judgements in physics. At the same time the acceptance of mathematical judgements and the proof of the *a priori* principles of physics have for Kant a common presupposition which distinguishes mathematics and physics from metaphysics. Like universal judgements in mathematics, singular judgements in physics, and therefore the principles which they presuppose, are true only if the objects to which they relate are phenomena. Both in mathematics and physics, therefore, it is a condition of *a priori* knowledge that it relates to phenomena and not to things in themselves. But, just for this reason, metaphysics is in a different position; since God, freedom, and immortality can never be objects of experience, *a priori* knowledge in metaphysics, and therefore metaphysics itself, is impossible. Thus for Kant the very condition, the realization of which justifies the acceptance of mathematical judgements and enables us to prove the principles of physics, involves the impossibility of metaphysics.

Further, the distinction drawn between *a priori* judgements in mathematics and in physics is largely responsible for the difficulty of understanding what Kant means by *a priori*. His unfortunate tendency to explain the term negatively could be remedied if it could be held either that the term refers solely to mathematical judgements or that he considers the truth of the law of causality to be apprehended in the same way that we see that two and two are four. For an *a priori* judgement could then be defined as one in which the mind, on the presentation of an individual in perception or imagination, and in virtue of its capacity of thinking, apprehends the necessity of a specific relation. But this definition is precluded by Kant's view that the law of causality and similar principles, though *a priori*, are not self-evident.

CHAPTER II. THE SENSIBILITY AND THE UNDERSTANDING

The distinction between the sensibility and the understanding is to Kant fundamental both in itself and in relation to the conclusions which he reaches. An outline, therefore, of this distinction must precede any statement or examination of the details of his position. Unfortunately, in spite of its fundamental character, Kant never thinks of questioning or criticizing the distinction in the form in which he draws it, and the presence of certain confusions often renders it difficult to be sure of his meaning.

The distinction may be stated in his own words thus: “There are two stems of human knowledge, which perhaps spring from a common but to us unknown root, namely sensibility and understanding.” “Our knowledge springs from two fundamental sources of the mind; the first receives representations (receptivity for impressions); the second is the power of knowing an object by means of these representations (spontaneity of conceptions). Through the first an object is *given* to us; through the second the object is *thought* in relation to the representation (which is a mere determination of the mind). Perception and conceptions constitute, therefore, the elements of all our knowledge, so that neither conceptions without a perception in some way corresponding to them, nor perception without conceptions can yield any knowledge.... Neither of these qualities has a preference over the other. Without sensibility no object would be given to us, and without understanding no object would be thought. Thoughts without content are empty, perceptions without conceptions are blind. Hence it is as necessary for the mind to make its conceptions sensuous (i. e. to add to them the object in perception) as to make its perceptions intelligible (i. e. to bring them under conceptions). Neither of these powers or faculties can exchange its function. The understanding cannot perceive, and the senses cannot think. Only by their union can knowledge arise.”

The distinction so stated appears straightforward and, on the whole, sound. And it is fairly referred to by Kant as the distinction between the faculties of perceiving and conceiving or thinking, provided that the terms perceiving and conceiving or thinking be taken to indicate a distinction within perception in the ordinary sense of the word. His meaning can be stated thus: ‘All knowledge requires the realization of two conditions; an individual must be presented to us in perception, and we as thinking beings must bring this individual under or recognize it as an instance of some universal. Thus, in order to judge ‘This is a house’ or ‘That is red’ we need the presence of the house or of the red colour in perception, and we must ‘recognize’ the house or the colour, i. e. apprehend the individual as a member of a certain kind. Suppose either condition unrealized. Then if we suppose a failure to conceive, i. e. to apprehend the individual as a member of some kind, we see that our perception — if it could be allowed to be anything at all — would be blind i. e. indeterminate, or a mere ‘blur’. What we perceived would be for us as good as nothing. In fact, we could not even say that we were perceiving. Again, if we suppose that we had merely the conception of a house, and neither perceived nor had perceived an individual to which it applied, we see that the conception, being without application, would be neither knowledge nor an element in knowledge. Moreover, the content of a conception is derived from perception; it is only through its relation to perceived individuals that we become aware of a universal. To know the meaning of ‘redness’ we must have experienced individual red things; to know the meaning of ‘house’ we must at least have had experience of individual men and of their physical needs. Hence ‘conceptions’ without ‘perceptions’ are void or empty. The existence of conceptions presupposes experience of corresponding individuals, even though it also implies the activity of thinking in relation to these individuals.’

Further, it is true to say that as perceiving we are passive; we do not do anything. This, as has been pointed out, is the element of truth contained in the statement that objects are *given* to us. On the other hand, it may be truly said that as conceiving, in the sense of bringing an individual under a universal, we

are essentially active. This is presupposed by the notice or attention involved in perception ordinarily so called, i. e. perception in the full sense in which it includes conceiving as well as perceiving. Kant, therefore, is justified in referring to the sensibility as a 'receptivity' and to the understanding as a 'spontaneity'.

The distinction, so stated, appears, as has been already said, intelligible and, in the main, valid. Kant, however, renders the elucidation of his meaning difficult by combining with this view of the distinction an incompatible and unwarranted theory of perception. He supposes, without ever questioning the supposition, that perception is due to the operation of things outside the mind, which act upon our sensibility and thereby produce sensations. On this supposition, what we perceive is not, as the distinction just stated implies, the thing itself, but a sensation produced by it. Consequently a problem arises as to the meaning on this supposition of the statements 'by the sensibility objects are given to us' and 'by the understanding they are thought'. The former statement must mean that when a thing affects us there is a sensation. It cannot mean that by the sensibility we know that there exists a thing which causes the sensation, for this knowledge would imply the activity of thinking; nor can it mean that in virtue of the sensibility the thing itself is presented to us. The latter statement must mean that when sensation arises, the understanding judges that there is something causing it; and this assertion must really be *a priori*, because not dependent upon experience. Unfortunately the two statements so interpreted are wholly inconsistent with the account of the functions of the sensibility and the understanding which has just been quoted.

Further, this theory of perception has two forms. In its first form the theory is physical rather than metaphysical, and is based upon our possession of physical organs. It assumes that the reality to be apprehended is the world of space and time, and it asserts that by the action of bodies upon our physical organs our sensibility is affected, and that thereby sensations are originated in us. Thereupon a problem arises. For if the contribution of the sensibility to our knowledge of the physical world is limited to a succession of sensations, explanation must be given of the fact that we have succeeded with an experience confined to these sensations in acquiring knowledge of a world which does not consist of sensations. Kant, in fact, in the *Aesthetic* has this problem continually before him, and tries to solve it. He holds that the mind, by means of its forms of perception and its conceptions of the understanding, superinduces upon sensations, as data, spatial and other relations, in such a way that it acquires knowledge of the spatial world.

An inherent difficulty, however, of this 'physical' theory of perception leads to a transformation of it. If, as the theory supposes, the cause of sensation is outside or beyond the mind, it cannot be known. Hence the initial assumption that this cause is the physical world has to be withdrawn, and the cause of sensation comes to be thought of as the thing in itself of which we can know nothing. This is undoubtedly the normal form of the theory in Kant's mind.

It may be objected that to attribute to Kant at any time the physical form of the theory is to accuse him of an impossibly crude confusion between things in themselves and the spatial world, and that he can never have thought that the cause of sensation, being as it is outside the mind, is spatial. But the answer is to be found in the fact that the problem just referred to as occupying Kant's attention in the *Aesthetic* is only a problem at all so long as the cause of sensation is thought of as a physical body. For the problem 'How do we, beginning with mere sensation, come to know a spatial and temporal world?' is only a problem so long as it is supposed that the cause of sensation is a spatial and temporal world or a part of it, and that this world is what we come to know. If the cause of sensation, as being beyond the mind, is held to be unknowable and so not known to be spatial or temporal, the problem has disappeared. Corroboration is given by certain passages in the *Critique* which definitely mention 'the senses', a term which refers to bodily organs, and by others to which meaning can be given only if they are taken to imply that the objects which affect our sensibility are not unknown things in themselves, but things known to be spatial. Even the use of the plural in the term 'things in themselves' implies a tendency to identify the unknowable reality

beyond the mind with bodies in space. For the implication that different sensations are due to different things in themselves originates in the view that different sensations are due to the operation of different spatial bodies.

It is now necessary to consider how the distinction between the sensibility and the understanding contributes to articulate the problem 'How are *a priori* synthetic judgements possible?' As has been pointed out, Kant means by this question, 'How is it possible that the mind is able, in virtue of its own powers, to make universal and necessary judgements which anticipate its experience of objects?' To this question his general answer is that it is possible and only possible because, so far from ideas, as is generally supposed, having to conform to things, the things to which our ideas or judgements relate, viz. phenomena, must conform to the nature of the mind. Now, if the mind's knowing nature can be divided into the sensibility and the understanding, the problem becomes 'How is it possible for the mind to make such judgements in virtue of its sensibility and its understanding?' And the answer will be that it is possible because the things concerned, i. e. phenomena, must conform to the sensibility and the understanding, i. e. to the mind's perceiving and thinking nature. But both the problem and the answer, so stated, give no clue to the particular *a priori* judgements thus rendered possible nor to the nature of the sensibility and the understanding in virtue of which we make them. It has been seen, however, that the judgements in question fall into two classes, those of mathematics and those which form the presuppositions of physics. And it is Kant's aim to relate these classes to the sensibility and the understanding respectively. His view is that mathematical judgements, which, as such, deal with spatial and temporal relations, are essentially bound up with our perceptive nature, i. e. with our sensibility, and that the principles underlying physics are the expression of our thinking nature, i. e. of our understanding. Hence if the vindication of this relation between our knowing faculties and the judgements to which they are held to give rise is approached from the side of our faculties, it must be shown that our sensitive nature is such as to give rise to mathematical judgements, and that our understanding or thinking nature is such as to originate the principles underlying physics. Again, if the account of this relation is to be adequate, it must be shown to be exhaustive, i. e. it must be shown that the sensibility and the understanding give rise to no other judgements. Otherwise there may be other *a priori* judgements bound up with the sensibility and the understanding which the inquiry will have ignored. Kant, therefore, by his distinction between the sensibility and the understanding, sets himself another problem, which does not come into sight in the first formulation of the general question 'How are *a priori* synthetic judgements possible?' He has to determine what *a priori* judgements are related to the sensibility and to the understanding respectively. At the same time the distinction gives rise to a division within the main problem. His chief aim is to discover how it is that *a priori* judgements are universally applicable. But, as Kant conceives the issue, the problem requires different treatment according as the judgements in question are related to the sensibility or to the understanding. Hence arises the distinction between the *Transcendental Aesthetic* and the *Transcendental Analytic*, the former dealing with the *a priori* judgements of mathematics, which relate to the sensibility, and the latter dealing with the *a priori* principles of physics, which originate in the understanding. Again, within each of these two divisions we have to distinguish two problems, viz. 'What *a priori* judgements are essentially related to the faculty in question?' and 'How is it that they are applicable to objects?'

It is important, however, to notice that the distinction between the sensibility and the understanding, in the form in which it serves as a basis for distinguishing the *Aesthetic* and the *Analytic*, is not identical with or even compatible with the distinction, as Kant states it when he is considering the distinction in itself and is not thinking of any theory which is to be based upon it. In the latter case the sensibility and the understanding are represented as inseparable faculties involved in *all* knowledge. Only from the union of both can knowledge arise. But, regarded as a basis for the distinction between the *Aesthetic* and the *Analytic*, they are implied to be the source of different kinds of knowledge, viz. mathematics and the principles of physics. It is no answer to this to urge that Kant afterwards points out that space as an object

presupposes a synthesis which does not belong to sense. No doubt this admission implies that even the apprehension of spatial relations involves the activity of the understanding. But the implication is really inconsistent with the existence of the *Aesthetic* as a distinct part of the subject dealing with a special class of *a priori* judgements.

CHAPTER III. SPACE

It is the aim of the *Aesthetic* to deal with the *a priori* knowledge which relates to the sensibility. This knowledge, according to Kant, is concerned with space and time. Hence he has to show *firstly* that our apprehension of space and time is *a priori*, i. e. that it is not derived from experience but originates in our apprehending nature; and *secondly* that within our apprehending nature this apprehension belongs to the sensibility and not to the understanding, or, in his language, that space and time are forms of perception or sensibility. Further, if his treatment is to be exhaustive, he should also show *thirdly* that space and time are the only forms of perception. This, however, he makes no attempt to do except in one passage, where the argument fails. The first two points established, Kant is able to develop his main thesis, viz. that it is a condition of the validity of the *a priori* judgements which relate to space and time that these are characteristics of phenomena, and not of things in themselves.

It will be convenient to consider his treatment of space and time separately, and to begin with his treatment of space. It is necessary, however, first of all to refer to the term ‘form of perception’. As Kant conceives a form of perception, it involves three antitheses.

(1) As a *form* of perception it is opposed, as a way or mode of perceiving, to particular perceptions.

(2) As a form or mode of *perception* it is opposed to a form or mode of *conception*.

(3) As a form of *perception* it is also opposed, as a way in which we apprehend things, to a way in which things are.

While we may defer consideration of the second and third antitheses, we should at once give attention to the nature of the first, because Kant confuses it with two other antitheses. There is no doubt that in general a *form* of perception means for Kant a general capacity of perceiving which, as such, is opposed to the actual perceptions in which it is manifested. For according to him our spatial perceptions are not foreign to us, but manifestations of our general perceiving nature; and this view finds expression in the assertion that space is a form of perception or of sensibility.

Unfortunately, however, Kant frequently speaks of this form of perception as if it were the same thing as the actual perception of empty space. In other words, he implies that such a perception is possible, and confuses it with a potentiality, i. e. the power of perceiving that which is spatial. The confusion is possible because it can be said with some plausibility that a perception of empty space — if its possibility be allowed — does not inform us about actual things, but only informs us what must be true of things, if there prove to be any; such a perception, therefore, can be thought of as a possibility of knowledge rather than as actual knowledge.

The second confusion is closely related to the first, and arises from the fact that Kant speaks of space not only as a form of *perception*, but also as the form of *phenomena* in opposition to sensation as their matter. “That which in the phenomenon corresponds to the sensation I term its matter; but that which effects that the manifold of the phenomenon can be arranged under certain relations I call the form of the phenomenon. Now that in which alone our sensations can be arranged and placed in a certain form cannot itself be sensation. Hence while the matter of all phenomena is only given to us *a posteriori*, their form [i. e. space] must lie ready for them all together *a priori* in the mind.” Here Kant is clearly under the influence of his theory of perception. He is thinking that, given the origination of sensations in us by the thing in itself, it is the business of the mind to arrange these sensations spatially in order to attain knowledge of the spatial world. Space being, as it were, a kind of empty vessel in which sensations are arranged, is said to be the form of phenomena. Moreover, if we bear in mind that ultimately bodies in space are for Kant only spatial arrangements of sensations, we see that the assertion that space is the form of phenomena is only Kant’s way of saying that all bodies are spatial. Now Kant, in thus asserting

that space is the form of phenomena, is clearly confusing this assertion with the assertion that space is a form of perception, and he does so in consequence of the first confusion, viz. that between a capacity of perceiving and an actual perception of empty space. For in the passage last quoted he continues thus: "I call all representations *pure* (in the transcendental sense) in which nothing is found which belongs to sensation. Accordingly there will be found *a priori* in the mind the pure form of sensuous perceptions in general, wherein all the manifold of phenomena is perceived in certain relations. This pure form of sensibility will also itself be called *pure perception*. Thus, if I abstract from the representation of a body that which the understanding thinks respecting it, such as substance, force, divisibility, &c., and also that which belongs to sensation, such as impenetrability, hardness, colour, &c., something is still left over for me from this empirical perception, viz. extension and shape. These belong to pure perception, which exists in the mind *a priori*, even without an actual object of the senses or a sensation, as a mere form of sensibility." Here Kant has passed, without any consciousness of a transition, from treating space as that in which the manifold of sensation is arranged to treating it as a capacity of perceiving. Moreover, since Kant in this passage speaks of space as a perception, and thereby identifies space with the perception of it, the confusion may be explained thus. The form of phenomena is said to be the space in which all sensations are arranged, or in which all bodies are; space, apart from all sensations or bodies, i. e. empty, being the object of a pure perception, is treated as identical with a pure perception, viz. the perception of empty space; and the perception of empty space is treated as identical with a capacity of perceiving that which is spatial.

The existence of the confusion, however, is most easily realized by asking, 'How did Kant come to think of space and time as the *only* forms of perception?' It would seem obvious that the perception of *anything* implies a form of perception in the sense of a mode or capacity of perceiving. To perceive colours implies a capacity for seeing; to hear noises implies a capacity for hearing. And these capacities may fairly be called forms of perception. As soon as this is realized, the conclusion is inevitable that Kant was led to think of space and time as the only forms of perception, because in this connexion he was thinking of each as a form of phenomena, i. e. as something in which all bodies or their states are, or, from the point of view of our knowledge, as that in which sensuous material is to be arranged; for there is nothing except space and time in which such arrangement could plausibly be said to be carried out.

As has been pointed out, Kant's argument falls into two main parts, one of which prepares the way for the other. The aim of the former is to show *firstly* that our apprehension of space is *a priori*, and *secondly* that it belongs to perception and not to conception. The aim of the latter is to conclude from these characteristics of our apprehension of space that space is a property not of things in themselves but only of phenomena. These arguments may be considered in turn.

The really valid argument adduced by Kant for the *a priori* character of our apprehension of space is based on the nature of geometrical judgements. The universality of our judgements in geometry is not based upon experience, i. e. upon the observation of individual things in space. The necessity of geometrical relations is apprehended directly in virtue of the mind's own apprehending nature. Unfortunately in the present context Kant ignores this argument and substitutes two others, both of which are invalid.

1. "Space is no empirical conception which has been derived from external experiences. For in order that certain sensations may be related to something external to me (that is, to something in a different part of space from that in which I am), in like manner, in order that I may represent them as external to and next to each other, and consequently as not merely different but as in different places, the representation of space must already exist as a foundation. Consequently, the representation of space cannot be borrowed from the relations of external phenomena through experience; but, on the contrary, this external experience is itself first possible only through the said representation." Here Kant is thinking that in order to apprehend, for example, that A is to the right of B we must first apprehend empty space. He concludes that

our apprehension of space is *a priori*, because we apprehend empty space *before* we become aware of the spatial relations of individual objects in it.

To this the following reply may be made. (*a*) The term *a priori* applied to an apprehension should mean, not that it arises prior to experience, but that its validity is independent of experience. (*b*) That to which the term *a priori* should be applied is not the apprehension of empty space, which is individual, but the apprehension of the nature of space in general, which is universal. (*c*) We do not apprehend empty space before we apprehend individual spatial relations of individual bodies or, indeed, at any time. (*d*) Though we come to apprehend *a priori* the nature of space in general, the apprehension is not prior but posterior in time to the apprehension of individual spatial relations. (*e*) It does not follow from the temporal priority of our apprehension of individual spatial relations that our apprehension of the nature of space in general is 'borrowed from experience', and is therefore not *a priori*.

2. "We can never represent to ourselves that there is no space, though we can quite well think that no objects are found in it. It must, therefore, be considered as the condition of the possibility of phenomena, and not as a determination dependent upon them, and it is an *a priori* representation, which necessarily underlies external phenomena."

Here the premise is simply false. If 'represent' or 'think' means 'believe', we can no more represent or think that there are no objects in space than that there is no space. If, on the other hand, 'represent' or 'think' means 'make a mental picture of', the assertion is equally false. Kant is thinking of empty space as a kind of receptacle for objects, and the *a priori* character of our apprehension of space lies, as before, in the supposed fact that in order to apprehend objects in space we must begin with the apprehension of empty space.

The examination of Kant's arguments for the *perceptive* character of our apprehension of space is a more complicated matter. By way of preliminary it should be noticed that they presuppose the possibility in general of distinguishing features of objects which belong to the perception of them from others which belong to the conception of them. In particular, Kant holds that our apprehension of a body as a substance, as exercising force and as divisible, is due to our understanding as conceiving it, while our apprehension of it as extended and as having a shape is due to our sensibility as perceiving it. The distinction, however, will be found untenable in principle; and if this be granted, Kant's attempt to distinguish in this way the extension and shape of an object from its other features can be ruled out on general grounds. In any case, it must be conceded that the arguments fail by which he seeks to show that space in particular belongs to perception.

There appears to be no way of distinguishing perception and conception as the apprehension of different realities except as the apprehension of the individual and of the universal respectively. Distinguished in this way, the faculty of perception is that in virtue of which we apprehend the individual, and the faculty of conception is that power of reflection in virtue of which a universal is made the explicit object of thought. If this be granted, the only test for what is perceived is that it is individual, and the only test for what is conceived is that it is universal. These are in fact the tests which Kant uses. But if this be so, it follows that the various characteristics of objects cannot be divided into those which are perceived and those which are conceived. For the distinction between universal and individual is quite general, and applies to all characteristics of objects alike. Thus, in the case of colour, we can distinguish colour in general and the individual colours of individual objects; or, to take a less ambiguous instance, we can distinguish a particular shade of redness and its individual instances. Further, it may be said that perception is of the individual shade of red of the individual object, and that the faculty by which we become explicitly aware of the particular shade of red in general is that of conception. The same distinction can be drawn with respect to hardness, or shape, or any other characteristic of objects. The distinction, then, between perception and conception can be drawn with respect to any characteristic of objects, and does not serve to distinguish one from another.

Kant's arguments to show that our apprehension of space belongs to perception are two in number, and both are directed to show not, as they should, that space is a *form* of perception, but that it is a *perception*. The first runs thus: "Space is no discursive, or, as we say, general conception of relations of things in general, but a pure perception. For, in the first place, we can represent to ourselves only one space, and if we speak of many spaces we mean thereby only parts of one and the same unique space. Again, these parts cannot precede the one all-embracing space as the component parts, as it were, out of which it can be composed, but can be thought only in it. Space is essentially one; the manifold in it, and consequently the general conception of spaces in general, rests solely upon limitations."

Here Kant is clearly taking the proper test of perception. Its object, as being an individual, is unique; there is only one of it, whereas any conception has a plurality of instances. But he reaches his conclusion by supposing that we first perceive empty space and then become aware of its parts by dividing it. Parts of space are essentially limitations of the one space; therefore to apprehend them we must first apprehend space. And since space is *one*, it must be object of perception; in other words, space, in the sense of the one all-embracing space, i. e. the totality of individual spaces, is something perceived.

The argument appears open to two objections. In the *first* place, we do *not* perceive space as a whole, and then, by dividing it, come to apprehend individual spaces. We perceive individual spaces, or, rather, individual bodies occupying individual spaces. We then apprehend that these spaces, as spaces, involve an infinity of other spaces. In other words, it is reflection on the general nature of space, the apprehension of which is involved in our apprehension of individual spaces or rather of bodies in space, which gives rise to the apprehension of the totality of spaces, the apprehension being an act, not of perception, but of thought or conception. It is necessary, then, to distinguish (*a*) individual spaces, which we perceive; (*b*) the nature of space in general, of which we become aware by reflecting upon the character of perceived individual spaces, and which we conceive; (*c*) the totality of individual spaces, the thought of which we reach by considering the nature of space in general.

In the *second* place, the distinctions just drawn afford no ground for distinguishing space as something perceived from any other characteristic of objects as something conceived; for any other characteristic admits of corresponding distinctions. Thus, with respect to colour it is possible to distinguish (*a*) individual colours which we perceive; (*b*) colouredness in general, which we conceive by reflecting on the common character exhibited by individual colours and which involves various kinds or species of colouredness; (*c*) the totality of individual colours, the thought of which is reached by considering the nature of colouredness in general.

Both in the case of colour and in that of space there is to be found the distinction between universal and individual, and therefore also that between conception and perception. It may be objected that after all, as Kant points out, there is only one space, whereas there are many individual colours. But the assertion that there is only one space simply means that all individual bodies in space are related spatially. This will be admitted, if the attempt be made to think of two bodies as in different spaces and therefore as not related spatially. Moreover, there is a parallel in the case of colour, since individual coloured bodies are related by way of colour, e. g. as brighter and duller; and though such a relation is different from a relation of bodies in respect of space, the difference is due to the special nature of the universals conceived, and does not imply a difference between space and colour in respect of perception and conception. In any case, space as a whole is not object of perception, which it must be if Kant is to show that space, as being one, is perceived; for space in this context must mean the totality of individual spaces.

Kant's second argument is stated as follows: "Space is represented as an infinite *given* magnitude. Now every conception must indeed be considered as a representation which is contained in an infinite number of different possible representations (as their common mark), and which therefore contains these *under itself*, but no conception can, as such, be thought of as though it contained *in itself* an infinite number of representations. Nevertheless, space is so conceived, for all parts of space *ad infinitum* exist

simultaneously. Consequently the original representation of space is an *a priori perception* and not a *conception*." In other words, while a conception implies an infinity of individuals which come under it, the elements which constitute the conception itself (e. g. that of triangularity or redness) are not infinite; but the elements which go to constitute space are infinite, and therefore space is not a conception but a perception.

Though, however, space in the sense of the infinity of spaces may be said to contain an infinite number of spaces if it be meant that it *is* these infinite spaces, it does not follow, nor is it true, that space in this sense is object of perception.

The aim of the arguments just considered, and stated in § 2 of the *Aesthetic*, is to establish the two characteristics of our apprehension of space, from which it is to follow that space is a property of things only as they appear to us and not as they are in themselves. This conclusion is drawn in § 4. §§ 2 and 4 therefore complete the argument. § 3, a passage added in the second edition of the *Critique*, interrupts the thought, for ignoring § 2, it once more establishes the *a priori* and perceptive character of our apprehension of space, and independently draws the conclusion drawn in § 4. Since, however, Kant draws the final conclusion in the same way in § 3 and in § 4, and since a passage in the *Prolegomena*, of which § 3 is only a summary, gives a more detailed account of Kant's thought, attention should be concentrated on § 3, together with the passage in the *Prolegomena*.

It might seem at the outset that since the arguments upon which Kant bases the premises for his final argument have turned out invalid, the final argument itself need not be considered. The argument, however, of § 3 ignores the preceding arguments for the *a priori* and perceptive character of our apprehension of space. It returns to the *a priori* synthetic character of geometrical judgements, upon which stress is laid in the Introduction, and appeals to this as the justification of the *a priori* and perceptive character of our apprehension of space.

The argument of § 3 runs as follows: "Geometry is a science which determines the properties of space synthetically and yet *a priori*. What, then, must be the representation of space, in order that such a knowledge of it may be possible? It must be originally perception, for from a mere conception no propositions can be deduced which go beyond the conception, and yet this happens in geometry. But this perception must be *a priori*, i. e. it must occur in us before all sense-perception of an object, and therefore must be pure, not empirical perception. For geometrical propositions are always apodeictic, i. e. bound up with the consciousness of their necessity (e. g. space has only three dimensions), and such propositions cannot be empirical judgements nor conclusions from them."

"Now how can there exist in the mind an external perception which precedes the objects themselves, and in which the conception of them can be determined *a priori*? Obviously not otherwise than in so far as it has its seat in the subject only, as the formal nature of the subject to be affected by objects and thereby to obtain *immediate representation*, i. e. *perception* of them, and consequently only as the form of the external sense in general."

Here three steps are taken. From the *synthetic* character of geometrical judgements it is concluded that space is not something which we *conceive*, but something which we *perceive*. From their *a priori* character, i. e. from the consciousness of necessity involved, it is concluded that the perception of space must be *a priori* in a new sense, that of taking place *before* the perception of objects in it. From the fact that we perceive space before we perceive objects in it, and thereby are able to anticipate the spatial relations which condition these objects, it is concluded that space is only a characteristic of our perceiving nature, and consequently that space is a property not of things in themselves, but only of things as perceived by us.

Two points in this argument are, even on the face of it, paradoxical. Firstly, the term *a priori*, as applied not to geometrical judgements but to the perception of space, is given a temporal sense; it means not something whose validity is independent of experience and which is the manifestation of the nature of

the mind, but something which takes place before experience. Secondly, the conclusion is not that the perception of space *is the manifestation of* the mind's perceiving nature, but that it *is* the mind's perceiving nature. For the conclusion is that space is the formal nature of the subject to be affected by objects, and therefore the form of the external sense in general. Plainly, then, Kant here confuses an actual perception and a form or way of perceiving. These points, however, are more explicit in the corresponding passage in the *Prolegomena*.

It begins thus: "Mathematics carries with it thoroughly apodeictic certainty, that is, absolute necessity, and, therefore, rests on no empirical grounds, and consequently is a pure product of reason, and, besides, is thoroughly synthetical. How, then, is it possible for human reason to accomplish such knowledge entirely *a priori*?... But we find that all mathematical knowledge has this peculiarity, that it must represent its conception previously in *perception*, and indeed *a priori*, consequently in a perception which is not empirical but pure, and that otherwise it cannot take a single step. Hence its judgements are always *intuitive*.... This observation on the nature of mathematics at once gives us a clue to the first and highest condition of its possibility, viz. that there must underlie it *a pure perception* in which it can exhibit or, as we say, *construct* all its conceptions in the concrete and yet *a priori*. If we can discover this pure perception and its possibility, we may thence easily explain how *a priori* synthetical propositions in pure mathematics are possible, and consequently also how the science itself is possible. For just as empirical perception enables us without difficulty to enlarge synthetically in experience the conception which we frame of an object of perception through new predicates which perception itself offers us, so pure perception also will do the same, only with the difference that in this case the synthetical judgement will be *a priori* certain and apodeictic, while in the former case it will be only *a posteriori* and empirically certain; for the latter [i. e. the empirical perception on which the *a posteriori* synthetic judgement is based] contains only that which is to be found in contingent empirical perception, while the former [i. e. the pure perception on which the *a priori* synthetic judgement is based] contains that which is bound to be found in pure perception, since, as *a priori* perception, it is inseparably connected with the conception *before all experience* or individual sense-perception."

This passage is evidently based upon the account which Kant gives in the *Doctrine of Method* of the method of geometry. According to this account, in order to apprehend, for instance, that a three-sided figure must have three angles, we must draw in imagination or on paper an individual figure corresponding to the conception of a three-sided figure. We then see that the very nature of the act of construction involves that the figure constructed must possess three angles as well as three sides. Hence, perception being that by which we apprehend the individual, a perception is involved in the act by which we form a geometrical judgement, and the perception can be called *a priori*, in that it is guided by our *a priori* apprehension of the necessary nature of the act of construction, and therefore of the figure constructed.

The account in the *Prolegomena*, however, differs from that of the *Doctrine of Method* in one important respect. It asserts that the perception involved in a mathematical judgement not only may, but must, be pure, i. e. must be a perception in which no spatial object is present, and it implies that the perception must take place *before* all experience of actual objects. Hence *a priori*, applied to perception, has here primarily, if not exclusively, the temporal meaning that the perception takes place *antecedently to all experience*.

The thought of the passage quoted from the *Prolegomena* can be stated thus: 'A mathematical judgement implies the perception of an individual figure antecedently to all experience. This may be said to be the first condition of the possibility of mathematical judgements which is revealed by reflection. There is, however, a prior or higher condition. The perception of an individual figure involves as its basis another pure perception. For we can only construct and therefore perceive an individual figure in empty space. Space is that *in which* it must be constructed and perceived. A perception of empty space is, therefore,

necessary. If, then, we can discover how this perception is possible, we shall be able to explain the possibility of *a priori* synthetical judgements of mathematics.'

Kant continues as follows: "But with this step the difficulty seems to increase rather than to lessen. For henceforward the question is '*How is it possible to perceive anything a priori?*' A perception is such a representation as would immediately depend upon the presence of the object. Hence it seems impossible *originally* to perceive *a priori*, because perception would in that case have to take place without an object to which it might refer, present either formerly or at the moment, and accordingly could not be perception.... How can *perception* of the object precede the object itself?" Kant here finds himself face to face with the difficulty created by the preceding section. Perception, as such, involves the actual presence of an object; yet the pure perception of space involved by geometry — which, as pure, is the perception of empty space, and which, as the perception of empty space, is *a priori* in the sense of temporally prior to the perception of actual objects — presupposes that an object is not actually present.

The solution is given in the next section. "Were our perception necessarily of such a kind as to represent things *as they are in themselves*, no perception would take place *a priori*, but would always be empirical. For I can only know what is contained in the object in itself, if it is present and given to me. No doubt it is even then unintelligible how the perception of a present thing should make me know it as it is in itself, since its qualities cannot migrate over into my faculty of representation; but, even granting this possibility, such a perception would not occur *a priori*, i. e. before the object was presented to me; for without this presentation, no basis of the relation between my representation and the object can be imagined; the relation would then have to rest upon inspiration. It is therefore possible only in one way for my perception to precede the actuality of the object and to take place as *a priori* knowledge, viz. *if it contains nothing but the form of the sensibility, which precedes in me, the subject, all actual impressions through which I am affected by objects*. For I can know *a priori* that objects of the senses can only be perceived in accordance with this form of the sensibility. Hence it follows that propositions which concern merely this form of sensuous perception will be possible and valid for objects of the senses, and in the same way, conversely, that perceptions which are possible *a priori* can never concern any things other than objects of our senses."

This section clearly constitutes the turning-point in Kant's argument, and primarily expresses, in an expanded form, the central doctrine of § 3 of the *Aesthetic*, that an external perception anterior to objects themselves, and in which our conceptions of objects can be determined *a priori*, is possible, if, and only if, it has its seat in the subject as its formal nature of being affected by objects, and consequently as the form of the external sense in general. It argues that, since this is true, and since geometrical judgements involve such a perception anterior to objects, space must be only the form of sensibility.

Now why does Kant think that this conclusion follows? Before we can answer this question we must remove an initial difficulty. In this passage Kant unquestionably identifies a form of perception with an actual perception. It is at once an actual perception and a capacity of perceiving. This is evident from the words, "It is possible only in one way for my perception to precede the actuality of the object ... viz. *if it contains nothing but the form of the sensibility*." The identification becomes more explicit a little later. "A pure perception (of space and time) can underlie the empirical perception of objects, because it is nothing but the mere form of the sensibility, which precedes the actual appearance of the objects, in that it in fact first makes them possible. Yet this faculty of perceiving *a priori* affects not the matter of the phenomenon, i. e. that in it which is sensation, for this constitutes that which is empirical, but only its form, viz. space and time." His argument, however, can be successfully stated without this identification. It is only necessary to re-write his cardinal assertion in the form 'the perception of space must be nothing but the *manifestation* of the form of the sensibility'. Given this modification, the question becomes, 'Why does Kant think that the perception of empty space, involved by geometrical judgements, can be only a manifestation of our perceiving nature, and not in any way the apprehension of a real quality of objects?'

The answer must be that it is because he thinks that, while in empirical perception a real object is present, in the perception of empty space a real object is not present. He regards this as proving that the latter perception is only of something subjective or mental. “Space and time, by being pure *a priori* perceptions, prove that they are mere forms of our sensibility which must precede all empirical perception, i. e. sense-perception of actual objects.” His main conclusion now follows easily enough. If in perceiving empty space we are only apprehending a manifestation of our perceiving nature, what we apprehend in a geometrical judgement is really a law of our perceiving nature, and therefore, while it *must* apply to our perceptions of objects or to objects as perceived, it *cannot* apply to objects apart from our perception, or, at least, there is no ground for holding that it does so.

If, however, this fairly represents Kant’s thought, it must be allowed that the conclusion which he should have drawn is different, and even that the conclusion which he does draw is in reality incompatible with his starting-point.

His starting-point is the view that the truth of geometrical judgements presupposes a perception of empty space, in virtue of which we can discover rules of spatial relation which must apply to all spatial objects subsequently perceived. His problem is to discover the presupposition of this presupposition. The proper answer must be, not that space is a form of sensibility or a way in which objects appear to us, but that space is the form of all objects, i. e. that all objects are spatial. For in that case they must be subject to the laws of space, and therefore if we can discover these laws by a study of empty space, the only condition to be satisfied, if the objects of subsequent perception are to conform to the laws which we discover, is that all objects should be spatial. Nothing is implied which enables us to decide whether the objects are objects as they are in themselves or objects as perceived; for in either case the required result follows. If in empirical perception we apprehend things only as they appear to us, and if space is the form of them as they appear to us, it will no doubt be true that the laws of spatial relation which we discover must apply to things as they appear to us. But on the other hand, if in empirical perception we apprehend things as they are, and if space is their form, i. e. if things are spatial, it will be equally true that the laws discovered by geometry must apply to things as they are.

Again, Kant’s starting-point really commits him to the view that space is a characteristic of things as they are. For — paradoxical though it may be — his problem is to explain the possibility of *perceiving a priori*, i. e. of *perceiving* the characteristics of an object anterior to the actual presence of the object in perception. This implies that *empirical* perception, which involves the actual presence of the object, involves no difficulty; in other words, it is implied that empirical perception is of objects as they are. And we find Kant admitting this to the extent of allowing *for the sake of argument* that the perception of a present thing can make us know the thing as it is in itself. But if empirical perception gives us things as they are, and if, as is the case, and as Kant really presupposes, the objects of empirical perception are spatial, then, since space is their form, the judgements of geometry must relate to things as they are. It is true that on this view Kant’s first presupposition of geometrical judgements has to be stated by saying that we are able to perceive a real characteristic of things in space, before we perceive the things; and, no doubt, Kant thinks this impossible. According to him, when we perceive empty space no object is present, and therefore what is before the mind must be merely mental. But no greater difficulty is involved than that involved in the corresponding supposition required by Kant’s own view. It is really just as difficult to hold that we can perceive a characteristic of things as they appear to us *before* they appear, as to hold that we can perceive a characteristic of them as they are in themselves *before* we perceive them.

The fact is that the real difficulty with which Kant is grappling in the *Prolegomena* arises, not from the supposition that spatial bodies are things in themselves, but from the supposed presupposition of geometry that we must be able to perceive empty space before we perceive bodies in it. It is, of course, impossible to defend the perception of empty space, but *if* it be maintained, the space perceived must be conceded to be not, as Kant thinks, something mental or subjective, but a real characteristic of things. For, as has been

pointed out, the paradox of pure perception is reached solely through the consideration that, while in empirical perception we perceive objects, in pure perception we do not, and since the objects of empirical perception are spatial, space must be a real characteristic of them.

The general result of the preceding criticism is that Kant's conclusion does not follow from the premises by which he supports it. It should therefore be asked whether it is not possible to take advantage of this hiatus by presenting the argument for the merely phenomenal character of space without any appeal to the possibility of perceiving empty space. For it is clear that what was primarily before Kant, in writing the *Critique*, was the *a priori* character of geometrical judgements themselves, and not the existence of a perception of empty space which they were held to presuppose.

If, then, the conclusion that space is only the form of sensibility can be connected with the *a priori* character of geometrical judgements without presupposing the existence of a perception of empty space, his position will be rendered more plausible.

This can be done as follows. The essential characteristic of a geometrical judgement is not that it takes place prior to experience, but that it is not based upon experience. Thus a judgement, arrived at by an activity of the mind in which it remains within itself and does not appeal to actual experience of the objects to which the judgement relates, is implied to hold good of those objects. If the objects were things as they are in themselves, the validity of the judgement could not be justified, for it would involve the gratuitous assumption that a necessity of thought is binding on things which *ex hypothesi* are independent of the nature of the mind. If, however, the objects in question are things as perceived, they will be through and through conditioned by the mind's perceiving nature; and, consequently, if a geometrical rule, e. g. that a three-sided figure must have three angles, is really a law of the mind's perceiving nature, all individual perceptions, i. e. all objects as perceived by us, will necessarily conform to the law. Therefore, in the latter case, and in that only, will the universal validity of geometrical judgements be justified. Since, then, geometrical judgements are universally valid, space, which is that of which geometrical laws are the laws, must be merely a form of perception or a characteristic of objects as perceived by us.

This appears to be the best form in which the substance of Kant's argument, stripped of unessentials, can be stated. It will be necessary to consider both the argument and its conclusion.

The argument, so stated, is undeniably plausible. Nevertheless, examination of it reveals two fatal defects. In the first place, its starting-point is false. To Kant the paradox of geometrical judgements lies in the fact that they are not based upon an appeal to experience of the things to which they relate. It is implied, therefore, that judgements which are based on experience involve no paradox, and for the reason that in experience we apprehend things as they are. In contrast with this, it is implied that in geometrical judgements the connexion which we apprehend is not real, i. e. does not relate to things as they are. Otherwise, there would be no difficulty; if in geometry we apprehended rules of connexion relating to things as they are, we could allow without difficulty that the things must conform to them. No such distinction, however, can be drawn between *a priori* and empirical judgements. For the necessity of connexion, e. g. between being a three-sided figure and being a three-angled figure, is as much a characteristic of things as the empirically-observed shape of an individual body, e. g. a table. Geometrical judgements, therefore, cannot be distinguished from empirical judgements on the ground that in the former the mind remains within itself, and does not immediately apprehend fact or a real characteristic of reality. Moreover, since in a geometrical judgement we do in fact think that we are apprehending a real connexion, i. e. a connexion which applies to things and to things as they are in themselves, to question the reality of the connexion is to question the validity of thinking altogether, and to do this is implicitly to question the validity of our thought about the nature of our own mind, as well as the validity of our thought about things independent of the mind. Yet Kant's argument, in the form in which it has just been stated, presupposes that our thought is valid at any rate when it is concerned with our perceptions of things, even if it is not valid when concerned with the things as they are in themselves.

This consideration leads to the second criticism. The supposition that space is only a form of perception, even if it be true, *in no way assists* the explanation of the universal validity of geometrical judgements. Kant's argument really confuses a *necessity* of relation with the *consciousness of a necessity* of relation. No doubt, if it be a law of our perceiving nature that, whenever we perceive an object as a three-sided figure, the object as perceived contains three angles, it follows that any object as perceived will conform to this law; just as if it be a law of things as they are in themselves that three-sided figures contain three angles, all three-sided figures will in themselves have three angles. But what has to be explained is the universal applicability, not of a law, but of a judgement about a law. For Kant's real problem is to explain why *our judgement* that a three-sided figure must contain three angles must apply to all three-sided figures. Of course, if it be granted that in the judgement we apprehend the true law, the problem may be regarded as solved. But how are we to know that what we judge *is* the true law? The answer is in no way facilitated by the supposition that the judgement relates to our perceiving nature. It can just as well be urged that what we think to be a necessity of our perceiving nature is not a necessity of it, as that what we think to be a necessity of things as they are in themselves is not a necessity of them. The best, or rather the only possible, answer is simply that that of which we apprehend the necessity must be true, or, in other words, that we *must* accept the validity of thought. Hence nothing is gained by the supposition that space is a form of sensibility. If what we judge to be necessary is, as such, valid, a judgement relating to things in themselves will be as valid as a judgement relating to our perceiving nature.

This difficulty is concealed from Kant by his insistence on the *perception* of space involved in geometrical judgements. This leads him at times to identify the judgement and the perception, and, therefore, to speak of the judgement as a perception. Thus we find him saying that mathematical judgements are always *perceptive*, and that "It is only possible for my perception to precede the actuality of the object and take place as *a priori* knowledge, if &c." Hence, if, in addition, a geometrical judgement, as being a judgement about a necessity, be identified with a necessity of judging, the conformity of things to these universal judgements will become the conformity of things to rules or necessities of our judging, i. e. of our perceiving nature, and Kant's conclusion will at once follow. Unfortunately for Kant, a geometrical judgement, however closely related to a perception, must itself, as the apprehension of what is necessary and universal, be an act of thought rather than of perception, and therefore the original problem of the conformity of things to our mind can be forced upon him again, even after he thinks that he has solved it, in the new form of that of the conformity within the mind of perceiving to thinking.

The fact is simply that the universal validity of geometrical judgements can in no way be 'explained'. It is not in the least explained or made easier to accept by the supposition that objects are 'phenomena'. These judgements must be accepted as being what we presuppose them to be in making them, viz. the direct apprehension of necessities of relation between real characteristics of real things. To explain them by reference to the phenomenal character of what is known is really — though contrary to Kant's intention — to throw doubt upon their validity; otherwise, they would not need explanation. As a matter of fact, it is *impossible* to question their validity. In the act of judging, doubt is impossible. Doubt can arise only when we subsequently reflect and temporarily lose our hold upon the consciousness of necessity in judging. The doubt, however, since it is non-existent in our geometrical consciousness, is really groundless, and, therefore, the problem to which it gives rise is unreal. Moreover if, *per impossibile*, doubt could be raised, it could not be set at rest. No vindication of a judgement in which we are conscious of a necessity could do more than take the problem a stage further back, by basing it upon some other consciousness of a necessity; and since this latter judgement could be questioned for precisely the same reason, we should only be embarking upon an infinite process.

We may now consider Kant's conclusion in abstraction from the arguments by which he reaches it. It

raises three main difficulties.

In the first place, it is not the conclusion to be expected from Kant's own standpoint. The phenomenal character of space is inferred, not from the fact that we make judgements at all, but from the fact that we make judgements of a particular kind, viz. *a priori* judgements. From this point of view empirical judgements present no difficulty. It should, therefore, be expected that the qualities which we attribute to things in empirical judgements are not phenomenal, but belong to things as they are. Kant himself implies this in drawing his conclusion concerning the nature of space. "Space does not represent any quality of things in themselves or things in relation to one another; that is, it does not represent any determination of things which would attach to the objects themselves and would remain, even though we abstracted from all subjective conditions of perception. For neither absolute nor relative determinations of objects can be perceived prior to the existence of the things to which they belong, and therefore not *a priori*." It is, of course, implied that in experience, where we do not discover determinations of objects prior to the existence of the objects, we do apprehend determinations of things as they are in themselves, and not as they are in relation to us. Thus we should expect the conclusion to be, not that all that we know is phenomenal — which is Kant's real position — but that spatial (and temporal) relations alone are phenomenal, i. e. that they alone are the result of a transmutation due to the nature of our perceiving faculties. This conclusion would, of course, be absurd, for what Kant considers to be the empirically known qualities of objects disappear, if the spatial character of objects is removed. Moreover, Kant is prevented by his theory of perception from seeing that this is the real solution of his problem, absurd though it may be. Since perception is held to arise through the origination of sensations by things in themselves, empirical knowledge is naturally thought of as knowledge about sensations, and since sensations are palpably within the mind, and are held to be due to things in themselves, knowledge about sensations can be regarded as phenomenal.

On the other hand, if we consider Kant's conclusion from the point of view, not of the problem which originates it, but of the distinction in terms of which he states it, viz. that between things as they are in themselves and things as perceived by us, we are led to expect the contrary result. Since perception is the being affected by things, and since the nature of the affection depends upon the nature of our capacity of being affected, in *all* perception the object will become distorted or transformed, as it were, by our capacity of being affected. The conclusion, therefore, should be that in all judgements, empirical as well as *a priori*, we apprehend things only as perceived. The reason why Kant does not draw this conclusion is probably that given above, viz. that by the time Kant reaches the solution of his problem empirical knowledge has come to relate to sensation only; consequently, it has ceased to occur to him that empirical judgements could possibly give us knowledge of things as they are. Nevertheless, Kant should not have retained in his formulation of the problem a distinction irreconcilable with his solution of it; and if he had realized that he was doing so he might have been compelled to modify his whole view.

The second difficulty is more serious. If the truth of geometrical judgements presupposes that space is only a property of objects as perceived by us, it is a paradox that geometricians should be convinced, as they are, of the truth of their judgements. They undoubtedly think that their judgements apply to things as they are in themselves, and not merely as they appear to us. They certainly do not think that the relations which they discover apply to objects only as perceived. Not only, therefore, do they not think that bodies in space are phenomena, but they do not even leave it an open question whether bodies are phenomena or not. Hence, if Kant be right, they are really in a state of illusion, for on his view the true geometrical judgement should include in itself the phenomenal character of spatial relations; it should be illustrated by expressing Euclid I. 5 in the form that the equality of the angles at the base of an isosceles triangle belongs to objects as perceived. Kant himself lays this down. "The proposition 'all objects are beside one another in space' is valid under the limitation that these things are taken as objects of our sensuous perception. If I join the condition to the perception, and say 'all things, as external phenomena, are beside

one another in space', the rule is valid universally, and without limitation." Kant, then, is in effect allowing that it is possible for geometricians to make judgements, of the necessity of which they are convinced, and yet to be wrong; and that, therefore, the apprehension of the necessity of a judgement is no ground of its truth. It follows that the truth of geometrical judgements can no longer be accepted as a starting-point of discussion, and, therefore, as a ground for inferring the phenomenal character of space.

There seems, indeed, one way of avoiding this consequence, viz. to suppose that for Kant it was an absolute starting-point, which nothing would have caused him to abandon, that only those judgements of which we apprehend the necessity are true. It would, of course, follow that geometricians would be unable to apprehend the necessity of geometrical judgements, and therefore to make such judgements, until they had discovered that things as spatial were only phenomena. It would not be enough that they should think that the phenomenal or non-phenomenal character of things as spatial must be left an open question for the theory of knowledge to decide. In this way the necessity of admitting the illusory character of geometry would be avoided. The remedy, however, is at least as bad as the disease. For it would imply that geometry must be preceded by a theory of knowledge, which is palpably contrary to fact. Nor could Kant accept it; for he avowedly bases his theory of knowledge, i. e. his view that objects as spatial are phenomena, upon the truth of geometry; this procedure would be circular if the making of true geometrical judgements was allowed to require the prior adoption of his theory of knowledge.

The third difficulty is the most fundamental. Kant's conclusion (and also, of course, his argument) presupposes the validity of the distinction between phenomena and things in themselves. If, then, this distinction should prove untenable in principle, Kant's conclusion with regard to space must fail on general grounds, and it will even have been unnecessary to consider his arguments for it. The importance of the issue, however, requires that it should be considered in a separate chapter.

CHAPTER IV. PHENOMENA AND THINGS IN THEMSELVES

The distinction between phenomena and things in themselves can be best approached by considering Kant's formulation of the alternative views of the nature of space and time. "What are space and time? Are they real existences? Or are they merely determinations or relations of things, such, however, as would also belong to them in themselves, even if they were not perceived, or are they attached to the form of perception only, and consequently to the subjective nature of our mind, without which these predicates can never be attributed to any thing?"

Of these three alternatives, the first can be ignored. It is opposed to the second, and is the view that space and time are things rather than relations between things. This opposition falls within the first member of the wider opposition between things as they are in themselves and things as they are as perceived, and Kant, and indeed any one, would allow that if space and time belong to things as they are in themselves and not to things only as perceived, they are relations between things rather than things. The real issue, therefore, lies between the second and third alternatives. Are space and time relations between things which belong to them both in themselves and also as perceived by us, or are they relations which belong to things only as perceived?

To this question we may at once reply that, inasmuch as it involves an impossible antithesis, it is wholly unreal. The thought of a property or a relation which belongs to things as perceived involves a contradiction. To take Plato's example, suppose that we are looking at a straight stick, partially immersed in water. If we have not previously seen the stick, and are ignorant of the laws of refraction, we say that the stick is bent. If, however, we learn the effect of refraction, and observe the stick from several positions, we alter our assertion. We say that the stick is not really bent, but only looks or appears bent to us. But, if we reflect at all, we do not express our meaning by saying that the stick *is* bent to us as perceiving, though not in reality. The word 'is' essentially relates to what really is. If, therefore, the phrase 'to us as perceiving' involves an opposition to the phrase 'in reality', as it must if it is to be a real qualification of 'is', it cannot rightly be added to the word 'is'. To put the matter more explicitly, the assertion that something *is* so and so implies that it is so and so in itself, whether it be perceived or not, and therefore the assertion that something is so and so to us as perceiving, though not in itself, is a contradiction in terms. The phrase 'to us as perceiving', as a restriction upon the word 'is', merely takes back the precise meaning of the word 'is'. That to which the phrase can be added is not the word 'is', but the word 'looks' or 'appears'. We can rightly say that the stick looks or appears bent to us as perceiving. But even then the addition only helps to make explicit the essential meaning of 'appears', for 'appears' really means 'appears to us', and 'as perceiving' only repeats the meaning of 'appears' from the side of the perceiving subject as opposed to that of the object perceived. The essential point, however, is thereby brought out that the phrase 'to us as perceiving' essentially relates not to what a thing is, but to what it looks or appears to us.

What, then, is the proper statement of Kant's view that space is a determination of things only as they appear to us, and not as they are in themselves? It should be said that things are not in reality spatial, but only look or appear spatial to us. It should not be said that they *are* spatial for our perception, though not in themselves. Thus the view properly stated implies that space is an illusion, inasmuch as it is not a real property of things at all. This implication, however, is precisely the conclusion which Kant wishes to avoid. He takes infinite trouble to explain that he does not hold space and time to be illusions. Though *transcendentally ideal* (i. e. though they do not belong to things in themselves), they are *empirically real*. In other words, space and time are real relations of *something*, though not of things in themselves.

How, then, does Kant obtain something of which space and time can be regarded as really relations?

He reaches it by a transition which at first sight seems harmless. In stating the fact of perception he substitutes for the assertion that things appear so and so to us the assertion that things produce appearances in us. In this way, instead of an assertion which relates to the thing and states what it is not but only appears, he obtains an assertion which introduces a second reality distinct from the thing, viz. an appearance or phenomenon, and thereby he gains something other than the thing to which space can be attached as a real predicate. He thus gains something in respect of which, with regard to spatial relations we can be said to have *knowledge* and not illusion. For the position now is that space, though not a property of things in themselves, *is* a property of phenomena or appearances; in other words, that while things in themselves are not spatial, phenomena and appearances *are* spatial. As evidence of this transition, it is enough to point out that, while he states the *problem* in the form 'Are things in themselves spatial or are they only spatial as appearing to us?' he usually states the *conclusion* in the form 'Space is the form of phenomena', i. e. phenomena are spatial. A transition is thereby implied from 'things as appearing' to 'appearances'. At the same time, it is clear that Kant is not aware of the transition, but considers the expressions equivalent, or, in other words, fails to distinguish them. For both modes of stating the conclusion are to be found even in the same sentence. "This predicate [space] is applied to things only in so far as they appear to us, i. e. are objects of sensibility [i. e. phenomena]." Again, the common phrase 'things as phenomena' implies the same confusion. Moreover, if Kant had realized that the transition was more than one of phraseology he must have seen that it was necessary to recast his argument.

It may be said, then, that Kant is compelled to end with a different distinction from that with which he begins. He begins with the distinction between things as they are in themselves and things as they appear to us, the distinction relating to one and the same reality regarded from two different points of view. He ends with the distinction between two different realities, things-in-themselves, external to, in the sense of independent of, the mind, and phenomena or appearances within it. Yet if his *argument* is to be valid, the two distinctions should be identical, for it is the first distinction to which the argument appeals. In fact, we find him expressing what is to him the same distinction now in the one way and now in the other as the context requires.

The final form of Kant's conclusion, then, is that while things in themselves are not, or, at least, cannot be known to be spatial, 'phenomena,' or the appearances produced in us by things in themselves, are spatial. Unfortunately, the conclusion in this form is no more successful than it is in the former form, that things are spatial only as perceived. Expressed by the formula 'phenomena are spatial', it has, no doubt, a certain plausibility; for the word 'phenomena' to some extent conceals the essentially mental character of what is asserted to be spatial. But the plausibility disappears on the substitution of 'appearances' — the true equivalent of Kant's *Erscheinungen* — for 'phenomena'. Just as it is absurd to describe the fact that the stick only looks bent by saying that, while the stick is not bent, the appearance which it produces is bent, so it is, even on the face of it, nonsense to say that while things are not spatial, the appearances which they produce in us are spatial. For an 'appearance', being necessarily something mental, cannot possibly be said to be extended. Moreover, it is really an abuse of the term 'appearance' to speak of appearances *produced by* things, for this phrase implies a false severance of the appearance from the things which appear. If there are 'appearances' at all, they are appearances *of* things and not appearances *produced by* them. The importance of the distinction lies in the difference of implication. To speak of appearances produced by things is to imply that the object of perception is merely something mental, viz. an appearance. Consequently, access to a non-mental reality is excluded; for a perception of which the object is something belonging to the mind's own being cannot justify an inference to something beyond the mind, and the result is inevitably solipsism. On the other hand, the phrase 'appearances of things', whatever defects it may have, at least implies that it is a non-mental reality which appears, and therefore that in perception we are in direct relation to it; the phrase, therefore, does not imply from the very

beginning that the apprehension of a non-mental reality is impossible.

The objection will probably be raised that this criticism is much too summary. We do, it will be said, distinguish in ordinary consciousness between appearance and reality. Consequently there must be some form in which Kant's distinction between things in themselves and phenomena and the conclusion based upon it are justified. Moreover, Kant's reiterated assertion that his view does not imply that space is an illusion, and that the distinction between the real and the illusory is possible *within* phenomena, requires us to consider more closely whether Kant may not after all be entitled to hold that space is not an illusion.

This objection is, of course, reasonable. No one can satisfy himself of the justice of the above criticisms until he has considered the real nature of the distinction between appearance and reality. This distinction must, therefore, be analysed. But before this is done it is necessary, in order to discover the real issue, to formulate the lines on which Kant may be defended. 'The reality,' it may be urged, 'which ideally we wish to know must be admitted to exist *in itself*, in the sense of independently of the perception, and consequently its nature must be admitted to be independent of perception. Ideally, then, our desire is to know things as they are in themselves, a desire sufficiently expressed by the assertion that we desire to know things, for to know them is to know them as they are, i. e. as they are independently of perception. Again, since the reality which we desire to know consists of individuals, and since the apprehension of an individual implies perception, knowledge of reality requires perception. If in perception we apprehended reality as it is, no difficulty would arise. But we do not, for we are compelled to distinguish what things are, and what they look or appear; and what they appear essentially relates to perception. We perceive them as they look or appear and, therefore, not as they are, for what they look and what they are are *ex hypothesi* distinguished. And this fact constitutes a fatal obstacle to knowledge in general. We cannot know anything as it *is*. At least the negative side of Kant's position must be justified. We never can know things as they are in themselves. What then do we know? Two alternative answers may be given. It may be held that the positive side of Kant's position, though indefensible in the form that we know things as they appear to us, is valid in the form that we know what things look or appear. This, no doubt, implies that our ordinary beliefs about reality are illusory, for what things look is *ex hypothesi* different from what they are. But the implication does not constitute an important departure from Kant's view. For in any case only that is knowledge proper which relates to things as they are, and therefore the supposed knowledge of things as they appear may be discarded without serious loss. On the other hand, it may be held that the positive side of Kant's position can be vindicated in the form that, while we do not know things in themselves, we do know the appearances which they produce in us. It is true that this view involves the difficulty of maintaining that appearances are spatial, but the difficulty is not insuperable. Moreover, in this form the doctrine has the advantage that, unlike the former, it does not imply that the knowledge which we have is only of illusions, for instead of implying that our knowledge is merely knowledge of what things look but really are not, it implies that we know the real nature of realities of another kind, viz. of appearances. Again, in this form of the view, it may be possible to vindicate Kant's doctrine that the distinction between the real and the illusory is tenable within what we know, for it may be possible to distinguish within appearances between a 'real' appearance and an 'illusory' appearance.'

An implication of this defence should be noticed. The issue relates to the nature of space, and may be stated in terms of it. For, since space is a presupposition of all other properties which the non-philosophical consciousness attributes to physical things, it makes no difference whether we say that things *only appear* heavy, hard, in motion, &c., or whether we say that things *only appear* spatial. In the same way it is a matter of indifference whether we say that, though things are not heavy, hard, &c., their appearances are so, or whether we say that, though things are not spatial, their appearances are so. The issue, then, concerns the possibility of maintaining either that things only appear spatial, or that the appearances which they produce are spatial, while the things themselves are not, or, at least cannot be

known to be, spatial.

The tenability of these alternative positions has to be considered apart from the argument of the *Aesthetic*, for this, as we have seen, breaks down. At the outset it is important to realize that these positions are the product of philosophical reflection, and constitute general theories of knowledge. As has been pointed out, the distinction between appearance and reality first arises in our ordinary or scientific consciousness. In this consciousness we are compelled to distinguish between appearance and reality with respect to the details of a reality which, as a whole, or, in principle, we suppose ourselves to know. Afterwards in our philosophical consciousness we come to reflect upon this distinction and to raise the question whether it is not applicable to reality as a whole. We ask with respect to knowledge in general, and not merely with respect to certain particular items of knowledge, whether we know or can know reality, and not merely appearance. The two positions just stated are alternative ways of answering the question in the negative. They are, then, philosophical views based upon a distinction found in our ordinary consciousness. Consequently, in order to decide whether the distinction will bear the superstructure placed upon it by the philosophical consciousness, it is necessary to examine the distinction as it exists in our ordinary consciousness.

The distinction is applied in our ordinary consciousness both to the primary and to the secondary qualities of matter, i. e. to the size, shape, position and motion of physical bodies, and to their colour, warmth, &c. We say, for instance, that the moon looks or appears as large as the sun, though really it is much smaller. We say that railway lines, though parallel, look convergent, just as we say that the straight stick in water looks bent. We say that at sunset the sun, though really below the horizon, looks above it. Again, we say that to a person who is colour blind the colour of an object looks different to what it really is, and that the water into which we put our hand may be warmer than it appears to our touch.

The case of the primary qualities may be considered first. Since the instances are identical in principle, and only differ in complexity, it will be sufficient to analyse the simplest, that of the apparent convergence of the railway lines.

Two points at once force themselves upon our notice. In the first place, we certainly suppose that we perceive the reality which we wish to know, i. e. the reality which, as we suppose, exists independently of our perception, and not an ‘appearance’ of it. It is, as we say, the real lines which we see. Even the term ‘convergent’, in the assertion that the lines look convergent, conveys this implication. For ‘convergent’ is essentially a characteristic not of an appearance but of a reality, in the sense in which something independent of perception may be opposed as a reality to an ‘appearance’, which, as such, presupposes perception. We can say neither that an appearance is convergent, nor that the appearance of the lines is convergent. Only a reality similar to the lines, e. g. two roads, can be said to be convergent. Our ordinary thought, therefore, furnishes no ground for the view that the object of perception is not the thing, but merely an appearance of or produced by it. In the second place, the assertion that the lines *look* convergent implies considerable knowledge of the real nature of the reality to which the assertion relates. Both the terms ‘lines’ and ‘convergent’ imply that the reality *is* spatial. Further, if the context is such that we mean that, while the lines look convergent, we do not know their real relation, we imply that the lines really possess some characteristic which falls within the genus to which convergence belongs, i. e. we imply that they are convergent, divergent, or parallel. If, on the other hand, the context is such that we mean that the lines only look convergent, we imply that the lines are parallel, and therefore presuppose complete knowledge in respect of the very characteristic in regard to which we state what is only appearance. The assertion, then, in respect of a primary quality, that a thing looks so and so implies knowledge of its general character as spatial, and ignorance only of a detail; and the assertion that a thing only looks or appears so and so implies knowledge of the detail in question.

Attention may now be drawn to a general difficulty which may be raised with respect to the use of the terms ‘looks’ and ‘appears’. It may be stated thus: ‘If the lines are not convergent, how is it possible even

to say that they *look* convergent? Must it not be implied that at least under *certain* circumstances we should perceive the lines as they are? Otherwise, why should we use the words ‘look’ or ‘appear’ at all? Moreover, this implication can be pushed further; for if we maintain that we perceive the real lines, we may reasonably be asked whether we must not under *all* circumstances perceive them as they are. It seems as though a reality cannot be perceived except as it is.’ It is the view to which this difficulty gives rise which is mainly responsible for the doctrine that the object of perception is not the reality, but an appearance. Since we do distinguish between what things look and what they are, it would seem that the object of perception cannot be the thing, but only an appearance produced by it. Moreover, the doctrine gains in plausibility from the existence of certain illusions in the case of which the reality to which the illusion relates seems non-existent. For instance, if we look steadily at the flame of a candle, and then press one eyeball with a finger, we see, as we say, two candles; but since *ex hypothesi* there is only one candle, it seems that what we see must be, not the candle, but two images or appearances produced by it.

This difficulty is raised in order to draw attention to the fact that, in the case of the railway lines, where it can be met on its own ground, this is because, and only because, we believe space to be ‘real’, i. e. to be a characteristic of reality, and because we understand its nature. The distinction between the actual and the apparent angle made by two straight lines presupposes a limiting case in which they coincide. If the line of sight along which we observe the point of intersection of two lines is known to be at right angles to both lines, we expect, and rightly expect, to see the angle of intersection as it is. Again, if we look at a short portion of two railway lines from a point known to be directly above them, and so distant that the effects of perspective are imperceptible, we can say that the lines look what they are, viz. parallel. Thus, from the point of view of the difficulty which has been raised, there is this justification in general for saying that two lines *look* parallel or *look* at right angles, that we know that in certain cases what they look is identical with what they are. In the same way, assertions of the type that the moon *looks* as large as the sun receive justification from our knowledge that two bodies of equal size and equally distant from the observer *are* what they look, viz. of the same size. And in both cases the justification presupposes knowledge of the reality of space and also such insight into its nature as enables us to see that in certain cases there must be an identity between what things look and what they are in respect of certain spatial relations. Again, in such cases we see that so far is it from being necessary to think that a thing must be perceived as it is, that it is not only possible but necessary to distinguish what a thing looks from what it is, and precisely in consequence of the nature of space. The visual perception of spatial relations from its very nature presupposes a particular point of view. Though the perception itself cannot be spatial, it presupposes a particular point in space as a standpoint or point of view, and is therefore subject to conditions of perspective. This is best realized by considering the supposition that perfect visual powers would enable us to see the whole of a body at once, and that this perception would be possible if we had eyes situated all round the body. The supposition obviously breaks down through the impossibility of combining two or more points of view in one perception. But if visual perception is necessarily subject to conditions of perspective, the spatial relations of bodies can never look what they are except in the limiting case referred to. Moreover, this distinction is perfectly intelligible, as we should expect from the necessity which we are under of drawing it. We understand perfectly why it is that bodies must, in respect of their spatial relations, look different to what they are, and we do so solely because we understand the nature of space, and therefore also the conditions of perspective involved in the perception of what is spatial. It is, therefore, needless to make the assertion ‘Two lines appear convergent’ intelligible by converting the verb ‘appears’ into a substantive, viz. an ‘appearance’, and then making the assertion relate to an ‘appearance’. For — apart from the fact that this would not achieve the desired end, since no suitable predicate could be found for the appearance — the assertion that the lines *look* or *appear* convergent is perfectly intelligible in itself, though not capable of being stated in terms of anything else. If we generalize this result, we may say that the distinction between appearance and reality, drawn with

regard to the primary qualities of bodies, throughout presupposes the reality of space, and is made possible, and indeed necessary, by the nature of space itself.

We may now turn to the way in which we draw the distinction with respect to the secondary qualities of physical things. It must, it seems, be admitted that in our ordinary consciousness we treat these qualities as real qualities of bodies. We say that a bell is noisy; that sugar is sweet; that roses smell; that a mustard plaster is hot; that the sky is blue. It must also be admitted that in our ordinary consciousness we draw a distinction between appearance and reality *within* these qualities, just as we do *within* the primary qualities. Just as we speak of the right or real shape of a body, so we speak of its right or real colour, taste, &c., and distinguish these from its apparent colours, taste, &c., to some individual. We thereby imply that these qualities are real qualities of bodies, and that the only difficulty is to determine the particular character of the quality in a given case. Yet, as the history of philosophy shows, it takes but little reflection to throw doubt on the reality of these qualities. The doubt arises not merely from the apparent impossibility of finding a principle by which to determine the right or real quality in a given case, but also and mainly from misgivings as to the possible reality of heat, smell, taste, noise, and colour apart from a percipient. It must also be admitted that this misgiving is well founded; in other words, that these supposed real qualities do presuppose a percipient, and therefore cannot be qualities of things, since the qualities of a thing must exist independently of the perception of the thing. This will readily be allowed in the case of all the secondary qualities except colour. No one, it may reasonably be said, who is familiar with and really faces the issue, will maintain that sounds, smells, tastes, and sensations of touch exist apart from a sensitive subject. So much is this the case, that when once the issue is raised, it is difficult and, in the end, impossible to use the word ‘appear’ in connexion with these qualities. Thus it is difficult and, in the end, impossible to say that a bell *appears* noisy, or that sugar *appears* sweet. We say, rather, that the bell and the sugar produce certain sensations in us.

The case of colour, however, is more difficult. From the closeness of its relation to the shape of bodies, it seems to be a real quality of bodies, and not something relative to a sensitive subject like the other secondary qualities. In fact, so intimate seems the relation of colour to the shape of bodies, that it would seem — as has, of course, often been argued — that if colour be relative to a sensitive subject, the primary qualities of bodies must also be relative to a sensitive subject, on the ground that shape is inseparable from colour. Yet whether this be so or not, it must, in the end, be allowed that colour does presuppose a sensitive subject in virtue of its own nature, and quite apart from the difficulty — which is in itself insuperable — of determining the right colour of individual bodies. It must, therefore, be conceded that colour is not a quality of bodies. But if this be true, the use of the term ‘look’ or ‘appear’ in connexion with colour involves a difficulty which does not arise when it is used in connexion with the primary qualities. Bodies undoubtedly look or appear coloured. Now, as has already been suggested, the term ‘look’ seems to presuppose some identity between what a thing is and what it looks, and at least the possibility of cases in which they are what they look — a possibility which, as we have seen, is realized in the case of the primary qualities. Yet, if colour is not a quality of bodies, then, with respect to colour, things look what they never are, or, in other words, are wholly different from what they look; and since it seems impossible to hold that colour is really a property of bodies, this conclusion must, in spite of its difficulty, be admitted to be true.

There remain, however, to be noticed two respects in which assertions concerning what things look in respect of colour agree with corresponding assertions in respect of the primary qualities. They imply that what we perceive is a reality, in the sense already explained. Thus the assertion that the grass looks green implies that it is a reality which looks green, or, in other words, that the object of perception is a reality, and not an ‘appearance’. Again, such assertions imply that the reality about which the assertion is made is spatial. The term ‘grass’ implies extension, and only what is extended can be said to look coloured. If it be urged that what looks coloured need only *look* extended, it may be replied that the two considerations

which lead us to think that things only *look* coloured presuppose that they *are* spatial. For the two questions, the consideration of which leads to this conclusion, are, 'What is the right or real colour of an individual thing?' and 'Has it really any colour at all, or does it only look coloured?' and neither question is significant unless the thing to which it refers is understood to be spatial.

We may now return to the main issue. Is it possible to maintain either (1) the position that only appearances are spatial and possess all the qualities which imply space, or (2) the position that things only appear spatial and only appear or look as if they possessed the qualities which imply space? It may be urged that these questions have already been implicitly answered in the negative. For the division of the qualities of things into primary and secondary is exhaustive, and, as has been shown, the distinction between 'appearance' and 'reality', when drawn with respect to the primary qualities and to colour — the only secondary quality with respect to which the term 'appears' can properly be used — presupposes the reality of space. Consequently, since we do draw the distinction, we must accept the reality of that which is the condition of drawing it at all. But even though this be conceded — and the concession is inevitable — the problem cannot be regarded as solved until we have discovered what it is in the nature of space which makes both positions untenable. Moreover, the admission that in the case of colour there is no identity between what things look and what they are removes at a stroke much of the difficulty of one position, viz. that we only know what things look or appear, and not what they are. For the admission makes it impossible to maintain as a general principle that there must be some identity between what they look and what they are. Consequently, it seems *possible* that things should be wholly different from what they appear, and, if so, the issue cannot be decided on general grounds. What is in substance the same point may be expressed differently by saying that just as things only *look* coloured, so things may only *look* spatial. We are thus again led to see that the issue really turns on the nature of space and of spatial characteristics in particular.

Cf. p-7.

Cf. .

In discussing the distinction between the real and the apparent shape of bodies, it was argued that while the nature of space makes it necessary to distinguish in general between what a body looks and what it is, yet the use of the term *look* receives justification from the existence of limiting cases in which what a thing looks and what it is are identical. The instances considered, however, related to qualities involving only two dimensions, e. g. convergence and bentness, and it will be found that the existence of these limiting cases is due solely to this restriction. If the assertion under consideration involves a term implying three dimensions, e. g. 'cubical' or 'cylindrical', there are no such limiting cases. Since our visual perception is necessarily subject to conditions of perspective, it follows that although we can and do see a cube, we can never see it as it *is*. It *is*, so to say, in the way in which a child draws the side of a house, i. e. with the effect of perspective eliminated; but it never can be seen in this way. No doubt, our unreflective knowledge of the nature of perspective enables us to allow for the effect of perspective, and to ascertain the real shape of a solid object from what it looks when seen from different points. In fact, the habit of allowing for the effect of perspective is so thoroughly ingrained in human beings that the child is not aware that he is making this allowance, but thinks that he draws the side of the house as he sees it. Nevertheless, it is true that we never see a cube as it is, and if we say that a thing looks cubical, we ought only to mean that it looks precisely what a thing looks which is a cube.

It is obvious, however, that two dimensions are only an abstraction from three, and that the spatial relations of bodies, considered fully, involve three dimensions; in other words, spatial characteristics are, properly speaking, three-dimensional. It follows that terms which fully state spatial characteristics can never express what things look, but only what they are. A body may be cylindrical, and we may see a cylindrical body; but such a body can never, strictly speaking, *look* cylindrical. The opposition, however, between what a thing *is* and what it *looks* implies that what it *is* is independent of a percipient, for it is

precisely correlation to a percipient which is implied by ‘looking’ or ‘appearing’. In fact, it is the view that what a thing really is it is, independently of a percipient, that forms the real starting-point of Kant’s thought. It follows, then, that the spatial characteristics of things, and therefore space itself, must belong to what they are in themselves apart from a percipient, and not to what they look. Consequently, it is so far from being true that we only know what things look and not what they are, that in the case of spatial relations we actually know what things are, even though they never look what they are.

This conclusion, however, seems to present a double difficulty. It is admitted that we perceive things as they look, and not as they are. How, then, is it possible for the belief that things *are* spatial to arise? For how can we advance from knowledge of what they look to knowledge of what they are but do not look? Again, given that the belief has arisen, may it not after all be illusion? No vindication seems possible. For how can it be possible to base the knowledge of what things are, independently of perception, upon the knowledge of what they look? Nevertheless, the answer is simple. In the case of the perception of what is spatial there is no transition *in principle* from knowledge of what things look to knowledge of what things are, though there is continually such a transition *in respect of details*. It is, of course, often necessary, and often difficult, to determine the precise position, shape, &c., of a thing, and if we are to come to a decision, we must appeal to what the thing looks or appears under various conditions. But, from the very beginning, our consciousness of what a thing appears in respect of spatial characteristics implies the consciousness of it as spatial and therefore also as, in particular, three-dimensional. If we suppose the latter consciousness absent, any assertion as to what a thing appears in respect of spatial characteristics loses significance. Thus, although there is a process by which we come to learn that railway lines are really parallel, there is no process by which we come to learn that they are really spatial. Similarly, although there is a process by which we become aware that a body is a cube, there is no process by which we become aware that it has a solid shape of some kind; the process is only concerned with the determination of the precise shape of the body. The second difficulty is, therefore, also removed. For if assertions concerning the apparent shape, &c. of things presuppose the consciousness that the things *are* spatial, to say that this consciousness may be illusory is to say that all statements concerning what things *appear*, in respect of spatial relations, are equally illusory. But, since it is wholly impossible to deny that we can and do state what things appear in this respect, the difficulty must fall to the ground.

There remains to be answered the question whether Kant’s position is tenable in its other form, viz. that while we cannot say that reality is spatial, we can and must say that the appearances which it produces are spatial. This question, in view of the foregoing, can be answered as soon as it is stated. We must allow that reality is spatial, since, as has been pointed out, assertions concerning the apparent shape of things presuppose that they are spatial. We must equally allow that an appearance cannot be spatial. For on the one hand, as has just been shown, space and spatial relations can only qualify something the existence of which is not relative to perception, since it is impossible to perceive what is spatial as it is; and on the other hand an appearance, as being *ex hypothesi* an appearance to some one, i. e. to a percipient, must be relative to perception.

We may say, then, generally, that analysis of the distinction between appearance and reality, as it is actually drawn in our ordinary consciousness, shows the falsity of both forms of the philosophical agnosticism which appeals to the distinction. We know things; not appearances. We know what things are; and not merely what they appear but are not. We may also say that Kant cannot possibly be successful in meeting, at least in respect of space, what he calls ‘the easily foreseen but worthless objection that the ideality of space and of time would turn the whole sensible world into pure illusion’. For space, according to him, is not a property of things in themselves; it cannot, as has been shown, be a property of appearances; to say that it is a property of things as they appear to us is self-contradictory; and there is nothing else of which it can be said to be a property.

In conclusion, it may be pointed out that the impossibility that space and spatial characteristics should

qualify appearances renders untenable Kant's attempt to draw a distinction between reality and appearance *within* 'phenomena' or 'appearances'. The passage in which he tries to do so runs as follows:

"We generally indeed distinguish in appearances that which essentially belongs to the perception of them, and is valid for every human sense in general, from that which belongs to the same perception accidentally, as valid not for the sensibility in general, but for a particular state or organization of this or that sense. Accordingly, we are accustomed to say that the former is knowledge which represents the object itself, whilst the latter represents only the appearance of the same. This distinction, however, is only empirical. If we stop here (as is usual) and do not again regard that empirical perception as itself a mere phenomenon (as we ought to do), in which nothing which concerns a thing in itself is to be found, our transcendental distinction is lost; and in that case we are after all believing that we know things in themselves, although in the world of sense, investigate its objects as profoundly as we may, we have to do with nothing but appearances. Thus we call the rainbow a mere appearance during a sunny shower, but the rain the thing in itself; and this is right, if we understand the latter conception only physically as that which in universal experience and under all different positions with regard to the senses is in perception so and so determined and not otherwise. But if we consider this empirical element in general, and inquire, without considering its agreement with every human sense, whether it represents an object in itself (not the raindrops, for their being phenomena by itself makes them empirical objects), the question of the relation of the representation to the object is transcendental; and not only are the raindrops mere appearances, but even their circular form, nay, even the space in which they fall, are nothing in themselves but mere modifications or fundamental dispositions of our sensuous perception; the transcendental object, however, remains unknown to us."

Kant's meaning is plain. He is anxious to justify the physical distinction made in our ordinary or non-philosophical consciousness between a thing in itself and a mere appearance, but at the same time to show that it falls within appearances, in respect of the philosophical distinction between things in themselves and appearances or phenomena. The physical distinction is the first of which we become aware, and it arises through problems connected with our senses. Owing, presumably, to the contradictions which would otherwise ensue, the mind is forced to distinguish between things and the 'appearances' which they produce, and to recognize that they do not correspond. The discrepancy is due to the fact that our perceptions are conditioned by the special positions of our physical organs with regard to the object of perception, and we discover its real nature by making allowance for these special positions. We thereby advance in knowledge to the extent of overcoming an obstacle due to the nature of our senses. But, this obstacle overcome, philosophical reflection forces upon us another. The thing which we distinguish in our ordinary consciousness from its appearances is, after all, only another appearance; and although the physical problem is solved concerning its accordance with our special senses, there remains the philosophical problem as to whether this appearance need correspond to what in the end is the real thing, viz. that which exists in itself and apart from all perception. The only possible answer is that it need not. We therefore can only know appearances and not reality; in other words, we cannot have knowledge proper. At the same time, our knowledge of appearances is objective to the extent that the appearances in question are the same for every one, and for us on various occasions; for the effects due to special positions of our senses have been removed. If, therefore, we return to the physical distinction, we see that the 'things' to which it refers are only a special kind of appearance, viz. that which is the same for every one, and for us at all times. The physical distinction, then, being a distinction between one kind of appearance and another, falls within 'phenomena' or 'appearances'.

Now the obvious objection to this line of thought is that the result of the second or metaphysical application of the distinction between reality and appearance is to destroy or annul the first or physical application of it. To oppose the rain, i. e. the raindrops as the thing in itself to the rainbow as a mere appearance is to imply that the rain is not an appearance. For though what is opposed to a *mere*

appearance may still be an appearance, it cannot be called an appearance at all if it be described as the thing in itself. If it be only another appearance, it is the same in principle as that to which it is opposed, and consequently cannot be opposed to it. Thus, if Kant means by the rain, in distinction from the rainbow, the appearance when, as we say, we see the circular raindrops, the title of this appearance to the term thing in itself is no better than that of the rainbow; it is, in fact, if anything, worse, for the appearance is actual only under exceptional circumstances. We may never see the raindrops thus, or in Kant's language, have this 'appearance'; and therefore, in general, an appearance of this kind is not actual but only possible. The truth is that we can only distinguish something as the thing in itself from an appearance, so long as we mean by the thing in itself what Kant normally means by it, viz. something which exists independently of perception and is not an appearance at all. That of which Kant is really thinking, and which he *calls* the appearance which is the thing, in distinction from a mere appearance, is not an appearance; on the contrary, it is the raindrops themselves, which he describes as circular and as falling through space, and which, as circular and falling, must exist and have these characteristics in themselves apart from a percipient. Kant's formula for an empirical thing, i. e. a thing which is an appearance, viz. 'that which in universal experience and under all different positions with regard to the senses is in perception so and so determined', is merely an attempt to achieve the impossible, viz. to combine in one the characteristics of a thing and an appearance. While the reference to *perception* and to *position with regard to the senses* implies that what is being defined is an appearance, the reference to *universal* experience, to *all* positions with regard to the senses, and to that which *is so and so determined* implies that it is a thing. But, plainly, mention of position with regard to the senses, if introduced at all, should refer to the *differences* in perception due to the different position of the object in particular cases. There is nothing of which it can be said that we perceive it in the same way or that it looks the same from *all* positions. When Kant speaks of that which under *all* different positions with regard to the senses is so and so determined, he is really referring to something in the consideration of which all reference to the senses has been discarded; it is what should be described as that which *in reality and apart from* all positions with regard to the senses is so and so determined; and this, as such, cannot be an appearance. Again, the qualification of 'is so and so determined' by 'in perception' is merely an attempt to treat as relative to perception, and so as an appearance, what is essentially independent of perception. Kant, no doubt, is thinking of a real presupposition of the process by which we distinguish between the real and the apparent qualities of bodies, i. e. between what they are and what they appear. We presuppose that that quality is really, and not only apparently, a quality of a body, which we and every one, judging from what it looks under various conditions (i. e. 'in universal experience'), must believe it to possess in itself and independently of all perception. His mistake is that in formulating this presupposition he treats as an appearance, and so as relative to perception, just that which is being distinguished from what, as an appearance, is relative to perception.

Underlying the mistake is the identification of perception with judgement. Our apprehension of what things *are* is essentially a matter of thought or judgement, and not of perception. We do not *perceive* but *think* a thing as it is. It is true that we can follow Kant's language so far as to say that our judgement that the portion of the great circle joining two points on the surface of a sphere is the shortest way between them *via* the surface belongs essentially to the thinking faculty of every intelligent being, and also that it is valid for all intelligences, in the sense that they must all hold it to be true; and we can contrast this judgement with a perception of the portion of the great circle as something which, though it cannot be said to be invalid, still differs for different beings according to the position from which they perceive it. Kant, however, treats the judgement as a *perception*; for if we apply his general assertion to this instance, we find him saying that what we judge the portion of the great circle to be essentially belongs to the *perception* of it, and is valid for the *sensuous* faculty of every human being, and that thereby it can be distinguished from what belongs to the same perception of a great circle accidentally, e. g. its apparent

colour, which is valid only for a particular organization of this or that sense. In this way he correlates what the great circle really is, as well as what it looks, with perception, and so is able to speak of what it is for perception. But, in fact, what the great circle is, is correlated with thought, and not with perception; and if we raise Kant's transcendental problem in reference not to perception but to thought, it cannot be solved in Kant's agnostic manner. For it is a presupposition of thinking that things are in themselves what we think them to be; and from the nature of the case a presupposition of thinking not only cannot be rightly questioned, but cannot be questioned at all.

NOTE ON THE FIRST ANTINOMY

Kant holds that the antinomy or contradiction which arises when we consider the character of the world as spatial and temporal, viz. that we are equally bound to hold that the world is infinite in space and time, and that it is finite in space and time, is due to regarding the world as a thing in itself. He holds that the contradiction disappears, as soon as it is recognized that the world is only a phenomenon, for then we find that we need only say that the world is *capable* of being extended infinitely in respect of time and space. Objects in space and time are only phenomena, and, as such, are actual only in perception. When we say that a past event, or that a body which we do not perceive, is real, we merely assert the possibility of a 'perception'. "All events from time immemorial prior to my existence mean nothing else than the possibility of prolonging the chain of experience from the present perception upwards to the conditions which determine this perception according to time." "That there may be inhabitants of the moon, although no one has ever seen them, must certainly be admitted, but this assertion only means that we could come upon them in the possible progress of experience." The contradictions, therefore, can be avoided by substituting for the actual infinity of space and time, as relating to things in themselves, the possible infinity of a series of 'perceptions'.

This contention, if successful, is clearly important. If it could be shown that the treatment of the world as a thing in itself is the source of a contradiction, we should have what at least would seem a strong, if not conclusive, ground for holding that the world is a phenomenon, and, consequently, that the distinction between phenomena and things in themselves is valid.

Professor Cook Wilson has, however, pointed out that Kant's own doctrine does not avoid the difficulty. For, though, according to Kant, the infinity of actual representations of spaces and times is only possible, yet the possibilities of these representations will be themselves infinite, and, as such, will give rise to contradictions similar to those involved in the infinity of space and time. Moreover, as Professor Cook Wilson has also pointed out, there is no contradiction involved in the thought of the world as spatial and temporal; for, as we see when we reflect, we always presuppose that space and time are infinite, and we are only tempted to think that they must be finite, because, when maintaining that the world must be a whole, we are apt to make the false assumption, without in any way questioning it, that any whole must be finite.

CHAPTER V. TIME AND INNER SENSE

The arguments by which Kant seeks to show that time is not a determination of things in themselves but only a form of perception are, *mutatis mutandis*, identical with those used in his treatment of space. They are, therefore, open to the same criticisms, and need no separate consideration.

Time, however, according to Kant, differs from space in one important respect. It is the form not of outer but of inner sense; in other words, while space is the form under which we perceive things, time is the form under which we perceive ourselves. It is upon this difference that attention must be concentrated. The existence of the difference at all is upon general grounds surprising. For since the arguments by which Kant establishes the character of time as a form of perception run *pari passu* with those used in the case of space, we should expect time, like space, to be a form under which we perceive things; and, as a matter of fact, it will be found that the only *argument* used to show that time is the form of inner, as opposed to outer, sense is not only independent of Kant's general theory of forms of sense, but is actually inconsistent with it. Before, however, we attempt to decide Kant's right to distinguish between inner and outer sense, we must consider the facts which were before Kant's mind in making the distinction.

These facts and, to a large extent, the frame of mind in which Kant approached them, find expression in the passage in Locke's *Essay*, which explains the distinction between 'ideas of sensation' and 'ideas of reflection'.

"Whence has it [i. e. the mind] all the materials of reason and knowledge? To this I answer, in one word, from experience.... Our observation, employed either about external, sensible objects, or about the internal operations of our minds, perceived and reflected on, by ourselves, is that which supplies our understandings with all the materials of thinking. These two are the fountains of knowledge...."

"First, Our senses, conversant about particular sensible objects, do convey into the mind several distinct perceptions of things, according to those various ways, wherein those objects do affect them: and thus we come by those ideas we have of Yellow, White, Heat, Cold, Soft, Hard, Bitter, Sweet, and all those, which we call sensible qualities; which, when I say the senses convey into the mind, I mean, they, from external objects, convey into the mind what produces there those perceptions. This great source of most of the ideas we have, depending wholly upon our senses, and derived by them to the understanding, I call *sensation*."

"Secondly, The other fountain, from which experience furnisheth the understanding with ideas, is the perception of the operations of our own mind within us, as it is employed about the ideas it has got; which operations, when the soul comes to reflect on, and consider, do furnish the understanding with another set of ideas, which could not be had from things without; and such are Perception, Thinking, Doubting, Believing, Reasoning, Knowing, Willing, and all the different actings of our own minds; which we being conscious of, and observing in ourselves, do, from these, receive into our understandings as distinct ideas, as we do from bodies affecting our senses. This source of ideas every man has wholly in himself; and though it be not sense as having nothing to do with external objects, yet it is very like it, and might properly enough be called internal sense. But, as I call the other sensation, so I call this *reflection*; the ideas it affords being such only as the mind gets, by reflecting on its own operations within itself."

Here Locke is thinking of the distinction between two attitudes of mind, which, however difficult it may be to state satisfactorily, must in some sense be recognized. The mind, undoubtedly, in virtue of its powers of perceiving and thinking — or whatever they may be — becomes through a temporal process aware of a spatial world in its varied detail. In the first instance, its attention is absorbed in the world of which it thus becomes aware; subsequently, however, it is in some way able to direct its attention away from this world to the activities in virtue of which it has become aware of this world, and in some sense to make

itself its own object. From being conscious it becomes self-conscious. This process by which the mind turns its attention back upon itself is said to be a process of ‘reflection’. While we should say that it is by perception that we become aware of things in the physical world, we should say that it is by reflection that we become aware of our activities of perceiving, thinking, willing, &c. Whatever difficulties the thought of self-consciousness may involve, and however inseparable, and perhaps even temporally inseparable, the attitudes of consciousness and self-consciousness may turn out to be, the distinction between these attitudes must be recognized. The object of the former is the world, and the object of the latter is in some sense the mind itself; and the attitudes may be described as that of our ordinary, scientific, or unreflecting consciousness and that of reflection.

The significance of Locke’s account of this distinction lies for our purposes in its anticipation of Kant. He states the second attitude, as well as the first, in terms of sense. Just as in our apprehension of the world things external to, in the sense of existing independently of, the mind are said to act on our physical organs or ‘senses’, and thereby to produce ‘perceptions’ in the mind, so the mind is said to become conscious of its own operations by ‘sense’. We should notice, however, that Locke hesitates to use the word ‘sense’ in the latter case, on the ground that it involves no operation of external things (presumably upon our physical organs), though he thinks that the difficulty is removed by calling the sense in question ‘internal’.

Kant is thinking of the same facts, and also states them in terms of sense, though allowance must be made for the difference of standpoint, since for him ‘sense’, in the case of the external sense, refers not to the affection of our physical organs by physical bodies, but to the affection of the mind by things in themselves. Things in themselves act on our minds and produce in them appearances, or rather sensations, and outer sense is the mind’s capacity for being so affected by outer things, i. e. things independent of the mind. This is, in essentials, Kant’s statement of the attitude of consciousness, i. e. of our apprehension of the world which exists independently of the mind, and which, for him, is the world of things in themselves. He also follows Locke in giving a parallel account of the attitude of self-consciousness. He asks, ‘How can the subject perceive itself?’ Perception *in man* is essentially passive; the mind must be *affected* by that which it perceives. Consequently, if the mind is to perceive itself, it must be affected by its own activity; in other words, there must be an inner sense, i. e. a capacity in virtue of which the mind is affected by itself. Hence Kant is compelled to extend his agnosticism to the knowledge of ourselves. Just as we do not know things, but only the appearances which they produce in us, so we do not know ourselves, but only the appearances which we produce in ourselves; and since time is a mode of relation of these appearances, it is a determination not of ourselves, but only of the appearances due to ourselves.

The above may be said to represent the train of thought by which Kant arrived at his doctrine of time and the inner sense. It was reached by combining recognition of the fact that we come to be aware not only of the details of the physical world, but also of the successive process on our part by which we have attained this knowledge, with the view that our apprehension of this successive process is based on ‘sense’, just as is our apprehension of the world. But the question remains whether Kant is, on his own principles, entitled to speak of an inner sense at all. According to him, knowledge begins with the production in us of sensations, or, as we ought to say in the present context, appearances by the action of things in themselves. These sensations or appearances can reasonably be ascribed to external sense. They may be ascribed to sense, because they arise through our being *affected* by things in themselves. The sense may be called external, because the object affecting it is external to the mind, i. e. independent of it. In conformity with this account, internal sense must be the power of being affected by something internal to the mind, i. e. dependent upon the mind itself, and since being affected implies the activity of affecting, it will be the power of being affected by the mind’s own activity. The activity will presumably be that of arranging spatially the sensations or appearances due to things in themselves. This activity must be said to produce an affection in us, the affection being an appearance due to ourselves. Lastly, the mind must be

said to arrange these appearances temporally. Hence it will be said to follow that we know only the appearances due to ourselves and not ourselves, and that time is only a determination of these appearances.

The weakness of the position just stated lies on the surface. It provides no means of determining whether any affection produced in us is produced by ourselves rather than by the thing in itself; consequently we could never say that a given affection was an appearance due to *ourselves*, and therefore to *inner* sense. On the contrary, we should ascribe all affections to things in themselves, and should, therefore, be unable to recognize an *inner* sense at all. In order to recognize an inner sense we must know that certain affections are due to *our* activity, and, to do this, we must know what the activity consists in — for we can only be aware that we are active by being aware of an activity of ours of a particular kind — and, therefore, we must know ourselves. Unless, then, we know ourselves, we cannot call any affections internal.

If, however, the doctrine of an internal sense is obviously untenable from Kant's own point of view, why does he hold it? The answer is that, inconsistently with his general view, he continues to think of the facts as they really are, and that he is deceived by an ambiguity into thinking that the facts justify a distinction between internal and external sense.

He brings forward only one argument to show that time is the form of the internal sense. "Time is nothing else than the form of the internal sense, i. e. of the perception of ourselves and our inner state. For time cannot be any determination of external phenomena; it has to do neither with a shape nor a position; on the contrary, it determines the relation of representations in our internal state."

To follow this argument it is first necessary to realize a certain looseness and confusion in the expression of it. The term 'external', applied to phenomena, has a double meaning. It must mean (1) that of which the parts are external to one another, i. e. spatial; for the ground on which time is denied to be a determination of external phenomena is that it has nothing to do with a shape or a position. It must also mean (2) external to, in the sense of independent of, the mind; for it is contrasted with our internal state, and if 'internal', applied to 'our state', is not to be wholly otiose, it can only serve to emphasize the contrast between our state and something external to in the sense of independent of us. Again, 'phenomena,' in the phrase 'external phenomena', can only be an unfortunate expression for things independent of the mind, these things being here called phenomena owing to Kant's view that bodies in space are phenomena. Otherwise, 'phenomena' offers no contrast to 'our state' and to 'representations'. The passage, therefore, presupposes a distinction between states of ourselves and things in space, the former being internal to, or dependent upon, and the latter external to, or independent of, the mind.

It should now be easy to see that the argument involves a complete *non sequitur*. The conclusion which is justified is that time is a form not of things but of our own states. For the fact to which he appeals is that while things, as being spatial, are not related temporally, our states are temporally related; and if 'a form' be understood as a mode of relation, this fact can be expressed by the formula 'Time is a form not of things but of our own states', the corresponding formula in the case of space being 'Space is a form not of our states but of things'. But the conclusion which Kant desires to draw — and which he, in fact, actually draws — is the quite different conclusion that time is a form of *perception* of our states, the corresponding conclusion in the case of space being that space is a form of perception of things. For time is to be shown to be the form of inner sense, i. e. the form of the perception of what is internal to ourselves, i. e. of our own states. The fact is that the same unconscious transition takes place in Kant's account of time which, as we saw, takes place in his account of space. In the case of space, Kant passes from the assertion that space is a form of things, in the sense that all things are spatially related — an assertion which he expresses by saying that space is the form of phenomena — to the quite different assertion that space is a form of perception, in the sense of a way in which we perceive things as opposed to a way in which things are. Similarly, in the case of time, Kant passes from the assertion that time is the

form of our internal states, in the sense that all our states are temporally related, to the assertion that time is a way in which we perceive our states as opposed to a way in which our states really are. Further, the two positions, which he thus fails to distinguish, are not only different, but incompatible. For if space is a form of things, and time is a form of our states, space and time cannot belong only to our mode of perceiving things and ourselves respectively, and not to the things and ourselves; for *ex hypothesi* things *are* spatially related, and our states *are* temporally related.

Kant's procedure, therefore, may be summed up by saying that he formulates a view which is true but at the same time inconsistent with his general position, the view, viz. that while things in space are not temporally related, the acts by which we come to apprehend them are so related; and further, that he is deceived by the verbally easy transition from a legitimate way of expressing this view, viz. that time is the form of our states, to the desired conclusion that time is the form of inner sense.

The untenable character of Kant's position with regard to time and the knowledge of ourselves can be seen in another way. It is not difficult to show that, in order to prove that we do not know *things*, but only the appearances which they produce, we must allow that we do know *ourselves*, and not appearances produced by ourselves, and, consequently, that time is real and not phenomenal. To show this, it is only necessary to consider the objection which Kant himself quotes against his view of time. The objection is important in itself, and Kant himself remarks that he has heard it so unanimously urged by intelligent men that he concludes that it must naturally present itself to every reader to whom his views are novel. According to Kant, it runs thus: "Changes are real (this is proved by the change of our own representations, even though all external phenomena, together with their changes, be denied). Now changes are only possible in time; therefore time is something real." And he goes on to explain why this objection is so unanimously brought, even by those who can bring no intelligible argument against the ideality of space. "The reason is that men have no hope of proving apodeictically the absolute reality of space, because they are confronted by idealism, according to which the reality of external objects is incapable of strict proof, whereas the reality of the object of our internal senses (of myself and my state) is immediately clear through consciousness. External objects might be mere illusion, but the object of our internal senses is to their mind undeniably something real."

Here, though Kant does not see it, he is faced with a difficulty from which there is no escape. On the one hand, according to him, we do not know things in themselves, i. e. things independent of the mind. In particular, we cannot know that they are spatial; and the objection quoted concedes this. On the other hand, we do know phenomena or the appearances produced by things in themselves. Phenomena or appearances, however, as he always insists, are essentially states or determinations of the mind. To the question, therefore, 'Why are we justified in saying that we do know phenomena, whereas we do not know the things which produce them?' Kant could only answer that it is because phenomena are dependent upon the mind, as being its own states. As the objector is made to say, 'the reality of the object of our internal senses (of myself and my state) is immediately clear through consciousness.' If we do not know things in themselves, because they are independent of the mind, we only know phenomena because they are dependent upon the mind. Hence Kant is only justified in denying that we know things in themselves if he concedes that we really know our own states, and not merely appearances which they produce.

Again, Kant must allow — as indeed he normally does — that these states of ours are related by way of succession. Hence, since these states are really our states and not appearances produced by our states, these being themselves unknown, time, as a relation of these states, must itself be real, and not a way in which we apprehend what is real. It must, so to say, be really in what we apprehend about ourselves, and not put into it by us as perceiving ourselves.

The objection, then, comes to this. Kant must at least concede that we undergo a succession of changing states, even if he holds that *things*, being independent of the mind, cannot be shown to undergo such a

succession; consequently, he ought to allow that time is not a way in which we apprehend ourselves, but a real feature of our real states. Kant's answer does not meet the point, and, in any case, proceeds on the untenable assumption that it is possible for the characteristic of a thing to belong to it as perceived, though not in itself.

CHAPTER VI. KNOWLEDGE AND REALITY

Kant's theory of space, and, still more, his theory of time, are bewildering subjects. It is not merely that the facts with which he deals are complex; his treatment of them is also complicated by his special theories of 'sense' and of 'forms of perception'. Light, however, may be thrown upon the problems raised by the *Aesthetic*, and upon Kant's solution of them, in two ways. In the first place, we may attempt to vindicate the implication of the preceding criticism, that the very nature of knowledge presupposes the independent existence of the reality known, and to show that, in consequence, all idealism is of the variety known as subjective. In the second place, we may point out the way in which Kant is misled by failing to realize (1) the directness of the relation between the knower and the reality known, and (2) the impossibility of transferring what belongs to one side of the relation to the other.

The question whether any reality exists independently of the knowledge of it may be approached thus. The standpoint of the preceding criticism of Kant may be described as that of the plain man. It is the view that the mind comes by a temporal process to apprehend or to know a spatial world which exists independently of it or of any other mind, and that the mind knows it as it exists in the independence. 'Now this view,' it may be replied, 'is exposed to at least one fatal objection. It presupposes the possibility of knowing the thing in itself, i. e. something which exists independently of the mind which comes to know it. Whatever is true, this is not. Whatever be the criticism to which Kant's doctrine is exposed in detail, it contains one inexpugnable thesis, viz. that the thing in itself cannot be known. Unless the physical world stands in essential relation to the mind, it is impossible to understand how it can be known. This position being unassailable, any criticism of an idealistic theory must be compatible with it, and therefore confined to details. Moreover, Kant's view can be transformed into one which will defy criticism. Its unsatisfactory character lies in the fact that in regarding the physical world as dependent on the mind, it really alters the character of the world by reducing the world to a succession of 'appearances' which, as such, can only be mental, i. e. can only belong to the mind's own being. Bodies, as being really appearances in the mind, are regarded as on the level of transitory mental occurrences, and as thereby at least resembling feelings and sensations. This consequence, however, can be avoided by maintaining that the real truth after which Kant was groping was that knower and known form an inseparable unity, and that, therefore, any reality which is not itself a knower, or the knowing of a knower, presupposes a mind which knows it. In that case nothing is suggested as to the special nature of the reality known, and, in particular, it is not implied to be a transitory element of the mind's own being. The contention merely attributes to any reality, conceived to have the special nature ordinarily attributed to it, the additional characteristic that it is known. Consequently, on this view, the physical world can retain the permanence ordinarily attributed to it. To the objection that, at any rate, *our* knowledge is transitory, and that if the world is relative to it the world also must be transitory, it may be replied — though with some sense of uneasiness — that the world must be considered relative not to us as knowers, but to a knower who knows always and completely, and whose knowing is in some way identical with ours. Further, the view so transformed has two other advantages. In the first place, it renders it possible to dispense with what has been called the Mrs. Harris of philosophy, the thing in itself. As Kant states his position, the thing in itself must be retained, for it is impossible to believe that there is no reality other than what is mental. But if the physical world need not be considered to be a succession of mental occurrences, it can be considered to be the reality which is not mental. In the second place, knowledge proper is vindicated, for on this view we do not know 'only' phenomena; we know the reality which is not mental, and we know it as it is, for it is as object of knowledge.'

'Moreover, the contention must be true, and must form the true basis of idealism. For the driving force

of idealism is furnished by the question, ‘How can the mind and reality come into the relation which we call knowledge?’ This question is unanswerable so long as reality is thought to stand in no essential relation to the knowing mind. Consequently, in the end, knowledge and reality must be considered inseparable. Again, even if it be conceded that the mind in some way gains access to an independent reality, it is impossible to hold that the mind can really know it. For the reality cannot in the relation of knowledge be what it is apart from this relation. It must become in some way modified or altered in the process. Hence the mind cannot on this view know the reality as it is. On the other hand, if the reality is essentially relative to a knower, the knower knows it as it is, for what it is is what it is in this relation.’

The fundamental objection, however, to this line of thought is that it contradicts the very nature of knowledge. Knowledge unconditionally presupposes that the reality known exists independently of the knowledge of it, and that we know it as it exists in this independence. It is simply *impossible* to think that any reality depends upon our knowledge of it, or upon any knowledge of it. If there is to be knowledge, there must first *be* something to be known. In other words, knowledge is essentially discovery, or the finding of what already is. If a reality could only be or come to be in virtue of some activity or process on the part of the mind, that activity or process would not be ‘knowing’, but ‘making’ or ‘creating’, and to make and to know must in the end be admitted to be mutually exclusive.

This presupposition that what is known exists independently of being known is quite general, and applies to feeling and sensation just as much as to parts of the physical world. It must in the end be conceded of a toothache as much as of a stone that it exists independently of the knowledge of it. There must be a pain to be attended to or noticed, which exists independently of our attention or notice. The true reason for asserting feeling and sensation to be dependent on the mind is that they presuppose not a knowing, but a feeling and a sentient subject respectively. Again, it is equally presupposed that knowing in no way alters or modifies the thing known. We can no more think that in apprehending a reality we do not apprehend it as it is apart from our knowledge of it, than we can think that its existence depends upon our knowledge of it. Hence, if ‘things in themselves’ means ‘things existing independently of the knowledge of them’, knowledge is essentially of ‘things in themselves’. It is, therefore, unnecessary to consider whether idealism is assisted by the supposition of a non-finite knowing mind, correlated with reality as a whole. For reality must equally be independent of it. Consequently, if the issue between idealism and realism is whether the physical world is or is not dependent on the mind, it cannot turn upon a dependence in respect of knowledge.

That the issue does not turn upon knowledge is confirmed by our instinctive procedure when we are asked whether the various realities which we suppose ourselves to know depend upon the mind. Our natural procedure is not to treat them simply as realities and to ask whether, as realities, they involve a mind to know them, but to treat them as realities of the particular kind to which they belong, and to consider relation to the mind of some kind other than that of knowledge. We should say, for instance, that a toothache or an emotion, as being a feeling, presupposes a mind capable of feeling, whose feeling it is; for if the mind be thought of as withdrawn, the pain or the feeling must also be thought of as withdrawn. We should say that an act of thinking presupposes a mind which thinks. We should, however, naturally deny that an act of thinking or knowing, in order to be, presupposes that it is known either by the thinker whose act it is, or by any other mind. In other words, we should say that knowing presupposes a mind, not as something which *knows* the knowing, but as something which *does* the knowing. Again, we should naturally say that the shape or the weight of a stone is *not* dependent on the mind which perceives the stone. The shape, we should say, would disappear with the disappearance of the stone, but would not disappear with the disappearance of the mind which perceives the stone. Again, we should assert that the stone itself, so far from depending on the mind which perceives it, has an independent being of its own. We might, of course, find difficulty in deciding whether a reality of some particular kind, e. g. a colour, is dependent on a mind. But, in any case, we should think that the ground for decision lay in the special

character of the reality in question, and should not treat it merely as a reality related to the mind as something known. We should ask, for instance, whether a colour, as a colour, involves a mind which sees, and not whether a colour, as a reality, involves its being known. Our natural procedure, then, is to divide realities into two classes, those which depend on a mind, and may therefore be called mental, and those which do not, and to conclude that some realities depend upon the mind, while others do not. We thereby ignore a possible dependence of realities on their being known; for not only is the dependence which we recognize of some other kind, e. g. in respect of feeling or sentience, but if the dependence were in respect of knowledge, we could not distinguish in respect of dependence between one reality and another.

Further, if reality be allowed to exist independently of knowledge, it is easy to see that, from the idealist's point of view, Kant's procedure was essentially right, and that all idealism, when pressed, must prove subjective; in other words, that the idealist must hold that the mind can only know what is mental and belongs to its own being, and that the so-called physical world is merely a succession of appearances. Moreover, our instinctive procedure is justified. For, in the first place, since it is impossible to think that a reality depends for its existence upon being known, it is impossible to reach an idealistic conclusion by taking into account relation by way of knowledge; and if this be the relation considered, the only conclusion can be that all reality is independent of the mind. Again, since knowledge is essentially of reality as it is apart from its being known, the assertion that a reality is dependent upon the mind is an assertion of the kind of thing which it is in itself, apart from its being known. And when we come to consider what we mean by saying of a reality that it depends upon the mind, we find we mean that it is in its own nature of such a kind as to disappear with the disappearance of the mind, or, more simply, that it is of the kind called mental. Hence, we can only decide that a particular reality depends upon the mind by appeal to its special character. We cannot treat it simply as a reality the relation of which to the mind is solely that of knowledge. And we can only decide that all reality is dependent upon the mind by appeal to the special character of all the kinds of reality of which we are aware. Hence, Kant in the *Aesthetic*, and Berkeley before him, were essentially right in their procedure. They both ignored consideration of the world simply as a reality, and appealed exclusively to its special character, the one arguing that in its special character as spatial and temporal it presupposed a percipient, and the other endeavouring to show that the primary qualities are as relative to perception as the secondary. Unfortunately for their view, in order to think of bodies in space as dependent on the mind, it is necessary to think of them as being in the end only certain sensations or certain combinations of sensations which may be called appearances. For only sensations or combinations of them can be thought of as at once dependent on the mind, and capable with any plausibility of being identified with bodies in space. In other words, in order to think of the world as dependent on the mind, we have to think of it as consisting only of a succession of appearances, and in fact Berkeley, and, at certain times, Kant, did think of it in this way.

That this is the inevitable result of idealism is not noticed, so long as it is supposed that the essential relation of realities to the mind consists in their being known; for, as we have seen, nothing is thereby implied as to their special nature. To say of a reality that it is essentially an object of knowledge is merely to add to the particular nature ordinarily attributed to the existent in question the further characteristic that it must be known. Moreover, since in fact, though contrary to the theory, any reality exists independently of the knowledge of it, when the relation thought of between a reality and the mind is *solely* that of knowledge, the realities can be thought of as independent of the mind. Consequently, the physical world can be thought to have that independence of the mind which the ordinary man attributes to it, and, therefore, need not be conceived as only a succession of appearances. But the advantage of this form of idealism is really derived from the very fact which it is the aim of idealism in general to deny. For the conclusion that the physical world consists of a succession of appearances is only avoided by taking into account the relation of realities to the mind by way of knowledge, and, then, without being aware of the inconsistency, making use of the independent existence of the reality known.

Again, that the real contrary to realism is *subjective* idealism is confirmed by the history of the theory of knowledge from Descartes onwards. For the initial supposition which has originated and sustained the problem is that in knowledge the mind is, at any rate in the first instance, confined within itself. This supposition granted, it has always seemed that, while there is no difficulty in understanding the mind's acquisition of knowledge of what belongs to its own being, it is difficult, if not impossible, to understand how it can acquire knowledge of what does not belong to its own being. Further, since the physical world is ordinarily thought of as something which does not belong to the mind's own being, the problem has always been not 'How is it possible to know anything?' but 'How is it possible to know a particular kind of reality, viz. the physical world?' Moreover, in consequence of the initial supposition, any answer to this question has always presupposed that our apprehension of the physical world is indirect. Since *ex hypothesi* the mind is confined within itself, it can only apprehend a reality independent of it through something within the mind which 'represents' or 'copies' the reality; and it is perhaps Hume's chief merit that he showed that no such solution is possible, or, in other words, that, on the given supposition, knowledge of the physical world is impossible.

Now the essential weakness of this line of thought lies in the initial supposition that the mind can only apprehend what belongs to its own being. It is as much a fact of our experience that we directly apprehend bodies in space, as that we directly apprehend our feelings and sensations. And, as has already been shown, what is spatial cannot be thought to belong to the mind's own being on the ground that it is relative to perception. Further, if it is legitimate to ask, 'How can we apprehend what does not belong to our being?' it is equally legitimate to ask, 'How can we apprehend what does belong to our own being?' It is wholly arbitrary to limit the question to the one kind of reality. If a question is to be put at all, it should take the form, 'How is it possible to apprehend anything?' But this question has only to be put to be discarded. For it amounts to a demand to *explain* knowledge; and any answer to it would involve the derivation of knowledge from what was not knowledge, a task which must be as impossible as the derivation of space from time or of colour from sound. Knowledge is *sui generis*, and, as such, cannot be explained.

Moreover, it may be noted that the support which this form of idealism sometimes receives from an argument which uses the terms 'inside' and 'outside' the mind is unmerited. At first sight it seems a refutation of the plain man's view to argue thus: 'The plain man believes the spatial world to exist whether any one knows it or not. Consequently, he allows that the world is outside the mind. But, to be known, a reality must be inside the mind. Therefore, the plain man's view renders knowledge impossible.' But, as soon as it is realized that 'inside the mind' and 'outside the mind' are metaphors, and, therefore, must take their meaning from their context, it is easy to see that the argument either rests on an equivocation or assumes the point at issue. The assertion that the world is outside the mind, being only a metaphorical expression of the plain man's view, should only mean that the world is something independent of the mind, as opposed to something inside the mind, in the sense of dependent upon it, or mental. But the assertion that, to be known, a reality must be inside the mind, if it is to be incontestably true, should only mean that a reality, to be apprehended, must really be object of apprehension. And in this case 'being inside the mind', since it only means 'being object of apprehension', is not the opposite of 'being outside the mind' in the previous assertion. Hence, on this interpretation, the second assertion is connected with the first only apparently and by an equivocation; there is really no argument at all. If, however, the equivocation is to be avoided, 'inside the mind' in the second assertion must be the opposite of 'outside the mind' in the first, and consequently the second must mean that a reality, to be known, must be dependent on the mind, or mental. But in that case the objection to the plain man's view is a *petitio principii*, and not an argument.

Nevertheless, the tendency to think that the only object or, at least, the only direct object of the mind is something mental still requires explanation. It seems due to a tendency to treat self-consciousness as

similar to consciousness of the world. When in reflection we turn our attention away from the world to the activity by which we come to know it, we tend to think of our knowledge of the world as a reality to be apprehended similar to the world which we apprehended prior to reflection. We thereby implicitly treat this knowledge as something which, like the world, merely *is* and is not the knowledge of anything; in other words, we imply that, so far from being knowledge, i. e. the knowing of a reality, it is precisely that which we distinguish from knowledge, viz. a reality to be known, although — since knowledge must be mental — we imply that it is a reality of the special kind called mental. But if the knowledge upon which we reflect is thus treated as consisting in a mental reality which merely *is*, it is implied that in this knowledge the world is not, at any rate directly, object of the mind, for *ex hypothesi* a reality which merely *is* and is not the knowledge of anything has no object. Hence it comes to be thought that the only object or, at least, the only direct object of the mind is this mental reality itself, which is the object of reflection; in other words, that the only immediate object of the mind comes to be thought of as its own idea. The root of the mistake lies in the initial supposition — which, it may be noted, seems to underlie the whole treatment of knowledge by empirical psychology — that knowledge can be treated as a reality to be apprehended, in the way in which any reality which is not knowledge is a reality to be apprehended.

We may now revert to that form of idealism which maintains that the essential relation of reality to the mind is that of *being known*, in order to consider two lines of argument by which it may be defended.

According to the first of these, the view of the plain man either is, or at least involves, materialism; and materialism is demonstrably absurd. The plain man's view involves the existence of the physical world prior to the existence of the knowledge of it, and therefore also prior to the existence of minds which know it, since it is impossible to separate the existence of a knowing mind from its actual knowledge. From this it follows that mere matter, having only the qualities considered by the physicist, must somehow have originated or produced knowing and knowing minds. But this production is plainly impossible. For matter, possessing solely, as it does, characteristics bound up with extension and motion, cannot possibly have originated activities of a wholly different kind, or beings capable of exercising them.

It may, however, be replied that the supposed consequence, though absurd, does not really follow from the plain man's realism. Doubtless, it would be impossible for a universe consisting solely of the physical world to originate thought or beings capable of thinking. But the real presupposition of the coming into existence of human knowledge at a certain stage in the process of the universe is to be found in the pre-existence, not of a mind or minds which always actually knew, but simply of a mind or minds in which, under certain conditions, knowledge is necessarily actualized. A mind cannot be the product of anything or, at any rate, of anything but a mind. It cannot be a new reality introduced at some time or other into a universe of realities of a wholly different order. Therefore, the presupposition of the present existence of knowledge is the pre-existence of a mind or minds; it is not implied that its or their knowledge must always have been actual. In other words, knowing implies the ultimate or unoriginated existence of beings possessed of the capacity to know. Otherwise, knowledge would be a merely derivative product, capable of being stated in terms of something else, and in the end in terms of matter and motion. This implication is, however, in no wise traversed by the plain man's realism. For that implies, not that the existence of the physical world is prior to the existence of a mind, but only that it is prior to a mind's actual knowledge of the world.

The second line of thought appeals to the logic of relation. It may be stated thus. If a term is relative, i. e. is essentially 'of' or relative to another, that other is essentially relative to it. Just as a doctor, for instance, is essentially a doctor of a patient, so a patient is essentially the patient of a doctor. As a ruler implies subjects, so subjects imply a ruler. As a line essentially has points at its ends, so points are essentially ends of a line. Now knowledge is essentially 'of' or relative to reality. Reality, therefore, is essentially relative to or implies the knowledge of it. And this correlativity of knowledge and reality finds linguistic confirmation in the terms 'subject' and 'object'. For, linguistically, just as a subject is always

the subject of an object, so an object is always the object of a subject.

Nevertheless, further analysis of the nature of relative terms, and in particular of knowledge, does not bear out this conclusion. To take the case of a doctor. It is true that if some one is healing, some one else is receiving treatment, i. e. is being healed; and 'patient' being the name for the recipient of treatment, we can express this fact by saying that a doctor is essentially the doctor of a patient. Further, it is true that a recipient of treatment implies a giver of it, as much as a giver of it implies a recipient. Hence we can truly say that since a doctor is the doctor of a patient, a patient is the patient of a doctor, meaning thereby that since that to which a doctor is relative is a patient, a patient must be similarly relative to a doctor. There is, however, another statement which can be made concerning a doctor. We can say that a doctor is a doctor of a human being who is ill, i. e. a sick man. But in this case we cannot go on to say that since a doctor is a doctor of a sick man, a sick man implies or is relative to a doctor. For we mean that the kind of reality capable of being related to a doctor as his patient is a sick man; and from this it does not follow that a reality of this kind does stand in this relation. Doctoring implies a sick man; a sick man does not imply that some one is treating him. We can only say that since a doctor is the doctor of a sick man, a sick man implies the possibility of doctoring. In the former case the terms, viz. 'doctor' and 'patient', are inseparable because they signify the relation in question in different aspects. The relation is one fact which has two inseparable 'sides', and, consequently, the terms must be inseparable which signify the relation respectively from the point of view of the one side and from the point of view of the other. Neither term signifies the nature of the elements which can stand in the relation. In the latter case, however, the terms, viz. 'doctor' and 'sick man', signify respectively the relation in question (in one aspect), and the nature of one of the elements capable of entering into it; consequently they are separable.

Now when it is said that knowledge is essentially knowledge of reality, the statement is parallel to the assertion that a doctor is essentially the doctor of a sick man, and not to the assertion that a doctor is essentially the doctor of a patient. It should mean that that which is capable of being related to a knower as his object is something which is or exists; consequently it cannot be said that since knowledge is of reality, reality must essentially be known. The parallel to the assertion that a doctor is the doctor of a patient is the assertion that knowledge is the knowledge of an object; for just as 'patient' means that which receives treatment from a doctor, so 'object' means that which is known. And here we *can* go on to make the further parallel assertion that since knowledge is essentially the knowledge of an object, an object is essentially an object of knowledge. Just as 'patient' means a recipient of treatment, or, more accurately, a sick man under treatment, so 'object' means something known, or, more accurately, a reality known. And 'knowledge' and 'object of knowledge', like 'doctor' and 'patient', indicate the same relation, though from different points of view, and, consequently, when we can use the one term, we can use the other. But to say that an object (i. e. a reality known) implies the knowledge of it is not to say that reality implies the knowledge of it, any more than to say that a patient implies a doctor is to say that a sick man implies a doctor.

But a doctor, it might be objected, is not a fair parallel to knowledge or a knower. A doctor, though an instance of a relative term, is only an instance of one kind of relative term, that in which the elements related are capable of existing apart from the relation, the relation being one in which they can come to stand and cease to stand. But there is another kind of relative term, in which the elements related presuppose the relation, and any thought of these elements involves the thought of the relation. A universal, e. g. whiteness, is always the universal of certain individuals, viz. individual whites; an individual, e. g. this white, is always an individual of a universal, viz. whiteness. A genus is the genus of a species, and vice versa. A surface is the surface of a volume, and a volume implies a surface. A point is the end of a line, and a line is bounded by points. In such cases the very being of the elements related involves the relation, and, apart from the relation, disappears. The difference between the two kinds of relative terms can be seen from the fact that only in the case of the former kind can two elements be found

of which we can say significantly that their relation is of the kind in question. We can say of two men that they are related as doctor and patient, or as father and son, for we can apprehend two beings as men without being aware of them as so related. But of no two elements is it possible to say that their relation is that of universal and individual, or of genus and species, or of surface and volume; for to apprehend elements which are so related we must apprehend them so related. To apprehend a surface is to apprehend a surface of a volume. To apprehend a volume is to apprehend a volume bounded by a surface. To apprehend a universal is to apprehend it as the universal of an individual, and vice versa. In the case of relations of this kind, the being of either element which stands in the relation is relative to that of the other; neither can be real without the other, as we see if we try to think of one without the other. And it is at least possible that knowledge and reality or, speaking more strictly, a knower and reality, are related in this way.

What is, however, at least a strong presumption against this view is to be found in the fact that while relations of the second kind are essentially non-temporal, the relation of knowing is essentially temporal. The relation of a universal and its individuals, or of a surface and the volume which it bounds, does not either come to be, or persist, or cease. On the other hand, it is impossible to think of a knowing which is susceptible of no temporal predicates and is not bound up with a process; and the thought of knowing as something which comes to be involves the thought that the elements which become thus related exist independently of the relation. Moreover, the real refutation of the view lies in the fact that, when we consider what we really think, we find that we think that the relation between a knower and reality is not of the second kind. If we consider what we mean by 'a reality', we find that we mean by it something which is not correlative to a mind knowing it. It does not mean something the thought of which disappears with the thought of a mind actually knowing it, but something which, though it can be known by a mind, need not be actually known by a mind. Again, just as we think of a reality as something which *can* stand as object in the relation of knowledge, without necessarily being in this relation, so, as we see when we reflect, we think of a knowing mind as something which *can* stand as subject in this relation without necessarily being in the relation. For though we think of the capacities which constitute the nature of a knowing mind as only recognized through their actualizations, i. e. through actual knowing, we think of the mind which is possessed of these capacities as something apart from their actualization.

It is now possible to direct attention to two characteristics of perception and knowledge with which Kant's treatment of space and time conflicts, and the recognition of which reveals his procedure in its true light.

It has been already urged that both knowledge and perception — which, though not identical with knowledge, is presupposed by it — are essentially of *reality*. Now, in the *first* place, it is thereby implied that the relation between the mind and reality in knowledge or in perception is essentially direct, i. e. that there is no *tertium quid* in the form of an 'idea' or a 'representation' between us as perceiving or knowing and what we perceive or know. In other words, it is implied that Locke's view is wrong in principle, and, in fact, the contrary of the truth. In the *second* place, it is implied that while the whole fact of perception includes the reality perceived and the whole fact of knowledge includes the reality known, since both perception and knowledge are 'of', and therefore inseparable from a reality, yet the reality perceived or known is essentially distinct from, and cannot be stated in terms of, the perception or the knowledge. Just as neither perception nor knowledge can be stated in terms of the reality perceived or known from which they are distinguished, so the reality perceived or known cannot be stated in terms of the perception or the knowledge. In other words, the terms 'perception' and 'knowledge' ought to stand for the activities of perceiving and knowing respectively, and not for the reality perceived or known. Similarly, the terms 'idea' and 'representation' — the latter of which has been used as a synonym for Kant's *Vorstellung* — ought to stand not for something thought of or represented, but for the act of thinking or representing.

Further, this second implication throws light on the proper meaning of the terms ‘form of perception’ and ‘form of knowledge or of thought’. For, in accordance with this implication, a ‘form of perception’ and a ‘form of knowledge’ ought to refer to the nature of our acts of perceiving and knowing or thinking respectively, and not to the nature of the realities perceived or known. Consequently, Kant was right in making the primary antithesis involved in the term ‘form of perception’ that between a way in which we perceive and a way in which things are, or, in other words, between a characteristic of our perceiving nature and a characteristic of the reality perceived. Moreover, Kant was also right in making this distinction a real antithesis and not a mere distinction within one and the same thing regarded from two points of view. That which is a form of perception cannot also be a form of the reality and vice versa. Thus we may illustrate a perceived form of perception by pointing out that our apprehension of the physical world (1) is a temporal process, and (2) is conditioned by perspective. Both the succession and the conditions of perspective belong to the act of perception, and do not form part of the nature of the world perceived. And it is significant that in our ordinary consciousness it never occurs to us to attribute either the perspective or the time to the reality perceived. Even if it be difficult in certain cases, as in that of colour, to decide whether something belongs to our act of perception or not, we never suppose that it can be *both* a form of perception *and* a characteristic of the reality perceived. We think that if it be the one, it cannot be the other.

Moreover, if we pass from perception to knowledge or thought — which in this context may be treated as identical — and seek to illustrate a form of knowledge or of thought, we may cite the distinction of logical subject and logical predicate of a judgement. The distinction as it should be understood — for it does not necessitate a difference of grammatical form — may be illustrated by the difference between the judgements ‘Chess is the *most trying of games*’ and ‘*Chess* is the most trying of games’. In the former case ‘chess’ is the logical subject, in the latter case it is the logical predicate. Now this distinction clearly does not reside in or belong to the reality about which we judge; it relates solely to the order of our approach in thought to various parts of its nature. For, to take the case of the former judgement, in calling ‘chess’ its subject, and ‘most trying of games’ its predicate, we are asserting that in this judgement we begin by apprehending the reality of which we are thinking as chess, and come to apprehend it as the most trying of games. In other words, the distinction relates solely to the order of our apprehension, and not to anything in the thing apprehended.

In view of the preceding, it is possible to make clear the nature of certain mistakes on Kant’s part. In the first place, space, and time also, so far as we are thinking of the world, and not of our apprehension of it, as undergoing a temporal process, are essentially characteristics not of perception but of the reality perceived, and Kant, in treating space, and time, so regarded, as forms of perception, is really transferring to the perceiving subject that which in the whole fact ‘perception of an object’ or ‘object perceived’ belongs to the object.

Again, if we go on to ask how Kant manages to avoid drawing the conclusion proper to this transference, viz. that space and time are not characteristics of any realities at all, but belong solely to the process by which we come to apprehend them, we see that he does so because, in effect, he contravenes both the characteristics of perception referred to. For, in the first place, although in conformity with his theory he almost always *speaks* of space and time in terms of perception, he consistently *treats* them as features of the reality perceived, i. e. of phenomena. Thus in arguing that space and time belong not to the understanding but to the sensibility, although he uniformly speaks of them as perceptions, his argument implies that they are objects of perception; for its aim, properly stated, is to show that space and time are not objects of thought but objects of perception. Consequently, in his treatment of space and time, he refers to what are both to him and in fact objects of perception in terms of perception, and thereby contravenes the second implication of perception to which attention has been drawn. Again, in the second place, if we go on to ask how Kant is misled into doing this, we see that it is because he contravenes the first

implication of perception. In virtue of his theory of perception he interposes a *tertium quid* between the reality perceived and the percipient, in the shape of an ‘appearance’. This *tertium quid* gives him something which can plausibly be regarded as at once a perception and something perceived. For, though from the point of view of the thing in itself an appearance is an appearance or a perception of it, yet, regarded from the point of view of what it is in itself, an appearance is a reality perceived of the kind called mental. Hence space and time, being characteristics of an appearance, can be regarded as at once characteristics of our perception of a reality, viz. of a thing in itself, and characteristics of a reality perceived, viz. an appearance. Moreover, there is another point of view from which the treatment of bodies in space as appearances or phenomena gives plausibility to the view that space, though a form of perception, is a characteristic of a reality. When Kant speaks of space as the form of phenomena the fact to which he refers is that all bodies are spatial. He means, not that space is a way in which we perceive something, but that it is a characteristic of things perceived, which he *calls* phenomena, and which *are* bodies. But, since in his statement of this fact he substitutes for bodies phenomena, which to him are perceptions, his statement can be put in the form ‘space is *the form of perceptions*’; and the statement in this form is verbally almost identical with the statement that space is *a form of perception*. Consequently, the latter statement, which *should* mean that space is a way in which we perceive things, is easily identified with a statement of which the meaning is that space is a characteristic of something perceived.

Again, Kant’s account of time will be found to treat something represented or perceived as also a perception. We find two consecutive paragraphs of which the aim is apparently to establish the contrary conclusions: (1) that time is only the form of our internal state and not of external phenomena, and (2) that time is the formal condition of all phenomena, external and internal.

To establish the first conclusion, Kant argues that time has nothing to do with shape or position, but, on the contrary, determines the relation of representations in our internal state. His meaning is that we have a succession of perceptions or representations of bodies in space, and that while the bodies perceived are not related temporally, our perceptions or representations of them are so related. Here ‘representations’ refers to our apprehension, and is distinguished from what is represented, viz. bodies in space.

How, then, does Kant reach the second result? He remembers that bodies in space are ‘phenomena’, i. e. representations. He is, therefore, able to point out that all representations belong, as determinations of the mind, to our internal state, whether they have external things, i. e. bodies in space, for their objects or not, and that, consequently, they are subject to time. Hence time is concluded to be the form of all phenomena. In this second argument, however, it is clear that Kant has passed from his previous treatment of bodies in space as something represented or perceived to the treatment of them as themselves representations or perceptions.

In conclusion, we may point out an insoluble difficulty in Kant’s account of time. His treatment of space and time as the forms of outer and inner sense respectively implies that, while spatial relations apply to the realities which we perceive, temporal relations apply solely to our perceptions of them. Unfortunately, however, as Kant in certain contexts is clearly aware, time also belongs to the realities perceived. The moon, for instance, moves round the earth. Thus there are what may be called real successions as well as successions in our perception. Further, not only are we aware of this distinction in general, but in particular cases we succeed in distinguishing a succession of the one kind from a succession of the other. Yet from Kant’s standpoint it would be impossible to distinguish them in particular cases, and even to be aware of the distinction in general. For the distinction is possible only so long as a distinction is allowed between our perceptions and the realities perceived. But for Kant this distinction has disappeared, for in the end the realities perceived are merely our perceptions; and time, if it be a characteristic of anything, must be a characteristic only of our perceptions.

CHAPTER VII. THE METAPHYSICAL DEDUCTION OF THE CATEGORIES

The aim of the *Aesthetic* is to answer the first question of the *Critique* propounded in the Introduction, viz. ‘How is pure mathematics possible?’ The aim of the *Analytic* is to answer the second question, viz. ‘How is pure natural science possible?’ It has previously been implied that the two questions are only verbally of the same kind. Since Kant thinks of the judgements of mathematics as self-evident, and therefore as admitting of no reasonable doubt, he takes their truth for granted. Hence the question, ‘How is pure mathematics possible?’ means ‘Granted the truth of mathematical judgements, what inference can we draw concerning the nature of the reality to which they relate?’; and the inference is to proceed from the truth of the judgements to the nature of the reality to which they relate. Kant, however, considers that the principles underlying natural science, of which the law of causality is the most prominent, are not self-evident, and consequently need proof. Hence, the question, ‘How is pure natural science possible?’ means ‘What justifies the assertion that the presuppositions of natural science are true?’ and the inference is to proceed from the nature of the objects of natural science to the truth of the *a priori* judgements which relate to them.

Again, as Kant rightly sees, the vindication of the presuppositions of natural science, to be complete, requires the discovery upon a definite principle of *all* these presuppositions. The clue to this discovery he finds in the view that, just as the perceptions of space and time originate in the sensibility, so the *a priori* conceptions and laws which underlie natural science originate in the understanding; for, on this view, the discovery of all the conceptions and laws which originate in the understanding will be at the same time the discovery of all the presuppositions of natural science.

Kant therefore in the *Analytic* has a twofold problem to solve. He has firstly to discover the conceptions and laws which belong to the understanding as such, and secondly to vindicate their application to individual things. Moreover, although it is obvious that the conceptions and the laws of the understanding must be closely related, he reserves them for separate treatment.

The *Analytic* is accordingly subdivided into the *Analytic of Conceptions* and the *Analytic of Principles*. The *Analytic of Conceptions*, again, is divided into the *Metaphysical Deduction of the Categories*, the aim of which is to discover the conceptions of the understanding, and the *Transcendental Deduction of the Categories*, the aim of which is to vindicate their validity, i. e. their applicability to individual things.

It should further be noticed that, according to Kant, it is the connexion of the *a priori* conceptions and laws underlying natural science with the *understanding* which constitutes the main difficulty of the vindication of their validity, and renders necessary an answer of a different kind to that which would have been possible, if the validity of mathematical judgements had been in question.

“We have been able above, with little trouble, to make comprehensible how the conceptions of space and time, although *a priori* knowledge, must necessarily relate to objects and render possible a synthetic knowledge of them independently of all experience. For since an object can appear to us, i. e. be an object of empirical perception, only by means of such pure forms of sensibility, space and time are pure perceptions, which contain *a priori* the condition of the possibility of objects as phenomena, and the synthesis in space and time has objective validity.”

“On the other hand, the categories of the understanding do not represent the conditions under which objects are given in perception; consequently, objects can certainly appear to us without their necessarily being related to functions of the understanding, and therefore without the understanding containing *a priori* the conditions of these objects. Hence a difficulty appears here, which we did not meet in the field of

sensibility, viz. how *subjective conditions of thought* can have *objective validity*, i. e. can furnish conditions of the possibility of all knowledge of objects; for phenomena can certainly be given us in perception without the functions of the understanding. Let us take, for example, the conception of cause, which indicates a peculiar kind of synthesis in which on A something entirely different B is placed according to a law. It is not *a priori* clear why phenomena should contain something of this kind ... and it is consequently doubtful *a priori*, whether such a conception is not wholly empty, and without any corresponding object among phenomena. For that objects of sensuous perception must conform to the formal conditions of the sensibility which lie *a priori* in the mind is clear, since otherwise they would not be objects for us; but that they must also conform to the conditions which the understanding requires for the synthetical unity of thought is a conclusion the cogency of which it is not so easy to see. For phenomena might quite well be so constituted that the understanding did not find them in conformity with the conditions of its unity, and everything might lie in such confusion that, e. g. in the succession of phenomena, nothing might present itself which would offer a rule of synthesis, and so correspond to the conception of cause and effect, so that this conception would be quite empty, null, and meaningless. Phenomena would none the less present objects to our perception, for perception does not in any way require the functions of thinking."

This passage, if read in connexion with that immediately preceding it, may be paraphrased as follows: 'The argument of the *Aesthetic* assumes the validity of mathematical judgements, which as such relate to space and time, and thence it deduces the phenomenal character of space and time, and of what is contained therein. At the same time the possibility of questioning the validity of the law of causality, and of similar principles, may lead us to question even the validity of mathematical judgements. In the case of mathematical judgements, however, in consequence of their relation to perception, an answer is readily forthcoming. We need only reverse the original argument and appeal directly to the phenomenal character of space and time and of what is contained in them. Objects in space and time, being appearances, must conform to the laws according to which we have appearances; and since space and time are only ways in which we perceive, or have appearances, mathematical laws, which constitute the general nature of space and time, are the laws according to which we have appearances. Mathematical laws, then, constitute the general structure of appearances, and, as such, enter into the very being of objects in space and time. But the case is otherwise with the conceptions and principles underlying natural science. For the law of causality, for instance, is a law not of our perceiving but of our thinking nature, and consequently it is not presupposed in the presentation to us of objects in space and time. Objects in space and time, being appearances, need conform only to the laws of our perceiving nature. We have therefore to explain the possibility of saying that a law of our thinking nature must be valid for objects which, as conditioned merely by our perceiving nature, are independent of the laws of our thinking; for phenomena might be so constituted as not to correspond to the necessities of our thought.'

No doubt Kant's *solution* of this problem in the *Analytic* involves an emphatic denial of the central feature of this statement of it, viz. that phenomena may be given in perception without any help from the activity of the understanding. Hence it may be urged that this passage merely expresses a temporary aberration on Kant's part, and should therefore be ignored. Nevertheless, in spite of this inconsistency, the view that phenomena may be given in perception without help from the activity of the understanding forms the basis of the difference of treatment which Kant thinks necessary for the vindication of the judgements underlying natural science and for that of the judgements of mathematics.

We may now consider how Kant 'discovers' the categories or conceptions which belong to the understanding as such. His method is sound in principle. He begins with an account of the understanding in general. He then determines its essential differentiations. Finally, he argues that each of these differentiations involves a special conception, and that therefore these conceptions taken together constitute an exhaustive list of the conceptions which belong to the understanding.

His account of the understanding is expressed thus: “The understanding was explained above only negatively, as a non-sensuous faculty of knowledge. Now, independently of sensibility, we cannot have any perception; consequently, the understanding is no faculty of perception. But besides perception there is no other kind of knowledge, except through conceptions. Consequently, the knowledge of every understanding, or at least of every human understanding, is a knowledge through conceptions, — not perceptive, but discursive. All perceptions, as sensuous, depend on affections; conceptions, therefore, upon functions. By the word function, I understand the unity of the act of arranging different representations under one common representation. Conceptions, then, are based on the spontaneity of thinking, as sensuous perceptions are on the receptivity of impressions. Now the understanding cannot make any other use of these conceptions than to judge by means of them. Since no representation, except only the perception, refers immediately to the object, a conception is never referred immediately to an object, but to some other representation thereof, be that a perception or itself a conception. A judgement, therefore, is the mediate knowledge of an object, consequently the representation of a representation of it. In every judgement there is a conception which is valid for many representations, and among these also comprehends a given representation, this last being then immediately referred to the object. For example, in the judgement ‘All bodies are divisible’, our conception of the divisible refers to various other conceptions; among these, however, it is herein particularly referred to the conception of body, and this conception of body is referred to certain phenomena which present themselves to us. These objects, therefore, are mediately represented by the conception of divisibility. Accordingly, all judgements are functions of unity in our representations, since, instead of an immediate, a higher representation, which comprehends this and several others, is used for the knowledge of the object, and thereby many possible items of knowledge are collected into one. But we can reduce all acts of the understanding to judgements, so that the *understanding* in general can be represented as a *faculty of judging*.”

It is not worth while to go into all the difficulties of this confused and artificial passage. Three points are clear upon the surface. In the first place, the account of the understanding now given differs from that given earlier in the *Critique* in that, instead of merely distinguishing, it separates the sensibility and the understanding, and treats them as contributing, not two inseparable factors involved in all knowledge, but two kinds of knowledge. In the second place, the guise of argument is very thin, and while Kant ostensibly *proves*, he really only *asserts* that the understanding is the faculty of judgement. In the third place, in describing judgement Kant is hampered by trying to oppose it as the mediate knowledge of an object to perception as the immediate knowledge of an object. A perception is said to relate immediately to an object; in contrast with this, a conception is said to relate immediately only to another conception or to a perception, and mediately to an object through relation to a perception, either directly or through another conception. Hence a judgement, as being the use of a conception, viz. the predicate of the judgement, is said to be the mediate knowledge of an object. But if this distinction be examined, it will be found that two kinds of immediate relation are involved, and that the account of perception is not really compatible with that of judgement. When a perception is said to relate immediately to an object, the relation in question is that between a sensation or appearance produced by an object acting upon or affecting the sensibility and the object which produces it. But when a conception is said to relate immediately to another conception or to a perception, the relation in question is that of universal and particular, i. e. that of genus and species or of universal and individual. For the conception is said to be ‘valid for’ (i. e. to ‘apply to’) and to ‘comprehend’ the conception or perception to which it is immediately related; and again, when a conception is said to relate mediately to an object, the relation meant is its ‘application’ to the object, even though in this case the application is indirect. Now if a perception to which a conception is related — either directly or indirectly through another conception — were an appearance produced by an object, the conception could never be related to the object in the sense required, viz. that it applies to it; for an appearance does not *apply to* but is *produced* by the object. Consequently, when Kant is

considering a conception, and therefore also when he is considering a judgement, which is the use of a conception, he is really thinking of the perception to which it is related as an *object of* perception, i. e. as a perceived individual, and he has ceased to think of a perception as an appearance produced by an object. Hence in considering Kant's account of a conception and of judgement, we should ignore his account of perception, and therefore also his statement that judgement is the mediate knowledge of an object.

If we do so, we see that Kant's account of judgement simply amounts to this: 'Judgement is the use of a conception or 'universal'; the use of a conception or universal consists in bringing under it corresponding individuals or species. Consequently, judgement is a function producing unity. If, for instance, we judge 'All bodies are divisible', we thereby unify 'bodies' with other kinds of divisible things by bringing them under the conception of divisibility; and if we judge 'This body is divisible' we thereby unify this divisible body with others by bringing it and them under the conception of divisibility.' Again, since 'the understanding in general can be represented as a *faculty of judging*', it follows that the activity of the understanding consists in introducing unity into our representations, by bringing individuals or species — both these being representations — under the corresponding universal or conception.

Having explained the nature of the understanding, Kant proceeds to take the next step. His aim being to connect the understanding with the categories, and the categories being a plurality, he has to show that the activity of judgement can be differentiated into several kinds, each of which must subsequently be shown to involve a special category. Hence, solely in view of the desired conclusion, and in spite of the fact that he has described the activity of judgement as if it were always of the same kind, he passes in effect from the singular to the plural and asserts that 'all the functions of the understanding can be discovered, when we can completely exhibit the functions of unity in judgements'. After this preliminary transition, he proceeds to assert that, if we abstract in general from all content of a judgement and fix our attention upon the mere form of the understanding, we find that the function of thinking in a judgement can be brought under four heads, each of which contains three subdivisions. These, which are borrowed with slight modifications from Formal Logic, are expressed as follows.

I. *Quantity.*
Universal
Particular
Singular.

II. *Quality.*
Affirmative
Negative
Infinite.

III. *Relation.*
Categorical
Hypothetical
Disjunctive.

IV. *Modality.*
Problematic
Assertoric

Apodeictic.

These distinctions, since they concern only the form of judgements, belong, according to Kant, to the activity of judgement as such, and in fact constitute its essential differentiations.

Now, before we consider whether this is really the case, we should ask what answer Kant's account of judgement would lead us to expect to the question 'What are all the functions of unity in judgement?' The question must mean 'What are the kinds of unity produced by judgement?' To this question three alternative answers are prima facie possible. (1) There is only one kind of unity, that of a group of particulars unified through relation to the corresponding universal. The special unity produced will differ for different judgements, since it will depend upon the special universal involved. The kind or form of unity, however, will always be the same, viz. that of particulars related through the corresponding universal. For instance, 'plants' and 'trees' are unified respectively by the judgements 'This body is a plant' and 'This body is a tree'; for 'this body' is in the one case related to other 'plants' and in the other case to other 'trees'. And though the unity produced is different in each case, the kind of unity is the same; for plants and trees are, as members of a kind, unities of a special kind distinct from unities of another kind, such as the parts of a spatial or numerical whole. (2) There are as many kinds of unity as there are universals. Every group of particulars forms a unity of a special kind through relation to the corresponding universal. (3) There are as many kinds of unity as there are highest universals or *summa genera*. These *summa genera* are the most general sources of unity through which individuals are related in groups, directly or indirectly. The kinds of unity are therefore in principle the Aristotelian categories, i. e. the highest forms of being under which all individuals fall.

Nevertheless, it is easy to see that the second and third answers should be rejected in favour of the first. For though, according to Kant, a judgement unifies particulars by bringing them under a universal, the special universal involved in a given judgement belongs not to the judgement as such, but to the particulars unified. What belongs to the judgement as such is simply the fact that the particulars are brought under a universal. In other words, the judgement as such determines the kind of unity but not the particular unity. The judgements 'Gold is a metal' and 'Trees are green', considered merely as judgements and not as the particular judgements which they are, involve the same kind of unity, viz. that of particulars as particulars of a universal; for the distinction between 'metal' and 'green' is a distinction not of kinds of unity but of unities. Moreover, to anticipate the discussion of Kant's final conclusion, the moral is that Kant's account of judgement should have led him to recognize that judgement involves the reality, not of any special universals or — in Kant's language — conceptions, but of universality or conception as such. In other words, on his view of judgement the activity of the understanding implies simply that there *are* universals or conceptions; it does not imply the existence of special conceptions which essentially belong to the understanding, e. g. that of 'cause' or 'plurality'.

If we now turn to the list of the activities of thought in judgement, borrowed from Formal Logic, we shall see that it is not in any way connected with Kant's account of judgement. For if the kinds of judgement distinguished by Formal Logic are to be regarded as different ways of unifying, the plurality unified must be allowed to be not a special kind of group of particulars, but the two conceptions which constitute the terms of the judgement; and the unity produced must be allowed to be in no case a special form of the unity of particulars related through the corresponding universal. Thus the particular judgement 'Some coroners are doctors' must be said to unify the conceptions of 'coroner' and of 'doctor', and presumably by means of the conception of 'plurality'. Again, the hypothetical judgement 'If it rains, the ground will be wet' must be said to unify the judgements 'It rains' and 'The ground will be wet', and presumably by means of the conception of 'reason and consequence'. In neither case can the act of unification be considered a special form of the act of recognizing particulars as particulars of the corresponding universal. The fact is that the distinctions drawn by Formal Logic are based on a view of

judgement which is different from, and even incompatible with, Kant's, and they arise from the attempt to solve a different problem. The problem before Kant in describing judgement is to distinguish the understanding from the sensibility, i. e. thought from perception. Hence he regards judgement as the act of unifying a manifold given in perception, directly, or indirectly by means of a conception. But this is not the problem with which Formal Logic is occupied. Formal Logic assumes judgement to be an act which relates material given to it in the shape of 'conceptions' or 'judgements' by analysis of this material, and seeks to discover the various modes of relation thereby effected. The work of judgement, however, cannot consist *both* in relating particulars through a conception *and* in relating two conceptions or judgements.

It may be urged that this criticism only affects Kant's argument, but not his conclusion. Possibly, it may be said, the list of types of judgement borrowed from Formal Logic really expresses the essential differentiations of judgement, and, in that case, Kant's only mistake is that he bases them upon a false or at least inappropriate account of judgement. Moreover, since this list furnishes Kant with the 'clue' to the categories, provided that it expresses the essential differentiations of judgement, the particular account of judgement upon which it is based is a matter of indifference.

This contention leads us to consider the last stage of Kant's argument, in which he deduces the categories in detail from his list of the forms of judgement. For it is clear that unless the forms of judgement severally involve the categories, it will not matter whether these forms are or are not the essential differentiations of judgement.

Kant's mode of connecting the categories in detail with the forms of judgement discovered by Formal Logic is at least as surprising as his mode of connecting the latter with the nature of judgement in general. Since the twelve distinctions within the form of judgement are to serve as a clue to the conceptions which belong to the understanding, we naturally expect that each distinction will be found directly to involve a special conception or category, and that therefore, to discover the categories, we need only look for the special conception involved in each form of judgement. Again, since the plurality unified in a judgement of each form is the two conceptions or judgements which form the matter of the judgement, we should expect the conception involved in each form of judgement to be merely the type of relationship established between these conceptions or judgements. This expectation is confirmed by a cursory glance at the table of categories.

I. *Of Quantity.*
Unity
Plurality
Totality.

II. *Of Quality.*
Reality
Negation
Limitation.

III. *Of Relation.*
Inherence and Subsistence (*Substantia et Accidens*)
Causality and Dependence (*Cause and Effect*)
Community (*Reciprocity between the agent and patient.*)

IV. *Of Modality.*

Possibility — Impossibility
Existence — Non-existence
Necessity — Contingence.

If we compare the first division of these categories with the first division of judgements we naturally think that Kant conceived singular, particular, and universal judgements to unify their terms by means of the conceptions of ‘one’, of ‘some’, and of ‘all’ respectively; and we form corresponding, though less confident, expectations in the case of the other divisions.

Kant, however, makes no attempt to show that each form of judgement distinguished by Formal Logic involves a special conception. In fact, his view is that the activities of thought studied by Formal Logic do not originate or use any special conceptions at all. For his actual deduction of the categories is occupied in showing that although thought, when exercised under the conditions under which it is studied by Formal Logic, does not originate and use conceptions of its own, it is able under certain other conditions to originate and use such conceptions, i. e. categories. Hence if we attend only to the professed procedure of the deduction, we are compelled to admit that the deduction not only excludes any use of the ‘clue’ to the categories, supposed to be furnished by Formal Logic, but even fails to deduce them at all. For it does not even nominally attempt to discover the categories in detail, but reverts to the prior task of showing merely that there are categories. Doubtless Kant thinks that the forms of judgement formulated by Formal Logic in some way *suggest* the conceptions which become operative in thought under these other conditions. Nevertheless, it is impossible to see how these forms of judgement can suggest these conceptions, unless they actually presuppose them.

It is clear, however, that the professed link between the forms of judgement and the categories does not represent the actual process by which Kant reached his list of categories; for he could never have reached any list of categories by an argument which was merely directed to show that there are categories. Moreover, an inspection of the list shows that he actually reached it partly by noticing the conceptions which the forms of judgement seemed to presuppose, and partly by bearing in mind the general conceptions underlying physics which it was his ultimate aim to vindicate. Since this is the case, and since the categories can only be connected with the forms of judgement by showing that they are presupposed in them, the proper question to be considered from the point of view of the metaphysical deduction is simply whether the forms of judgement really presuppose the categories.

If, however, we examine the forms of judgement distinguished by Formal Logic, we find that they do not presuppose the categories. To see this, it is only necessary to examine the four main divisions of judgement *seriatim*.

The first division of judgements is said to be a division in respect of quantity into singular, particular, and universal. So stated, the division is numerical. It is a division of judgements according as they make an assertion about one, more than one, or all the members of a kind. Each species may be said to presuppose (1) the conception of quantity, and (2) a conception peculiar to itself: the first presupposing the conception of one member of a kind, the second that of more than one but less than all members of a kind, the third that of all members of a kind. Moreover, a judgement of each kind may perhaps be said to relate the predicate conception to the subject conception by means of one of these three conceptions.

The fundamental division, however, into which universal and singular judgements enter is not numerical at all, and ignores particular judgements altogether. It is that between such judgements as ‘Three-sided figures, as such, are three-angled’ and ‘This man is tall’. The essential distinction is that in the universal judgement the predicate term is apprehended to belong to the subject through our insight that it is necessitated by the nature of the subject term, while in the singular judgement our apprehension that the predicate term belongs to the subject is based upon the perception or experience of the coexistence of predicate and subject terms in a common subject. In other words, it is the distinction between an *a priori*

judgement and a judgement of perception. The merely numerically universal judgement, and the merely numerically particular judgement are simply aggregates of singular judgements, and therefore are indistinguishable in principle from the singular judgement. If then we ask what conceptions are really presupposed by the kinds of judgement which Kant seeks to distinguish in the first division, we can only reply that the universal judgement presupposes the conception of a connected or systematic whole of attributes, and that the singular judgement presupposes the conception of the coexistence of two attributes in a common subject. Neither kind of judgement presupposes the conception of quantity or the conceptions of unity, plurality, and totality.

The second division of judgements is said to be a division in respect of quality into affirmative, negative, and infinite, i. e. into species which may be illustrated by the judgements, ‘A college is a place of education,’ ‘A college is not a hotel,’ and ‘A college is a not-hotel’. The conceptions involved are said to be those of reality, of negation, and of limitation respectively. The conception of limitation may be ignored, since the infinite judgement said to presuppose it is a fiction. On the other hand, the conceptions of reality and negation, even if their existence be conceded, cannot be allowed to be the conceptions presupposed. For when we affirm or deny, we affirm or deny of something not mere being, but being of a particular kind. The conceptions presupposed are rather those of identity and difference. It is only because differences fall within an identity that we can affirm, and it is only because within an identity there are differences that we can deny.

The third division of judgements is said to be in respect of relation into categorical, hypothetical, and disjunctive judgements. Here, again, the conclusion which Kant desires is clearly impossible. The categorical judgement may be said to presuppose the conception of subject and attribute, but not that of substance and accident. The hypothetical judgement may be conceded to presuppose the conception of reason and consequence, but it certainly does not presuppose the conception of cause and effect. Lastly, while the disjunctive judgement may be said to presuppose the conception of mutually exclusive species of a genus, it certainly does not presuppose the conception of reciprocal action between physical things.

The fourth division of judgement is said to be in respect of modality into assertoric, problematic, and apodeictic, the conceptions involved being respectively those of possibility and impossibility, of actuality and non-actuality, and of necessity and contingence. Now, from the point of view of Kant’s argument, these conceptions, like those which he holds to be involved in the other divisions of judgement, must be considered to relate to reality and not to our attitude towards it. Considered in this way, they resolve themselves into the conceptions of —

(1) the impossible (impossibility);

(2) the possible but not actual (possibility, nonexistence);

(3) the actual but not necessary (existence, contingence);

(4) the necessary (necessity).

But since it must, in the end, be conceded that all fact is necessary, it is impossible to admit the reality of the conception of the possible but not actual, and of the actual but not necessary. There remain, therefore, only the conceptions of the necessary and of the impossible. In fact, however, the distinctions between the assertoric, the problematic, and the apodeictical judgement relate to our attitude to reality and not to reality, and therefore involve no different conceptions relating to reality. It must, therefore, be admitted that the ‘metaphysical’ deduction of the categories breaks down doubly. Judgement, as Kant describes it, does not involve the forms of judgement borrowed from Formal Logic as its essential differentiations; and these forms of judgement do not involve the categories.

CHAPTER VIII. THE TRANSCENDENTAL DEDUCTION OF THE CATEGORIES

The aim of the *Transcendental Deduction* is to show that the categories, though *a priori* as originating in the understanding, are valid, i. e. applicable to individual things. It is the part of the *Critique* which has attracted most attention and which is the most difficult to follow. The difficulty of interpretation is increased rather than diminished by the complete rewriting of this portion in the second edition. For the second version, though it does not imply a change of view, is undoubtedly even more obscure than the first. It indeed makes one new contribution to the subject by adding an important link in the argument, but the importance of the link is nullified by the fact that it is not really the link which it professes to be. The method of treatment adopted here will be to consider only the minimum of passages necessary to elucidate Kant's meaning and to make use primarily of the first edition.

It is necessary, however, first to consider the passage in the *Metaphysical Deduction* which nominally connects the list of categories with the list of forms of judgement. For its real function is to introduce a new and third account of knowledge, which forms the keynote of the *Transcendental Deduction*.

In this passage, the meaning of which it is difficult to state satisfactorily, Kant's thought appears to be as follows: 'The activity of thought studied by Formal Logic relates by way of judgement conceptions previously obtained by an analysis of perceptions. For instance, it relates the conceptions of body and of divisibility, obtained by analysis of perceptions of bodies, in the judgement 'Bodies are divisible'. It effects this, however, merely by analysis of the conception 'body'. Consequently, the resulting knowledge or judgement, though *a priori*, is only analytic, and the conceptions involved originate not from thought but from the manifold previously analysed. But besides the conceptions obtained by analysis of a given manifold, there are others which belong to thought or the understanding as such, and in virtue of which thought originates synthetic *a priori* knowledge, this activity of thought being that studied by Transcendental Logic. Two questions therefore arise. Firstly, how do these conceptions obtain a matter to which they can apply and without which they would be without content or empty? And, secondly, how does thought in virtue of these conceptions originate synthetic *a priori* knowledge? The first question is easily answered, for the manifolds of space and time, i. e. individual spaces and individual times, afford matter of the kind needed to give these conceptions content. As perceptions (i. e. as objects of perception), they are that to which a conception can apply, and as pure or *a priori* perceptions, they are that to which those conceptions can apply which are pure or *a priori*, as belonging to the understanding. The second question can be answered by considering the process by which this pure manifold of space and time enters into knowledge. All synthetic knowledge, whether empirical or *a priori*, requires the realization of three conditions. In the first place, there must be a manifold given in perception. In the second place, this manifold must be 'gone through, taken up, and combined'. In other words, if synthesis be defined as 'the act of joining different representations to one another and of including their multiplicity in one knowledge', the manifold must be subjected to an act of synthesis. This is effected by the imagination. In the third place, this synthesis produced by the imagination must be brought to a conception, i. e. brought under a conception which will constitute the synthesis a unity. This is the work of the understanding. The realization of *a priori* knowledge, therefore, will require the realization of the three conditions in a manner appropriate to its *a priori* character. There must be a pure or *a priori* manifold; this is to be found in individual spaces and individual times. There must be an act of pure synthesis of this manifold; this is effected by the pure imagination. Finally, this pure synthesis must be brought under a conception. This is effected by the pure understanding by means of its pure or a priori conceptions, i. e. the categories. This, then, is the process by which *a priori* knowledge is originated. The activity of

thought or understanding, however, which unites two conceptions in a judgement by analysis of them — this being the act studied by Formal Logic — is the same as that which gives unity to the synthesis of the pure manifold of perception — this being the act studied by Transcendental Logic. Consequently, 'the same understanding, and indeed by the same activities whereby in dealing with conceptions it unifies them in a judgement by an act of analysis, introduces by means of the synthetical unity which it produces in the pure manifold of perception a content into its own conceptions, in consequence of which these conceptions are called pure conceptions of the understanding,' and we are entitled to say *a priori* that these conceptions apply to objects because they are involved in the process by which we acquire *a priori* knowledge of objects.'

A discussion of the various difficulties raised by the general drift of this passage, as well as by its details, is unnecessary, and would anticipate discussion of the *Transcendental Deduction*. But it is necessary to draw attention to three points.

In the first place, as has been said, Kant here introduces — and introduces without warning — a totally new account of knowledge. It has its origin in his theory of perception, according to which knowledge begins with the production of sensations in us by things in themselves. Since the spatial world which we come to know consists in a multiplicity of related elements, it is clear that the isolated data of sensation have somehow to be combined and unified, if we are to have this world before us or, in other words, to know it. Moreover, since these empirical data are subject to space and time as the forms of perception, individual spaces and individual times, to which the empirical data will be related, have also to be combined and unified. On this view, the process of knowledge consists in combining certain data into an individual whole and in unifying them through a principle of combination. If the data are empirical, the resulting knowledge will be empirical; if the data are *a priori*, i. e. individual spaces and individual times, the resulting knowledge will be *a priori*. This account of knowledge is new, because, although it treats knowledge as a process or act of unifying a manifold, it describes a different act of unification. As Kant first described the faculty of judgement, it unifies a group of particulars through relation to the corresponding universal. As Formal Logic, according to Kant, treats the faculty of judgement, it unifies two conceptions or two prior judgements into a judgement. As Kant now describes the faculty of judgement or thought, it unifies an empirical or an *a priori* manifold of perception combined into an individual whole, through a conception which constitutes a principle of unity. The difference between this last account and the others is also shown by the fact that while the first two kinds of unification are held to be due to mere analysis of the material given to thought, the third kind of unification is held to be superinduced by thought, and to be in no way capable of being extracted from the material by analysis. Further, this new account of knowledge does not replace the others, but is placed side by side with them. For, according to Kant, there exist *both* the activity of thought which relates two conceptions in a judgement, *and* the activity by which it introduces a unity of its own into a manifold of perception. Nevertheless, this new account of knowledge, or rather this account of a new kind of knowledge, must be the important one; for it is only the process now described for the first time which produces synthetic as opposed to analytic knowledge.

In the second place, the passage incidentally explains why, according to Kant, the forms of judgement distinguished by Formal Logic do not involve the categories. For its doctrine is that while thought, if exercised under the conditions under which it is studied by Formal Logic, can only analyse the manifold given to it, and so has, as it were, to borrow from the manifold the unity through which it relates the manifold, yet if an *a priori* manifold be given to it, it can by means of a conception introduce into the manifold a unity of its own which could not be discovered by analysis of the manifold. Thus thought as studied by Formal Logic merely analyses and consequently does not and cannot make use of conceptions of its own; it can use conceptions of its own only when an *a priori* manifold is given to it to deal with.

In the third place, there is great difficulty in following the part in knowledge assigned to the

understanding. The synthesis of the manifold of perception is assigned to the imagination, a faculty which, like the new kind of knowledge, is introduced without notice. The business of the understanding is to 'bring this synthesis to conceptions' and thereby to 'give unity to the synthesis'. Now the question arises whether 'the activity of giving unity to the synthesis' really means what it says, i. e. an activity which *unifies* or *introduces a unity into* the synthesis, or whether it only means an activity which *recognizes* a unity already given to the synthesis by the imagination. Prima facie Kant is maintaining that the understanding really unifies, or introduces the principle of unity. For the twice-repeated phrase 'give unity to the synthesis' seems unmistakable in meaning, and the important rôle in knowledge is plainly meant to be assigned to the understanding. Kant's language, however, is not decisive; for he speaks of the synthesis of the manifold as that which 'first produces a knowledge which indeed at first may be crude and confused and therefore needs *analysis*', and he says of the conceptions which give unity to the synthesis that 'they consist solely in the *representation* of this necessary synthetical unity'. Again, 'to bring the synthesis to a conception' may well be understood to mean 'to recognize the synthesis as an instance of the conception'; and, since Kant is speaking of knowledge, 'to give unity to the synthesis' may only mean 'to give unity to the synthesis *for us*', i. e. 'to make us aware of its unity'. Moreover, consideration of what thought can possibly achieve with respect to a synthesis presented to it by the imagination renders it necessary to hold that the understanding only recognizes the unity of the synthesis. For if a synthesis has been effected, it must have been effected in accordance with a principle of construction or synthesis, and therefore it would seem that the only work left for the understanding is to discover the principle latent in the procedure of the imagination. At any rate, if the synthesis does not involve a principle of synthesis, it is impossible to see how thought can subsequently introduce a principle. The imagination, then, must be considered to have already introduced the principle of unity into the manifold by combining it in accordance with a conception or principle of combination, and the work of the understanding must be considered to consist in recognizing that the manifold has been thereby combined and unified through the conception. We are therefore obliged to accept one of two alternatives. *Either* the understanding merely renders the mind conscious of the procedure of a faculty different from itself, viz. the imagination, in which case the important rôle in knowledge, viz. the effecting of the synthesis according to a principle, is played by a faculty different from the understanding; *or* the imagination is the understanding working unreflectively, and the subsequent process of bringing the synthesis to a conception is merely a process by which the understanding becomes conscious of its own procedure. Moreover, it is the latter alternative which we must accept as more in accordance with the general tenor of Kant's thought. For the synthesis of the imagination is essentially the outcome of activity or spontaneity, and, as such, it belongs to the understanding rather than to the sensibility; in fact we find Kant in one place actually saying that 'it is one and the same spontaneity which at one time under the name of imagination, at another time under that of understanding, introduces connexion into the manifold of perception'. Further, it should be noted that since the imagination must be the understanding working unreflectively, and since it must be that which introduces unity into the manifold, there is some justification for his use of language which implies that the understanding is the source of the unity, though it will not be so in the sense in which the passage under discussion might at first sight lead us to suppose.

We can now turn to the argument of the *Transcendental Deduction* itself. Kant introduces it in effect by raising the question, 'How is it that, beginning with the isolated data of sense, we come to acquire knowledge?' His aim is to show (1) that knowledge requires the performance of certain operations by the mind upon the manifold of sense; (2) that this process is a condition not merely of knowledge, but also of self-consciousness; and (3) that, since the manifold is capable of entering into knowledge, and since we are capable of being self-conscious, the categories, whose validity is implied by this process, are valid.

Kant begins by pointing out that all knowledge, *a priori* as well as empirical, requires the manifold, produced successively in the mind, to be subjected to three operations.

1. Since the elements of the manifold are as given mere isolated units, and since knowledge is the apprehension of a unity of connected elements, the mind must first run through the multiplicity of sense and then grasp it together into a whole, i. e. into an image. This act is an act of synthesis; it is called 'the synthesis of apprehension' and is ascribed to the imagination. It must be carried out as much in respect of the pure or *a priori* elements of space and time as in respect of the manifold of sensation, for individual spaces and times contain a multiplicity which, to be apprehended, must be combined. The necessity of this act of synthesis is emphasized in the second edition. "We cannot represent anything as combined in the object without having previously combined it ourselves. Of all representations, *combination* is the only one which cannot be given through objects, but can be originated only by the subject itself because it is an act of its own activity."

2. Since the data of perception are momentary, and pass away with perception, the act of grasping them together requires that the mind shall reproduce the past data in order to combine them with the present datum. "It is plain that if I draw a line in thought, or wish to think of the time from one midday to another, or even to represent to myself a certain number, I must first necessarily grasp in thought these manifold representations one after another. But if I were continually to lose from my thoughts the preceding representations (the first parts of the line, the preceding parts of time or the units successively represented), and were not to reproduce them, while I proceeded to the succeeding parts, there could never arise a complete representation, nor any of the thoughts just named, not even the first and purest fundamental representations of space and time." This act of reproduction is called 'the synthesis of reproduction in the imagination'.

Further, the necessity of reproduction brings to light a characteristic of the synthesis of apprehension. "It is indeed only an empirical law, according to which representations which have often followed or accompanied one another in the end become associated, and so form a connexion, according to which, even in the absence of the object, one of these representations produces a transition of the mind to another by a fixed rule. But this law of reproduction presupposes that phenomena themselves are actually subject to such a rule, and that in the manifold of their representations there is a concomitance or sequence, according to a fixed rule; for, without this, our empirical imagination would never find anything to do suited to its capacity, and would consequently remain hidden within the depths of the mind as a dead faculty, unknown to ourselves. If cinnabar were now red, now black, now light, now heavy, if a man were changed now into this, now into that animal shape, if our fields were covered on the longest day, now with fruit, now with ice and snow, then my empirical faculty of imagination could not even get an opportunity of thinking of the heavy cinnabar when there occurred the representation of red colour; or if a certain name were given now to one thing, now to another, or if the same thing were called now by one and now by another name, without the control of some rule, to which the phenomena themselves are already subject, no empirical synthesis of reproduction could take place."

"There must then be something which makes this very reproduction of phenomena possible, by being the *a priori* foundation of a necessary synthetical unity of them. But we soon discover it, if we reflect that phenomena are not things in themselves, but the mere play of our representations, which in the end resolve themselves into determinations of our internal sense. For if we can prove that even our purest *a priori* perceptions afford us no knowledge, except so far as they contain such a combination of the manifold as renders possible a thoroughgoing synthesis of reproduction, then this synthesis of imagination is based, even before all experience, on *a priori* principles, and we must assume a pure transcendental synthesis of the imagination which lies at the foundation of the very possibility of all experience (as that which necessarily presupposes the reproducibility of phenomena)."

In other words, the faculty of reproduction, if it is to get to work, presupposes that the elements of the manifold are parts of a necessarily related whole; or, as Kant expresses it later, it presupposes the *affinity* of phenomena; and this affinity in turn presupposes that the synthesis of apprehension by combining the

elements of the manifold on certain principles makes them parts of a necessarily related whole.

3. Kant introduces the third operation, which he calls ‘the synthesis of recognition in the conception’, as follows:

“Without consciousness that what we are thinking is identical with what we thought a moment ago, all reproduction in the series of representations would be in vain. For what we are thinking would be a new representation at the present moment, which did not at all belong to the act by which it was bound to have been gradually produced, and the manifold of the same would never constitute a whole, as lacking the unity which only consciousness can give it. If in counting I forget that the units which now hover before my mind have been gradually added by me to one another, I should not know the generation of the group through this successive addition of one to one, and consequently I should not know the number, for this conception consists solely in the consciousness of this unity of the synthesis.”

“The word ‘conception’ might itself lead us to this remark. For it is this *one* consciousness which unites the manifold gradually perceived and then also reproduced into one representation. This consciousness may often be only weak, so that we connect it with the production of the representation only in the result but not in the act itself, i. e. immediately; but nevertheless there must always be one consciousness, although it lacks striking clearness, and without it conceptions, and with them knowledge of objects, are wholly impossible.”

Though the passage is obscure and confused, its general drift is clear. Kant, having spoken hitherto only of the operation of the imagination in apprehension and reproduction, now wishes to introduce the understanding. He naturally returns to the thought of it as that which recognizes a manifold as unified by a conception, the manifold, however, being not a group of particulars unified through the corresponding universal or conception, but the parts of an individual image, e. g. the parts of a line or the constituent units of a number, and the conception which unifies it being the principle on which these parts are combined. His main point is that it is not enough for knowledge that we should combine the manifold of sense into a whole in accordance with a specific principle, but we must also be in some degree conscious of our continuously identical act of combination, this consciousness being at the same time a consciousness of the special unity of the manifold. For the conception which forms the principle of the combination has necessarily two sides; while from our point of view it is the principle according to which we combine and which makes our combining activity one, from the point of view of the manifold it is the special principle by which the manifold is made *one*. If I am to count a group of five units, I must not only add them, but also be conscious of my continuously identical act of addition, this consciousness consisting in the consciousness that I am successively taking units up to, and only up to, five, and being at the same time a consciousness that the units are acquiring the unity of being a group of five. It immediately follows, though Kant does not explicitly say so, that all knowledge implies self-consciousness. For the consciousness that we have been combining the manifold on a certain definite principle is the consciousness of our identity throughout the process, and, from the side of the manifold, it is just that consciousness of the manifold as unified by being brought under a conception which constitutes knowledge. Even though it is Kant’s view that the self-consciousness need only be weak and need only arise after the act of combination, when we are aware of its result, still, without it, there will be no consciousness of the manifold as unified through a conception and therefore no knowledge. Moreover, if the self-consciousness be weak, the knowledge will be weak also, so that if it be urged that knowledge in the strictest sense requires the full consciousness that the manifold is unified through a conception, it must be allowed that knowledge in this sense requires a full or clear self-consciousness.

As is to be expected, however, the passage involves a difficulty concerning the respective functions of the imagination and the understanding. Is the understanding represented as only recognizing a principle of unity introduced into the manifold by the imagination, or as also for the first time introducing a principle of unity? At first sight the latter alternative may seem the right interpretation. For he says that unless we

were conscious that what we are thinking is identical with what we thought a moment ago, ‘what we are thinking would *be* a new representation which *did not at all belong* to the act by which it was bound to have been gradually produced, and the manifold of the same *would never* constitute a whole, as lacking the unity which only *consciousness can give it*.’ Again, in speaking of a conception — which of course implies the understanding — he says that ‘it is this one consciousness which *unites* the manifold gradually perceived and then reproduced into *one* representation’. But these statements are not decisive, for he uses the term ‘recognition’ in his formula for the work of the understanding, and he illustrates its work by pointing out that in counting we must *remember* that we have added the units. Moreover, there is a consideration which by itself makes it necessary to accept the former interpretation. The passage certainly represents the understanding as recognizing the identical action of the mind in combining the manifold on a principle, whether or not it also represents the understanding as the source of this activity. But if it were the understanding which combined the manifold, there would be no synthesis which the imagination could be supposed to have performed, and therefore it could play no part in knowledge at all, a consequence which must be contrary to Kant’s meaning. Further if, as the general tenor of the deduction shows, the imagination is really only the understanding working unreflectively, we are able to understand why Kant should for the moment cease to distinguish between the imagination and the understanding, and consequently should use language which implies that the understanding both combines the manifold on a principle and makes us conscious of our activity in so doing. Hence we may say that the real meaning of the passage should be stated thus: ‘Knowledge requires one consciousness which, as imagination, combines the manifold on a definite principle constituted by a conception, and, as understanding, is to some extent conscious of its identical activity in so doing, this self-consciousness being, from the side of the whole produced by the synthesis, the consciousness of the conception by which the manifold is unified.’

Hitherto there has been no mention of an *object* of knowledge, and since knowledge is essentially knowledge of an object, Kant’s next task is to give such an account of an object of knowledge as will show that the processes already described are precisely those which give our representations, i. e. the manifold of sense, relation to an object, and consequently yield knowledge.

He begins by raising the question, ‘What do we mean by the phrase ‘an object of representations’?’ He points out that a phenomenon, since it is a mere sensuous representation, and not a thing in itself existing independently of the faculty of representations, is just not an object. To the question, therefore, ‘What is meant by an object corresponding to knowledge and therefore distinct from it?’ we are bound to answer from the point of view of the distinction between phenomena and things in themselves, that the object is something in general = *x*, i. e. the thing in itself of which we know only *that* it is and not *what* it is. There is, however, another point of view from which we can say something more about an object of representations and the correspondence of our representations to it, viz. that from which we consider what is involved in the thought of the relation of knowledge or of a representation to its object. “We find that our thought of the relation of all knowledge to its object carries with it something of necessity, since its object is regarded as that which prevents our cognitions being determined at random or capriciously, and causes them to be determined *a priori* in a certain way, because in that they are to relate to an object, they must necessarily also, in relation to it, agree with one another, that is to say, they must have that unity which constitutes the conception of an object.”

Kant’s meaning seems to be this: ‘If we think of certain representations, e. g. certain lines or the representations of extension, impenetrability, and shape, as related to an object, e. g. to an individual triangle or an individual body, we think that they must be mutually consistent or, in other words, that they must have the unity of being parts of a necessarily related whole or system, this unity in fact constituting the conception of an object in general, in distinction from the conception of an object of a particular kind. The latter thought in turn involves the thought of the object of representations as that which prevents them

being anything whatever and in fact makes them parts of a system. The thought therefore of representations as related to an object carries with it the thought of a certain necessity, viz. the necessary or systematic unity introduced into the representations by the object. Hence by an object of representations we mean something which introduces into the representations a systematic unity which constitutes the nature of an object in general, and the relatedness of representations to, or their correspondence with, an object involves their systematic unity.'

Certain points, however, should be noticed. In the *first* place, Kant is for the moment tacitly ignoring his own theory of knowledge, in accordance with which the object proper, i. e. the thing in itself, is unknowable, and is reverting to the ordinary conception of knowledge as really *knowledge* of its object. For the elements which are said, in virtue of being related to an object, to agree and to have the unity which constitutes the conception of an object must be elements of an object which we know; for if the assertion that they agree is to be significant, they must be determinate parts or qualities of the object, e. g. the sides of an individual triangle or the impenetrability or shape of an individual body, and therefore it is implied that we know that the object has these parts or qualities. In the *second* place, both the problem which Kant raises and the clue which he offers for its solution involve an impossible separation of knowledge or a representation from its object. Kant begins with the thought of a phenomenon as a mere representation which, as mental, and as the representation of an object, is just not an object, and asks, 'What is meant by the object of it?' He finds the clue to the answer in the thought that though a representation or idea when considered in itself is a mere mental modification, yet, when considered as related to an object, it is subject to a certain necessity. In fact, however, an idea or knowledge is essentially an idea or knowledge of an object, and we are bound to think of it as such. There is no meaning whatever in saying that the thought of an idea as related to an object carries with it something of necessity, for to say so implies that it is possible to think of it as unrelated to an object. Similarly there is really no meaning in the question, 'What is meant by an object corresponding to knowledge or to an idea?' for this in the same way implies that we can first think of an idea as unrelated to an object and then ask, 'What can be meant by an object corresponding to it?' In the *third* place, Kant only escapes the absurdity involved in the thought of a mere idea or a mere representation by treating representations either as parts or as qualities of an object. For although he speaks of our cognitions, i. e. of our representations, as being determined by the object, he says that they must agree, i. e. they must have that unity which constitutes the conception of an object, and he illustrates representations by the sides of an individual triangle and the impenetrability and shape of an individual body, which are just as 'objective' as the objects to which they relate. The fact is that he really treats a representation not as his problem requires that it should be treated, i. e. as a representation of something, but as something represented, i. e. as something of which we are aware, viz. a part or a quality of an object. In the *fourth* place, not only is that which Kant speaks of as related to an object really not a representation, but also — as we see if we consider the fact which Kant has in mind — that to which he speaks of it as related is really not *an* object but *one and the same object to which another so-called representation is related*. For what Kant says is that representations as related to an object must agree among themselves. But this statement, to be significant, implies that the object to which various representations are related is *one and the same*. Otherwise why should the representations agree? In view, therefore, of these last two considerations we must admit that the real thought underlying Kant's statement should be expressed thus: 'We find that the thought that *two or more parts or qualities of an object* relate to *one and the same object* carries with it a certain necessity, since this object is considered to be that which *prevents these parts or qualities which we know it to possess* from being determined at random, because by being related to *one and the same object*, they must agree among themselves.' The importance of the correction lies in the fact that what Kant is stating is not what he thinks he is stating. He is really stating the implication of the thought that two or more qualities or parts of some object or other, which, as such, already relate to an object, relate to one and the same object. He

thinks he is stating the implication of the thought that a representation which in itself has no relation to an object, has relation to an object. And since his problem is simply to determine what constitutes the relatedness to an object of that which in itself is a mere representation, the distinction is important; for it shows that he really elucidates it by an implication respecting something which already has relation to an object and is not a mental modification at all, but a quality or a part of an object.

Kant continues thus: "But it is clear that, since we have to do only with the manifold of our representations, and the *x*, which corresponds to them (the object), since it is to be something distinct from all our representations, is for us nothing, the unity which the object necessitates can be nothing else than the formal unity of consciousness in the synthesis of the manifold of representations." [I. e. since the object which produces systematic unity in our representations is after all only the unknown thing in itself, viz. *x*, any of the parts or qualities of which it is impossible to know, that to which it gives unity can be only our representations and not its own parts or qualities. For, since we do not know any of its parts or qualities, these representations cannot be its parts or qualities. Consequently, the unity produced by this *x* can only be the formal unity of the combination of the manifold in consciousness.] "Then and then only do we say that we know the object," [i. e. we know that the manifold relates to an object] "if we have produced synthetical unity in the manifold of perception. But this unity would be impossible, if the perception could not be produced by means of such a function of synthesis according to a rule as renders the reproduction of the manifold a priori necessary, and a conception in which the manifold unifies itself possible. Thus we think a triangle as an object, in that we are conscious of the combination of three straight lines in accordance with a rule by which such a perception can at any time be presented. This *unity of the rule* determines all the manifold and limits it to conditions which make the unity of apperception possible, and the conception of this unity is the representation of the object=*x*, which I think through the aforesaid predicates of a triangle." [I. e., apparently, 'to conceive this unity of the rule is to represent to myself the object *x*, i. e. the thing in itself, of which I come to think by means of the rule of combination.']

In this passage several points claim attention. In the *first* place, it seems impossible to avoid the conclusion that in the second sentence the argument is exactly reversed. Up to this point, it is the thing in itself which produces unity in our representations. Henceforward it is we who produce the unity by our activity of combining the manifold. The discrepancy cannot be explained away, and its existence can only be accounted for by the exigencies of Kant's position. When he is asking 'What is meant by the object (beyond the mind) corresponding to our representations?' he has to think of the unity of the representations as due to the object. But when he is asking 'How does the manifold of sense become unified?' his view that all synthesis is due to the mind compels him to hold that the unity is produced by us. In the *second* place, the passage introduces a second object in addition to the thing in itself, viz. the phenomenal object, e. g. a triangle considered as a whole of parts unified on a definite principle. It is this object which, as the object that we know, is henceforward prominent in the first edition, and has exclusive attention in the second. The connexion between this object and the thing in itself appears to lie in the consideration that we are only justified in holding that the manifold of sense is related to a thing in itself when we have unified it and therefore know it to be a unity, and that to know it to be a unity is *ipso facto* to be aware of it as related to a phenomenal object; in other words, the knowledge that the manifold is related to an object beyond consciousness is acquired through our knowledge of its relatedness to an object within consciousness. In the *third* place, in view of Kant's forthcoming vindication of the categories, it is important to notice that the process by which the manifold is said to acquire relation to an object is illustrated by a synthesis on a particular principle which constitutes the phenomenal object an object of a particular kind. The synthesis which enables us to recognize three lines as an object is not a synthesis based on general principles constituted by the categories, but a synthesis based on the particular principle that the three lines must be so put together as to form an enclosed space. Moreover, it should be noticed

that the need of a particular principle is really inconsistent with his view that relation to an object gives the manifold the systematic unity which constitutes the conception of an object, or that at least a [Greek: hysteron proteron] is involved. For if the knowledge that certain representations form a systematic unity justifies our holding that they relate to an object, it would seem that in order to know that they relate to an object we need not know the special character of their unity. Yet, as Kant states the facts, we really have to know the special character of their unity in order to know that they possess systematic unity in general. *Lastly*, it is easy to see the connexion of this account of an object of representations with the preceding account of the synthesis involved in knowledge. Kant had said that knowledge requires a synthesis of the imagination in accordance with a definite principle, and the recognition of the principle of the synthesis by the understanding. From this point of view it is clear that the aim of the present passage is to show that this process yields knowledge of an object; for it shows that this process yields knowledge of a phenomenal object of a particular kind, e. g. of a triangle or of a body, and that this object as such refers to what after all is *the* object, viz. the thing in itself.

The position reached by Kant so far is this. Knowledge, as being knowledge of an object, consists in a process by which the manifold of perception acquires relation to an object. This process again is a process of combination of the manifold into a systematic whole upon a definite principle, accompanied by the consciousness in some degree of the act of combination, and therefore also of the acquisition by the manifold of the definite unity which forms the principle of combination. In virtue of this process there is said to be 'unity of consciousness in the synthesis of the manifold', a phrase which the context justifies us in understanding as a condensed expression for a situation in which (1) the manifold of sense is a unity of necessarily related parts, (2) there is *consciousness* of this unity, and (3) the consciousness which combines and is conscious of combining the manifold, as being necessarily one and the same throughout this process, is itself a unity.

Kant then proceeds to introduce what he evidently considers the keystone of his system, viz. 'transcendental apperception.'

"There is always a transcendental condition at the basis of any necessity. Hence we must be able to find a transcendental ground of the unity of consciousness in the synthesis of the manifold of all our perceptions, and therefore also of the conceptions of objects in general, consequently also of all objects of experience, a ground without which it would be impossible to think any object for our perceptions; for this object is no more than that something, the conception of which expresses such a necessity of synthesis."

"Now this original and transcendental condition is no other than *transcendental apperception*. The consciousness of self according to the determinations of our state in internal sense-perception is merely empirical, always changeable; there can be no fixed or permanent self in this stream of internal phenomena, and this consciousness is usually called *internal sense* or *empirical apperception*. That which is *necessarily* to be represented as numerically identical cannot be thought as such by means of empirical data. The condition which is to make such a transcendental presupposition valid must be one which precedes all experience, and makes experience itself possible."

"Now no cognitions can occur in us, no combination and unity of them with one another, without that unity of consciousness which precedes all data of perception, and by relation to which alone all representation of objects is possible. This pure original unchangeable consciousness I shall call *transcendental apperception*. That it deserves this name is clear from the fact that even the purest objective unity, viz. that of *a priori* conceptions (space and time) is only possible by relation of perceptions to it. The numerical unity of this apperception therefore forms the *a priori* foundation of all conceptions, just as the multiplicity of space and time is the foundation of the perceptions of the sensibility."

The argument is clearly meant to be 'transcendental' in character; in other words, Kant continues to

argue from the existence of knowledge to the existence of its presuppositions. We should therefore expect the passage to do two things: firstly, to show what it is which is presupposed by the ‘unity of consciousness in the synthesis of the manifold’; and secondly, to show that this presupposition deserves the title ‘transcendental apperception’. Unfortunately Kant introduces ‘transcendental apperception’ after the manner in which he introduced the ‘sensibility’, the ‘imagination’ and the ‘understanding’, as if it were a term with which every one is familiar, and which therefore needs little explanation. To interpret the passage, it seems necessary to take it in close connexion with the preceding account of the three ‘syntheses’ involved in knowledge, and to bear in mind that, as a comparison of passages will show, the term ‘apperception’, which Kant borrows from Leibniz, always has for Kant a reference to consciousness of self or self-consciousness. If this be done, the meaning of the passage seems to be as follows:

‘To vindicate the existence of a self which is necessarily one and the same throughout its representations, and which is capable of being aware of its own identity throughout, it is useless to appeal to that consciousness of ourselves which we have when we reflect upon our successive states. For, although in being conscious of our states we are conscious of ourselves we are not conscious of ourselves as unchanging. The self as going through successive states is changing, and even if in fact its states did not change, its identity would be only contingent; it need not continue unchanged. Consequently, the only course possible is to show that the self-consciousness in question is presupposed in any experience or knowledge. Now it is so presupposed. For, as we have already shown, the relation of representations to an object presupposes one consciousness which combines and unifies them, and is at the same time conscious of the identity of its own action in unifying them. This consciousness is the ground of the unity of consciousness in the synthesis of the manifold. It may fairly be called transcendental, because even a conception which relates to space or time, and therefore is the most remote from sensation, presupposes one consciousness which combines and unifies the manifold of space and time through the conception, and is conscious of the identity of its own action in so doing. It may, therefore, be regarded as the presupposition of *all* conceiving or bringing a manifold under a conception, and therefore of all knowledge. Consequently, since knowledge is possible, i. e. since the manifold of representations can be related to an object, there must be one self capable of being aware of its own identity throughout its representations.’

At this point of Kant’s argument, however, there seems to occur an inversion of the thought. Hitherto, Kant has been arguing from the possibility of knowledge to the possibility of the consciousness of our own identity. But in the next paragraph he appears to reverse this procedure and to argue from the possibility of self-consciousness to the possibility of knowledge.

“But it is just this transcendental unity of apperception which forms, from all possible phenomena which can be together in one experience, a connexion of them according to laws. For this unity of consciousness would be impossible, if the mind in the knowledge of the manifold could not become conscious of the identity of the function whereby it unites the manifold synthetically in one knowledge. Consequently, the original and necessary consciousness of the identity of oneself is at the same time a consciousness of an equally necessary unity of the synthesis of all phenomena according to conceptions, i. e. according to rules which not only make them necessarily reproducible, but thereby determine an object for their perception, i. e. determine the conception of something in which they are necessarily connected. For the mind could not possibly think the identity of itself in the manifold of its representations, and this indeed *a priori*, if it had not before its eyes the identity of its action which subjects all synthesis of apprehension (which is empirical) to a transcendental unity, and first makes possible its connexion according to rules.”

The argument seems indisputably to be as follows: ‘The mind is necessarily able to be aware of its own identity throughout its manifold representations. To be aware of this, it must be aware of the identity of the activity by which it combines the manifold of representations into a systematic whole. Therefore it

must be capable of combining, and of being conscious of its activity in combining, all phenomena which can be its representations into such a whole. But this process, from the point of view of the representations combined, is the process by which they become related to an object and so enter into knowledge. Therefore, since we are capable of being conscious of our identity with respect to all phenomena which can be our representations, the process of combination and consciousness of combination which constitutes knowledge must be possible with respect to them.' Thus the thought of this and the preceding paragraph seems to involve a circle. First the possibility of self-consciousness is deduced from the possibility of knowledge, and then the possibility of knowledge is deduced from the possibility of self-consciousness.

An issue therefore arises, the importance of which can be seen by reference to the final aim of the 'deduction', viz. the vindication of the categories. The categories are 'fundamental conceptions which enable us to think objects in general for phenomena'; in other words, they are the principles of the synthesis by which the manifold of sense becomes related to an object. Hence, if this be granted, the proof that the categories are applicable to objects consists in showing that the manifold can be subjected to this synthesis. The question therefore arises whether Kant's real starting-point for establishing the possibility of this synthesis and therefore the applicability of the categories, is to be found in the possibility of knowledge, or in the possibility of self-consciousness, or in both. In other words, does Kant start from the position that all representations must be capable of being related to an object, or from the position that we must be capable of being conscious of our identity with respect to all of them, or from both?

Prima facie the second position is the more plausible basis for the desired conclusion. On the one hand, it does not seem obvious that the manifold *must* be capable of being related to an object; for even if it be urged that otherwise we should have only 'a random play of representations, less than a dream', it may be replied, that this might be or might come to be the case. On the other hand, the fact that our representations are ours necessarily seems to presuppose that we are identical subjects of these representations, and recognition of this fact is the consciousness of our identity.

If we turn to the text for an answer to this question, we find that Kant seems not only to use both starting-points, but even to regard them as equivalents. Thus in introducing the categories Kant begins by appealing to the necessity for knowledge that representations should relate to an object.

"Unity of synthesis according to empirical conceptions would be purely contingent, and were these not based on a transcendental ground of unity, it would be possible for a confused crowd of phenomena to fill our soul, without the possibility of experience ever arising therefrom. But then also all relation of knowledge to objects would fall away, because knowledge would lack connexion according to universal and necessary laws; it would be thoughtless perception but never knowledge, and therefore for us as good as nothing."

"The *a priori* conditions of any possible experience whatever are at the same time conditions of the possibility of the objects of experience. Now I assert that the above mentioned *categories* are nothing but *the conditions of thinking in any possible experience*, just as *space and time* are the *conditions of perception* requisite for the same. The former therefore are also fundamental conceptions by which we think objects in general for phenomena, and are therefore objectively valid *a priori* — which is exactly what we wished to know."

The next sentence, however, bases the necessity of the categories on the possibility of self-consciousness, without giving any indication that a change of standpoint is involved.

"But the possibility, nay, even the necessity, of these categories rests on the relation which the whole sensibility, and with it also all possible phenomena, have to original apperception, a relation which forces everything to conform to the conditions of the thoroughgoing unity of self-consciousness, i. e. to stand under universal functions of synthesis, i. e. of synthesis according to conceptions, as that wherein alone apperception can prove *a priori* its thorough-going and necessary identity."

Finally, the conclusion of the paragraph seems definitely to treat both starting-points as really the same. "Thus the conception of a cause is nothing but a synthesis (of the consequent in the time series with other phenomena) *according to conceptions*; and without such a unity, which has its *a priori* rule and subjects phenomena to itself, thorough-going and universal and therefore necessary unity of consciousness in the manifold of sense-perceptions would not be met with. But then also these perceptions would belong to no experience, consequently they would have no object, and would be nothing but a blind play of representations, less than a dream."

The fact is that since for Kant the synthesis of representations in accordance with the categories, accompanied by the consciousness of it, is at once the necessary and sufficient condition of the relatedness of representations to an object and of the consciousness of our identity with respect to them, it seems to him to be one and the same thing whether, in vindicating the synthesis, we appeal to the possibility of knowledge or to the possibility of self-consciousness, and it even seems possible to argue, *via* the synthesis, from knowledge to self-consciousness and vice versa.

Nevertheless, it remains true that the vindication of the categories is different, according as it is based upon the possibility of relating representations to an object or upon the possibility of becoming self-conscious with respect to them. It also remains true that Kant vindicates the categories in both ways. For while, in expounding the three so-called syntheses involved in knowledge, he is vindicating the categories from the point of view of knowledge, when he comes to speak of transcendental apperception, of which the central characteristic is the consciousness of self involved, there is a shifting of the centre of gravity. Instead of treating representations as something which can become related to an object, he now treats them as something of which, as belonging to a self, the self must be capable of being conscious as its own, and argues that a synthesis in accordance with the categories is required for this self-consciousness. It must be admitted then — and the admission is only to be made with reluctance — that when Kant reaches transcendental apperception, he really adopts a new starting-point, and that the passage which introduces transcendental apperception by showing it to be implied in knowledge only serves to conceal from Kant the fact that, from the point of view of the deduction of the categories, he is really assuming without proof the possibility of self-consciousness with respect to all our representations, as a new basis for argument.

The approach to the categories from the side of self-consciousness is, however, more prominent in the second edition, and consequently we naturally turn to it for more light on this side of Kant's position. There Kant vindicates the necessity of the synthesis from the side of self-consciousness as follows:

" It must be possible that the 'I think' should accompany all my representations; for otherwise something would be represented in me which could not be thought; in other words, the representation would be either impossible or at least for me nothing. That representation which can be given before all thought is called *perception*. All the manifold of perception has therefore a necessary relation to the 'I think' in the same subject in which this manifold is found. But this representation [i. e. the 'I think'] is an act of *spontaneity*, i. e. it cannot be regarded as belonging to sensibility. I call it *pure apperception*, to distinguish it from *empirical apperception*, or *original apperception* also, because it is that self-consciousness which, while it gives birth to the representation 'I think', which must be capable of accompanying all others and is one and the same in all consciousness, cannot itself be accompanied by any other. I also call the unity of it the *transcendental* unity of self-consciousness, in order to indicate the possibility of *a priori* knowledge arising from it. For the manifold representations which are given in a perception would not all of them be *my* representations, if they did not all belong to one self-consciousness, that is, as my representations (even though I am not conscious of them as such), they must necessarily conform to the condition under which alone they *can* stand together in a universal self-consciousness, because otherwise they would not all belong to me. From this original connexion much can be concluded."

"That is to say, this thorough-going identity of the apperception of a manifold given in perception

contains a synthesis of representations, and is possible only through the consciousness of this synthesis. For the empirical consciousness which accompanies different representations is in itself fragmentary, and without relation to the identity of the subject. This relation, therefore, takes place not by my merely accompanying every representation with consciousness, but by my *adding* one representation to another, and being conscious of the synthesis of them. Consequently, only because I can connect a manifold of given representations *in one consciousness*, is it possible for me to represent to myself the *identity of consciousness in these representations*; i. e. the *analytical* unity of apperception is possible only under the presupposition of a *synthetical* unity. The thought, 'These representations given in perception belong all of them to me' is accordingly just the same as, 'I unite them in one self-consciousness, or at least can so unite them;' and although this thought is not itself as yet the consciousness of the *synthesis* of representations, it nevertheless presupposes the possibility of this synthesis; that is to say, it is only because I can comprehend the manifold of representations in one consciousness, that I call them all *my* representations; for otherwise I should have as many-coloured and varied a self as I have representations of which I am conscious. Synthetical unity of the manifold of perceptions, as given *a priori*, is therefore the ground of the identity of apperception itself, which precedes *a priori* all *my* determinate thinking. But connexion does not lie in the objects, nor can it be borrowed from them through perception and thereby first taken up into the understanding, but it is always an operation of the understanding which itself is nothing more than the faculty of connecting *a priori*, and of bringing the manifold of given representations under the unity of apperception, which principle is the highest in all human knowledge."

"Now this principle of the necessary unity of apperception is indeed an identical, and therefore an analytical, proposition, but nevertheless it declares a synthesis of the manifold given in a perception to be necessary, without which the thorough-going identity of self-consciousness cannot be thought. For through the Ego, as a simple representation, is given no manifold content; in perception, which is different from it, a manifold can only be given, and through *connexion* in one consciousness it can be thought. An understanding, through whose self-consciousness all the manifold would *eo ipso* be given, would *perceive*; our understanding can only *think* and must seek its perception in the senses. I am, therefore, conscious of the identical self, in relation to the manifold of representations given to me in a perception, because I call all those representations *mine*, which constitute *one*. But this is the same as to say that I am conscious *a priori* of a necessary synthesis of them, which is called the original synthetic unity of apperception, under which all representations given to me stand, but also under which they must be brought through a synthesis."

Though this passage involves many difficulties, the main drift of it is clear. Kant is anxious to establish the fact that the manifold of sense must be capable of being combined on principles, which afterwards turn out to be the categories, by showing this to be involved in the fact that we must be capable of being conscious of ourselves as the identical subject of all our representations. To do this, he seeks to prove in the first paragraph that self-consciousness in this sense must be possible, and in the second that this self-consciousness presupposes the synthesis of the manifold.

Examination of the argument, however, shows that the view that self-consciousness must be possible is, so far as Kant is concerned, an assumption for which Kant succeeds in giving no reason at all, and that even if it be true, it cannot form a basis from which to deduce the possibility of the synthesis.

Before, however, we attempt to prove this, it is necessary to draw attention to three features of the argument. In the *first* place, it implies a somewhat different account of self-consciousness to that implied in the passages of the first edition which we have already considered. Self-consciousness, instead of being the consciousness of the identity of our activity in combining the manifold, is now primarily the consciousness of ourselves as identical subjects of all our representations, i. e. it is what Kant calls the analytical unity of apperception; and consequently it is somewhat differently related to the activity of synthesis involved in knowledge. Instead of being regarded as the consciousness of this activity, it is

regarded as presupposing the consciousness of the product of this activity, i. e. of the connectedness of the manifold produced by the activity, this consciousness being what Kant calls the synthetical unity of apperception. In the *second* place, it is plain that Kant's view is not that self-consciousness involves the consciousness of our representations as a connected whole, but that it involves the consciousness of them as capable of being connected by a synthesis. Yet, if it is only because I can connect (and therefore apprehend as connected) a manifold of representations in one consciousness, that I can represent to myself the identity of consciousness in these representations, self-consciousness really requires the consciousness of our representations as *already* connected; the mere consciousness of our representations as *capable* of being connected would not be enough. The explanation of the inconsistency seems to lie in the fact that the synthetic unity of which Kant is thinking is the unity of nature. For, as Kant of course was aware, in our ordinary consciousness we do not apprehend the interconnexion of the parts of nature in detail, but only believe that there is such an interconnexion; consequently he naturally weakened the conclusion which he ought to have drawn, viz. that self-consciousness presupposes consciousness of the synthesis, in order to make it conform to the facts of our ordinary consciousness. Yet, if his *argument* is to be defended, its conclusion must be taken in the form that self-consciousness presupposes consciousness of the actual synthesis or connexion and not merely of the possibility of it. In the *third* place, Kant twice in this passage definitely makes the act of synthesis, which his argument maintains to be the condition of *consciousness of the identity* of ourselves, the condition of the *identity* of ourselves. The fact is that, on Kant's view, the act of synthesis of the representations is really a condition of their belonging to one self, the self being presupposed to be a self capable of self-consciousness.

We may now turn to the first of the two main points to be considered, viz. the reason given by Kant for holding that self-consciousness must be possible. In the first paragraph (§§ 1-4) Kant appears twice to state a reason, viz. in §§ 1 and 4. What is meant by the first sentence, "It must be possible that the 'I think' should accompany all my representations; for otherwise something would be represented in me which could not be thought; in other words, the representation would either be impossible or at least for me nothing"? It is difficult to hold that 'my representations' here means objects of which I am aware, and that the thesis to be established is that I must be capable of being conscious of my own identity throughout all awareness or thought of objects. For the next sentence refers to perceptions as representations which can be given previously to all thought, and therefore, presumably, as something of which I am not necessarily aware. Again, the ground adduced for the thesis would be in part a mere restatement of it, and in part nonsense. It would be 'otherwise something would be apprehended with respect to which I could not be aware that I was apprehending it; in other words, I could not apprehend it [since otherwise I could be aware that I was apprehending it]', the last words being incapable of any interpretation. It is much more probable that though Kant is leading up to self-consciousness, the phrase 'I think' here refers not to 'consciousness that I am thinking', but to 'thinking'. He seems to mean 'It must be possible to apprehend all my 'affections' (i. e. sensations or appearances in me), for otherwise I should have an affection of which I could not be aware; in other words, there could be no such affection, or at least it would be of no possible importance to me.' And on this interpretation self-consciousness is not introduced till § 3, and then only surreptitiously. On neither interpretation, however, does Kant give the vestige of a *reason* for the possibility of self-consciousness. Again, it seems clear that in § 4 'my representations', and 'representations which belong to me' mean objects of which I am aware (i. e. something presented); for he says of my representations, not that I may not be conscious of them — which he should have said if 'my representations' meant my mental affections of which I could become conscious — but that I may not be conscious of them as my representations. Consequently in § 4 he is merely asserting that I must be able to be conscious of my identity throughout my awareness of objects. So far, then, we find merely the *assertion* that self-consciousness must be possible.

In the next paragraph — which is clearly meant to be the important one — Kant, though he can hardly

be said to be aware of it, seems to *assume* that it is the very nature of a knowing self, not only to be identical throughout its thoughts or apprehendings, but to be capable of being conscious of its own identity. § 6 runs: “The empirical consciousness which accompanies different representations is in itself fragmentary, and without relation to the identity of the subject.” Kant is saying that if there existed merely a consciousness of A which was not at the same time a consciousness of B and a consciousness of B which was not at the same time a consciousness of A, these consciousnesses would not be the consciousnesses belonging to one self. But this is only true, if the one self to which the consciousness of A and the consciousness of B are to belong must be capable of being aware of its own identity. Otherwise it might be one self which apprehended A and then, forgetting A, apprehended B. No doubt in that case the self could not be aware of its own identity in apprehending A and in apprehending B, but none the less it would *be* identical in so doing. We reach the same conclusion if we consider the concluding sentence of § 10. “It is only because I can comprehend the manifold of representations in one consciousness, that I call them all my representations; for otherwise I should have as many-coloured and varied a self as I have representations of which I am conscious.” Doubtless if I am to *be aware of* myself as the same in apprehending A and B, then, in coming to apprehend B, I must continue to apprehend A, and therefore must apprehend A and B as related; and such a consciousness on Kant’s view involves a synthesis. But if I am merely to *be* the same subject which apprehends A and B, or rather if the apprehension of A and that of B are merely to *be* apprehensions on the part of one and the same subject, no such consciousness of A and B as related and, therefore, no synthesis is involved.

Again, the third paragraph assumes the possibility of self-consciousness as the starting-point for argument. The thought seems to be this: ‘For a self to be aware of its own identity, there must be a manifold in relation to which it can apprehend itself as one and the same throughout. An understanding which was perceptive, i. e. which originated objects by its own act of thinking, would necessarily by its own thinking originate a manifold in relation to which it could be aware of its own identity in thinking, and therefore its self-consciousness would need no synthesis. But our understanding, which is not perceptive, requires a manifold to be given to it, in relation to which it can be aware of its own identity by means of a synthesis of the manifold.’ If this be the thought, it is clearly presupposed that *any* understanding must be capable of being conscious of its own identity.

Further, it is easy to see how Kant came to take for granted the possibility of self-consciousness, in the sense of the consciousness of ourselves as the identical subject of all our representations. He approaches self-consciousness with the presupposition derived from his analysis of knowledge that our apprehension of a manifold does not consist in separate apprehensions of its elements, but is one apprehension or consciousness of the elements as related. He thinks of this as a general presupposition of all apprehension of a manifold, and, of course, to discover this presupposition is to be self-conscious. To recognize the oneness of our apprehension is to be conscious of our own identity.

Again, to pass to the second main point to be considered, Kant has no justification for arguing from the possibility of self-consciousness to that of the synthesis. This can be seen from the mere form of his argument. Kant, as has been said, seems first to establish the possibility of self-consciousness, and thence to conclude that a synthesis must be possible. But if, as it is his point to urge, consciousness of our identity only takes place through consciousness of the synthesis, this method of argument must be invalid. It would clearly be necessary to know that the synthesis is possible, *before* and *in order that* we could know that self-consciousness is possible. An objector has only to urge that the manifold might be such that it could not be combined into a systematic whole, in order to secure the admission that in that case self-consciousness would not be possible.

Nevertheless, the passage under consideration may be said to lay bare an important presupposition of self-consciousness. It is true that self-consciousness would be impossible, if we merely apprehended the parts of the world in isolation. To be conscious that I who am perceiving C perceived B and A, I must be

conscious at once of A, B, and C, in one act of consciousness or apprehension. To be conscious separately of A and B and C is not to be conscious of A and B and C. And, to be conscious of A and B and C in one act of consciousness, I must apprehend A, B, and C as related, i. e. as forming parts of a whole or system. Hence it is only because our consciousness of A, B, and C is never the consciousness of a mere A, a mere B, and a mere C, but is always the consciousness of A B C as elements in one world that we can be conscious of our identity in apprehending A, B, and C. If *per impossibile* our apprehension be supposed to cease to be an apprehension of a plurality of objects in relation, self-consciousness must be supposed to cease also. At the same time, it is impossible to argue from the consciousness of our identity in apprehending to the consciousness of what is apprehended as a unity, and thence to the existence of that unity. For, apart from the consideration that in fact all thinking presupposes the relatedness or — what is the same thing — the necessary relatedness of objects to one another, and that therefore any assertion to the contrary is meaningless, the consciousness of objects as a unity is a condition of the consciousness of our identity, and therefore any doubt that can be raised in regard to the former can be raised equally with regard to the latter.

We may now pass to the concluding portion of the deduction. For the purpose of considering it, we may sum up the results of the preceding discussion by saying that Kant establishes the synthesis of the manifold on certain principles by what are really two independent lines of thought. The manifold may be regarded either as something which, in order to enter into knowledge, must be given relation to an object, or as something with respect to which self-consciousness must be possible. Regarded in either way, the manifold, according to Kant, involves a process of synthesis on certain principles, which makes it a systematic unity. Now Kant introduces the categories by maintaining that they are the principles of synthesis in question. “I assert that the above mentioned *categories* are nothing but the *conditions of thinking in a possible experience*.... They are fundamental conceptions by which we think objects in general for phenomena.” A synthesis according to the categories is ‘that wherein alone apperception can prove *a priori* its thorough-going and necessary identity’. In the first edition this identification is simply asserted, but in the second Kant offers a proof.

Before, however, we consider the proof, it is necessary to refer to a difficulty which seems to have escaped Kant altogether. The preceding account of the synthesis involved in knowledge and in self-consciousness implies, as his illustrations conclusively show, that the synthesis requires a particular principle which constitutes the individual manifold a whole of a particular kind. But, if this be the case, it is clear that the categories, which are merely conceptions of an object in general, and are consequently quite general, cannot possibly be sufficient for the purpose. And since the manifold in itself includes no synthesis and therefore no principle of synthesis, Kant fails to give any account of the source of the particular principles of synthesis required for particular acts of knowledge. This difficulty — which admits of no solution — is concealed from Kant in two ways. In the first place, when he describes what really must be stated as the process by which parts or qualities of an object become related to an object of a particular kind, he thinks that he is describing a process by which representations become related to an object in general. Secondly, he thinks of the understanding as the source of general principles of synthesis, individual syntheses and the particular principles involved being attributed to the imagination; and so, when he comes to consider the part played in knowledge by the understanding, he is apt to ignore the need of particular principles. Hence, Kant’s proof that the categories are the principles of synthesis can at best be taken only as a proof that the categories, though not sufficient for the synthesis, are involved in it.

The proof runs thus:

“I could never satisfy myself with the definition which logicians give of a judgement in general. It is, according to them, the representation of a relation between two conceptions....”

“But if I examine more closely the relation of given representations in every judgement, and distinguish it, as belonging to the understanding, from their relation according to the laws of the reproductive

imagination (which has only subjective validity), I find that a judgement is nothing but the mode of bringing given representations under the *objective* unity of apperception. This is what is intended by the term of relation 'is' in judgements, which is meant to distinguish the objective unity of given representations from the subjective. For this term indicates the relation of these representations to the original apperception, and also their *necessary unity*, even though the judgement itself is empirical, and therefore contingent, e. g. 'Bodies are heavy.' By this I do not mean that these representations *necessarily* belong *to each other* in empirical perception, but that they belong to each other *by means of the necessary unity* of apperception in the synthesis of perceptions, that is, according to principles of the objective determination of all our representations, in so far as knowledge can arise from them, these principles being all derived from the principle of the transcendental unity of apperception. In this way alone can there arise from this relation *a judgement*, that is, a relation which is *objectively valid*, and is adequately distinguished from the relation of the very same representations which would be only subjectively valid, e. g. according to laws of association. According to these laws, I could only say, 'If I carry a body, I feel an impression of weight', but not 'It, the body, *is* heavy'; for this is tantamount to saying, 'These two representations are connected in the object, that is, without distinction as to the condition of the subject, and are not merely connected together in the perception, however often it may be repeated.'"

This ground for the identification of the categories with the principles of synthesis involved in knowledge may be ignored, as on the face of it unsuccessful. For the argument is that since the activity by which the synthesis is affected is that of judgement, the conceptions shown by the *Metaphysical Deduction* to be involved in judgement must constitute the principles of synthesis. But it is essential to this argument that the present account of judgement and that which forms the basis of the *Metaphysical Deduction* should be the same; and this is plainly not the case. Judgement is now represented as an act by which we relate the manifold of sense in certain necessary ways as parts of the physical world, whereas in the *Metaphysical Deduction* it was treated as an act by which we relate conceptions; and Kant now actually says that this latter account is faulty. Hence even if the metaphysical deduction had successfully derived the categories from the account of judgement which it presupposed, the present argument would not justify the identification of the categories so deduced with the principles of synthesis. The fact is that Kant's vindication of the categories is in substance independent of the *Metaphysical Deduction*. Kant's real thought, as opposed to his formal presentation of it, is simply that when we come to consider what are the principles of synthesis involved in the reference of the manifold to an object, we find that they are the categories. The success, then, of this step in Kant's vindication of the categories is independent of that of the metaphysical deduction, and depends solely upon the question whether the principles of synthesis involved in knowledge are in fact the categories.

The substance of Kant's vindication of the categories may therefore be epitomized thus: 'We may take either of two starting-points. On the one hand, we may start from the fact that our experience is no mere dream, but an intelligent experience in which we are aware of a world of individual objects. This fact is conceded even by those who, like Hume, deny that we are aware of any necessity of relation between these objects. We may then go on to ask how it comes about that, beginning as we do with a manifold of sense given in succession, we come to apprehend this world of individual objects. If we do so, we find that there is presupposed a synthesis on our part of the manifold upon principles constituted by the categories. To deny, therefore, that the manifold is so connected is implicitly to deny that we have an apprehension of objects at all. But the existence of this apprehension is plainly a fact which even Hume did not dispute. On the other hand, we may start with the equally obvious fact that we must be capable of apprehending our own identity throughout our apprehension of the manifold of sense, and look for the presupposition of this fact. If we do this, we again find that there is involved a combination of the manifold according to the categories.'

In conclusion, attention may be drawn to two points. In the first place, Kant completes his account by at once emphasizing and explaining the paradoxical character of his conclusion. “Accordingly, the order and conformity to law in the phenomena which we call *nature* we ourselves introduce, and we could never find it there, if we, or the nature of our mind, had not originally placed it there.” “However exaggerated or absurd then it may sound to say that the understanding itself is the source of the laws of nature and consequently of the formal unity of nature, such an assertion is nevertheless correct and in accordance with the object, i. e. with experience.” The explanation of the paradox is found in the fact that objects of nature are phenomena. “But if we reflect that this nature is in itself nothing else than a totality of phenomena and consequently no thing in itself but merely a number of representations of the mind, we shall not be surprised that only in the radical faculty of all our knowledge, viz. transcendental apperception, do we see it in that unity through which alone it can be called object of all possible experience, i. e. nature.” “It is no more surprising that the laws of the phenomena in nature must agree with the understanding and with its *a priori* form, that is, its faculty of connecting the manifold in general, than that the phenomena themselves must agree with the *a priori* form of our sensuous perception. For laws exist in the phenomena as little as phenomena exist in themselves; on the contrary, laws exist only relatively to the subject in which the phenomena inhere, so far as it has understanding, just as phenomena exist only relatively to the subject, so far as it has senses. To things in themselves their conformity to law would necessarily also belong independently of an understanding which knows them. But phenomena are only representations of things which exist unknown in respect of what they may be in themselves. But, as mere representations, they stand under no law of connexion except that which the connecting faculty prescribes.”

In the second place, this last paragraph contains the real reason from the point of view of the deduction of the categories for what may be called the negative side of his doctrine, viz. that the categories only apply to objects of experience and not to things in themselves. According to Kant, we can only say that certain principles of connexion apply to a reality into which we introduce the connexion. Things in themselves, if connected, are connected in themselves and apart from us. Hence there can be no guarantee that any principles of connexion which we might assert them to possess are those which they do possess.

CHAPTER IX. GENERAL CRITICISM OF THE TRANSCENDENTAL DEDUCTION OF THE CATEGORIES

The preceding account of Kant's vindication of the categories has included much criticism. But the criticism has been as far as possible restricted to details, and has dealt with matters of principle only so far as has been necessary in order to follow Kant's thought. We must now consider the position as a whole, even though this may involve some repetition. The general difficulties of the position may be divided into two kinds, (1) difficulties involved in the working out of the theory, even if its main principles are not questioned, and (2) difficulties involved in accepting its main principles at all.

The initial difficulty of the first kind, which naturally strikes the reader, concerns the possibility of performing the synthesis. The mind has certain general ways of combining the manifold, viz. the categories. But on general grounds we should expect the mind to possess only one mode of combining the manifold. For the character of the manifold to be combined cannot affect the mind's power of combination, and, if the power of the mind consists in combining, the combining should always be of the same kind. Thus, suppose the manifold given to the mind to be combined consisted of musical notes, we could think of the mind's power of combination as exercised in combining the notes by way of succession, *provided that* this be regarded as the only mode of combination. But if the mind were thought also capable of combining notes by way of simultaneity, we should at once be confronted with the insoluble problem of determining why the one mode of combination was exercised in any given case rather than the other. If, several kinds of synthesis being allowed, this difficulty be avoided by the supposition that, not being incompatible, they are all exercised together, we have the alternative task of explaining how the same manifold can be combined in each of these ways. As a matter of fact, Kant thinks of manifolds of different kinds as combined or related in different ways; thus events are related causally and quantities quantitatively. But since, on Kant's view, the manifold as given is unrelated and all combination comes from the mind, the mind should not be held capable of combining manifolds of different kinds differently. Otherwise the manifold would in its own nature imply the need of a particular kind of synthesis, and would therefore not be unrelated.

Suppose, however, we waive the difficulty involved in the plurality of the categories. There remains the equally fundamental difficulty that any single principle of synthesis contains in itself no ground for the different ways of its application. Suppose it to be conceded that in the apprehension of definite shapes we combine the manifold in accordance with the conception of figure, and, for the purpose of the argument, that the conception of figure can be treated as equivalent to the category of quantity. It is plain that we apprehend different shapes, e. g. lines and triangles, of which, if we take into account differences of relative length of sides, there is an infinite variety, and houses, which may also have an infinite variety of shape. But there is nothing in the mind's capacity of relating the manifold by way of figure to determine it to combine a given manifold into a figure of one kind rather than into a figure of any other kind; for to combine the manifold into a particular shape, there is needed not merely the thought of a figure in general, but the thought of a definite figure. No 'cue' can be furnished by the manifold itself, for any such cue would involve the conception of a particular figure, and would therefore imply that the particular synthesis was implicit in the manifold itself, in which case it would not be true that all synthesis comes from the mind.

This difficulty takes a somewhat different form in the case of the categories of relation. To take the case of cause and effect, the conception of which, according to Kant, is involved in our apprehension of a succession, Kant's view seems to be that we become aware of two elements of the manifold A B as a succession of events in the world of nature by combining them as necessarily successive in a causal order,

in which the state of affairs which precedes B and which contains A contains something upon which B must follow (i. e. a cause of B), which therefore makes it necessary that B must follow A. But if we are to do this, we must in some way succeed in selecting or picking out from among the elements of the manifold that element A which is to be thus combined with B. We therefore need something more than the category. It is not enough that we should think that B has a cause; we must think of something in particular as the cause of B, and we must think of it either as coexistent with, or as identical with, A.

Kant fails to notice this second difficulty, and up to a certain point avoids it owing to his distinction between the imagination and the understanding. For he thinks of the understanding as the source of general principles of synthesis, viz. the categories, and attributes individual syntheses to the imagination. Hence the individual syntheses, which involve particular principles, are already effected before the understanding comes into play. But to throw the work of effecting individual syntheses upon the imagination is only to evade the difficulty. For in the end, as has been pointed out, the imagination must be the understanding working unreflectively, and, whether this is so or not, some account must be given of the way in which the imagination furnishes the particular principles of synthesis required.

The third and last main difficulty of the first kind concerns the relation of the elements of the manifold and the kinds of synthesis by which they are combined. This involves the distinction between relating in general and terms to be related. For to perform a synthesis is in general to relate, and the elements to be combined are the terms to be related. Now it is only necessary to take instances to realize that the possibility of relating terms in certain ways involves two presuppositions, which concern respectively the general and the special nature of the terms to be related.

In the first place, it is clear that the general nature of the terms must correspond with or be adapted to the general nature of the relationship to be effected. Thus if two terms are to be related as more or less loud, they must be sounds, since the relation in question is one in respect of sound and not, e. g., of time or colour or space. Similarly, terms to be related as right and left must be bodies in space, right and left being a spatial relation. Again, only human beings can be related as parent and child. Kant’s doctrine, however, does not conform to this presupposition. For the manifold to be related consists solely of sensations, and of individual spaces, and perhaps individual times, as elements of pure perception; and such a manifold is not of the kind required. Possibly individual spaces may be regarded as adequate terms to be related or combined into geometrical figures, e. g. into lines or triangles. But a house as a synthesis of a manifold cannot be a synthesis of spaces, or of times, or of sensations. Its parts are bodies, which, whatever they may be, are neither sensations nor spaces nor times, nor combinations of them. In reality they are substances of a special kind. Again, the relation of cause and effect is not a relation of sensations or spaces or times, but of successive states of physical things or substances, the relation consisting in the necessity of their succession.

In the second place, it is clear that the special nature of the relation to be effected presupposes a special nature on the part of the terms to be related. If one sound is to be related to another by way of the octave, that other must be its octave. If one quantity is to be related to another as the double of it, that quantity must be twice as large as the other. In the same way, proceeding to Kant’s instances, we see that if we are to combine or relate a manifold into a triangle, and therefore into a triangle of a particular size and shape, the elements of the manifold must be lines, and lines of a particular size. If we are to combine a manifold into a house, and therefore into a house of a certain shape and size, the manifold must consist of bodies of a suitable shape and size. If we are to relate a manifold by way of necessary succession, the manifold must be such that it can be so related; in other words, if we are to relate an element X of the manifold with some other Y as the necessary antecedent of X, there must be some definite element Y which is connected with, and always occurs along with, X. To put the matter generally, we may say that the manifold must be adapted to or ‘fit’ the categories not only, as has been pointed out, in the sense that it must be of the right kind, but also in the sense that its individual elements must have that orderly character

which enables them to be related according to the categories.

Now it is plain from Kant's vindication of what he calls the affinity of phenomena, that he recognizes the existence of this presupposition. But the question arises whether this vindication can be successful. For since the manifold is originated by the thing in itself, it seems prima facie impossible to prove that the elements of the manifold must have affinity, and so be capable of being related according to the categories. Before, however, we consider the chief passage in which Kant tries to make good his position, we may notice a defence which might naturally be offered on his behalf. It might be said that he establishes the conformity of the manifold to the categories at least hypothetically, i. e. upon the supposition that the manifold is capable of entering into knowledge, and also upon the supposition that we are capable of being conscious of our identity with respect to it; for upon either supposition any element of the manifold must be capable of being combined with all the rest into one world of nature. Moreover, it might be added that these suppositions are justified, for our experience is not a mere dream, but is throughout the consciousness of a world, and we are self-conscious throughout our experience; and therefore it is clear that the manifold does in fact 'fit' the categories. But the retort is obvious. Any actual conformity of the manifold to the categories would upon this view be at best but an empirical fact, and, although, if the conformity ceased, we should cease to be aware of a world and of ourselves, no reason has been or can be given why the conformity should not cease.

The passage in which Kant vindicates the affinity of phenomena in the greatest detail is the following:

"We will now try to exhibit the necessary connexion of the understanding with phenomena by means of the categories, by beginning from below, i. e. from the empirical end. The first that is given us is a phenomenon, which if connected with consciousness is called perception.... But because every phenomenon contains a manifold, and consequently different perceptions are found in the mind scattered and single, a connexion of them is necessary, which they cannot have in mere sense. There is, therefore, in us an active power of synthesis of this manifold, which we call imagination, and the action of which, when exercised immediately upon perceptions, I call apprehension. The business of the imagination, that is to say, is to bring the manifold of intuition into an *image*; it must, therefore, first receive the impressions into its activity, i. e. apprehend them."

"But it is clear that even this apprehension of the manifold would not by itself produce an image and a connexion of the impressions, unless there were a subjective ground in virtue of which one perception, from which the mind has passed to another, is summoned to join that which follows, and thus whole series of perceptions are presented, i. e. a reproductive power of imagination, which power, however, is also only empirical."

"But if representations reproduced one another at haphazard just as they happened to meet together, once more no determinate connexion would arise, but merely chaotic heaps of them, and consequently no knowledge would arise; therefore the reproduction of them must have a rule, according to which a representation enters into connexion with this rather than with another in the imagination. This subjective and *empirical* ground of reproduction according to rules is called the *association* of representations."

"But now, if this unity of association had not also an objective ground, so that it was impossible that phenomena should be apprehended by the imagination otherwise than under the condition of a possible synthetic unity of this apprehension, it would also be a pure accident that phenomena were adapted to a connected system of human knowledge. For although we should have the power of associating perceptions, it would still remain wholly undetermined and accidental whether they were associable; and in the event of their not being so, a multitude of perceptions and even perhaps a whole sensibility would be possible, in which much empirical consciousness would be met with in my mind, but divided and without belonging to *one* consciousness of myself, which however is impossible. For only in that I ascribe all perceptions to one consciousness (the original apperception) can I say of all of them that I am conscious of them. There must therefore be an objective ground, i. e. a ground to be recognized *a priori*

before all empirical laws of the imagination, on which rests the possibility, nay even the necessity, of a law which extends throughout all phenomena, according to which we regard them without exception as such data of the senses, as are in themselves associable and subjected to universal rules of a thoroughgoing connexion in reproduction. This objective ground of all association of phenomena I call the *affinity* of phenomena. But we can meet this nowhere else than in the principle of the unity of apperception as regards all cognitions which are to belong to me. According to it, all phenomena without exception must so enter into the mind or be apprehended as to agree with the unity of apperception, which agreement would be impossible without synthetical unity in their connexion, which therefore is also objectively necessary."

"The objective unity of all (empirical) consciousness in one consciousness (the original apperception) is therefore the necessary condition even of all possible perception, and the affinity of all phenomena (near or remote) is a necessary consequence of a synthesis in the imagination, which is *a priori* founded upon rules."

"The imagination is therefore also a power of *a priori* synthesis, for which reason we give it the name of the productive imagination; and so far as it, in relation to all the manifold of the phenomenon, has no further aim than the necessary unity in the synthesis of the phenomenon, it can be called the transcendental function of the imagination. It is therefore strange indeed, but nevertheless clear from the preceding, that only by means of this transcendental function of the imagination does even the affinity of phenomena, and with it their association and, through this, lastly their reproduction according to laws, and consequently experience itself become possible, because without it no conceptions of objects would ever come together into one experience."

If it were not for the last two paragraphs, we should understand this difficult passage to be substantially identical in meaning with the defence of the affinity of phenomena just given. We should understand Kant to be saying (1) that the synthesis which knowledge requires presupposes not merely a faculty of association on our part by which we reproduce elements of the manifold according to rules, but also an affinity on the part of the manifold to be apprehended, which enables our faculty of association to get to work, and (2) that this affinity can be vindicated as a presupposition at once of knowledge and of self-consciousness.

In view, however, of the fact that, according to the last two paragraphs, the affinity is due to the imagination, it seems necessary to interpret the passage thus:

'Since the given manifold of sense consists of isolated elements, this manifold, in order to enter into knowledge, must be combined into an image. This combination is effected by the imagination, which however must first apprehend the elements one by one.'

'But this apprehension of the manifold by the imagination could produce no image, unless the imagination also possessed the power of reproducing past elements of the manifold, and, if knowledge is to arise, of reproducing them according to rules. This faculty of reproduction by which, on perceiving the element A, we are led to think of or reproduce a past element B — B being reproduced according to some rule — rather than C or D is called the faculty of association; and since the rules according to which it works depend on empirical conditions, and therefore cannot be anticipated *a priori*, it may be called the subjective ground of reproduction.'

'But if the image produced by association is to play a part in knowledge, the empirical faculty of reproduction is not a sufficient condition or ground of it. A further condition is implied, which may be called objective in the sense that it is *a priori* and prior to all empirical laws of imagination. This condition is that the act by which the data of sense enter the mind or are apprehended, i. e. the act by which the imagination *apprehends and combines* the data of sense into a sensuous image, must *make* the elements such that they have affinity, and therefore such that they can subsequently be recognized as parts of a necessarily related whole. Unless this condition is satisfied, even if we possessed the faculty of

association, our experience would be a chaos of disconnected elements, and we could not be self-conscious, which is impossible. Starting, therefore, with the principle that we must be capable of being self-conscious with respect to all the elements of the manifold, we can lay down *a priori* that this condition is a fact.'

'It follows, then, that the affinity or connectedness of the data of sense presupposed by the *re*production which is presupposed in knowledge, is actually produced by the *pro*ductive faculty of imagination, which, in combining the data into a sensuous image, gives them the unity required.'

If, as it seems necessary to believe, this be the correct interpretation of the passage, Kant is here trying to carry out to the full his doctrine that *all* unity or connectedness comes from the mind's activity. He is maintaining that the imagination, acting *pro*ductively on the data of sense and thereby combining them into an image, gives the data a connectedness which the understanding can subsequently recognize. But to maintain this is, of course, only to throw the problem one stage further back. If reproduction, in order to enter into knowledge, implies a manifold which has such connexion that it is capable of being reproduced according to rules, so the production of sense-elements into a coherent image in turn implies sense-elements capable of being so combined. The act of combination cannot confer upon them or introduce into them a unity which they do not already possess.

The fact is that this step in Kant's argument exhibits the final breakdown of his view that all unity or connectedness or relatedness is conferred upon the data of sense by the activity of the mind. Consequently, this forms a convenient point at which to consider what seems to be the fundamental mistake of this view. The mistake stated in its most general form appears to be that, misled by his theory of perception, he regards 'terms' as given by things in themselves acting on the sensibility, and 'relations' as introduced by the understanding, whereas the fact is that in the sense in which terms can be said to be given, relations can and must also be said to be given.

To realize that this is the case, we need only consider Kant's favourite instance of knowledge, the apprehension of a straight line. According to him, this presupposes that there is given to us a manifold, which — whether he admits it or not — must really be parts of the line, and that we combine this manifold on a principle involved in the nature of straightness. Now suppose that the manifold given is the parts AB, BC, CD, DE of the line AE. It is clearly only possible to recognize AB and BC as contiguous parts of a straight line, if we immediately apprehend that AB and BC form one line of which these parts are identical in direction. Otherwise, we might just as well join AB and BC at a right angle, and in fact at any angle; we need not even make AB and BC contiguous. Similarly, the relation of BC to CD and of CD to DE must be just as immediately apprehended as the parts themselves. Is there, however, any relation of which it could be said that it is not given, and to which therefore Kant's doctrine might seem to apply? There is. Suppose AB, BC, CD to be of such a size that, though we can see AB and BC, or BC and CD, together, we cannot see AB and CD together. It is clear that in this case we can only learn that AB and CD are parts of the same straight line through an inference. We have to infer that, because each is in the same straight line with BC, the one is in the same straight line with the other. Here the fact that AB and CD are in the same straight line is not immediately apprehended. This relation, therefore, may be said not to be given; and, from Kant's point of view, we could say that we introduce this relation into the manifold through our activity of thinking, which combines AB and CD together in accordance with the principle that two straight lines which are in the same line with a third are in line with one another. Nevertheless, this case is no exception to the general principle that relations must be given equally with terms; for we only become aware of the relation between AB and CD, which is not given, because we are already aware of other relations, viz. those between AB and BC, and BC and CD, which are given. Relations then, or, in Kant's language, particular syntheses must be said to be given, in the sense in which the elements to be combined can be said to be given.

Further, we can better see the nature of Kant's mistake in this respect, if we bear in mind that Kant

originally and rightly introduced the distinction between the sensibility and the understanding as that between the passive faculty by which an individual is given or presented to us and the active faculty by which we bring an individual under, or recognize it as an instance of a universal. For we then see that Kant in the *Transcendental Deduction*, by treating what is given by the sensibility as terms and what is contributed by the understanding as relations, is really confusing the distinction between a relation and its terms with that between universal and individual; in other words, he says of terms what ought to be said of individuals, and of relations what ought to be said of universals. That the confusion is a confusion, and not a legitimate identification, it is easy to see. For, on the one hand, a relation between terms is as much an individual as either of the terms. That a body A is to the right of a body B is as much an individual fact as either A or B. And if terms, as being individuals, belong to perception and are given, in the sense that they are in an immediate relation to us, relations, as being individuals, equally belong to perception and are given. On the other hand, individual terms just as much as individual relations imply corresponding universals. An individual body implies 'bodiness', just as much as the fact that a body A is to the right of a body B implies the relationship of 'being to the right of something'. And if, as is the case, thinking or conceiving in distinction from perceiving, is that activity by which we recognize an individual, given in perception, as one of a kind, conceiving is involved as much in the apprehension of a term as in the apprehension of a relation. The apprehension of 'this red body' as much involves the recognition of an individual as an instance of a kind, i. e. as much involves an act of the understanding, as does the apprehension of the fact that it is brighter than some other body.

Kant has failed to notice this confusion for two reasons. In the first place, beginning in the *Analytic* with the thought that the thing in itself, by acting on our sensibility, produces isolated sense data, he is led to adopt a different view of the understanding from that which he originally gave, and to conceive its business as consisting in relating these data. In the second place, by distinguishing the imagination from the understanding, he is able to confine the understanding to being the source of universals or principles of relation in distinction from individual relations. Since, however, as has been pointed out, and as Kant himself sees at times, the imagination is the understanding working unreflectively, this limitation cannot be successful.

There remain for consideration the difficulties of the second kind, i. e. the difficulties involved in accepting its main principles at all. These are of course the most important. Throughout the deduction Kant is attempting to formulate the nature of knowledge. According to him, it consists in an activity of the mind by which it combines the manifold of sense on certain principles and is to some extent aware that it does so, and by which it thereby gives the manifold relation to an object. Now the fundamental and final objection to this account is that what it describes is not knowledge at all. The justice of this objection may be seen by considering the two leading thoughts underlying the view, which, though closely connected, may be treated separately. These are the thought of knowledge as a process by which representations acquire relation to an object, and the thought of knowledge as a process of synthesis.

It is in reality meaningless to speak of 'a process by which representations or ideas acquire relation to an object'. The phrase must mean a process by which a mere apprehension, which, as such, is not the apprehension of an object, becomes the apprehension of an object. Apprehension, however, is essentially and from the very beginning the apprehension of an object, i. e. of a reality apprehended. If there is no object which the apprehension is 'of', there is no apprehension. It is therefore wholly meaningless to speak of a process by which an apprehension *becomes* the apprehension of an object. If when we reflected we were not aware of an object, i. e. a reality apprehended, we could not be aware of our apprehension; for our apprehension is the apprehension of it, and is itself only apprehended in relation to, though in distinction from, it. It is therefore impossible to suppose a condition of mind in which, knowing what 'apprehension' means, we proceed to ask, 'What is meant by an object of it?' and 'How does an apprehension become related to an object?'; for both questions involve the thought of a mere

representation, i. e. of an apprehension which as yet is not the apprehension of anything.

These questions, when their real nature is exhibited, are plainly absurd. Kant's special theory, however, enables him to evade the real absurdity involved. For, according to his view, a representation is the representation or apprehension of something only from the point of view of the thing in itself. As an appearance or perhaps more strictly speaking as a sensation, it has also a being of its own which is not relative; and from this point of view it *is* possible to speak of 'mere' representations and to raise questions which presuppose their reality.

But this remedy, if remedy it can be called, is at least as bad as the disease. For, in the first place, the change of standpoint is necessarily illegitimate. An appearance or sensation is not from any point of view a representation in the proper sense, i. e. a representation or apprehension of something. It is simply a reality to be apprehended, of the special kind called mental. If it be called a representation, the word must have a new meaning; it must mean something represented, or presented, i. e. object of apprehension, with the implication that what is presented, or is object of apprehension, is mental or a modification of the mind. Kant therefore only avoids the original absurdity by an illegitimate change of standpoint, the change being concealed by a tacit transition in the meaning of representation. In the second place, the change of standpoint only saves the main problem from being absurd by rendering it insoluble. For if a representation be taken to be an appearance or a sensation, the main problem becomes that of explaining how it is that, beginning with the apprehension of mere appearances or sensations, we come to apprehend an object, in the sense of an object in nature, which, as such, is not an appearance or sensation but a part of the physical world. But if the immediate object of apprehension were in this way confined to appearances, which are, to use Kant's phrase, determinations of our mind, our apprehension would be limited to these appearances, and any apprehension of an object in nature would be impossible. In fact, it is just the view that the immediate object of apprehension consists in a determination of the mind which forms the basis of the solipsist position. Kant's own solution involves an absurdity at least as great as that involved in the thought of a mere representation, in the proper sense of representation. For the solution is that appearances or sensations become related to an object, in the sense of an object in nature, by being combined on certain principles. Yet it is plainly impossible to combine appearances or sensations into an object in nature. If a triangle, or a house, or 'a freezing of water' is the result of any process of combination, the elements combined must be respectively lines, and bricks, and physical events; these are objects in the sense in which the whole produced by the combination is an object, and are certainly not appearances or sensations. Kant conceals the difficulty from himself by the use of language to which he is not entitled. For while his instances of objects are always of the kind indicated, he persists in calling the manifold combined 'representations', i. e. presented mental modifications. This procedure is of course facilitated for him by his view that nature is a phenomenon or appearance, but the difficulty which it presents to the reader culminates when he speaks of the very same representations as having both a subjective and an objective relation, i. e. as being both modifications of the mind and parts of nature.

We may now turn to Kant's thought of knowledge as a process of synthesis. When Kant speaks of synthesis, the kind of synthesis of which he usually is thinking is that of spatial elements into a spatial whole; and although he refers to other kinds, e. g. of units into numbers, and of events into a temporal series, nevertheless it is the thought of spatial synthesis which guides his view. Now we must in the end admit that the spatial synthesis of which he is thinking is really the *construction* or *making* of spatial objects in the literal sense. It would be rightly illustrated by making figures out of matches or spelicans, or by drawing a circle with compasses, or by building a house out of bricks. Further, if we extend this view of the process of which Kant is thinking, we have to allow that the process of synthesis in which, according to Kant, knowledge consists is that of making or constructing parts of the physical world, and in fact the physical world itself, out of elements given in perception. The deduction throughout presupposes that the synthesis is really *manufacture*, and Kant is at pains to emphasize the fact. "The order and

conformity to law in the phenomena which we call *nature* we ourselves introduce, and we could not find it there, if we or the nature of our mind had not originally placed it there." He naturally rejoices in the manufacture, because it is just this which makes the categories valid. If knowing is really making, the principles of synthesis must apply to the reality known, because it is by these very principles that the reality is made. Moreover, recognition of this fact enables us to understand certain features of his view which would otherwise be inexplicable. For if the synthesis consists in literal construction, we are able to understand why Kant should think (1) that in the process of knowledge the mind *introduces* order into the manifold, (2) that the mind is limited in its activity of synthesis by having to conform to certain principles of construction which constitute the nature of the understanding, and (3) that the manifold of phenomena must possess affinity. If, for example, we build a house, it can be said (1) that we introduce into the materials a plan or principle of arrangement which they do not possess in themselves, (2) that the particular plan is limited by, and must conform to, the laws of spatial relation and to the general presuppositions of physics, such as the uniformity of nature, and (3) that only such materials are capable of the particular combination as possess a nature suitable to it. Moreover, if, for Kant, knowing is really making, we are able to understand two other prominent features of his view. We can understand why Kant should lay so much stress upon the 'recognition' of the synthesis, and upon the self-consciousness involved in knowledge. For if the synthesis of the manifold is really the making of an object, it results merely in the existence of the object; knowledge of it is still to be effected. Consequently, knowledge of the object only finds a place in Kant's view by the *recognition* (on the necessity of which he insists) of the manifold as combined on a principle. This recognition, which Kant considers only an element in knowledge, is really the knowledge itself. Again, since the reality to be known is a whole of parts which we construct on a principle, we know that it is such a whole, and therefore that 'the manifold is related to one object', because, and only because, we know that we have combined the elements on a principle. Self-consciousness therefore *must* be inseparable from consciousness of an object.

The fundamental objection to this account of knowledge seems so obvious as to be hardly worth stating; it is of course that knowing and making are not the same. The very nature of knowing presupposes that the thing known is already made, or, to speak more accurately, already exists. In other words, knowing is essentially the discovery of what already is. Even if the reality known happens to be something which we make, e. g. a house, the knowing it is distinct from the making it, and, so far from being identical with the making, presupposes that the reality in question is already made. Music and poetry are, no doubt, realities which in some sense are 'made' or 'composed', but the apprehension of them is distinct from and presupposes the process by which they are composed.

How difficult it is to resolve knowing into making may be seen by consideration of a difficulty in the interpretation of Kant's phrase 'relation of the manifold to an object', to which no allusion has yet been made. When it is said that a certain manifold is related to, or stands in relation to, an object, does the relatedness referred to consist in the fact that the manifold is combined into a whole, or in the fact that we are conscious of the combination, or in both? If we accept the first alternative we must allow that, while relatedness to an object implies a process of synthesis, yet the relatedness, and therefore the synthesis, have nothing to do with knowledge. For the relatedness of the manifold to an object will be the combination of the elements of the manifold as parts of an object constructed, and the process of synthesis involved will be that by which the object is constructed. This process of synthesis will have nothing to do with knowledge; for since it is merely the process by which the object is constructed, knowledge so far is not effected at all, and no clue is given to the way in which it comes about. If, however, we accept the second alternative, we have to allow that while relatedness to an object has to do with knowledge, yet it in no way implies a process of synthesis. For since in that case it consists in the fact that we are conscious of the manifold as together forming an object, it in no way implies that the object has been produced by a process of synthesis. Kant, of course, would accept the third alternative. For, firstly, since it is

knowledge which he is describing, the phrase ‘relatedness to an object’ cannot refer simply to the *existence* of a combination of the manifold, and of a process by which it has been produced; its meaning must include *consciousness* of the combination. In the second place, it is definitely his view that we cannot represent anything as combined in the object without having previously combined it ourselves. Moreover, it is just with respect to this connexion between the synthesis and the consciousness of the synthesis that his reduction of knowing to making helps him; for to make an object, e. g. a house, is to make it consciously, i. e. to combine materials on a principle of which we are aware. Since, then, the combining of which he speaks is really making, it seems to him impossible to combine a manifold without being aware of the nature of the act of combination, and therefore of the nature of the whole thereby produced. But though this is clearly Kant’s view, it is not justified. In the first place, ‘relatedness of the manifold to an object’ ought not to refer *both* to its combination in a whole *and* to our consciousness of the combination; and in strictness it should refer to the former only. For as referring to the former it indicates a relation of the manifold *to the object*, as being the parts of the object, and as referring to the latter it indicates a relation of the manifold *to us*, as being apprehended by us as the parts of the object. But two relations which, though they are of one and the same thing, are nevertheless relations of it to two different things, should not be referred to by the same phrase. Moreover, since the relatedness is referred to as relatedness to an object, the phrase properly indicates the relation of the manifold to an object, and not to us as apprehending it. Again, in the second place, Kant cannot successfully maintain that the phrase is primarily a loose expression for our consciousness of the manifold as related to an object, and that since this implies a process of synthesis, the phrase may fairly include in its meaning the thought of the combination of the manifold by us into a whole. For although Kant asserts — and with some plausibility — that we can only apprehend as combined what we have ourselves combined, yet when we consider this assertion seriously we see it to be in no sense true.

The general conclusion, therefore, to be drawn is that the process of synthesis by which the manifold is said to become related to an object is a process not of knowledge but of construction in the literal sense, and that it leaves knowledge of the thing constructed still to be effected. But if knowing is obviously different from making, why should Kant have apparently felt no difficulty in resolving knowing into making? Three reasons may be given.

In the first place, the very question, ‘What does the process of knowing consist in?’ at least suggests that knowing can be resolved into and stated in terms of something else. In this respect it resembles the modern phrase ‘*theory* of knowledge’. Moreover, since it is plain that in knowing we are active, the question is apt to assume the form, ‘What do we *do* when we know or think?’ and since one of the commonest forms of doing something is to perform a physical operation on physical things, whereby we effect a recombination of them on some plan, it is natural to try to resolve knowing into this kind of doing, i. e. into making in a wide sense of the word.

In the second place, Kant never relaxed his hold upon the thing in itself. Consequently, there always remained for him a reality which existed in itself and was not made by us. This was to him the fundamental reality, and the proper object of knowledge, although unfortunately inaccessible to *our* faculties of knowing. Hence to Kant it did not seriously matter that an inferior reality, viz. the phenomenal world, was made by us in the process of knowing.

In the third place, it is difficult, if not impossible, to read the *Deduction* without realizing that Kant failed to distinguish knowing from that formation of mental imagery which accompanies knowing. The process of synthesis, if it is even to seem to constitute knowledge and to involve the validity of the categories, must really be a process by which we construct, and recognize our construction of, an individual reality in nature out of certain physical data. Nevertheless, it is plain that what Kant normally describes as the process of synthesis is really the process by which we construct an imaginary picture of a reality in nature not present to perception, i. e. by which we imagine to ourselves what it would look like

if we were present to perceive it. This is implied by his continued use of the terms ‘reproduction’ and ‘imagination’ in describing the synthesis. To be aware of an object of past perception, it is necessary, according to him, that the object should be *re*produced. It is thereby implied that the object of our present awareness is not the object of past perception, but a mental image which copies or reproduces it. The same implication is conveyed by his use of the term ‘imagination’ to describe the faculty by which the synthesis is effected; for ‘imagination’ normally means the power of making a mental image of something not present to perception, and this interpretation is confirmed by Kant’s own description of the imagination as ‘the faculty of representing an object even without its presence in perception’. Further, that Kant really fails to distinguish the construction of mental imagery from literal construction is shown by the fact that, although he insists that the formation of an image and reproduction are both necessary for knowledge, he does not consistently adhere to this. For his general view is that the elements combined and recognized as combined are the original data of sense, and not reproductions of them which together form an image, and his instances imply that the elements retained in thought, i. e. the elements of which we are aware subsequently to perception, are the elements originally perceived, e. g. the parts of a line or the units counted. Moreover, in one passage Kant definitely describes certain *objects* of *perception* taken together as an *image* of that ‘kind’ of which, when taken together, they are an instance. “If I place five points one after another, ... this is an image of the number five.” Now, if it be granted that Kant has in mind normally the process of imagining, we can see why he found no difficulty in the thought of knowledge as construction. For while we cannot reasonably speak of making *an object of knowledge*, we can reasonably speak of making *a mental image* through our own activity, and also of making it in accordance with the categories and the empirical laws which presuppose them. Moreover, the ease with which it is possible to take the imagining which accompanies knowing for knowing — the image formed being taken to be the object known and the forming it being taken to be the knowing it — renders it easy to transfer the thought of construction to the knowledge itself. The only defect, however, under which the view labours is the important one that, whatever be the extent to which imagination must accompany knowledge, it is distinct from knowledge. To realize the difference we have only to notice that the process by which we present to ourselves in imagination realities not present to perception presupposes, and is throughout guided by, the knowledge of them. It should be noted, however, that, although the process of which Kant is normally thinking is doubtless that of constructing mental imagery, his real view must be that knowledge consists in constructing a world out of the data of sense, or, more accurately, as his instances show, out of the objects of isolated perceptions, e. g. parts of a line or units to be counted. Otherwise the final act of recognition would be an apprehension not of the world of nature, but of an image of it.

‘This criticism,’ it may be said, ‘is too sweeping. It may be true that the process which Kant describes is really making in the literal sense and not knowing, but Kant’s mistake may have been merely that of thinking of the wrong kind of synthesis. For both ordinary language and that of philosophical discussion imply that synthesis plays some part in knowledge. Thus we find in ordinary language the phrases ‘*putting* 2 and 2 *together*’ and ‘2 and 2 *make* 4’. Even in philosophical discussions we find it said that a complex conception, e. g. gold, is a *synthesis* of simple conceptions, e. g. yellowness, weight, &c.; that in judgement we *relate* or *refer* the predicate to the subject; and that in inference we *construct* reality, though only mentally or ideally. Further, in any case it is by thinking or knowing that the world comes to be *for us*; the more we think, the more of reality there is for us. Hence at least the world *for us* or *our* world is due to our activity of knowing, and so is in some sense made by us, i. e. by our relating activity.’

This position, however, seems in reality to be based on a simple but illegitimate transition, viz. the transition to the assertion that in knowing we relate, or combine, or construct from the assertion that in knowing we recognize as related, or combined, or constructed — the last two terms being retained to preserve the parallelism. While the latter assertion may be said to be true, although the terms ‘combined’

and ‘constructed’ should be rejected as misleading, the former assertion must be admitted to be wholly false, i. e. true in no sense whatever. Moreover, the considerations adduced in favour of the position should, it seems, be met by a flat denial of their truth or, if not, of their relevance. For when it is said that *our* world, or the world *for us*, is due to our activity of thinking, and so is in some sense *made* by us, all that should be meant is that our *apprehending* the world as whatever we apprehend it to be *presupposes* activity on our part. But since the activity is after all only the activity itself of apprehending or knowing, this assertion is only a way of saying that apprehending or knowing is not a condition of mind which can be produced in us *ab extra*, but is something which we have to do for ourselves. Nothing is implied to be made. If anything is to be said to be made, it must be not our world but our activity of apprehending the world; but even we and our activity of apprehending the world are not related as maker and thing made. Again, to speak of a complex conception, e. g. gold, and to say that it involves a synthesis of simple conceptions by the mind is mere ‘conceptualism’. If, as we ought to do, we replace the term ‘conception’ by ‘universal’, and speak of gold as a synthesis of universals, any suggestion that the mind performs the synthesis will vanish, for a ‘synthesis of universals’ will mean simply a connexion of universals. All that is mental is our apprehension of their connexion. Again, in judgement we cannot be said to *relate* predicate to subject. Such an assertion would mean either that we relate a conception to a conception, or a conception to a reality, or a reality to a reality; and, on any of these interpretations, it is plainly false. To retain the language of ‘relation’ or of ‘combination’ at all, we must say that in judgement we recognize real elements as related or combined. Again, when we infer, we do not construct, ideally or otherwise. ‘Ideal construction’ is a contradiction in terms, unless it refers solely to mental imagining, in which case it is not inference. Construction which is not ‘ideal’, i. e. literal construction, plainly cannot constitute the nature of inference; for inference would cease to be inference, if by it we made, and did not apprehend, a necessity of connexion. Again, the phrase ‘2 and 2 *make* 4’ does not justify the view that in some sense we ‘make’ reality. It of course suggests that 2 and 2 are not 4 until they are added, i. e. that the addition makes them 4. But the language is only appropriate when we are literally making a group of 4 by physically placing 2 pairs of bodies in one group. Where we are counting, we should say merely that 2 and 2 *are* 4. Lastly, it must be allowed that the use of the phrase ‘putting two and two together’, to describe an inference from facts not quite obviously connected, is loose and inexact. If we meet a dog with a blood-stained mouth and shortly afterwards see a dead fowl, we may be said to put two and two together and to conclude thereby that the dog killed the fowl. But, strictly speaking, in drawing the inference we do not put anything together. We certainly do not put together the facts that the mouth of the dog is blood-stained and that the fowl has just been killed. We do not even put the premises together, i. e. our apprehensions of these facts. What takes place should be described by saying simply that seeing that the fowl is killed, we also remember that the dog’s mouth was stained, and then apprehend a connexion between these facts.

The fact seems to be that the thought of synthesis in no way helps to elucidate the nature of knowing, and that the mistake in principle which underlies Kant’s view lies in the implicit supposition that it is possible to elucidate the nature of knowledge by means of something other than itself. Knowledge is *sui generis* and therefore a ‘theory’ of it is impossible. Knowledge is simply knowledge, and any attempt to state it in terms of something else must end in describing something which is not knowledge.

CHAPTER X. THE SCHEMATISM OF THE CATEGORIES

As has already been pointed out, the *Analytic* is divided into two parts, the *Analytic of Conceptions*, of which the aim is to discover and vindicate the validity of the categories, and the *Analytic of Principles*, of which the aim is to determine the use of the categories in judgement. The latter part, which has now to be considered, is subdivided into two. It has, according to Kant, firstly to determine the sensuous conditions under which the categories are used, and secondly to discover the *a priori* principles involved in the categories, as exercised under these sensuous conditions, such, for instance, as the law that all changes take place according to the law of cause and effect. The first problem is dealt with in the chapter on the 'schematism of the pure conceptions of the understanding', the second in the chapter on the 'system of all principles of the pure understanding'.

We naturally feel a preliminary difficulty with respect to the existence of this second part of the *Analytic* at all. It seems clear that if the first part is successful, the second must be unnecessary. For if Kant is in a position to lay down that the categories must apply to objects, no special conditions of their application need be subsequently determined. If, for instance, it can be laid down that the category of quantity must apply to objects, it is implied either that there are no special conditions of its application, or that they have already been discovered and shown to exist. Again, to assert the applicability of the categories is really to assert the existence of principles, and in fact of just those principles which it is the aim of the *System of Principles* to prove. Thus to assert the applicability of the categories of quantity and of cause and effect is to assert respectively the principles that all objects of perception are extensive quantities, and that all changes take place according to the law of cause and effect. The *Deduction of the Categories* therefore, if successful, must have already proved the principles now to be vindicated; and it is a matter for legitimate surprise that we find Kant in the *System of Principles* giving proofs of these principles which make no appeal to the *Deduction of the Categories*. On the other hand, for the existence of the account of the schematism of the categories Kant has a better show of reason. For the conceptions derived in the *Metaphysical Deduction* from the nature of formal judgement are in themselves too abstract to be the conceptions which are to be shown applicable to the sensible world, since all the latter involve the thought of time. Thus, the conception of cause and effect derived from the nature of the hypothetical judgement includes no thought of time, while the conception of which he wishes to show the validity is that of necessary succession in time. Hence the conceptions discovered by analysis of formal judgement have in some way to be rendered more concrete in respect of time. The account of the schematism, therefore, is an attempt to get out of the false position reached by appealing to Formal Logic for the list of categories. Nevertheless, the mention of a sensuous condition under which alone the categories can be employed should have suggested to Kant that the transcendental deduction was defective, and, in fact, in the second version of the transcendental deduction two paragraphs are inserted which take account of this sensuous condition.

The beginning of Kant's account of schematism may be summarized thus: 'Whenever we subsume an individual object of a certain kind, e. g. a plate, under a conception, e. g. a circle, the object and the conception must be homogeneous, that is to say, the individual must possess the characteristic which constitutes the conception, or, in other words, must be an instance of it. Pure conceptions, however, and empirical perceptions, i. e. objects of empirical perception, are quite heterogeneous. We do not, for instance, perceive cases of cause and effect. Hence the problem arises, 'How is it possible to subsume objects of empirical perception under pure conceptions?' The possibility of this subsumption presupposes a *tertium quid*, which is homogeneous both with the object of empirical perception and with the conception, and so makes the subsumption mediately possible. This *tertium quid* must be, on the one side,

intellectual and, on the other side, sensuous. It is to be found in a ‘transcendental determination of time’, i. e. a conception involving time and involved in experience. For in the first place this is on the one side intellectual and on the other sensuous, and in the second place it is so far homogeneous with the category which constitutes its unity that it is universal and rests on an *a priori* rule, and so far homogeneous with the phenomenon that all phenomena are in time. Such transcendental determinations of time are the schemata of the pure conceptions of the understanding.’ Kant continues as follows:

“The schema is in itself always a mere product of the imagination. But since the synthesis of the imagination has for its aim no single perception, but merely unity in the determination of the sensibility, the schema should be distinguished from the image. Thus, if I place five points one after another, ... this is an image of the number five. On the other hand, if I only just think a number in general — no matter what it may be, five or a hundred — this thinking is rather the representation of a method of representing in an image a group (e. g. a thousand), in conformity with a certain conception, than the image itself, an image which, in the instance given, I should find difficulty in surveying and comparing with the conception. Now this representation of a general procedure of the imagination to supply its image to a conception, I call the schema of this conception.”

“The fact is that it is not images of objects, but schemata, which lie at the foundation of our pure sensuous conceptions. No image could ever be adequate to our conception of a triangle in general. For it would not attain the generality of the conception which makes it valid for all triangles, whether right-angled, acute-angled, &c., but would always be limited to one part only of this sphere. The schema of the triangle can exist nowhere else than in thought, and signifies a rule of the synthesis of the imagination in regard to pure figures in space. An object of experience or an image of it always falls short of the empirical conception to a far greater degree than does the schema; the empirical conception always relates immediately to the schema of the imagination as a rule for the determination of our perception in conformity with a certain general conception. The conception of ‘dog’ signifies a rule according to which my imagination can draw the general outline of the figure of a four-footed animal, without being limited to any particular single form which experience presents to me, or indeed to any possible image that I can represent to myself *in concreto*. This schematism of our understanding in regard to phenomena and their mere form is an art hidden in the depths of the human soul, whose true modes of action we are not likely ever to discover from Nature and unveil. Thus much only can we say: the *image* is a product of the empirical faculty of the productive imagination, while the *schema* of sensuous conceptions (such as of figures in space) is a product and, as it were, a monogram of the pure *a priori* imagination, through which, and according to which, images first become possible, though the images must be connected with the conception only by means of the schema which they express, and are in themselves not fully adequate to it. On the other hand, the schema of a pure conception of the understanding is something which cannot be brought to an image; on the contrary, it is only the pure synthesis in accordance with a rule of unity according to conceptions in general, a rule of unity which the category expresses, and it is a transcendental product of the imagination which concerns the determination of the inner sense in general according to conditions of its form (time) with reference to all representations, so far as these are to be connected *a priori* in one conception according to the unity of apperception.”

Now, in order to determine whether schemata can constitute the desired link between the pure conceptions or categories and the manifold of sense, it is necessary to follow closely this account of a schema. Kant unquestionably in this passage treats as a mental image related to a conception what really is, and what on his own theory ought to have been, an individual object related to a conception, i. e. an instance of it. In other words, he takes a mental image of an individual for the individual itself. On the one hand, he treats a schema of a conception throughout as the thought of a procedure of the imagination to present to the conception its *image*, and he opposes schemata not to objects but to *images*; on the other hand, his problem concerns subsumption under a conception, and what is subsumed must be an instance of

the conception, i. e. an individual object of the kind in question. Again, in asserting that if I place five points one after another, ... this is an image of the number five, he is actually saying that an individual group of five points is an image of a group of five in general. Further, if the process of schematizing is to enter — as it must — into knowledge of the phenomenal world, what Kant here speaks of as the images related to a conception must be taken to be individual instances of the conception, whatever his language may be. For, in order to enter into knowledge, the process referred to must be that by which *objects of experience* are constructed. Hence the passage should be interpreted as if throughout there had been written for ‘image’ ‘individual instance’ or more simply ‘instance’. Again, the process of schematizing, although *introduced* simply as a process by which an individual is to be subsumed indirectly under a conception, is assumed in the passage quoted to be a process of *synthesis*. Hence we may say that the process of schematizing is a process by which we combine the manifold of perception into an individual whole in accordance with a conception, and that the schema of a conception is the thought of the rule of procedure on our part by which we combine the manifold in accordance with the conception, and so bring the manifold under the conception. Thus the schema of the conception of 100 is the thought of a process of synthesis by which we combine say 10 groups of 10 units into 100, and the schematizing of the conception of 100 is the process by which we do so. Here it is essential to notice three points. In the first place, the schema is a conception which relates not to the reality apprehended but to us. It is the thought of a rule of procedure on our part by which an instance of a conception is constructed, and not the thought of a characteristic of the reality constructed. For instance, the thought of a rule by which we can combine points to make 100 is a thought which concerns us and not the points; it is only the conception corresponding to this schema, viz. the thought of 100, which concerns the points. In the second place, although the thought of time is involved in the schema, the succession in question lies not in the object, but in our act of construction or apprehension. In the third place, the schema presupposes the corresponding conception and the process of schematizing directly brings the manifold of perception under the conception. Thus the thought of combining 10 groups of 10 units to make 100 presupposes the thought of 100, and the process of combination brings the units under the conception of 100.

If, however, we go on to ask what is required of schemata and of the process of schematizing, if they are to enable the manifold to be subsumed under the categories, we see that each of these three characteristics makes it impossible for them to fulfil this purpose. For firstly, an individual manifold A has to be brought under a category B. Since *ex hypothesi* this cannot be effected directly, there is needed a mediating conception C. C, therefore, it would seem, must be at once a species of B and a conception of which A is an instance. In any case C must be a conception relating to the reality to be known, and not to any process of knowing on our part, and, again, it must be more concrete than B. This is borne out by the list of the schemata of the categories. But, although a schema may be said to be more concrete than the corresponding conception, in that it presupposes the conception, it neither is nor involves a more concrete conception of an *object* and in fact, as has been pointed out, relates not to the reality to be known but to the process on our part by which we construct or apprehend it. In the second place, the time in respect of which the category B has to be made more concrete must relate to the object, and not to the successive process by which we apprehend it, whereas the time involved in a schema concerns the latter and not the former. In the third place, from the point of view of the categories, the process of schematizing should be a process whereby we combine the manifold into a whole A in accordance with the conception C, and thereby render *possible* the subsumption of A under the category B. If it be a process which actually subsumes the manifold under B, it will *actually* perform that, the very impossibility of which has made it necessary to postulate such a process at all. For, according to Kant, it is just the fact that the manifold cannot be subsumed directly under the categories that renders schematism necessary. Yet, on Kant’s general account of a schema, the schematizing must actually bring a manifold under the corresponding conception. If we present to ourselves an individual triangle by successively joining three

lines according to the conception of a triangle, i. e. so that they enclose a space, we are directly bringing the manifold, i. e. the lines, under the conception of a triangle. Again, if we present to ourselves an instance of a group of 100 by combining 10 groups of 10 units of any kind, we are directly bringing the units under the conception of 100. If this consideration be applied to the schematism of a category, we see that the process said to be necessary because a certain other process is impossible is the very process said to be impossible.

If, therefore, Kant succeeds in finding schemata of the categories in detail in the sense in which they are required for the solution of his problem, i. e. in the sense of more concrete conceptions involving the thought of time and relating to objects, we should expect either that he ignores his general account of a schema, or that if he appeals to it, the appeal is irrelevant. This we find to be the case. His account of the first two transcendental schemata makes a wholly irrelevant appeal to the temporal process of synthesis on our part, while his account of the remaining schemata makes no attempt to appeal to it at all.

"The pure *schema* of *quantity*, as a conception of the understanding, is *number*, a representation which comprises the successive addition of one to one (homogeneous elements). Accordingly, number is nothing else than the unity of the synthesis of the manifold of a homogeneous perception in general, in that I generate time itself in the apprehension of the perception."

It is clear that this passage, whatever its precise interpretation may be, involves a confusion between the thought of counting and that of number. The thought of number relates to objects of apprehension and does not involve the thought of time. The thought of counting, which presupposes the thought of number, relates to our apprehension of objects and involves the thought of time; it is the thought of a successive process on our part by which we count the number of units contained in what we already know to consist of units. Now we must assume that the schema of quantity is really what Kant says it is, viz. number, or to express it more accurately, the thought of number, and not the thought of counting, with which he wrongly identifies it. For his main problem is to find conceptions which at once are more concrete than the categories and, at the same time, like the categories, relate to objects, and the thought of counting, though more concrete than that of number, does not relate to objects. Three consequences follow. In the first place, although the schema of quantity, i. e. the thought of number, is more concrete than the thought of quantity, it is not, as it should be, more concrete in respect of time; for the thought of number does not include the thought of time. Secondly, the thought of time is only introduced into the schema of quantity irrelevantly by reference to the temporal process of *counting*, by which we come to apprehend the number of a given group of units. Thirdly, the schema of quantity is only in appearance connected with the nature of a schema in general, as Kant describes it, by a false identification of the thought of number with the thought of the process on our part by which we count groups of units, i. e. numbers.

The account of the schema of reality, the second category, runs as follows: "Reality is in the pure conception of the understanding that which corresponds to a sensation in general, that therefore of which the conception in itself indicates a being (in time), while negation is that of which the conception indicates a not being (in time). Their opposition, therefore, arises in the distinction between one and the same time as filled or empty. Since time is only the form of perception, consequently of objects as phenomena, that which in objects corresponds to sensation is the transcendental matter of all objects as things in themselves (thinghood, reality). Now every sensation has a degree or magnitude by which it can fill the same time, i. e. the internal sense, in respect of the same representation of an object, more or less, until it vanishes into nothing (= 0 = *negatio*). There is, therefore, a relation and connexion between reality and negation, or rather a transition from the former to the latter, which makes every reality representable as a *quantum*; and the schema of a reality, as the quantity of something so far as it fills time, is just this continuous and uniform generation of the reality in time, as we descend in time from the sensation which has a certain degree, down to the vanishing thereof, or gradually ascend from negation to the magnitude thereof."

This passage, if it be taken in connexion with the account of the anticipations of perception, seems to have the following meaning: ‘In thinking of something as a reality, we think of it as that which corresponds to, i. e. produces, a sensation, and therefore as something which, like the sensation, is in time; and just as every sensation, which, as such, occupies time, has a certain degree of intensity, so has the reality which produces it. Now to produce for ourselves an instance of a reality in this sense, we must add units of reality till a reality of the required degree is produced, and the thought of this method on our part of constructing an individual reality is the schema of reality.’ But if this represents Kant’s meaning, the schema of reality relates only to our process of apprehension, and therefore is not a conception which relates to objects and is more concrete than the corresponding category in respect of time. Moreover, it is matter for surprise that in the case of this category Kant should have thought schematism necessary, for time is actually included in his own statement of the category.

The account of the schemata of the remaining categories need not be considered. It merely *asserts* that certain conceptions relating to objects and involving the thought of time are the schemata corresponding to the remaining categories, without any attempt to connect them with the nature of a schema. Thus, the schema of substance is asserted to be the *permanence* of the real *in time*, that of cause the *succession* of the manifold, in so far as that succession is subjected to a rule, that of interaction the *coexistence* of the determinations or accidents of one substance with those of another according to a universal rule. Again, the schemata of possibility, of actuality and of necessity are said to be respectively the accordance of the synthesis of representations with the conditions of time in general, existence in a determined time, and existence of an object in all time.

The main confusion pervading the chapter is of course that between temporal relations which concern the process of apprehension and temporal relations which concern the realities apprehended. Kant is continually referring to the former as if they were the latter. The cause of this confusion lies in Kant’s reduction of physical realities to representations. Since, according to him, these realities are only our representations, all temporal relations are really relations of our representations, and these relations have to be treated at one time as relations of our apprehensions, and at another as relations of the realities apprehended, as the context requires.

CHAPTER XI. THE MATHEMATICAL PRINCIPLES

As has been pointed out, the aim of the second part of the *Analytic of Principles* is to determine the *a priori* principles involved in the use of the categories under the necessary sensuous conditions. These principles Kant divides into four classes, corresponding to the four groups of categories, and he calls them respectively ‘axioms of perception’, ‘anticipations of sense-perception’, ‘analogies of experience’, and ‘postulates of empirical thought’. The first two and the last two classes are grouped together as ‘mathematical’ and ‘dynamical’ respectively, on the ground that the former group concerns the perception of objects, i. e. their nature apprehended in perception, while the latter group concerns their existence, and that consequently, since assertions concerning the existence of objects presuppose the realization of empirical conditions which assertions concerning their nature do not, only the former possesses an absolute necessity and an immediate evidence such as is found in mathematics. These two groups of principles are not, as their names might suggest, principles within mathematics and physics, but presuppositions of mathematics and physics respectively. Kant also claims appropriateness for the special terms used of each minor group to indicate the kind of principles in question, viz. ‘axioms’, ‘anticipations’, ‘analogies’, ‘postulates’. But it may be noted as an indication of the artificiality of the scheme that each of the first two groups contains only one principle, although Kant refers to them in the plural as axioms and anticipations respectively, and although the existence of three categories corresponding to each group would suggest the existence of three principles.

The axiom of perception is that ‘All perceptions are extensive quantities’. The proof of it runs thus:

“An extensive quantity I call that in which the representation of the parts renders possible the representation of the whole (and therefore necessarily precedes it). I cannot represent to myself any line, however small it may be, without drawing it in thought, that is, without generating from a point all its parts one after another, and thereby first drawing this perception. Precisely the same is the case with every, even the smallest, time.... Since the pure perception in all phenomena is either time or space, every phenomenon as a perception is an extensive quantity, because it can be known in apprehension only by a successive synthesis (of part with part). All phenomena, therefore, are already perceived as aggregates (groups of previously given parts), which is not the case with quantities of every kind, but only with those which are represented and apprehended by us as *extensive*.”

Kant opposes an extensive quantity to an intensive quantity or a quantity which has a degree. “That quantity which is apprehended only as unity and in which plurality can be represented only by approximation to negation = 0, I call *intensive quantity*.” The aspect of this ultimate distinction which underlies Kant’s mode of stating it is that only an extensive quantity is a whole, i. e. something made up of parts. Thus a mile can be said to be made up of two half-miles, but a velocity of one foot per second, though comparable with a velocity of half a foot per second, cannot be said to be made up of two such velocities; it is essentially one and indivisible. Hence, from Kant’s point of view, it follows that it is only an extensive magnitude which can, and indeed must, be apprehended through a successive synthesis of the parts. The proof of the axiom seems to be simply this: ‘All phenomena as objects of perception are subject to the forms of perception, space and time. Space and time are [homogeneous manifolds, and therefore] extensive quantities, only to be apprehended by a successive synthesis of the parts. Hence phenomena, or objects of experience, must also be extensive quantities, to be similarly apprehended.’ And Kant goes on to add that it is for this reason that geometry and pure mathematics generally apply to objects of experience.

We need only draw attention to three points. Firstly, no justification is given of the term ‘axiom’. Secondly, the argument does not really appeal to the doctrine of the categories, but only to the character

of space and time as forms of perception. Thirdly, it need not appeal to space and time as forms of perception in the proper sense of ways in which we apprehend objects, but only in the sense of ways in which objects are related; in other words, it need not appeal to Kant's theory of knowledge. The conclusion follows simply from the nature of objects as spatially and temporally related, whether they are phenomena or not. It may be objected that Kant's thesis is that *all* objects of perception are extensive quantities, and that unless space and time are allowed to be ways in which *we must perceive* objects, we cannot say that all objects will be spatially and temporally related, and so extensive quantities. But to this it may be replied that it is only true that all objects of perception are extensive quantities if the term 'object of perception' be restricted to parts of the physical world, i. e. to just those realities which Kant is thinking of as spatially and temporally related, and that this restriction is not justified, since a sensation or a pain which has only intensive quantity is just as much entitled to be called an object of perception.

The anticipation of sense-perception consists in the principle that 'In all phenomena, the real, which is an object of sensation, has intensive magnitude, i. e. a degree'. The proof is stated thus:

"Apprehension merely by means of sensation fills only one moment (that is, if I do not take into consideration the succession of many sensations). Sensation, therefore, as that in the phenomenon the apprehension of which is not a successive synthesis advancing from parts to a complete representation, has no extensive quantity; the lack of sensation in one and the same moment would represent it as empty, consequently = 0. Now that which in the empirical perception corresponds to sensation is reality (*realitas phaenomenon*); that which corresponds to the lack of it is negation = 0. But every sensation is capable of a diminution, so that it can decrease and thus gradually vanish. Therefore, between reality in the phenomenon and negation there exists a continuous connexion of many possible intermediate sensations, the difference of which from each other is always smaller than that between the given sensation and zero, or complete negation. That is to say, the real in the phenomenon has always a quantity, which, however, is not found in apprehension, since apprehension takes place by means of mere sensation in one moment and not by a successive synthesis of many sensations, and therefore does not proceed from parts to the whole. Consequently, it has a quantity, but not an extensive quantity."

"Now that quantity which is apprehended only as unity, and in which plurality can be represented only by approximation to negation = 0, I call an *intensive quantity*. Every reality, therefore, in a phenomenon has intensive quantity, that is, a degree."

In other words, 'We can lay down *a priori* that all sensations have a certain degree of intensity, and that between a sensation of a given intensity and the total absence of sensation there is possible an infinite number of sensations varying in intensity from nothing to that degree of intensity. Therefore the real, which corresponds to sensation, can also be said *a priori* to admit of an infinite variety of degree.'

Though the principle established is of little intrinsic importance, the account of it is noticeable for two reasons. In the first place, although Kant clearly means by the 'real corresponding to sensation' a body in space, and regards it as a phenomenon, it is impossible to see how he can avoid the charge that he in fact treats it as a thing in itself. For the correspondence must consist in the fact that the real causes or excites sensation in us, and therefore the real, i. e. a body in space, is implied to be a thing in itself. In fact, Kant himself speaks of considering the real in the phenomenon as the cause of sensation, and, in a passage added in the second edition, after proving that sensation must have an intensive quantity, he says that, corresponding to the intensive quantity of sensation, an intensive quantity, i. e. *a degree of influence on sense*, must be attributed to all objects of sense-perception. The difficulty of consistently maintaining that the real, which corresponds to sensation, is a phenomenon is, of course, due to the impossibility of distinguishing between reality and appearance within phenomena.

In the second place, Kant expressly allows that in this anticipation we succeed in discovering *a priori* a characteristic of sensation, although sensation constitutes that empirical element in phenomena, which on Kant's general view cannot be apprehended *a priori*.

“Nevertheless, this anticipation of sense-perception must always be somewhat surprising to an inquirer who is used to transcendental reflection, and is thereby rendered cautious. It leads us to feel some misgiving as to whether the understanding can anticipate such a synthetic proposition as that respecting the degree of all that is real in phenomena, and consequently respecting the possibility of the internal distinction of sensation itself, if we abstract from its empirical quality. There remains, therefore, a problem not unworthy of solution, viz. ‘How can the understanding pronounce synthetically and *a priori* upon phenomena in this respect, and thus anticipate phenomena even in that which is specially and merely empirical, viz. that which concerns sensations?’” But although Kant recognizes that the anticipation is surprising, he is not led to revise his general theory, as being inconsistent with the existence of the anticipation. He indeed makes an attempt to deal with the difficulty; but his solution consists not in showing that the anticipation is consistent with his general theory — as he should have done, if the theory was to be retained — but in showing that, in the case of the degree of sensation, we do apprehend the nature of sensation *a priori*.

Strangely enough, Hume finds himself face to face with what is in principle the same difficulty, and treats it in a not dissimilar way. “There is, however, one contradictory phenomenon, which may prove, that ’tis not absolutely impossible for ideas to go before their correspondent impressions. I believe it will readily be allow’d, that the several distinct ideas of colours, which enter by the eyes, or those of sounds, which are convey’d by the hearing, are really different from each other, tho’ at the same time resembling. Now if this be true of different colours, it must be no less so of the different shades of the same colour, that each of them produces a distinct idea, independent of the rest. For if this shou’d be deny’d, ’tis possible, by the continual gradation of shades, to run a colour insensibly into what is most remote from it; and if you will not allow any of the means to be different, you cannot without absurdity deny the extremes to be the same. Suppose therefore a person to have enjoyed his sight for thirty years, and to have become perfectly well acquainted with colours of all kinds, excepting one particular shade of blue, for instance, which it never has been his fortune to meet with. Let all the different shades of that colour, except that single one, be plac’d before him, descending gradually from the deepest to the lightest; ’tis plain that he will perceive a blank, where that shade is wanting, and will be sensible, that there is a greater distance in that place betwixt the contiguous colours, than in any other. Now I ask, whether ’tis possible for him, from his own imagination, to supply this deficiency, and raise up to himself the idea of that particular shade, tho’ it had never been conveyed to him by his senses? I believe there are few but will be of opinion that he can; and this may serve as a proof, that the simple ideas are not always derived from the correspondent impressions; tho’ the instance is so particular and singular, that ’tis scarce worth our observing, and does not merit that for it alone we should alter our general maxim.”

CHAPTER XII. THE ANALOGIES OF EXPERIENCE

Each of the three categories of relation, i. e. those of substance and accident, of cause and effect, and of interaction between agent and patient involves, according to Kant, a special principle, and these special principles he calls ‘analogies of experience’. They are stated thus: (1) In all changes of phenomena the substance is permanent, and its quantity in nature is neither increased nor diminished. (2) All changes take place according to the law of the connexion of cause and effect. (3) All substances, so far as they can be perceived in space as coexistent, are in complete interaction. The justification of the term *analogy* of experience is as follows. In mathematics an analogy is a formula which asserts the equality of two *quantitative* relations, and is such that, if three of the terms are given, we can discover the fourth, e. g. if we know that $a : b = c : d$, and that $a = 2$, $b = 4$, $c = 6$ we can discover that $d = 12$. But in philosophy an analogy is the assertion of the equality of two *qualitative* relations and is such that, if three of the terms are given, we can discover, not the fourth, but only the relation of the third to the fourth, though at the same time we are furnished with a clue whereby to search for the fourth in experience. In this philosophical sense, the principles involved in the categories of relation are analogies. For instance, the principles of causality can be stated in the form ‘Any known event *X* is to *some other* event *Y*, whatever it be, as effect to cause’; so stated, it clearly informs us not of the character of *Y* but only of the fact that there must be a *Y*, i. e. a necessary antecedent, though at the same time this knowledge enables us to search in experience for the special character of *Y*.

The principles to be established relate to the two kinds of temporal relation apprehended in the world of nature, viz. coexistence and succession. The *method* of proof, which is to be gathered from the proofs themselves rather than from Kant’s general remarks on the subject, is the same in each case. Kant expressly rejects any proof which is ‘dogmatical’ or ‘from conceptions’, e. g. any attempt to show that the very conception of change presupposes the thought of an identical subject of change. The proof is transcendental in character, i. e. it argues that the principle to be established is a condition of the possibility of *apprehending* the temporal relation in question, e. g. that the existence of a permanent subject of change is presupposed in any *apprehension* of change. It assumes that we become aware of sequences and coexistences in the world of nature by a process which begins with a succession of mere perceptions, i. e. perceptions which are so far not the perceptions of a sequence or of a coexistence or indeed of anything; and it seeks to show that this process involves an appeal to one of the principles in question — the particular principle involved depending on the temporal relation apprehended — and consequently, that since we do apprehend this temporal relation, which, as belonging to the world of nature, must be distinct from any temporal relation of our perceptions, the principle appealed to is valid.

The proof of the first analogy is given somewhat differently in the first edition, and in a passage added in the second. The earlier version, which is a better expression of the attitude underlying Kant’s general remarks on the analogy, is as follows:

“Our *apprehension* of the manifold of a phenomenon is always successive, and is therefore always changing. By it alone, therefore, we can never determine whether this manifold, as an object of experience, is coexistent or successive, unless there lies at the base of it something that exists *always*, that is, something *enduring* and *permanent*, of which all succession and coexistence are nothing but so many ways (*modi* of time) in which the permanent exists. Only in the permanent, then, are time relations possible (for simultaneity and succession are the only relations in time); i. e. the permanent is the *substratum* of the empirical representation of time itself, in which alone all time-determination is possible. Permanence expresses in general time, as the persisting correlate of all existence of phenomena, of all change, and of all concomitance.... Only through the permanent does *existence* in different parts of

the successive series of time gain a *quantity* which we call *duration*. For, in mere succession, existence is always vanishing and beginning, and never has the least quantity. Without this permanent, then, no time relation is possible. Now, time in itself cannot be perceived; consequently this permanent in phenomena is the substratum of all time-determination, and therefore also the condition of the possibility of all synthetic unity of sense-perceptions, that is, of experience, and in this permanent all existence and all change in time can only be regarded as a mode of the existence of that which endures and is permanent. Therefore in all phenomena the permanent is the object itself, i. e. the substance (*phenomenon*); but all that changes or can change belongs only to the way in which this substance or substances exist, consequently to their determinations." "Accordingly since substance cannot change in existence, its quantity in nature can neither be increased nor diminished." The argument becomes plainer if it be realized that in the interval between the two editions, Kant came to think that the permanent in question was matter or bodies in space. "We find that in order to give something *permanent* in perception corresponding to the conception of *substance* (and thereby to exhibit the objective reality of this conception), we need a perception *in space* (of matter), because space alone has permanent determinations, while time, and consequently everything which is in the internal sense, is continually flowing."

Kant's thought appears to be as follows: 'Our apprehension of the manifold consists of a series of successive acts in which we apprehend its elements one by one and in isolation. This apprehension, therefore, does not enable us to determine that its elements are temporally related either as successive or as coexistent. In order to determine this, we must apprehend the elements of the manifold as related to something permanent. For a succession proper, i. e. a change, is a succession of states or determinations of something permanent or unchanging. A mere succession which is not a succession of states of something which remains identical is an unconnected series of endings and beginnings, and with respect to it, 'duration', which has meaning with regard to changes, i. e. successions proper, has no meaning at all. Similarly, coexistence is a coexistence of states of two permanents. Hence, to apprehend elements of the manifold as successive or coexistent, we must apprehend them in relation to a permanent or permanents. Therefore, to apprehend a coexistence or a succession, we must perceive something permanent. But this permanent something cannot be time, for time cannot be perceived. It must therefore be a permanent in phenomena; and this must be the object itself or the substance of a phenomenon, i. e. the substratum of the changes which it undergoes, or that of which the elements of the manifold are states or modifications. Consequently, there must be a permanent substance of a phenomenon, and the quantity of substances taken together must be constant.'

Now, if Kant's thought has been here represented fairly, it is open to the following comments. In the first place, even if his position be right in the main, Kant should not introduce the thought of the *quantity* of substance, and speak of the quantity as constant. For he thereby implies that in a plurality of substances — if such a plurality can in the end be admitted — there may be total extinction of, or partial loss in, some, if only there be a corresponding compensation in others; whereas such extinction and creation would be inconsistent with the nature of a substance. Even Kant himself speaks of having established the impossibility of the origin and extinction of substance.

In the second place, it is impossible to see how it can be legitimate for Kant to speak of a permanent substratum of change at all. For phenomena or appearances neither are nor imply the substratum of which Kant is thinking. They might be held to imply ourselves as the identical substratum of which they are successive states, but this view would be irrelevant to, if not inconsistent with, Kant's doctrine. It is all very well to *say* that the substratum is to be found in matter, i. e. in bodies in space, but the assertion is incompatible with the phenomenal character of the world; for the sensations or appearances produced in us by the thing in itself cannot be successive states of bodies in space. In the third place, in spite of Kant's protests against any proof which is 'dogmatical' or 'from conceptions', such a proof really forms the basis of his thought. For if the argument is to proceed not from the nature of change as such but from the

possibility of perceiving change, it must not take into account any implications of the possibility of perceiving change which rest upon implications of the nature of change as such. Yet this is what the argument does. For the reason really given for the view that the apprehension of change involves the apprehension of the manifold as related to a permanent substratum is that a change, as such, implies a permanent substratum. It is only because change is held to imply a substratum that we are said to be able to apprehend a change only in relation to a substratum. Moreover, shortly afterwards, Kant, apparently without realizing what he is doing, actually uses what is, on the very face of it, the dogmatic method, and in accordance with it develops the implications of the perception of change. "Upon this permanence is based the justification of the conception of *change*. Coming into being and perishing are not changes of that which comes to be or perishes. Change is but a mode of existence, which follows on another mode of existence of the same object. Hence everything which changes *endures* and only its *condition changes*.... Change, therefore, can be perceived only in substances, and absolute coming to be or perishing, which does not concern merely a determination of the permanent, cannot be a possible perception." Surely the fact that Kant is constrained in spite of himself to use the dogmatic method is some indication that it is the right method. It is in reality impossible to make any discoveries about change, or indeed about anything, except by consideration of the nature of the thing itself; no study of the conditions under which it can be apprehended can throw any light upon its nature. Lastly, although the supposition is not so explicit as the corresponding supposition made in the case of the other analogies, Kant's argument really assumes, and assumes wrongly, the existence of a process by which, starting with the successive apprehension of elements of the manifold in isolation, we come to apprehend them as temporally related.

The deduction of the second and third analogies argues that the principles of causality and reciprocal action are involved respectively in the processes by which we become aware of successions and of coexistences in the world of nature. From this point of view it would seem that the first analogy is a presupposition of the others, and that the process which involves the first is presupposed by the process which involves the others. It would seem that it is only upon the conclusion of a process by which, beginning with the successive apprehension of elements of the manifold in isolation, we come to apprehend them as *either* successive or coexistent elements in the world of nature, that there can arise a process by which we come to decide *whether* the specific relation is that of succession or of coexistence. For if the latter process can take place independently of the former, i. e. if it can start from the successive apprehension of the manifold, the former process will be unnecessary, and in that case the vindication of the first analogy will be invalid. It is necessary, however, to distinguish between Kant's nominal and his actual procedure. Though he nominally regards the first analogy as the presupposition of the others, he really does not. For he does not in fact treat the process which involves the validity of the first analogy as an antecedent condition of the processes which involve the validity of the others. On the contrary, the latter processes begin *ab initio* with the mere successive apprehension of the manifold, i. e. they begin at a stage where we are not aware of any relation in the physical world at all; and Kant, in his account of them, nowhere urges that they involve the first analogy.

Moreover, just because Kant does not face the difficulties involved in the thought of a process which begins in this way until he comes to vindicate causality, it is only when we come to this vindication that we realize the real nature of his deduction of the analogies, and, in particular, of that of the first.

Kant, prompted no doubt by his desire to answer Hume, treats the principle of causality very fully. The length of the discussion, however, is due not so much to the complication of the argument as to Kant's desire to make his meaning unmistakable; his account consists mainly in a repetition of what is substantially the same argument no less than five times. Hence it will suffice to consider those passages which best express Kant's meaning. At the same time, the prominence of the principle of causality in Kant's theory, and in the history of philosophy generally, and also the way in which Kant's treatment of it reveals the true nature of his general position, makes it necessary to consider these passages in some

detail.

Hume had denied that we are justified in asserting any causal connexion, i. e. any necessity of succession in the various events which we perceive, but even this denial presupposed that we do apprehend particular sequences in the world of nature, and therefore that we succeed in distinguishing between a sequence of events in nature and a mere sequence of perceptions, such as is also to be found when we apprehend a coexistence of bodies in space. Kant urges, in effect, that this denial renders it impossible to explain, as we should be able to do, the possibility of making the distinction in question, which even the denial itself presupposes that we make. Holding, with Hume, that in all cases of perception what we are directly aware of is a succession of perceptions, he contends that it is necessary to explain how in certain cases we succeed in passing from the knowledge of our successive perceptions to the knowledge of a succession in what we perceive. How is it that we know, when, as we say, we see a boat going down stream, that there is a succession in what we perceive, and not merely a succession in our perception of it, as is the case when, as we say, we see the parts of a house? Hume, according to Kant, cannot answer this question; he has only the right to say that in all cases we have a succession of perceptions; for in reality an answer to the question will show that the acquisition of this knowledge involves an appeal to the principle of causality. Since, then, we do in fact, as even Hume implicitly allowed, succeed in distinguishing between a succession in objects in nature and a succession in our apprehension of them, the law of causality must be true. “It is only under this presupposition (i. e. of causality) that even the experience of an event is possible.”

Kant begins his proof as follows: “Our apprehension of the manifold of a phenomenon is always successive. The representations of the parts succeed one another. Whether they succeed one another in the object also is a second point for reflection which is not contained in the first.” But, before he can continue, the very nature of these opening sentences compels him to consider a general problem which they raise. The distinction referred to between a succession in our apprehensions or representations and a succession in the object implies an object distinct from the apprehensions or representations. What, then, can be meant by such an object? For prima facie, if we ignore the thing in itself as unknowable, there is no object; there are only representations. But, in that case, what can be meant by a succession in the object? Kant is therefore once more forced to consider the question ‘What is meant by object of representations?’ although on this occasion with special reference to the meaning of a succession in the object; and the vindication of causality is bound up with the answer. The answer is stated thus:

“Now we may certainly give the name of object to everything, and even to every representation, so far as we are conscious thereof; but what this word may mean in the case of phenomena, not in so far as they (as representations) are objects, but in so far as they only indicate an object, is a question requiring deeper consideration. So far as they, as representations only, are at the same time objects of consciousness, they are not to be distinguished from apprehension, i. e. reception into the synthesis of imagination, and we must therefore say, ‘The manifold of phenomena is always produced successively in the mind’. If phenomena were things in themselves, no man would be able to infer from the succession of the representations of their manifold how this manifold is connected in the object. For after all we have to do only with our representations; how things may be in themselves, without regard to the representations through which they affect us, is wholly outside the sphere of our knowledge. Now, although phenomena are not things in themselves, and are nevertheless the only thing which can be given to us as data for knowledge, it is my business to show what kind of connexion in time belongs to the manifold in phenomena themselves, while the representation of this manifold in apprehension is always successive. Thus, for example, the apprehension of the manifold in the phenomenon of a house which stands before me is successive. Now arises the question, whether the manifold of this house itself is in itself also successive, which of course no one will grant. But, so soon as I raise my conceptions of an object to the transcendental meaning thereof, the house is not a thing in itself, but only a phenomenon, i. e. a

representation, the transcendental object of which is unknown. What, then, am I to understand by the question, ‘How may the manifold be connected in the phenomenon itself (which is nevertheless nothing in itself)?’ Here that which lies in the successive apprehension is regarded as representation, while the phenomenon which is given me, although it is nothing more than a complex of these representations, is regarded as the object thereof, with which my conception, drawn from the representations of apprehension, is to agree. It is soon seen that, since agreement of knowledge with the object is truth, we can ask here only for the formal conditions of empirical truth, and that the phenomenon, in opposition to the representations of apprehension, can only be represented as the object of the same, distinct therefrom, if it stands under a rule, which distinguishes it from every other apprehension, and which renders necessary a mode of conjunction of the manifold. That in the phenomenon which contains the condition of this necessary rule of apprehension is the object.”

This passage is only intelligible if we realize the *impasse* into which Kant has been led by his doctrine that objects, i. e. realities in the physical world, are only representations or ideas. As has already been pointed out, an apprehension is essentially inseparable from a reality of which it is the apprehension. In other words, an apprehension is always the apprehension of a reality, and a reality apprehended, i. e. an object of apprehension, cannot be stated in terms of the apprehension of it. We never confuse an apprehension and its object; nor do we take the temporal relations which belong to the one for the temporal relations which belong to the other, for these relations involve different terms which are never confused, viz. apprehensions and the objects apprehended. Now Kant, by his doctrine of the unknowability of the thing in itself, has really deprived himself of an object of apprehension or, in his language, of an object of representations. For it is the thing in itself which is, properly speaking, the object of the representations of which he is thinking, i. e. representations of a reality in nature; and yet the thing in itself, being on his view inapprehensible, can never be for him an object in the proper sense, i. e. a reality apprehended. Hence he is only able to state the fact of knowledge in terms of mere apprehensions, or ideas, or representations — the particular name is a matter of indifference — and consequently his efforts to recover an object of apprehension are fruitless. As a matter of fact, these efforts only result in the assertion that the object of representations consists in the representations themselves related in a certain necessary way. But this view is open to two fatal objections. In the first place, a complex of representations is just not an object in the proper sense, i. e. a reality apprehended. It essentially falls on the subject side of the distinction between an apprehension and the reality apprehended. The *complexity* of a complex of representations in no way divests it of the character which it has as a complex of *representations*. In the second place, on this view the same terms have to enter at once into two incompatible relations. Representations have to be related successively as our representations or apprehensions — as in fact they are related — and, at the same time, successively or otherwise, as the case may be, as parts of the object apprehended, viz. a reality in nature. In other words, the same terms have to enter into both a subjective and an objective relation, i. e. both a relation concerning us, the knowing subjects, and a relation concerning the object which we know. “A phenomenon in opposition to the representations of apprehension can only be represented as the object of the same, distinct therefrom, if it stands under a rule which distinguishes it from *every other* apprehension, and renders necessary a mode of conjunction of the manifold.” A representation, however, cannot be so related by a rule to another representation, for the rule meant relates to realities in nature, and, however much Kant may try to maintain the contrary, two representations, not being realities in nature, cannot be so related. Kant is in fact only driven to treat rules of nature as relating to representations, because there is nothing else to which he can regard them as relating. The result is that he is unable to justify the very distinction, the implications of which it is his aim to discover, and he is unable to do so for the very reason which would have rendered Hume unable to justify it. Like Hume, he is committed to a philosophical vocabulary which makes it meaningless to speak of relations of objects at

all in distinction from relations of apprehensions. It has been said that for Kant the road to objectivity lay through necessity. But whatever Kant may have thought, in point of fact there is no road to objectivity, and, in particular, no road through necessity. No necessity in the relation between two representations can render the relation objective, i. e. a relation between objects. No doubt the successive acts in which we come to apprehend the world are necessarily related; we certainly do not suppose their order to be fortuitous. Nevertheless, their relations are not in consequence a relation of realities apprehended.

Kant only renders his own view plausible by treating an apprehension or representation as if it consisted in a sensation or an appearance. A sensation or an appearance, so far from being the apprehension of anything, is in fact a reality which can be apprehended, of the kind called mental. Hence it can be treated as an object, i. e. something apprehended or presented, though not really as an object in nature. On the other hand, from the point of view of the thing in itself it can be treated as only an apprehension, even though it is an unsuccessful apprehension. Thus, for Kant, there is something which can with some plausibility be treated as an object as well as an apprehension, and therefore as capable of standing in both a subjective and an objective relation to other realities of the same kind.

If we now turn to the passage under discussion, we find it easy to vindicate the justice of the criticism that Kant, inconsistently with the distinction which he desires to elucidate, treats the same thing as at once the representation of an object and the object represented. He is trying to give such an account of 'object of representations' as will explain what is meant by a succession in an object in nature, i. e. a phenomenon, in distinction from the succession in our apprehension of it. In order to state this distinction at all, he has to speak of what enters into the two successions as different. "It is my business to show what sort of connexion in time belongs to the *manifold* in phenomena themselves, while the *representation* of this manifold in apprehension is always successive." Here an element of the manifold is distinguished from the representation of it. Yet Kant, though he thus distinguishes them, repeatedly identifies them; in other words, he identifies a representation with that of which it is a representation, viz. an element in or part of the object itself. "*Our apprehension* of the manifold of the phenomenon is always successive. *The representations* of the parts succeed one another. Whether *they* [i. e. *the representations*] succeed one another *in the object* also, is a second point for reflection.... So far as they [i. e. phenomena], as representations only, are at the same time objects of consciousness, they are not to be distinguished from apprehension, i. e. reception into the synthesis of imagination, and we must therefore say, '*The manifold of phenomena* is always produced successively in the mind'. If phenomena were things in themselves, no man would be able to infer from the succession of the representations how *this manifold* is connected *in the object*.... The phenomenon, in opposition to the representations of apprehension, can only be represented as the object of the same, distinct therefrom, if it stands under a rule, which distinguishes *it* from every *other* representation and which renders necessary a mode of conjunction of the manifold."

Since Kant in introducing his vindication of causality thus identifies elements in the object apprehended (i. e. the manifold of phenomena) with the apprehensions of them, we approach the vindication itself with the expectation that he will identify a causal rule, which consists in a necessity in the succession of objects, viz. of events in nature, with the necessity in the succession of our apprehensions of them. This expectation turns out justified. The following passage adequately expresses the vindication:

"Let us now proceed to our task. That something happens, i. e. that something or some state comes to be which before was not, cannot be empirically perceived, unless a phenomenon precedes, which does not contain in itself this state; for a reality which follows upon an empty time, and therefore a coming into existence preceded by no state of things, can just as little be apprehended as empty time itself. Every apprehension of an event is therefore a perception which follows upon another perception. But because this is the case with all synthesis of apprehension, as I have shown above in the phenomenon of a house, the apprehension of an event is thereby not yet distinguished from other apprehensions. But I notice also, that if in a phenomenon which contains an event, I call the preceding state of my perception A, and the

following state B, B can only follow A in apprehension, while the perception A cannot follow B but can only precede it. For example, I see a ship float down a stream. My perception of its place lower down follows upon my perception of its place higher up the course of the river, and it is impossible that in the apprehension of this phenomenon the vessel should be perceived first below and afterwards higher up the stream. Here, therefore, the order in the sequence of perceptions in apprehension is determined, and apprehension is bound to this order. In the former example of a house, my perceptions in apprehension could begin at the roof and end at the foundation, or begin below and end above; in the same way they could apprehend the manifold of the empirical perception from left to right, or from right to left. Accordingly, in the series of these perceptions, there was no determined order, which necessitated my beginning at a certain point, in order to combine the manifold empirically. But this rule is always to be found in the perception of that which happens, and it makes the order of the successive perceptions (in the apprehension of this phenomenon) *necessary*."

"In the present case, therefore, I shall have to derive the *subjective sequence* of apprehension from the *objective sequence* of phenomena, for otherwise the former is wholly undetermined, and does not distinguish one phenomenon from another. The former alone proves nothing as to the connexion of the manifold in the object, for it is wholly arbitrary. The latter, therefore [i. e. the objective sequence of phenomena], will consist in that order of the manifold of the phenomenon, according to which the apprehension of the one (that which happens) follows that of the other (that which precedes) *according to a rule*. In this way alone can I be justified in saying of the phenomenon itself, and not merely of my apprehension, that a sequence is to be found therein, which is the same as to say that I cannot arrange my apprehension otherwise than in just this sequence."

"In conformity with such a rule, therefore, there must exist in that which in general precedes an event the condition of a rule, according to which this event follows always and necessarily, but I cannot conversely go back from the event, and determine (by apprehension) that which precedes it. For no phenomenon goes back from the succeeding point of time to the preceding point, although it does certainly relate to *some preceding point of time*; on the other hand, the advance from a given time to the determinate succeeding time is necessary. Therefore, because there certainly is something which follows, I must relate it necessarily to something else in general, which precedes, and upon which it follows in conformity with a rule, that is necessarily, so that the event, as the conditioned, affords certain indication of some condition, while this condition determines the event."

"If we suppose that nothing precedes an event, upon which this event must follow in conformity with a rule, all sequence of perception would exist only in apprehension, i. e. would be merely subjective, but it would not thereby be objectively determined which of the perceptions must in fact be the preceding and which the succeeding one. We should in this manner have only a play of representations, which would not be related to any object, i. e. no phenomenon would be distinguished through our perception in respect of time relations from any other, because the succession in apprehension is always of the same kind, and so there is nothing in the phenomenon to determine the succession, so as to render a certain sequence objectively necessary. I could therefore not say that in the phenomenon two states follow each other, but only that one apprehension follows on another, a fact which is merely *subjective* and does not determine any object, and cannot therefore be considered as knowledge of an object (not even in the phenomenon)."

"If therefore we experience that something happens, we always thereby presuppose that something precedes, on which it follows according to a rule. For otherwise, I should not say of the object, that it follows, because the mere sequence in my apprehension, if it is not determined by a rule in relation to something preceding, does not justify the assumption of a sequence in the object. It is therefore always in reference to a rule, according to which phenomena are determined in their sequence (i. e. as they happen) by the preceding state, that I make my subjective synthesis (of apprehension) objective, and it is solely upon this presupposition that even the experience of something which happens is possible."

The meaning of the first paragraph is plain. Kant is saying that when we reflect upon the process by which we come to apprehend the world of nature, we can lay down two propositions. The first is that the process is equally successive whether the object apprehended be a succession in nature or a coexistence of bodies in space, so that the knowledge that we have a succession of apprehensions would not by itself enable us to decide whether the object of the apprehensions is a sequence or not. The second proposition is that, nevertheless, there is this difference between the succession of our apprehensions where we apprehend a succession and where we apprehend a coexistence, that in the former case, and in that only, the succession of our apprehensions is irreversible or, in other words, is the expression of a rule of order which makes it a necessary succession. So far we find no mention of causality, i. e. of a necessity of succession in objects, but only a necessity of succession in our apprehension of them. So far, again, we find no contribution to the problem of explaining how we distinguish between successive perceptions which are the perceptions of an event and those which are not. For it is reasonable to object that it is only possible to say that the order of our perceptions is irreversible, if and because we already know that what we have been perceiving is an event, and that therefore any attempt to argue from the irreversibility of our perceptions to the existence of a sequence in the object must involve a [Greek: hysteron proteron]. And it is clear that, if irreversibility in our perceptions were the only irreversibility to which appeal could be made, even Kant would not have supposed that the apprehension of a succession was reached through belief in an irreversibility.

The next paragraph, of which the interpretation is difficult, appears to introduce a causal rule, i. e. an irreversibility in objects, by identifying it with the irreversibility in our perceptions of which Kant has been speaking. The first step to this identification is taken by the assertion: “In the present case, therefore, I shall have to derive the subjective sequence of perceptions from the objective sequence of phenomena.... The latter will consist in the order of the *manifold of the phenomenon*, according to which *the apprehension* of the one (that which happens) follows that of the other (that which precedes) according to a rule.” Here Kant definitely implies that an objective sequence, i. e. an order or sequence of the *manifold* of a phenomenon, consists in a sequence of *perceptions or apprehensions* of which the order is necessary or according to a rule; in other words, that a succession of perceptions in the special case where the succession is necessary is a succession of events perceived. This implication enables us to understand the meaning of the assertion that ‘we must therefore derive the subjective sequence of perceptions from the objective sequence of phenomena’, and to see its connexion with the preceding paragraph. It means, ‘in view of the fact that in all apprehensions of a succession, and in them alone, the sequence of perceptions is irreversible, we are justified in saying that a given sequence of perceptions is the apprehension of a succession, if we know that the sequence is irreversible; in that case we must be apprehending a real succession, for an irreversible sequence of perceptions *is* a sequence of events perceived.’ Having thus implied that irreversibility of perceptions constitutes them events perceived, he is naturally enough able to go on to speak of the irreversibility of perceptions as if it were the same thing as an irreversibility of events perceived, and thus to bring in a causal rule. “In this way alone [i. e. only by deriving the subjective from the objective sequence] can I be justified in saying of the phenomenon itself, and not merely of my apprehension, that a sequence is to be found therein, *which is the same as to say* that I cannot *arrange* my apprehension otherwise than in just this sequence. In conformity with *such a rule*, therefore, there must exist in that which in general precedes *an event* the condition of a rule, according to which *this event follows always and necessarily*.” Here the use of the word ‘arrange’ and the statement about the rule in the next sentence imply that Kant has now come to think of the rule of succession as a causal rule relating to the objective succession. Moreover, if any doubt remains as to whether Kant really confuses the two irreversibilities or necessities of succession, it is removed by the last paragraph of the passage quoted. “If therefore we experience that something happens, we always thereby presuppose that something precedes on which *it* follows according to a rule. For otherwise I

should not say of the object that *it* follows; because the mere succession of my apprehension, if *it* is not determined by a rule in relation to something preceding, does not justify the assumption of a succession in the object. It is therefore always in reference to a rule, according to which *phenomena* are determined in their sequence (i. e. as they happen) by the preceding state, that I make my subjective sequence (of apprehension) objective." The fact is simply that Kant *must* identify the two irreversibilities, because, as has been pointed out, he has only one set of terms to be related as irreversible, viz. the elements of the manifold, which have to be, from one point of view, elements of an object and, from another, representations or apprehensions of it.

As soon, therefore, as the real nature of Kant's vindication of causality has been laid bare, it is difficult to describe it as an argument at all. He is anxious to show that in apprehending A B as a real or objective succession we presuppose that they are elements in a causal order of succession. Yet in support of his contention he points only to the quite different fact that where we apprehend a succession A B, we think of the *perception* of A and the *perception* of B as elements in a necessary but subjective succession.

Before we attempt to consider the facts with which Kant is dealing, we must refer to a feature in Kant's account to which no allusion has been made. We should on the whole expect from the passage quoted that, in the case where we regard two perceptions A B as necessarily successive and therefore as constituting an objective succession, the necessity of succession consists in the fact that A is the cause of B. This, however, is apparently not Kant's view; on the contrary, he seems to hold that, in thinking of A B as an objective succession, we presuppose not that A causes B, but only that the state of affairs which precedes B, and which therefore includes A, contains a cause of B, the coexistence or identity of this cause with A rendering the particular succession A B necessary. "Thus [if I perceive that something happens] it arises that there comes to be an order among our representations in which the present (so far as it has taken place) points to some preceding state as a correlate, *though a still undetermined correlate*, of this event which is given, and this correlate relates to the event by determining the event as its consequence, and connects the event with itself necessarily in the series of time."

The fact is that Kant is in a difficulty which he feels obscurely himself. He seems driven to this view for two reasons. If he were to maintain that A was necessarily the cause of B, he would be maintaining that all observed sequences are causal, i. e. that in them the antecedent and consequent are always cause and effect, which is palpably contrary to fact. Again, his aim is to show that we become aware of a succession by presupposing the law of causality. This law, however, is quite general, and only asserts that *something* must precede an event upon which it follows always and necessarily. Hence by itself it palpably gives no means of determining whether this something is A rather than anything else. Therefore if he were to maintain that the antecedent member of an apprehended objective succession must be thought of as its cause, the analogy would obviously provide no means of determining the antecedent member, and therefore the succession itself, for the succession must be the sequence of B upon some definite antecedent. On the other hand, the view that the cause of B need not be A only incurs the same difficulty in a rather less obvious form. For, even on this view, the argument implies that in order to apprehend two individual perceptions A B as an objective succession, we must know that A *must* precede B, and the presupposition that B implies a cause in the state of affairs preceding B in no way enables us to say either that A coexists with the cause, or that it is identical with it, and therefore that it must precede B.

Nevertheless, it cannot be regarded as certain that Kant did not think of A, the apprehended antecedent of B, as necessarily the cause of B, for his language is both ambiguous and inconsistent. When he considers the apprehension of a succession from the side of the successive perceptions, he at least tends to think of A B as cause and effect; and it may well be that in discussing the problem from the side of the law of causality, he means the cause of B to be A, although the generality of the law compels him to refer to it as *something* upon which B follows according to a rule.

Further, it should be noticed that to allow as Kant, in effect, does elsewhere, that experience is needed

to determine the cause of B is really to concede that the apprehension of objective successions is *prior to*, and *presupposed by*, any process which appeals to the principle of causality; for if the principle of causality does not by itself enable us to determine the cause of B, it cannot do more than enable us to pick out the cause of B among events known to precede B independently of the principle. Hence, from this point of view, there can be no process such as Kant is trying to describe, and therefore its precise nature is a matter of indifference.

We may now turn to the facts. There is, it seems, no such thing as a process by which, beginning with the knowledge of successive apprehensions or representations, of the object of which we are unaware, we come to be aware of their object. Still less is there a process — and it is really this which Kant is trying to describe — by which, so beginning, we come to apprehend these successive representations as objects, i. e. as parts of the physical world, through the thought of them as necessarily related. We may take Kant's instance of our apprehension of a boat going down stream. We do not first apprehend two perceptions of which the object is undetermined and then decide that their object is a succession rather than a coexistence. Still less do we first apprehend two perceptions or representations and then decide that they are related as successive events in the physical world. From the beginning we apprehend a real sequence, viz. the fact that the boat having left one place is arriving at another; there is no process *to* this apprehension. In other words, from the beginning we are aware of real elements, viz. of events in nature, and we are aware of them as really related, viz. as successive in nature. This must be so. For if we begin with the awareness of two mere perceptions, we could never thence reach the knowledge that their object was a succession, or even the knowledge that they had an object; nor, so beginning, could we become aware of the perceptions themselves as successive events in the physical world. For suppose, *per impossibile*, the existence of a process by which we come to be aware of two elements A and B as standing in a relation of sequence in the physical world. In the first place, A and B, with the awareness of which we begin, must be, and be known to be, real or objective, and not perceptions or apprehensions; otherwise we could never come to apprehend them as related in the physical world. In the second place, A and B must be, and be known to be, real with the reality of a physical event, otherwise we could never come to apprehend them as related by way of succession in the physical world. If A and B were bodies, as they are when we apprehend the parts of a house, they could never be apprehended as successive. In other words, the process by which, on Kant's view, A and B become, and become known to be, events presupposes that they already are, and are known to be, events. Again, even if it be granted that A and B are real events, it is clear that there can be no process by which we come to apprehend them as successive. For if we apprehended events A and B separately, we could never thence advance to the apprehension of their relation, or, in other words, we could never discover which came first. Kant himself saw clearly that the perception of A followed by the perception of B does not by itself yield the perception that B follows A. In fact it was this insight which formed the starting-point of his discussion. Unfortunately, instead of concluding that the apprehension of a succession is ultimate and underivable from a more primitive apprehension, he tried to formulate the nature of the process by which, starting from such a succession of perceptions, we reach the apprehension of a succession. The truth is simply that there is and can be no *process to* the apprehension of a succession; in other words, that we do and must apprehend a real succession immediately or not at all. The same considerations can of course be supplied *mutatis mutandis* to the apprehension of the coexistence of bodies in space, e. g. of the parts of a house.

It may be objected that this denial of the existence of the process which Kant is trying to describe must at least be an overstatement. For the assertion that the apprehension of a succession or of a coexistence is immediate may seem to imply that the apprehension of the course of a boat or of the shape of a house involves no process at all; yet either apprehension clearly takes time and so must involve a process. But though a process is obviously involved, it is not a process from the apprehension of what is not a succession to the apprehension of a succession, but a process from the apprehension of one succession to

that of another. It is the process by which we pass from the apprehension of one part of a succession which may have, and which it is known may have, other parts to the apprehension of what is, and what is known to be, another part of the same succession. Moreover, the assertion that the apprehension of a succession must be immediate does not imply that it may not be reached by a process. It is not inconsistent with the obvious fact that to apprehend that the boat is now turning a corner is really to apprehend that what before was going straight is now changing its course, and therefore presupposes a previous apprehension of the boat's course as straight. It only implies that the apprehension of a succession, if reached by a process at all, is not reached by a process of which the starting-point is not itself the apprehension of a succession.

Nevertheless, a plausible defence of Kant's treatment of causality can be found, which may be formulated thus: 'Time, just as much as space, is a sphere within which we have to distinguish between appearance and reality. For instance, when moving in a lift, we see, as we say, the walls moving, while the lift remains stationary. When sitting in a train which is beginning to move out of a station, we see, as we say, another train beginning to move, although it is in fact standing still. When looking at distant trees from a fast train, we see, as we say, the buildings in the intermediate space moving backwards. In these cases the events seen are not real, and we only succeed in determining what is really happening, by a process which presupposes the law of causality. Thus, in the last case we only believe that the intermediate buildings do not move, by realizing that, given the uniformity of nature, belief in their motion is incompatible with what we believe on the strength of experience of these buildings on other occasions and of the rest of the world. These cases prove the existence of a process which enables us, and is required to enable us, to decide whether a given change is objective or subjective, i. e. whether it lies in the reality apprehended or in our apprehension of it; and this process involves an appeal to causality. Kant's mistake lay in his choice of illustrations. His illustrations implied that the process which involves causality is one by which we distinguish a succession in the object apprehended from another relation in the object, viz. a coexistence of bodies. But he ought to have taken illustrations which implied that the process is one by which we distinguish a succession in the object from a succession in our perception of it. In other words, the illustrations should, like those just given, have illustrated the process by which we distinguish an objective from a subjective change, and not a process by which we distinguish an objective change from something else also objective. Consequently, Kant's conclusion and his *general* method of treatment are right, even if, misled by his instances, he supports his position by arguments which are wrong.'

This defence is, however, open to the following reply: 'At first sight the cases taken undoubtedly seem to illustrate a process in which we seek to discover whether a certain change belongs to objects or only to our apprehension of them, and in which we appeal to causality in arriving at a decision. But this is only because we ignore the relativity of motion. To take the third case: our first statement of the facts is that we saw the intermediate buildings moving, but that subsequent reflection on the results of other experience forced us to conclude that the change perceived was after all only in our apprehension and not in the things apprehended. The statement, however, that we saw the buildings moving really assumes that we, the observers, were stationary; and it states too much. What we really perceived was a relative changing of position between us, the near buildings, and the distant trees. This is a fact, and the apprehension of it, therefore, does not afterwards prove mistaken. It is equally compatible with motion on the part of the trees, or of the buildings, or of the observers, or of a combination of them; and that for which an appeal to causality is needed is the problem of deciding which of these alternatives is correct. Moreover, the perceived relative change of position is objective; it concerns the things apprehended. Hence, in this case too, it can be said that we perceive an objective succession from the beginning, and that the appeal to causality is only needed to determine something further about it. It is useless to urge that to be aware of an event is to be aware of it in all its definiteness, and that this awareness admittedly involves an appeal to

causality; for it is easy to see that unless our awareness of the relative motion formed the starting-point of any subsequent process in which we appealed to the law of causality, we could never use the law to determine which body really moved.'

Two remarks may be made in conclusion. In the first place, the basis of Kant's account, viz. the view that in our apprehension of the world we advance from the apprehension of a succession of perceptions to the apprehension of objects perceived, involves a [Greek: hysteron proteron]. As Kant himself in effect urges in the *Refutation of Idealism*, self-consciousness, in the sense of the consciousness of the successive process in which we apprehend the world, is plainly only attained by reflecting upon our apprehension of the world. We first apprehend the world and only by subsequent reflection become aware of our activity in apprehending it. Even if consciousness of the world must lead to, and so is in a sense inseparable from, self-consciousness, it is none the less its presupposition.

In the second place, it seems that the true vindication of causality, like that of the first analogy, lies in the dogmatic method which Kant rejects. It consists in insight into the fact that it is of the very nature of a physical event to be an element in a process of change undergone by a system of substances in space, this process being through and through necessary in the sense that any event (i. e. the attainment of any state by a substance) is the outcome of certain preceding events (i. e. the previous attainment of certain states by it and other substances), and is similarly the condition of certain subsequent events. To attain this insight, we have only to reflect upon what we really mean by a 'physical event'. The vindication can also be expressed in the form that the very *thought* of a physical event presupposes the *thought* of it as an element in a necessary process of change — provided, however, that no distinction is implied between the nature of a thing and what we think its nature to be. But to vindicate causality in this way is to pursue the dogmatic method; it is to argue from the nature, or, to use Kant's phrase, from the conception, of a physical event. On the other hand, it seems that the method of arguing transcendentally, or from the possibility of perceiving events, must be doomed to failure in principle. For if, as has been argued to be the case, apprehension is essentially the apprehension of a reality as it exists independently of the apprehension of it, only those characteristics can be attributed to it, as characteristics which it must have if it is to be apprehended, which belong to it in its own nature or in virtue of its being what it is. It can only be because we think that a thing has some characteristic in virtue of its own nature, and so think 'dogmatically', that we can think that in apprehending it we must apprehend it as having that characteristic.

There remains to be considered Kant's proof of the third analogy, i. e. the principle that all substances, so far as they can be perceived in space as coexistent, are in thorough-going interaction. The account is extremely confused, and it is difficult to extract from it a consistent view. We shall consider here the version added in the second edition, as being the fuller and the less unintelligible.

"Things are *coexistent*, when in empirical intuition the perception of the one can follow upon the perception of the other, and vice versa (which cannot occur in the temporal succession of phenomena, as we have shown in the second principle). Thus I can direct my perception first to the moon and afterwards to the earth, or conversely, first to the earth and then to the moon, and because the perceptions of these objects can reciprocally follow each other, I say that they coexist. Now coexistence is the existence of the manifold in the same time. But we cannot perceive time itself, so as to conclude from the fact that things are placed in the same time that the perceptions of them can follow each other reciprocally. The synthesis of the imagination in apprehension, therefore, would only give us each of these perceptions as existing in the subject when the other is absent and vice versa; but it would not give us that the objects are coexistent, i. e. that, if the one exists, the other also exists in the same time, and that this is necessary in order that the perceptions can follow each other reciprocally. Hence there is needed a conception-of-the-understanding of the reciprocal sequence of the determinations of these things coexisting externally to one another, in order to say that the reciprocal succession of perceptions is grounded in the object, and thereby to

represent the coexistence as objective. But the relation of substances in which the one contains determinations the ground of which is contained in the other is the relation of influence, and if, reciprocally, the former contains the ground of the determinations in the latter, it is the relation of community or interaction. Consequently, the coexistence of substances in space cannot be known in experience otherwise than under the presupposition of their interaction; this is therefore also the condition of the possibility of things themselves as objects of experience."

The proof begins, as we should expect, in a way parallel to that of causality. Just as Kant had apparently argued that we learn that a succession of perceptions is the perception of a sequence when we find the order of the perceptions to be irreversible, so he now definitely asserts that we learn that certain perceptions are the perceptions of a coexistence of bodies in space when we find that the order of the perceptions is reversible, or, to use Kant's language, that there can be a reciprocal sequence of the perceptions. This beginning, if read by itself, seems as though it should also be the end. There seems nothing more which need be said. Just as we should have expected Kant to have completed his account of the apprehension of a succession when he pointed out that it is distinguished by the irreversibility of the perceptions, so here we should expect him to have said enough when he points out that the earth and the moon are said to be coexistent because our perceptions of them can follow one another reciprocally.

The analogy, however, has in some way to be brought in, and to this the rest of the proof is devoted. In order to consider how this is done, we must first consider the nature of the analogy itself. Kant speaks of 'a conception-of-the-understanding of the reciprocal sequence of the determinations of things which coexist externally to one another'; and he says that 'that relation of substances in which the one contains determinations, the ground of which is contained in the other substance, is the relation of influence'. His meaning can be illustrated thus. Suppose two bodies, A, a lump of ice, and B, a fire, close together, yet at such a distance that they can be observed in succession. Suppose that A passes through changes of temperature a_1 a_2 a_3 ... in certain times, the changes ending in states α_1 α_2 α_3 ..., and that B passes through changes of temperature b_1 b_2 b_3 ... in the same times, the changes ending in states β_1 β_2 β_3. Suppose also, as we must, that A and B interact, i. e. that A in passing through its changes conditions the changes through which B passes, and therefore also the states in which B ends, and vice versa, so that a_2 and α_2 will be the outcome not of a_1 and α_1 alone, but of a_1 and α_1, and b_1 and β_1 jointly. Then we can say (1) that A and B are in the relation of influence, and also of interaction or reciprocal influence, in the sense that they *mutually* (not alternately) determine one another's states. Again, if we first perceive A in the state α1 by a perception A_1, then B in the state β_2 by a perception B_2, then A in the state α_3 by a perception A_3 and so on, we can speak (2) of a reciprocal sequence of perceptions, in the sense of a sequence of perceptions in which alternately a perception of B follows a perception of A and a perception of A follows a perception of B; for first a perception of B, viz. B_2, follows a perception of A, viz. A_1, and then a perception of A, viz. A_3, follows a perception of B, viz. B_2. We can also speak (3) of a reciprocal sequence of the determinations of two things in the sense of a necessary succession of states which *alternately* are states of A and of B; for α_1, which is perceived first, can be said to contribute to determine β_2, which is perceived next, and β_2 can be said to contribute to determine α_3, which is perceived next, and so on; and this reciprocal sequence can be said to be involved in the very nature of interaction. Further, it can be said (4) that if we perceive A and B alternately, and so only in the states α_1 α_3 ... β_2 β_4 ... respectively, we can only fill in the blanks, i. e. discover the states α_2 α_4 ... β_1 β_3 ... *coexistent* with β_2 β_4 ... and α_1 α_3 ... respectively, if we presuppose the thought of interaction. For it is only possible to use the observed states as a clue to the unobserved states, if we presuppose that the observed states are members of a necessary succession of which the unobserved states are also members and therefore have partially determined and been determined by the observed states. Hence it may be said that the determination of the unobserved states coexistent with the observed states presupposes the thought of interaction.

How then does Kant advance from the assertion that the apprehension of a coexistence requires the knowledge that our *perceptions* can be reciprocally sequent to the assertion that it presupposes the thought that the *determinations of phenomena* are reciprocally sequent? The passage in which the transition is effected is obscure and confused, but it is capable of interpretation as soon as we see that it is intended to run parallel to the proof of the second analogy which is added in the second edition. Kant apparently puts to himself the question, 'How are we to know when we have a reciprocal sequence of perceptions from which we can infer a coexistence in what we perceived?' and apparently answers it thus: 'Since we cannot perceive time, and therefore cannot perceive objects as dated in time with respect to one another, we cannot begin with the apprehension of the coexistence of two objects, and thence infer the possibility of reciprocal sequence in our perceptions. This being so, the synthesis of imagination in apprehension can indeed combine these perceptions [these now being really considered as determinations or states of an object perceived] in a reciprocal sequence, but there is so far no guarantee that the sequence produced by the synthesis is not an arbitrary product of the imagination, and therefore we cannot think of it as a reciprocal sequence in objects. In order to think of such a reciprocal sequence as not arbitrary but as constituting a real sequence in objects [= 'as grounded in the object'], we must think of the states reciprocally sequent [as necessarily related and therefore] as successive states of two coexisting substances which interact or mutually determine one another's successive states. Only then shall we be able to think of the coexistence of objects involved in the reciprocal sequence as an objective fact, and not merely as an arbitrary product of the imagination.' But, if this fairly expresses Kant's meaning, his argument is clearly vitiated by two confusions. In the first place, it confuses a subjective sequence of perceptions which are alternately perceptions of A and of B, two bodies in space, with an objective sequence of perceived states of bodies, α_1 β_2 α_3 β_4, which are alternately states of two bodies A and B, the same thing being regarded at once as a perception and as a state of a physical object. In the second place, mainly in consequence of the first confusion, it confuses the necessity that the perceptions of A and of B can follow one another alternately with the necessity of succession in the alternately perceived states of A and B as interacting. Moreover, there is really a change in the cases under consideration. The case with which he begins, i. e. when he is considering merely the reciprocal sequence of perceptions, is the successive perceptions of two *bodies in space* alternately, e. g. of the moon and the earth, the nature of their states at the time of perception not being in question. But the case with which he ends is the successive perception of the *states of two bodies* alternately, e. g. of the states of the fire and of the lump of ice. Moreover, it is only in the latter case that the objective relation apprehended is that of coexistence in the proper sense, and in the sense which Kant intends throughout, viz. that of being contemporaneous in distinction from being successive. For when we say that two bodies, e. g. the moon and the earth, coexist, we should only mean that both exist, and not, as Kant means, that they are contemporaneous. For to a substance, being as it is the substratum of changes, we can ascribe no temporal predicates. That which changes cannot be said either to begin, or to end, or to exist at a certain moment of time, or, therefore, to exist contemporaneously with, or after, or before anything else; it cannot even be said to persist through a portion of time or, to use the phrase of the first analogy, to be permanent. It will be objected that, though the cases are different, yet the transition from the one to the other is justified, for it is precisely Kant's point that the existence together of two substances in space can only be discovered by consideration of their successive states under the presupposition that they mutually determine one another's states. "Besides the mere fact of existence there must be something by which A determines the place in time for B, and conversely B the place for A, because only under this condition can these substances be empirically represented as coexistent." The objection, however, should be met by two considerations, each of which is of some intrinsic importance. In the first place, the apprehension of a body in space in itself involves the apprehension that it exists together with all other bodies in space, for the apprehension of something as spatial involves the apprehension of it as spatially related to, and therefore as existing

together with, everything else which is spatial. No process, therefore, such as Kant describes is required in order that we may learn that it exists along with some other body. In the second place, that for which the principle of interaction is really required is not, as Kant supposes, the determination of the coexistence of an unperceived body with a perceived body, but the determination of that unperceived state of a body already known to exist which is coexistent with a perceived state of a perceived body. As has been pointed out, if we perceive A and B alternately in the states α_1 β_2 α_3 β_4 ... we need the thought of interaction to determine the nature of β_1 α_2 β_3 α_4 ... Thus it appears that Kant in his vindication of the third analogy omits altogether to notice the one process which really presupposes it.

CHAPTER XIII. THE POSTULATES OF EMPIRICAL THOUGHT

The postulates of empirical thought, which correspond to the categories of modality, are stated as follows:

"1. That which agrees with the formal conditions of experience (according to perception and conceptions) is *possible*.

2. That which is connected with the material conditions of experience (sensation) is *actual*.

3. That of which the connexion with the actual is determined according to universal conditions of experience is *necessary* (exists necessarily)."

These principles, described as only 'explanations of the conceptions of possibility, actuality, and necessity as employed in experience', are really treated as principles by which we decide what is possible, what is actual, and what is necessary. The three conceptions involved do not, according to Kant, enlarge our knowledge of the nature of objects, but only 'express their relation to the faculty of knowledge'; i. e. they only concern our ability to apprehend an object whose nature is already determined for us otherwise as at least possible, or as real, or as even necessary. Moreover, it is because these principles do not enlarge our knowledge of the nature of objects that they are called postulates; for a postulate in geometry, from which science the term is borrowed (e. g. that it is possible with a given line to describe a circle from a given point), does not augment the conception of the figure to which it relates, but only asserts the possibility of the conception itself. The discussion of these principles is described, contrary to the terminology adopted in the case of the preceding principles, as 'explanation' and not as 'proof'. The discussion, however, certainly includes a proof of them, for it is Kant's main object to *prove* that these principles constitute the general character of what can be asserted to be possible, actual, or necessary respectively. Again, as before, the basis of proof lies in a theory of knowledge, and in particular in Kant's theory of knowledge; for it consists in the principle that everything knowable must conform to the conditions involved in its being an object of possible experience.

To understand these principles and the proof of them, we must notice certain preliminary considerations. In the *first* place, the very problem of distinguishing the possible, the actual, and the necessary presupposes the existence of distinctions which may prove open to question. It presupposes that something may be possible without being actual, and again that something may be actual without being necessary. In the *second* place, Kant's mode of approaching the problem assumes that we can begin with a conception of an object, e. g. of a man with six toes, and then ask whether the object of it is possible, whether, if possible, it is also actual, and whether, if actual, it is also necessary. In other words, it assumes the possibility of separating what is conceived from what is possible, and therefore *a fortiori* from what is actual, and from what is necessary. *Thirdly*, in this context, as in most others, Kant in speaking of a conception is thinking, to use Locke's phraseology, not of a 'simple' conception, such as that of equality or of redness, but of a 'complex' conception, such as that of a centaur, or of a triangle in the sense of a three-sided three-angled figure. It is the apprehension of a 'complex' of elements. *Fourthly*, what is said to be possible, real, or necessary is not the conception but the corresponding object. The question is not, for instance, whether the conception of a triangle or of a centaur is possible, actual, or necessary, but whether a triangle or a centaur is possible, actual, or necessary. Kant sometimes speaks loosely of conceptions as possible, but the terms which he normally and, from the point of view of his theory, rightly applies to conceptions are 'objectively real' and 'fictitious'. *Lastly*, Kant distinguishes 'objectively real' and 'fictitious' conceptions in two ways. He speaks of establishing the objective reality of a conception as consisting in establishing the possibility of a corresponding object, implying therefore that a fictitious conception is a conception of which the corresponding object is not known to be possible.

Again, he describes as fictitious new conceptions of substances, powers, and interactions, which we might form from the material offered to us by perception without borrowing from experience itself the example of their connexions, e. g. the conception of a power of the mind to perceive the future; and he says that the possibility of these conceptions (i. e. the possibility of corresponding objects) cannot, like that of the categories, be acquired *a priori* through their being conditions on which all experience depends, but must be discovered empirically or not at all. Of such conceptions he says that, without being based upon experience and its known laws, they are arbitrary syntheses which, although they contain no contradiction, have no claim to objective reality, and therefore to the possibility of corresponding objects. He implies, therefore, that the object of a conception can be said to be possible only when the conception is the apprehension of a complex of elements together with the apprehension — which, if not *a priori*, must be based upon experience — that they are connected. Hence a conception may be regarded as 'objectively real', or as 'fictitious' according as it is the apprehension of a complex of elements accompanied by the apprehension that they are connected, or the apprehension of a complex of elements not so accompanied.

It is now possible to state Kant's problem more precisely. With regard to a given complex conception he wishes to determine the way in which we can answer the questions (1) 'Has the conception a possible object to correspond to it', or, in other words, 'Is the conception 'objectively real' or 'fictitious'?' (2) 'Given that a corresponding object is possible, is it also real?' (3) 'Given that it is real, is it also necessary?'

The substance of Kant's answer to this problem may be stated thus: 'The most obvious guarantee of the objective reality of a conception, i. e. of the possibility of a corresponding object, is the experience of such an object. For instance, our experience of water guarantees the objective reality of the conception of a liquid which expands as it solidifies. This appeal to experience, however, takes us beyond the possibility of the object to its reality, for the experience vindicates the possibility of the object only through its reality. Moreover, here the basis of our assertion of possibility is only empirical, whereas our aim is to discover the conceptions of which the objects can be determined *a priori* to be possible. What then is the answer to this, the real problem? To take the case of cause and effect, we cannot reach any conclusion by the mere study of the conception of cause and effect. For although the conception of a necessary succession contains no contradiction, the necessary succession of events is a mere arbitrary synthesis as far as our thought of it is concerned; we have no direct insight into the necessity. Therefore we cannot argue from this conception to the possibility of a corresponding object, viz. a necessarily successive series of events in nature. We can, however, say that that synthesis is not arbitrary but necessary to which any object must conform, if it is to be an object of experience. From this point of view we can say that there must be a possible object corresponding to the conception of cause and effect, because only as subjected to this synthesis are there objects of experience at all. Hence, if we take this point of view, we can say generally that all spatial and temporal conceptions, as constituting the conditions of perceiving in experience, and all the categories, as constituting the conditions of conceiving in experience, must have possible objects. In other words, 'that which agrees with the formal conditions of experience (according to perception and conceptions) is *possible*'. Again, if we know that the object of a conception is possible, how are we to determine whether it is also actual? It is clear that, since we cannot advance from the mere conception, objectively real though it may be, to the reality of the corresponding object, we need perception. The case, however, where the corresponding object is directly perceived may be ignored, for it involves no inference or process of thought; the appeal is to experience alone. Therefore the question to be considered is, 'How do we determine the actuality of the object of a conception comparatively *a priori,* i. e. without direct experience of it?' The answer must be that we do so by finding it to be 'connected with an actual perception in accordance with the analogies of experience'. For instance, we must establish the actuality of an object corresponding to the conception of

a volcanic eruption by showing it to be involved, in accordance with the analogies (and with particular empirical laws), in the state of a place which we are now perceiving. In other words, we can say that 'that which is connected with the material conditions of existence (sensation) is *actual*'. Finally, since we cannot learn the existence of any object of experience wholly *a priori*, but only relatively to another existence already given, the necessity of the existence of an object can never be known from conceptions, but only from its connexion with what is perceived; this necessity, however, is not the necessity of the existence of a substance, but only the necessity of connexion of an unobserved state of a substance with some observed state of a substance. Therefore we can (and indeed must) say of an unobserved object corresponding to a conception, not only that it is real, but also that it is necessary, when we know it to be connected with a perceived reality 'according to universal conditions of experience'; but the necessity can be attributed only to states of substances and not to substances themselves.'

Throughout this account there runs one fatal mistake, that of supposing that we can separate our knowledge of things as possible, as actual, and as necessary. Even if this supposition be tenable in certain cases, it is not tenable in respect of the objects of a complex conception, with which Kant is dealing. If we know the object of a complex conception to be possible, we already know it to be actual, and if we know it to be actual, we already know it to be necessary. A complex conception in the proper sense is the apprehension of a complex of elements together with the apprehension of, or insight into, their connexion. Thus, in the case of the conception of a triangle we see that the possession of three sides necessitates the possession of three angles. From such a conception must be distinguished Kant's 'fictitious' conception, i. e. the apprehension of a complex of elements without the apprehension of connexion between them. Thus, in the case of the conception of a man with six toes, there is no apprehension of connexion between the possession of the characteristics indicated by the term 'man' and the possession of six toes. In such a case, since we do not apprehend any connexion between the elements, we do not really 'conceive' or 'think' the object in question, e. g. a man with six toes. Now in the case of a complex conception proper, it is impossible to think of a corresponding individual as only possible. The question 'Is a triangle, in the sense of a figure with three sides and three angles, possible?' really means 'Is it possible for a three-sided figure to have three angles?' To this question we can only answer that we see that a three-sided figure can have three angles, because we see that it must have, and therefore has, and can have, three angles; in other words, that we see a triangle in the sense in question to be possible, because we see it to be necessary, and, therefore, actual, and possible. It cannot be argued that our insight is limited to the fact that if there are three-sided figures they must be three-angled, and that therefore we only know a triangle in the sense in question to be possible. Our apprehension of the fact that the possession of three sides necessitates the possession of three angles presupposes knowledge of the existence of three-sided figures, for it is only in an actual three-sided figure that we can apprehend the necessity. It may, however, be objected that the question ought to mean simply 'Is a three-sided figure possible?' and that, understood in this sense, it cannot be answered in a similar way. Nevertheless, a similar answer is the right answer. For the question 'Is a three-sided figure possible?' really means 'Is it possible for three straight lines to form a figure, i. e. to enclose a space?' and we can only answer it for ourselves by seeing that a group of three straight lines or directions, no two of which are parallel, must, as such, enclose a space, this insight presupposing the apprehension of an actual group of three straight lines. It may be said, therefore, that we can only determine the possibility of the object of a complex conception in the proper sense, through an act in which we apprehend its necessity and its actuality at once. It is only where conceptions are 'fictitious', and so not properly conceptions, that appeal to experience is necessary. The question 'Is an object corresponding to the conception of a man with six toes possible?' presupposes the reality of man and asks whether any man can have six toes. If we understood the nature of man and could thereby apprehend either that the possession of six toes was, or that it was not, involved in one of the possible differentiations of man, we could decide the question of possibility *a priori*, i. e. through our conceiving

alone without an appeal to experience; but we could do so only because we apprehended either that a certain kind of man with six toes was necessary and actual, or that such a man was impossible and not actual. If, however, as is the case, we do not understand the nature of man, we can only decide the question of possibility by an appeal to experience, i. e. to the experience of a corresponding object, or of an object from which the existence of such an object could be inferred. Here, therefore — assuming the required experience to be forthcoming — we can appeal to Kant's formula and say that we know that such a man, i. e. an object corresponding to the conception, is actual, as being connected with the material conditions of experience. But the perception which constitutes the material conditions of experience in the case in question is only of use because it carries us beyond possibility to actuality, and appeal to it is only necessary because the object is not really conceived or, in other words, because the so-called conception is not really a conception.

Kant really treats his 'objectively real' conceptions as if they were 'fictitious', even though he speaks of them as complete. Consequently, his conceptions not being conceptions proper, he is necessarily led to hold that an appeal to experience is needed in order to establish the reality of a corresponding object. Yet, this being so, he should have asked himself whether, without an appeal to perception, we could even say that a corresponding object was possible. That he did not ask this question is partly due to the fact that he attributes the form and the matter of knowledge to different sources, viz. to the mind and to things in themselves. While the conceptions involved in the forms of perception, space, and time, and also the categories are the manifestations of the mind's own nature, sensations, which form the matter of knowledge, are due to the action of things in themselves on our sensibility, and of this activity we can say nothing. Hence, from the point of view of our mind — and since we do not know things in themselves, this is the only point of view we can take — the existence of sensations, and therefore of objects, which must be given in perception, is wholly contingent and only to be discovered through experience. On the other hand, since the forms of perception and conception necessarily determine in certain ways the nature of objects, *if* there prove to be any objects, the conceptions involved may be thought to determine what objects are possible, even though the very existence of the objects is uncertain. Nevertheless, on his own principles, Kant should have allowed that, apart from perception, we could discover *a priori* at least the reality, even if not the necessity, of the objects of these conceptions. For his general view is that the forms of perception and the categories are only actualized on the occasion of the stimulus afforded by the action of things in themselves on the sensibility. Hence the fact that the categories and forms of perception are actualized — a fact implied in the very existence of the *Critique* — involves the existence of objects corresponding to the categories and to the conceptions involved in the forms of perception. On Kant's own principles, therefore, we could say *a priori* that there must be objects corresponding to these conceptions, even though their nature in detail could only be filled in by experience.

NOTE ON THE REFUTATION OF IDEALISM

This well-known passage practically replaces a long section, contained only in the first edition, on the fourth paralogism of pure reason. Its aim is to vindicate against ‘idealism’ the reality of objects in space, and it is for this reason inserted after the discussion of the second postulate. The interest which it has excited is due to Kant’s use of language which at least seems to imply that bodies in space are things in themselves, and therefore that here he really abandons his main thesis.

Idealism is the general name which Kant gives to any view which questions or denies the reality of the physical world; and, as has been pointed out before, he repeatedly tries to defend himself against the charge of being an idealist in this general sense. This passage is the expression of his final attempt. Kant begins by distinguishing two forms which idealism can take according as it regards the existence of objects in space as false and *impossible*, or as doubtful and *indemonstrable*. His own view, which regards their existence as certain and demonstrable, and which he elsewhere calls transcendental idealism, constitutes a third form. The first form is the dogmatic idealism of Berkeley. This view, Kant says, is unavoidable, if space be regarded as a property of things in themselves, and the basis of it has been destroyed in the *Aesthetic*. The second form is the problematic idealism of Descartes, according to which we are immediately aware only of our own existence, and belief in the existence of bodies in space can be only an inference, and an uncertain inference, from the immediate apprehension of our own existence. This view, according to Kant, is the outcome of a philosophical attitude of mind, in that it demands that a belief should be proved, and apparently — to judge from what Kant says of Berkeley — it does not commit Descartes to the view that bodies in space, if their reality can be vindicated, are things in themselves.

The assertion that the *Aesthetic* has destroyed the basis of Berkeley’s view, taken together with the drift of the *Refutation* as a whole, and especially of Remark I, renders it clear that the *Refutation* is directed against Descartes and not Berkeley. Kant regards himself as having already refuted Berkeley’s view, as he here states it, viz. that the existence of objects in space is *impossible*, on the ground that it arose from the mistake of supposing that space, if real at all, must be a property of things in themselves, whereas the *Aesthetic* has as he thinks, shown that space can be, and in point of fact is, a property of phenomena. He now wants to prove — compatibly with their character as phenomena — that the existence of bodies in space is not even, as Descartes contends, *doubtful*. To prove this he seeks to show that Descartes is wrong in supposing that we have no immediate experience of these objects. His method is to argue that reflection shows that internal experience presupposes external experience, i. e. that unless we were directly aware of spatial objects, we could not be aware of the succession of our own states, and consequently that it is an inversion to hold that we must reach the knowledge of objects in space, if at all, by an inference from the immediate apprehension of our own states.

An examination of the proof itself, however, forces us to allow that Kant, without realizing what he is doing, really abandons the view that objects in space are phenomena, and uses an argument the very nature of which implies that these objects are things in themselves. The proof runs thus:

Theorem. “The mere but empirically determined consciousness of my own existence proves the existence of objects in space external to me.”

“*Proof*. I am conscious of my own existence as determined in time. All time-determination presupposes something permanent in perception. This permanent, however, cannot be an intuition in me. For all grounds of determination of my own existence, which can be found in me, are representations, and as such themselves need a permanent different from them, in relation to which their change and consequently my existence in the time in which they change can be determined. The perception of this permanent, therefore,

is possible only through a *thing* external to me, and not through the mere *representation* of a thing external to me. Consequently, the determination of my existence in time is possible only through the existence of actual things, which I perceive external to me. Now consciousness in time is necessarily connected with the consciousness of the possibility of this time-determination; hence it is necessarily connected also with the existence of things external to me, as the condition of time-determination, i. e. the consciousness of my own existence, is at the same time an immediate consciousness of the existence of other things external to me."

The nature of the argument is clear. 'In order to be conscious, as I am, of a determinate succession of my states, I must perceive something permanent as that in relation to which alone I can perceive my states as having a definite order. But this permanent cannot be a perception in me, for in that case it would only be a representation of mine, which, as such, could only be apprehended in relation to another permanent. Consequently, this permanent must be a thing external to me and not a representation of a thing external to me. Consequently, the consciousness of my own existence, which is necessarily a consciousness of my successive states, involves the immediate consciousness of things external to me.'

Here there is no way of avoiding the conclusion that Kant is deceived by the ambiguity of the phrase 'a thing external to me' into thinking that he has given a proof of the existence of bodies in space which is compatible with the view that they are only phenomena, although in reality the proof presupposes that they are things in themselves. In the 'proof', the phrase 'a thing external to me' must have a double meaning. It must mean a thing external to my body, i. e. any body which is not my body; in other words, it must be a loose expression for a body in space. For, though the 'proof' makes us appeal to the spatial character of things external to me, the *Refutation* as a whole, and especially Remark II, shows that it is of bodies in space that he is thinking throughout. The phrase must also, and primarily, mean a thing external to, in the sense of independent of, my mind, i. e. a thing in itself. For the nerve of the argument consists in the contention that the permanent the perception of which is required for the consciousness of my successive states must be a *thing* external to me in opposition to the representation of a thing external to me, and a thing external to me in opposition to a thing external to me can only be a thing in itself. On the other hand, in Kant's conclusion, 'a thing external to me' can only mean a body in space, this being supposed to be a phenomenon; for his aim is to establish the reality of bodies in space compatibly with his general view that they are only phenomena. The proof therefore requires that things external to me, in order that they may render possible the consciousness of my successive states, should have the very character which is withheld from them in the conclusion, viz. that of existing independently of me; in other words, if Kant establishes the existence of bodies in space at all, he does so only at the cost of allowing that they are things in themselves.

Nevertheless, the *Refutation* may be considered to suggest the proper refutation of Descartes. It is possible to ignore Kant's demand for a permanent as a condition of the apprehension of our successive states, and to confine attention to his remark that he has shown that external experience is really immediate, and that only by means of it is the consciousness of our existence as determined in time possible. If we do so, we may consider the *Refutation* as suggesting the view that Descartes' position is precisely an inversion of the truth; in other words, that our consciousness of the world, so far from being an uncertain inference from the consciousness of our successive states, is in reality a presupposition of the latter consciousness, in that this latter consciousness only arises through reflection upon the former, and that therefore Descartes' admission of the validity of self-consciousness implicitly involves the admission *a fortiori* of the validity of our consciousness of the world.

INTRODUCTION TO KANT by Ralph Barton Perry

"Introduction to Kant" from The Harvard Classics, Vol. 51 (1914)

IT IS generally admitted that Kant is one of the great epoch-making philosophers, like Socrates and Descartes. There are two things that are universally true of intellectual epoch-makers: first, they embody in themselves certain general tendencies cof their age, which are usually due to a reaction against the more pronounced tendencies of the previous age; second, their thought is peculiarly germinal, and among their followers assumes a maturer form, in which the originators would scarcely recognize it as their own. Let us consider these two aspects of the philosophy of Kant.

REVOLT AGAINST PURE EMPIRICISM AND PURE RATIONALISM

From among the pronounced tendencies of the seventeenth and eighteenth centuries I shall select two for special emphasis. In the first place, it was characteristic of these two centuries to isolate and over-emphasize either one or the other of the two great sources of human knowledge, sense-perception or reason. Locke and his followers attempted to convert reason into a mere echo of sense; while for Descartes and his followers, sense was always viewed with suspicion as confusing the intellect, or as supplying only an inferior sort of knowledge which must yield precedence to "rational science." Extreme sensationalism or empiricism seemed to have reached an impasse in Hume; while rationalism degenerated into formalism and word-making in Wolff. Thus Kant's greatest work, the "Critique of Pure Reason" (1789), was an attempt to correct these extreme views by making the necessary provision for both sense-perception and reason. Perception without conception, he said, is blind; while conception without perception is empty. Kant's critique was aimed first at excessive emphasis on sense-perception. He showed that the bare sequence of sense-impressions can never yield the connections, necessities, unities, laws, etc., which are required for science. The intellect must supply these itself. They constitute what Kant called "categories," the instruments which the mind must use when it works in that peculiar way which is called knowing. But it follows that they are not by themselves sufficient for knowledge. They cannot themselves be known in the ordinary way because they are *what one knows with*. And since they are instruments, it follows that they require some material to work upon; they cannot spin knowledge out of nothing. Hence the data of sense are indispensable also. In short, to know is to systematize, by the instrumentalities native to the mind, the content conveyed by the senses. This is the Kant of the first Critique, the Kant of technical philosophy who numbers many faithful devotees among the thinkers of to-day.

REASSERTION OF THE SPIRITUAL

A second and more general tendency of seventeenth and eighteenth century philosophy was its comparative neglect of what are vaguely called the "spiritual" demands. These centuries themselves may be regarded as a reaction against what was thought to be the excessive anthropomorphism of earlier times. Man had erred by reading himself into his world; now he was to view it impersonally and dispassionately. He might prefer to record the findings of perception, or the necessities of reason, but in either case he was to repress his own interests and yearnings. Of course at the time it was confidently

expected that morality and religion would in this way be served best. Men believed in the possibility of a "natural religion," without mystery or dogma, a rational morality without authority, and a demonstrable theology without either revelation or faith. But gradually there developed a sense of failure. Man had left himself too much out of it, and felt homeless and unprotected. Early in the seventeenth century Pascal had announced the religious bankruptcy of the mathematical rationalism of Descartes. Natural religion was readily converted into atheism by Hume. The most vigorous and stirring protest against the whole spirit of the age was made by Rousseau, who urged men to trust their feelings, make allowance for the claims of the heart, and return to the elemental and spontaneous in human nature. The same note was caught up by Jacobi and Herder. Finally Lessing, in his "Education of the Human Race" (1780), turned the attention of philosophy to the history of culture, to the significance of human life in its historical unfolding. It is a strange paradox that Immanuel Kant, valetudinarian and pedant that he was, should have represented this rising revolt of sentiment and faith. But such was the fact. Let us, then, view him in this light.

THE KANTIAN REVOLUTION

One of the most famous of Kant's remarks was that he proposed to effect a Copernican Revolution in thought. As Copernicus had established a new center for the planetary system, so he proposed to establish a new center for knowledge. This new center was to be the mind itself. The errors of the earlier period had been largely due, he thought, to the attempt to make knowledge center in the object, it being expected that the mind should reflect, either by perception or reason, the nature of an outward and independently existing thing. This method leads inevitably, said Kant, either to scepticism or to what is just as bad for philosophical purposes, dogmatism. The new way is to expect that the object shall conform to the mind. Thus nature, which in the earlier view was construed as an external order by which the mind is affected, or which the mind is somehow to reproduce by its own ratiocination, is now construed as the original creation of the mind. It owes all of its arrangements and connections, even its very distribution in space and time, to the constitution of the knower. The mind imposes its conditions on the object, and thus gets out of nature what it has already put into it. The bearing of this on man's spiritual claims is apparent. It is now nature that is creature; and man, in virtue of his intelligence, that is creator. The fatal world of fact and necessity, that seemed so alien to spirit, turns out to be but an expression of the intellectual part of spirit.

THE SPHERE OF THE WILL

But a Rousseau might still complain that this victory of spirit over matter was dearly bought, since it left the rest of spirit in harsh subjection to the intellectual part. What guarantee is there that the intellect, thus clothed with authority, will make due allowance for the claims of sentiment and conscience? Kant's answer lies in his famous doctrine of the "primacy of the practical reason." Nature, he says, is indeed the work of the theoretical faculties; and the theoretical faculties can recognize only facts and laws. But the theoretical faculties are themselves but the expression of something deeper, namely, the will. Thinking is a kind of action, and action in general has its own laws, revealed in conscience, and taking precedence of the rules that govern any special department of action, such as knowing. This does not mean that conscience over-rules the understanding, or that the will can violate nature; but that conscience reveals another world, deeper and more real than nature, which is the proper sphere for the exercise of the will.

This is the world of God, freedom, and immortality. It cannot be known in the strict sense, only nature can be known; but it can and must be believed in, because it is presupposed in all action. If one is to live at all, one must claim such a world to live in. So Kant, who began by justifying science, ended by justifying faith.

THE FOLLOWERS OF KANT

I have said that it was the fate of epoch-makers to have their ideas promptly converted into something that they never meant. Kant was a cautious, or as he terms it, a “critical” thinker. He concerned himself with questions regarding the possibility of knowledge and the legitimacy of faith; and avoided so far as possible making positive assertions about the world. But his followers were fired with speculative zeal, and at once passed over from “criticism” to metaphysics.

There resulted the great Romantic and Idealistic movement that formed the main current of philosophical thought during the nineteenth century.

In the idealistic movement the Kantian theory of knowledge is united with a pantheistic tendency that may be traced continuously back even to Plato himself. According to this pantheistic view, nature and God are the same thing viewed differently. God, foreshortened and taken in the limited perspectives defined by man’s earth-bound intelligence, is nature; nature, consummated, seen in its fullness and harmony, is God.

For all we have power to see, is a straight staff bent in a pool;

And the ear of man cannot hear, and the eye of man cannot see;
But if we could see and hear, this Vision — were it not He?

Nature, on Kantian grounds, is the work of intelligence, and intelligence, in turn, obeys some deeper spiritual law. That law, when interpreted according to the Platonic-pantheistic tradition, is the perfection of the whole. There are many possible variations of the view. The perfection of the whole may be regarded as a moral perfection, the ideal of the moral will, as suggested by Kant, and more positively and constructively maintained by Fichte; or as the ideal of reason, as was maintained by Hegel and his followers; or as a general realization of all spiritual values, a perfection transcending moral and rational standards, and more nearly approached in the experience of beauty, or in flashes of mystical insight, as was proclaimed by the sentimentalists and romanticists. In the popular literary expressions of the view, these varieties have alternated, or have been indiscriminately mingled. But it is this view in some form that has inspired those English poets and essayists, such as Coleridge, Wordsworth, Carlyle, Emerson, Tennyson, and Browning, who so profoundly influenced the men of the last generation. There is thus a continuous current of thought from the closest philosophy of the sage of Konigsberg to the popular incentives and consolations of to-day.

The Biographies

Kant’s home in Königsberg (modern day Kaliningrad) from 1750

Kant by an unknown artist, c. 1755

MEMOIR OF KANT by Thomas Kingsmill Abbott

Immanuel Kant was born in Königsberg on the 22nd of April, 1724, thirteen years after Hume, and fourteen after Reid. His family was of Scottish origin, his grandfather having been one of the many Scotchmen who emigrated from Scotland at the end of the seventeenth century, some settling in Prussia, and some in Sweden; and he is said to have been himself the first to change the spelling of the name from Cant, which he did in order to avoid the mispronunciation Zant. His father was a saddler in modest, if not humble, circumstances. Both parents were persons of simple and sincere piety. Kant himself, although he did not sympathize with their religious views, bears the strongest testimony to the practical effect of their religion on their life. "Although," said he, speaking warmly, "the religious ideas of that time, and the notions of what was called virtue and piety were far from being distinct and satisfactory, yet such persons had the root of the matter in them. Let men decry pietism as they may, the people who were in earnest with it were honourably distinguished. They possessed the highest that man can possess — that calm, that serenity, that inward peace which is not disturbed by any passion. No trouble, no persecution dismayed them; no contest had the power to stir them up to anger or hostility: in a word, even the mere observer was involuntarily compelled to respect them. I still remember," added he, "how a quarrel once broke out between the harnessmakers and the saddlers about their respective privileges. My father suffered considerably; nevertheless, even in conversation amongst his own family he spoke about this quarrel with such forbearance and love towards his opponents, and with such firm trust in Providence, that although I was then only a boy, I shall never forget it." Of his mother, especially, he ever retained a tender and grateful memory, saying, "I shall never forget my mother, for she planted and fostered the first germ of good in me: she opened my heart to the impressions of nature, she awoke and enlarged my thoughts, and her teaching has always had an enduring and wholesome influence on my life." She died when he was only thirteen, and even in his later years he could scarcely restrain his emotion, when he related to his intimate friends how she had sacrificed her own life through her devotion to a friend. Kant strongly resembled his mother in features and in his singularly contracted chest.

At ten years of age Kant was sent to the Collegium Fridericianum, where he continued for seven years. Here he applied himself chiefly to classical studies, and learned to write Latin with ease and fluency. Of Greek he does not seem to have ever read much.

Amongst his schoolfellows was David Ruhnken, and these two, with a third, named Kunde, read their favourite authors together and laid their plans for the future, all three proposing to devote themselves to classical literature. Ruhnken actually attained high distinction in this field. At the age of sixteen Kant passed to the University, where he applied himself chiefly to mathematics and philosophy, the instruction in his favourite subject, the ancient classics, being inadequate. He had entered himself as a theological student, and, as was then the practice with such students in Prussia, he occasionally preached in the neighbouring churches. Indeed, he had completed his theological course when he finally gave up that line of study. No doubt his tastes had been long turning in a different direction; but the immediate cause of his decision seems to have been the failure of his application for a subordinate post in a school, such posts being usually the first step to ecclesiastical appointments.

During the latter part of his residence at the University he had been obliged to eke out his scanty means by giving instruction in classics, mathematics, and natural philosophy to some of his fellow-students, for whom the lectures of the professors were too difficult; but the little that he could earn in this way was insufficient for his support, when by his father's death (1746) he was thrown altogether on his own resources. He therefore sought and obtained employment as a resident tutor in families of distinction. He

was thus engaged for nine years, and, according to his own candid confession in later years, there was hardly ever a tutor with a better theory or a worse practice. However that may be, he certainly gained the affection of his pupils, and the respect of their parents. At the beginning of this period he published his first work — an Essay on the estimation of vis viva; and towards the end of it his second — a brief discussion of the question whether the length of the day has undergone any change, a question which had been proposed by the Berlin Academy as the subject for a prize essay. Kant argues that the tides must have the effect of retarding the earth's rotation, and he enters into a rough calculation of the amount of this retardation, his first step to a conjectural approximation being an estimate of the effect of the impulse of the water on the whole east coast of the American continent. His suggestion was sound and sagacious; but he overrated vastly the amount of the effect. He inferred that the day had lengthened by about 1½s in two thousand years. According to Delaunay, the actual amount of retardation is 1s in 200,000 years. This result is based on historical facts (the record of eclipses). Kant's was a purely physical calculation, and for this he did not possess sufficient data. On account of this inevitable lack of precision, he did not offer his essay in competition for the prize.

The same essay contained another very remarkable suggestion in explanation of the fact, that the moon always presents the same face to the earth. In fact, if the moon were originally in a fluid state the tides produced in it by the earth (which would be very great) would similarly retard its rotation until the fluid surface attained a position of equilibrium relatively to the earth, i. e. until the moon rotated round its axis in the same time that it revolved round the earth. This speculation has been recently brought forward as novel.

The conjecture as to the moon's original fluidity was no isolated one in Kant's mind; on the contrary, he speaks of it as part of a general theory of the heavens, which he was about to publish. In the following year (1755), accordingly, he published (anonymously) an important work of about 200 pages, entitled, A General Theory of the Heavens; or, Essay on the Mechanical Origin of the Structure of the Universe, on the Principles of Newton. This work is an elaborate exposition of the Nebular Theory, commonly called by the name of Laplace, although Laplace's Système du Monde was not published till forty years later (1796). The only considerable differences are, first, that Laplace supposes the condensation of the diffused matter to be the result of cooling; and, secondly, that he postulates an original movement of rotation; whereas Kant thought he could account for both condensation and rotation from the two elementary forces of attraction and repulsion. It is not easy to say whether Laplace was aware of Kant's priority. He asserts, indeed, that he was not aware of any theory except Buffon's (a rather extravagant one); but then Laplace never did acknowledge that he borrowed anything from anybody else. Even when he used the mathematical discoveries of contemporary Frenchmen, he introduces them as if they were his own; how much more if he adopted a suggestion of an anonymous German philosopher. If he really did calculate on the ignorance of his reader, the event has justified his expectation; for even those writers who mention Kant's priority speak as if Kant had merely thrown out a hint, while Laplace had developed a theory; whereas, in fact, Kant wrote a treatise on the subject, and Laplace only a few pages.

Kant begins by defending his attempt against the possible objections of those who might regard it as an endeavour to dispense with the necessity for a Divine Author. Such persons, he says, appear to suppose that nature, left to its own laws, would produce only disorder, and that the adaptations we admire indicate the interference of a compelling hand, as if nature were a rebellious subject that could be reduced to order only by compulsion, or else were an independent principle, whose properties are uncaused, and which God strives to reduce into the plan of His purposes. But, answers he, if the general laws of matter are themselves a result of supreme wisdom, must they not be fitted to carry out its wise design? In fact, we have here a powerful weapon in aid of Theism. When we trace certain beneficial effects to the regular working of the laws of nature, we see that these effects are not produced by chance, but that these laws can work in no other way. But if the nature of things were independent and necessary, what an astounding

accident, or rather what an impossibility, would it not be that they should fit together just as a wise and good choice would have made them fit! As this applies to such reasoning in general, so it applies also to the present undertaking. We shall find that matter had certain laws imposed on it, by virtue of which it necessarily produced the finest combinations. That there is a God is proved even by this, that Nature, even in chaos, could only proceed with regularity and order.

He proceeds to work out in detail the problem of the formation of the planets out of the originally diffused matter, taking into consideration the eccentricities, inclinations, &c., of the planets, the rings of Saturn, the satellites, the comets. It is noticeable that he does not, like Laplace, regard the rings of Saturn as an illustration of his theory. On account of their large inclination to the ecliptic (28°), he thought it necessary to assign to them a different origin. His hypothesis was, that they were produced by emanations from the planet itself, and he showed further (as Laplace afterwards did) that the ring must have a movement of rotation, and that in consequence of the different velocities belonging to different distances from the planet, its stability required that it should consist of several distinct rings. This conjecture, or rather deduction, has been verified. He also conjectured, as a result of his hypothesis regarding the formation of the ring, that the great velocity of rotation of particles of the inner ring would be the same as that of the planet's equator. From this consideration, combined with the assumption that the ring conforms to Kepler's third law, he deduced the time of the planet's rotation. He drew particular attention to this as the first prediction of the kind. His deduction, however, has not been verified. Saturn's time of rotation is nearly double what it ought to be on Kant's theory. Another conjecture of his, subsequently verified, was, that there are planets beyond Saturn. Later, he conjectured also the existence of a planet between Mars and Jupiter.

Kant then extends his view to the sidereal system. He states that the first to suggest to him that the fixed stars constituted a system was Wright, of Durham. Kant develops this conception. If gravitation is a universal property of matter, we cannot suppose the sun's attractive force limited to our system; but if it extends to the nearest fixed star, and if the fixed stars, like suns, exercise a similar force around them, then they would, sooner or later, fall together if not prevented (like the planets) by a centrifugal force. Hence we may conclude that all the stars of the firmament have their own orbital motion. If we conceive our planetary system multiplied a thousand-fold, and the several bodies in it to be self-luminous, the appearance, as seen from the earth, would resemble that of the Milky Way. The form of the heaven of the fixed stars then is in great an effect of the same systematic arrangement as our system in little; our sun with the other stars are, in short, the planets of a vaster system, which is, in fact, the Milky Way. There may be many such systems, and some of these may appear to us as nebulæ, and these being seen obliquely would present an elliptic form. The Milky Way seen from a sufficient distance would appear like one of these elliptic nebulæ. But these systems, again, may be mutually related, and constitute together a still more immeasurable system. This opens to us a view into the infinite field of creation, and gives us a conception of the work of God suitable to the infinity of the great Creator. If the magnitude of a planetary system in which the earth is as a grain of sand fills our understanding with wonder, with what amazement are we seized when we consider the vast multitude of worlds and systems which constitute the Milky Way; and how is this amazement increased again when we learn that all these immeasurable star systems are in their turn only a unit in a number whose limit we know not, and which is perhaps as inconceivably great as the former, while it is itself the unit of a new combination. There is here a veritable abyss of immensity in which all human power of conception is lost. The wisdom, the goodness, the power, that are revealed are infinite, and in the same degree fruitful and active; the plan of its revelation must, therefore, be equally infinite. He ventures upon the conjecture (giving his reasons) that nature may in course of time be again reduced to chaos, and again emerge like a phœnix from its ashes. When we contemplate nature in these successive changes, carrying out the plan by which God reveals Himself in wonders that fill space and eternity, the mind is overwhelmed with astonishment; but not satisfied with this vast yet perishable object,

the soul desires to know more nearly that Being whose intelligence and whose greatness are the source of that light which spreads as from a centre over all nature. With what awe must not the soul regard even its own nature, when it reflects that it shall outlive all these changes. “O happy,” he exclaims, “when amid the tumult of the elements and the ruin of nature it is placed on a height from whence it can, as it were, see beneath its feet the desolation of all perishable things of the world. Reason could not even dare to wish for such happiness, but Revelation teaches us to hope for it with confidence. When the fetters that have bound us to the vanity of the creature have fallen off, the immortal spirit will find itself in the enjoyment of true happiness in communion with the Infinite Being. The contemplation of the harmony of universal nature with the will of God must fill with ever-increasing satisfaction the rational creature who finds himself united to this source of all perfection. Viewed from this centre, nature will show on all sides nothing but stability and fitness; its changes cannot interfere with the happiness of a creature who has reached this height. In sweet foretaste of this condition the soul can exercise its mouth in those songs of praise with which all eternity shall ring: —

> “When nature fails, and day and night
> Divide Thy works no more,
> My ever-grateful heart, O Lord,
> Thy mercy shall adore.
> Through all eternity to Thee
> A joyful song I’ll raise;
> For, oh! eternity’s too short
> To utter all Thy praise.”
> Addison.

Discussing the question, whether the planets are inhabited, he states his opinion that it would be absurd to deny this as to all or even most of them. But in the wealth of nature, in which worlds and systems are to the whole creation only sundust, there may well be waste and uninhabited places as there are uninhabited waste on our own earth. Perhaps, indeed, he adds, some of the planets are not yet brought into a state fit for habitation; it may take thousands of years to bring the matter of a great planet into a steady condition. Jupiter appears to be in this transition state. One planet may come to its perfection thousands of years later than another. We may be sure that most of the planets are inhabited, and those that are not will be so in due time. He imagines that the further the planets are from the sun the more the inhabitants excel in liveliness and distinctness of thought. Indulging in fancy, he asks, Does sin exist in those worlds? and suggests that perhaps the beings in the inferior planets may be too low to be responsible; those in the superior planets too wise and too elevated to fall into sin, with the exception, perhaps, of Mars. Perhaps, he adds, some of these bodies may be preparing for our future habitation: who knows whether the satellites which revolve round Jupiter are destined one day to illumine us? “No one, however, will base his hopes of the future on such uncertain fancies. When corruption has claimed its part in human nature, then shall the immortal spirit swiftly soar above all that is finite, and continue its existence in a new relation to the whole of nature arising from its nearer relation to the Supreme Being. When we gaze on the starry heavens with our mind filled with such thoughts as have here been expressed, while all nature is at rest and our senses also in repose, the hidden faculties of the immortal soul speak in a language unutterable, and give us conceptions which can be felt but not described. If there are on this planet thinking beings so base as to bind themselves to the service of corruption, in spite of all that draws them away from it, how unhappy is this globe to produce such miserable creatures! but how happy, on the other hand, that under conditions worthy of all acceptation a way is opened to them to attain to a happiness and a dignity infinitely beyond all the advantages which the most favourable arrangements of nature can reach

in all the bodies of the universe!”

The reader who is interested in Kant himself will readily pardon this long notice of a work to which he attached some importance. At its first publication it was dedicated to the king, Frederick the Great, and the theory developed in it is frequently referred to by Kant in his subsequent writings, for he never ceased to take an interest in these subjects. So late as 1785 he wrote an essay on the volcanoes in the moon, with reference to an observation of Herschel. In this Paper he suggests a mode of accounting for the great heat of the sun, and (originally) of the planets. His suggestion is based on the discovery of Crawford, that heat is developed by condensation. On the hypothesis then that the sun and planets were formed by the condensation of matter originally diffused through the whole space, this heat would be a direct consequence of the condensation. Still later, in 1794, writing on the influence of the moon on the weather, he throws out the suggestion that the moon’s centre of gravity may (for reasons which he gives) lie beyond its centre of figure: a consequence of which would be that any air and water which might be upon its surface would be collected at the side remote from us.

In another instance, both Kant and Laplace might have had reason to say, “Pereant qui ante nos nostra dixerunt.” In 1756 Kant wrote a short Paper on the theory of the winds, in which, for the first time, as he believed, he gave the true account of the trade winds and monsoons. Halley had shown that the effect of the sun in heating the atmosphere at the equator would be to cause an indraught towards the equator from north and south. This indraught, according to him, naturally followed the daily course of the sun, and hence the easting. Kant showed that this theory was untenable. In fact, the wind would tend rather to meet the sun, the region to the west being the cooler. Nor could a wind from such a cause extend with nearly equal force all round the earth. Kant showed further, that owing to the difference in the velocity of rotation between the parts near the equator and those near the poles, all winds that move from the poles towards the equator tend to become more and more easterly, and those that move from the equator towards the poles become more and more westerly. Hence, in the northern hemisphere every north wind tends to become a north-east, and every south wind a south-west wind. In the southern hemisphere, on the contrary, south winds tend to become south-east, and north winds north-west. He follows out in some detail the general principles of this circulation of the atmosphere. We can thus explain, for instance, the monsoons of the Indian Ocean, &c., which blow from April to September from the south-west; for when the sun is north of the equator the wind blows from the equator towards these parts, and therefore takes a south-westerly direction. Again, the current from the poles towards the equator is balanced by a counter current, the heated air in the upper strata at the equator overflowing as it were towards the poles. When this descends, or overcomes the weaker motion of the lower strata, it becomes in the northern hemisphere a westerly wind, such as prevail between the 28th and 40th degrees of latitude. Kant subsequently introduced this theory into his course of lectures on Physical Geography, which was very numerously attended. Laplace propounded the same theory forty years later.

In 1763, Kant published his Essay On the only possible Demonstrative Proof of the Existence of God. The proof developed in this Essay is founded on the principle that every possibility of existence presupposes an actually existing thing on which it depends. This he characterizes as a more thoroughly à priori argument than any other that has been proposed, since it does not assume any actual fact of existence. I need not explain how he develops step by step the attributes of Unity, Intelligence, &c. At a later period he himself abandoned this line of argument. However, the greater part of the Essay is occupied with remarks on design in the constitution of nature, and with an exposition of the theory developed in the above-mentioned treatise on the structure of the heavens. We may, he observes, argue from design, either as exhibited in a contingent arrangement, for example, in the body of an animal or in a plant; or we may argue from the necessary results of the constitution of matter, the laws of motion, &c. The latter method has the great advantage of presenting the First Cause not merely as an architect, but as a

creator. From this point of view he instances first the simplicity and harmony resulting from the geometrical conditions of space, e. g. that if we seek all the paths which a falling body would traverse either to or from the same point in the same time, they are found to be chords of the same circle. Again, he takes the manifold and harmonious benefits resulting by necessary laws from the mere fact of the existence of an atmosphere. There may be many reasons for its existence: if we suppose its primary purpose to be that it should serve for respiration, we find that its existence leads to other important beneficial results. It makes clouds possible which intercept excessive heat, prevents too rapid cooling and drying, and keeps the land supplied with the necessary moisture from the great reservoir of the sea. By causing twilight it prevents the strain on the eyes which would be caused by the sudden change from day to night. Its existence prevents rain from dropping with too great force, and its pressure makes sucking possible. If it occurs to anyone to say — Oh, these are all the necessary results of the nature of matter, &c., he answers: Yes; it is just this that shows that they proceed from a wise Creator. He treats of the laws of motion from the same point of view, and then takes occasion to show how the laws of the planetary motions result from the simplest laws of matter, attraction, and repulsion.

In conclusion, he remarks that while it is of the greatest consequence to be convinced of the existence of God, it is by no means necessary to have a demonstration of it, and those who cannot grasp the demonstrative proof are advised to hold fast by the more easily apprehended proof from design. Hardly, indeed, he observes, would anyone stake his whole happiness on the correctness of a metaphysical proof, especially if it were opposed to the convictions of sense. The argument from design is more striking and vivid, as well as easy to the common understanding, and more natural than any other. It also gives an idea of the wisdom and providence, &c., of God, which comes home and has the greatest effect in producing awe and humility; and it is in fine more practical than any other, even in the view of a philosopher. It does not, indeed, give a definite abstract idea of Divinity, nor does it claim mathematical certainty; but so many proofs, each of great force, take possession of the soul, and the speculation may calmly follow since conviction has preceded — a conviction far above the force of any subtile objections.

In the same year in which Kant published his Theory of the Heavens, he issued his first metaphysical treatise, Principiorum Primorum Cognitionis Metaphysicœ Nova Dilucidatio, and publicly defended it as an exercise prior to his obtaining permission to deliver lectures in the University as a “Privat-docent.” He forthwith commenced lecturing on mathematics and physics; to these subjects he afterwards added lectures on philosophy, natural theology, physical geography, anthropology, and fortification. He had already so great a reputation, that at his first lecture the room (in his own house) was filled literally to overflowing, the students crowding even on the stairs. His lectures are thus described by the celebrated Herder, who attended them in the years 1762-1764; “I have had the good fortune to know a philosopher who was my teacher; he had the happy sprightliness of a youth, and this I believe he retains even in old age. His open, thoughtful brow was the seat of unruffled calmness and joy; discourse full of thought flowed from his lips; jest and wit and humour were at his command, and his lecture was the most entertaining conversation. With the same genius with which he criticised Leibnitz, Wolf, Crusius, Hume, and expounded the laws of Newton and Kepler, he would also take up the writings of Rousseau, or any recent discovery in nature, give his estimate of them, and come back again to the knowledge of nature and to the moral worth of man. Natural history, natural philosophy, the history of nations and human nature, mathematics, and experience — these were the sources from which he enlivened his lecture and his conversation. Nothing worth knowing was indifferent to him; no party, no sect, no desire of fame or profit had the smallest charm for him compared with the advancement and elucidation of the truth. He encouraged and urged to independent thought, and was far from wishing to dominate. This man, whom I name with the greatest gratitude and reverence, is Immanuel Kant; his image stands pleasantly before me.” His lectures attracted many hearers of mature age, and visitors to Königsberg even prolonged their stay for the purpose of attending them. At the same time he continued to act as tutor to young men specially

entrusted to his care, who lived with him.

He had to wait fifteen years in the position of “Privat-docent” before obtaining a professorship. He had, indeed, been offered a professorship by the Government before this, but it was almost the only chair which he felt he could not worthily fill — the Chair of Poetry. This involved not only the censorship of new poems, but the composition of poems for academic celebrations, and Kant declined the office. In the following year he was appointed sub-librarian at the modest salary of 62 thalers. This was his first official appointment (œt. 42). Four years later he was nominated to the professorship of Logic and Metaphysics , with an income (from all sources) of 400 thalers. This was ultimately increased to 620. This was of course exclusive of fees from students. He inaugurated his professorship by defending his essay, De mundi sensibilis atque intelligibilis forma et principiis. In this he distinguishes the sensible apprehension of phenomena from the Concept of the Understanding, just as in the Critique of Pure Reason. He shows, precisely as in the latter work, that space and time are forms of the intuitions of sense.

As professor, he continued to lecture in the same wide circle of subjects as before. The lectures on physical geography and anthropology were especially popular. He was fond of studying nature, but especially human nature in all its phases, and took great pleasure in reading books of travel, although he never travelled. Having an excellent memory and a lively power of imagination, he could distinctly picture to himself, even in minute detail, the several objects described. On one occasion he described Westminster Bridge, its form, dimensions, &c., with such detail and distinctness, that an Englishman who was present thought he was an architect, and had spent some years in London. At another time he spoke of Italy as if he had known it from long personal acquaintance. So popular were his lectures, that we find Von Zedlitz, the Prussian Minister, writing from Berlin to say that he is reading with pleasure an imperfect manuscript report of the lectures on Physical Geography, and requesting Kant to favour him with a correct copy. These lectures were published in 1802. The lectures on Anthropology had appeared in 1798. Both works are written in an extremely interesting and popular style, and those on Anthropology are full of entertaining remarks and illustrative anecdotes, not without humour. Thus speaking of the emotions that nature employs for the promotion of health, which are chiefly laughing and weeping, he remarks that anger also conduces to health, if one can indulge in a good scolding without fear of opposition; and in fact many a housewife gets no hearty exercise, except in scolding her children and servants, and provided these take it patiently, a pleasant feeling of fatigue spreads itself through the organism. This sort of exercise, however, he adds, is not without danger, as the objects of the scolding may possibly resist. Even when lecturing on Metaphysics, Kant is said to have been lucid and interesting. When the difficulty of his writings was complained of, he used to say that he wrote for thinkers by profession, and with these technical expressions had the advantage of brevity. Besides, said he, it flatters the vanity of the reader to find perplexities and obscurities here and there, which he can solve by his own acuteness. But in his lectures he endeavoured to be clear and intelligible. He sought, as he expressed it, to teach “not philosophy, but to philosophize.” In one of his letters he states that he was unceasingly observant of phenomena and their laws, even in common life, so that, from first to last, his hearers should not have to listen to a dry exposition, but be interested by being led to compare his remarks with their own observations.

It was his custom to keep his eyes fixed on some particular student sitting near him, perhaps in order to judge from the hearer’s countenance whether he was making himself understood. So Arago, in his popular lectures, used to select for the same purpose the most stupid-looking person in the audience, continuing his explanations until the person “fixed” showed signs of intelligence. With Kant, however, the consequences were disastrous if the student happened to have any peculiarity or defect, either in person or dress. One day the student thus selected happened to have lost a button from his coat. Kant’s glance recurred to the vacant spot, and during the whole lecture his thoughts were distracted, and even confused, in a manner inexplicable to those who were not in the secret.

He did not like to see his hearers taking notes; but would say, “Put up your pencils, gentlemen,” and would not begin until they had done so. The reason of this was that he thought such attempts at reporting interfered with their attention to the matter of the lecture, by fixing it on the words. Some of his hearers took full notes, nevertheless.

In 1772 he formed the design of writing a Critical Examination of Pure Reason, Theoretical and Practical, the former part of which he hoped to complete in three months. The months grew to years. Six years later he writes that he expects it to appear “this summer,” and that it would not be a large volume. It did not see the light, however, until 1781, nine years after he had announced that it would be ready in three months. When this master-work was produced, Kant was fifty-seven years of age. He states himself that it was Hume that roused him from his dogmatic slumber, and compelled him to seek a solid barrier against scepticism.

It is stated on Kant’s own authority that he did not commit to writing a single sentence in this work, on which he had not first asked the judgment of his friend Green. A man to whom Kant showed such deference deserves a brief notice. He was an English merchant, and during the American War of Independence happened to be present when Kant, who sympathized with the Americans, denounced the conduct of England in strong terms. Green sprang up in a rage, declared that Kant’s words were a personal insult to him as an Englishman, and demanded satisfaction. Kant replied so calmly and persuasively that Green shook hands with him, and they became fast friends, and continued so until the death of Green in 1784, a loss which Kant deeply felt.

Of the Critique of Pure Reason I need not here speak. Suffice it to say, that as Locke’s attempt to keep the mind from “going beyond its tether” was followed at no long interval by the Idealism of Berkeley, and the annihilating Scepticism of Hume, so Kant’s analogous attempt led in a still shorter space to the most complete idealism and transcendentalism. Indeed his reviewers not unnaturally mistook him for an idealist, and Hamann called him the Prussian Hume. The work excited a lively controversy in the philosophical world, but most of the publications to which it gave rise have been long forgotten. Kant’s fame, however, rose to the highest, and Königsberg became a shrine to which students and tourists made pilgrimages.

The Critique of Pure Reason was to be followed by the Metaphysical Elements of Natural Philosophy and of Moral Philosophy. The former appeared in 1786, under the title Metaphysische Anfangsgründe der Naturwissenschaft. The views respecting motion with which this treatise commences had, however, already been published as a programme of lectures in 1758. Motion is only relative to the surrounding space. While I sit with a ball on the table before me in the cabin of a ship moored in a river, I say that the ball is at rest; I look out and see that the ship has been unmoored, and is drifting westward; the ball then is moving. But I reflect that the earth is rotating with greater velocity eastward; the ball then is moving eastward. Nay; for the earth in its orbit is moving westward with still higher speed. The orbit itself is moving, I cannot tell how rapidly, nor do I know in what direction. In any case then it is the same thing whether I regard a point as moving in its space, or regard the space as moving and the point as at rest. Hence the law of the composition of motions results directly; for if A be a point having a motion of one foot per second westward, and two feet per second southward, I can regard it as having only the southward motion, while the space in which it is, is moving one foot per second eastward. At the end, therefore, of one second, the point will be found two feet to the south; and as its space in moving east has left it one foot behind, it will also be one foot west, relatively to its surrounding space. This is the same as if it had moved in the diagonal of the parallelogram. Kant claimed as an advantage of this proof, that it represented the resultant motion, not as an effect of the two motions, but as actually including them. It is incomparably simpler and more philosophical than the proof given by D’Alembert, and other contemporary mathematicians. When we treat of collision of bodies, this mode of viewing the matter becomes absolutely indispensable. If the body A is approaching the body B (equal to it) with a velocity of

two degrees, we regard A as moving with a speed of one degree, while B and its space move one degree in the opposite direction. The motions being equal and opposite, the result of their contact is mutual rest; but, as the space is moving, this rest is equivalent to a motion of the two bodies in contact, relative to the surrounding space, and in amount one degree. If the bodies are unequal and have unequal velocities, we have only to divide the velocities in the inverse proportion of the masses, and assign to the space the motion which we take from one to add to the other, and the result will again be mutual rest, which is equivalent to a motion of the bodies in contact, with a velocity equal and opposite to what we have assigned to the space. We can in this way banish altogether the notion of vis inertiœ.

Matter could not exist unless there were both a repulsive force and an attractive force. If attraction only existed, matter would be condensed into a point; if repulsion only, it would be dispersed infinitely. The relative incompressibility of matter is nothing but the repulsive force emanating from points, which increases as the distance diminishes (perhaps inversely as the cube), and would therefore require an infinite pressure to overcome it altogether. Physical contact is the immediate action and reaction of incompressibility. The action of matter on matter without contact is what is called actio in distans, and the attraction of gravitation is of this kind. Both attraction and repulsion being elementary forces, are inexplicable, but the force of attraction is not a whit more incomprehensible than the original repulsive force. Incompressibility appears more comprehensible, solely because it is immediately presented to the senses, whereas attraction is only inferred. It seems at first sight a contradiction to say that a body can act where it is not; but in fact we might rather say, that everything in space acts where it is not; for to act where it is, it should occupy the very same space as the thing acted on. To say that there can be no action without physical contact is as much as to say that matter can act only by the force of incompressibility: in other words, that repulsive forces are either the only forces of matter or the conditions of all its action, which is a groundless assertion. The ground of the mistake is a confusion between mathematical contact and physical contact. That bodies attract one another without contact, means that they approach one another according to a certain law, without any force of repulsion being required as a condition; and this is just as conceivable as that they should separate from one another without an attractive force being supposed as a condition.

Kant, however, thought it conceivable that in the case of chemical solution there might be complete interpenetration or “intussusception.” On this view of matter we may, he remarks, regard matter as infinitely divisible.

The Fundamental Principles of the Metaphysic of Morals had appeared the year before the last-mentioned work, and was followed in 1788 by the Critical Examination of Practical Reason. Both these are translated in the present volume. The few remarks I have to offer on them will be found at the end of the Memoir. In 1790 was published the Critical Examination of the Faculty of Judgment.

The essay on the corruption of human nature, which forms the third part of this volume, appeared in 1792 in a Berlin magazine. Four years before this an edict had been issued, limiting the freedom of the Press, and appointing special censors, whose business was to examine as to the orthodoxy, not only of books, but of professors, lecturers, and theological candidates. The magazine in question was printed in Jena; but in order to avoid any appearance of underhand dealing, Kant expressly desired that his essay should be submitted to the Berlin licensing authority, who gave his imprimatur, on the ground that only deep thinkers read Kant’s works. The second part of the work on the Theory of Religion was referred to the theological censor, who refused his imprimatur. Kant accordingly submitted his essay to the censorship of the theological faculty of Königsberg, and this unanimously sanctioned the publication, which reached a second edition in the following year. The Berlin censors were naturally annoyed at this way of escaping their decision, and the severe remarks in the preface did not tend to conciliate them. A few months afterwards Kant received an order from the King (Frederick William II.), forbidding him to teach or write anything further in this manner. Kant did not mention the order even to his intimate friends.

A slip of paper, found after his death, contained this reflection: “To deny one’s inner conviction is mean, but in such a case as this silence is the duty of a subject; and, although a man must say only what is true, it is not always a duty to say all the truth publicly.” He therefore, in his reply to the King, declared that to avoid all suspicion, he, “as his Majesty’s most loyal subject,” solemnly engaged to refrain from writing or lecturing on religion, natural or revealed. The words, “as your Majesty’s most loyal subject,” were inserted with the intention of limiting his engagement to the life of the King, and on the death of Frederick William in 1797, Kant regarded himself as free, and published his Contest of the Faculties (i. e. of the Academical Faculties).

In 1797 Kant ceased to lecture publicly. In the same year he published his Metaphysical Elements of Morals, which treats of the several virtues and vices in detail, and Metaphysical Elements of Law. After the publication of these, he seems to have been regarded as a counsellor to be consulted in all difficulties, and an authority in all questions of conscience. The pains he took to give real assistance in such cases, both by his own reflection, and by inquiring from his colleagues, are attested by his written and often corrected memoranda. As an example may be mentioned the question whether inoculation was morally allowable or not. This question was addressed to him at the same time by a Professor of Medicine in Halle, and by a young nobleman who was going to be married, and whose bride wished to be inoculated. Kant’s reply is not known, although some memoranda for it exist.

After this time he began to feel the burden of age, and his powers, mental and bodily, gradually failed. He was quite aware of his condition, and resigned. “Gentlemen,” said he one day, “I do not fear to die. I assure you, as in the presence of God, that if on this very night, suddenly the summons to death were to reach me, I should bear it with calmness, should raise my hands to heaven, and say, ‘Blessed be God!’ Were it indeed possible that such a whisper as this could reach my ear— ‘Fourscore years thou hast lived, in which time thou hast inflicted much evil upon thy fellow-men,’ the case would be otherwise.” This was spoken, says Wasianski, in a tone of earnest sincerity. Two days after his seventy-ninth birthday he wrote in his memoranda: “According to the Bible our life lasts seventy years, and if very long, fourscore years, and though it was pleasant, it has been labour and sorrow.” Up to this time he was able to read the smallest print without spectacles, although he had lost the sight of one eye nearly twenty years before. But soon after he had written this memorandum his sight also failed, and he died in February, 1804, in his eightieth year. His body was so dried up that the physicians said they had hardly ever seen so wasted a body. Indeed he had himself said jestingly some years before, that he thought he had reached the minimum of muscular substance.

Kant was of weak frame, and still weaker muscular power; he was barely five feet in height. His chest was flat, almost concave, the right shoulder slightly crooked, his complexion fresh, his forehead high, square, and broad, while his piercing blue eyes made so lively an impression that it was long remembered by some of his pupils. Even after he had lost the sight of one eye, the defect was not visible to a stranger. In consequence of his contracted chest he suffered from a feeling of oppression, which early in life caused a tendency to hypochondria, to such an extent as even to make him feel weary of life. This, however, he overcame by force of thought. When engaged on the Kritik, in 1771, he speaks of his health being seriously impaired, and some years later he says that it is unceasingly broken; yet by dint of careful attention and great regularity he was able, without medical aid, to maintain such good health on the whole, that at a later period he used to say to himself on going to bed, “Is it possible to conceive any human being enjoying better health than I do?” His maxim for preserving health was, sustine et abstine. His practice illustrated this. The two indulgences of which he was found were tobacco and coffee. But of the former he limited himself to a single pipe in the morning, whilst he altogether abstained from the latter until far advanced in life, thinking it injurious to health. At the age of seventy he wrote an essay, On the Power of the Mind to Master the Feeling of Illness by Force of Resolution. The essay was originally addressed to Hufeland, the celebrated author of the treatise on the Art of Prolonging Life, and the principles contained

in it are exemplified from Kant's own experience. He attached great importance to the habit of breathing through the nostrils instead of through the mouth, and asserted that he had by this means overcome a tendency to cough and cold in the head. There is more truth in this than is perhaps generally thought. Kant, however, is said to have regarded it as of so much importance that he did not like to have a companion in his daily walk, lest he should have to open his mouth. The true reason of this preference (in later life only) for solitary walks was, beyond doubt, that which is mentioned in this essay, that it is undesirable to exercise the limbs and the brain (or the brain and the stomach) at the same time.

His punctilious attention to health is amusingly illustrated by the artifice he used for suspending his stockings. Thinking that garters injuriously impeded the circulation, he had a couple of bands attached to each stocking, and passing through a hole in the pocket of his breeches. Inside the pocket they were connected with a spring enclosed in a box, and this spring regulated the tension. That he might not be without some exercise in his study, he habitually left his handkerchief at the other side of the room, so that now and then he should have to get up and walk to it. On the same principle his hours of sleep, &c., were adhered to with the utmost regularity. He went to bed punctually at ten, and rose punctually at five. His servant had orders not to let him sleep longer on any account; and on being asked once by Kant, in presence of guests, testified that for thirty years his master had never once indulged beyond the appointed hour. On rising he took a cup (indefinite cups) of tea, but no solid food. The early hours were devoted to preparation for his lectures, which in his earlier years occupied four or five hours, but subsequently only two. At seven o'clock precisely, or eight, as the case might be, he entered his lecture-room. Lectures ended, at nine or ten, he returned to his study, and applied himself to preparing his books for the press. He worked thus without interruption until one o'clock, the hour for dinner. This was his only meal, and he liked to have pleasant company, and to prolong the meal (ducere cœnam) with lively, sometimes brilliant conversation, for three or four hours. Kant had no Boswell, and nothing is preserved of these conversations, in which he is said to have often thrown out profound and suggestive remarks with extraordinary richness. Until his sixty-third year, not having a house of his own, he dined at a public restaurant, which, however, he occasionally found it necessary to change, in consequence of persons coming for the purpose of discussing philosophical questions with him. He considered that meal-time ought to be a time of perfect mental relaxation, and was not disposed to turn the dinner table into a lecture pulpit. His afternoons were, however, often spent at the houses of his friends, where he enjoyed meeting foreign merchants, sea captains, and travelled scholars, from whom he might learn much about foreign nations and countries. His instructive and entertaining conversation, flavoured with mild satiric humour, made him a welcome guest, and even with the children he was a favourite. After he became famous he declined invitations if he thought he was to be made a lion of.

When he had a house of his own, he had every day a few friends to dine with him. He liked to have a mixed company — merchants, professional men, and especially a few younger men. After dinner followed regularly his daily walk for an hour or more, along what was from him named "The Philosopher's Walk," until he was driven from it by the number of beggars whom his habit of almsgiving had attracted there. Even the severest weather did not interfere with this daily walk, in which in his earlier years he usually had companions; after sixty years of age he walked alone, for the reason already mentioned.

He had on one occasion a narrow escape from assassination. A lunatic, who had made up his mind to kill some one, waylaid Kant for the purpose, and followed him for three miles, but on reflection, thinking it a pity to kill an old professor who must have so many sins on his head, the unfortunate madman killed a child instead.

The evening was devoted to lighter reading and meditation. He would read over and over again such books as Don Quixote, Hudibras, Swift's Tale of a Tub, Juvenal, and Horace. In his later years he was

especially fond of reading books on physical science, and books of travel. Purely speculative works he cared little for, but liked to read Locke, Hutcheson, Pope, Hume, Montaigne, Rousseau.

How unwilling Kant was to depart from his regular routine appears from a characteristic anecdote. One day as he was returning from his walk, a nobleman who was driving came up with him, and politely invited him to take a drive with him as the evening was fine. Kant yielded to the first impulse of politeness, and consented. The Count, after driving over some of his property near the city, proposed to visit a friend some miles from the town, and Kant of course could not refuse. At last Kant was set down at his own door near ten o'clock, full of vexation at this violation of his regular habits. He thereupon made it a fixed rule never to get into a carriage that he had not hired himself, so that he could manage it as he pleased. When once he had made such a resolution, he was satisfied that he could not be taken by surprise, and nothing would make him depart from it.

So his life passed, says one of his biographers, like the most regular of regular verbs.

Punctual, however, as he was, his punctuality did not come up to the standard of his friend Green. One evening Kant had promised that he would accompany Green in a drive the next morning at eight. At a quarter before eight Green was walking up and down his room, watch in hand; at fifty minutes past seven he put on his coat, at fifty-five he took his stick, and at the first stroke of eight entered his carriage and drove off; and although he met Kant, who was a couple of minutes late, he would not stop for him, because this was against the agreement and against his rule. This gentleman, for whom Kant had a great esteem, served as the model for the description of the English character in the Anthropologie. Kant's savings were invested with this Mr. Green, and allowed to accumulate at 6 per cent. interest.

Kant is said to have been on two occasions on the point of marrying, or at least of making a proposal, but he took so long to calculate his incomings and outgoings with exactness, in order to see whether he could afford it, that the lady in the first case was married, and in the second had left Königsberg before he had made up his mind. When he was seventy years of age, an officious friend actually printed a dialogue on marriage, with a view to persuade the philosopher to marry. Kant reimbursed him for the expense of printing, but at that age, not unnaturally, thought the advice rather too late. How sensible he was to the charms of female society appears from the Essay On the Sublime and Beautiful, ff, where he discusses the difference between the sublime and beautiful in the natural relations of the sexes.

Kant's personal character is described, by those who knew him best, as truly childlike. He was kind-hearted and actively benevolent; of rare candour in estimating the abilities of other men, with high respect for every thing that was noble or deserving; always disposed to recognise the good rather than the bad in men's characters. He was always ready with counsel and assistance for the young. His modesty towards scholars of great fame almost degenerated into shyness.

As may be supposed from the regularity of his habits, he never allowed himself to run into debt. When a student at the University, with very narrow means, his only coat had once become so shabby, that some friends subscribed a sum of money, which was offered to him in the most delicate manner possible for the purchase of a new one. Kant, however, preferred to retain his shabby coat rather than incur debt or lose his independence. In his old age he boasted that he had never owed any man a penny, so that when a knock came to his door he was never afraid to say, "Come in." When his means had increased (chiefly through the profits on his writings), he assisted such of his relatives as were in want in the most liberal manner. On the death of his brother, he assigned to the widow a pension of 200 thalers. Many poor persons also received a weekly allowance from him, and Wasianski, who in later years managed Kant's affairs for him, states that his charitable expenses amounted to about 400 thalers annually.

His kindness was shown in his last will, in which he left an annual sum to a servant who had treated him shamefully, but who had served him (not indeed faithfully) for thirty years. Kant had dismissed him two years before, with a pension, on condition of his never setting foot inside the house again. After some other small legacies, the residue was left to the children of his brother and sisters. The whole amount was

under four thousand pounds.

The principal questions on the Theory of Morals may, with sufficient accuracy for the present purpose, be said to be these: First, the purely speculative question, What is the essential nature of moral rightness? Secondly, the practical questions, What is to man the criterion of his duty? and what is the foundation of obligation? The additional question, By what faculty do we discern right and wrong? is properly a psychological one.

If we had only to do with a being in whom Reason was irresistibly dominant, we should not need to raise any further questions; but having to treat of a being with affections and appetites distinct from Reason, and not of themselves dependent on it, we must answer the further question: How is Reason to maintain its authority in spite of these resisting forces? i.e. What is the Motive? Lastly, since we have to deal with a corrupt creature, a new question arises: How is such a creature to be reformed?

Now how does Kant deal with these questions? His categorical imperative — Act as if the maxim of thy action were to become by thy will a universal law of Nature — gives perhaps not the essence of virtue, but a property of it, which may indeed serve as a subjective criterion. That this criterion is formal only, and therefore empty, is hardly of itself a valid objection. The test of valid reasoning, the syllogism, is equally empty. The categorical imperative is, however, rather negative than positive, and it is far from being sufficiently clear as a test of the morality of actions. This appears even in the examples which Kant himself gives. For example, treating of Compassion, he supposes that if a man refuses aid to the distressed, it is out of selfishness, and then shows that if selfishness was the ruling principle, it would contradict itself. But why assume a motive for refusing help? What we want is a motive for giving help. There is nothing contradictory in willing that none should help others. So in the case of gratitude, there is no contradiction in willing that those who receive benefits should entertain no peculiar feeling toward their benefactor. It is true we should look for it ourselves, but this implies that such a feeling is natural to man, and that we approve it. Again, put the case of self-sacrifice of a man giving his life to save his friend; it would seem as easy on Kant's principle to prove this a vice as a virtue.

Kant has in fact treated human nature too abstractly. In eliminating the "matter" he has eliminated that on which frequently the whole question turns. Indeed, in some of the instances he himself chooses, he elicits a contradiction only by bringing in a teleological consideration; e. g. as to suicide, he brings in the end for which self-love was given. The will to destroy one's own life is not contradictory of the will to sustain it, unless the circumstances be supposed the same.

These remarks, however, only show that the formula is not a mechanical rule of conduct; they do not disprove its scientific value. In fact precisely similar objections have been alleged against the logical analysis of speculative reasoning, that it leaves untouched what in practice is the most difficult part of the problem. If all poisonous substances could be brought under a single chemical formula, the generalization would be of value both theoretically and practically, although its application to particular cases might be difficult and uncertain. Kant never attempted "to deduce a complete code of duty from a purely formal principle;" he expressly states that this is only a negative principle, and that the matter of practical maxims is to be derived from a different source (cf. the present work,). Nor is it to be supposed that Kant was not fully aware of the difficulty of applying his formula to the complex circumstances of actual life. In his Metaphysic of Morals he states a great number of questions of casuistry, which he leaves undecided, as puzzles or exercises to the reader. And indeed similar difficulties might be raised, from a speculative point of view, respecting the rule, "Whatsoever ye would that men should do unto you, even so do unto them" — a rule of which we may nevertheless say that in practice it probably never misled anyone, for everyone sees that the essence of it is the elimination of self-partiality and inward dishonesty. The scientific basis of it is stated by Clarke in language nearly equivalent to Kant's. The reason of it, says the former, is the same as that which forces us in speculation to affirm that if one line or number be equal to

another, that other is equal to it. “Whatever relation or proportion one man in any case bears to another, the same that other, when put in like circumstances, bears to him. Whatever I judge reasonable or unreasonable for another to do for me, that, by the same judgment, I declare reasonable or unreasonable that I in the like case should do for him.” Kant’s rule is a generalization of this, so as to include duties to ourselves as well as to others. As such it has a real scientific value. Practically, its value consists, like that of the golden rule, in the elimination of inward dishonesty.

Mr. Mill’s criticism on Kant’s formula is, that when we speak of a maxim being “fit” to be a universal law, it is obvious that some test of fitness is required, and that Kant, in fact, tests the maxims by their consequences; as if the whole gist of Kant’s argument were not that the only test of this fitness is logical possibility; or as if this were not the one thing expressed in his formula. As to testing maxims by consequences, he does so in the same sense in which Euclid in indirect demonstrations tests a hypothesis by its consequences, and in no other, i. e. by the logical consequences, not the practical. Take the case of a promise. In Kant’s view, the argument against the law permitting unfaithfulness is not that it would be attended with consequences injurious to society, but that it would annihilate all promises (the present included), and therefore annihilate itself. Of inconvenience to society not a word is said or implied. Hence Kant’s objection rests wholly on the absolute universality of the supposed law, whereas the Utilitarian objection from practical consequences would be applicable in a proportionate degree to a law not supposed universal. Hence, also, Kant’s test would hold even if the present promise were never to be followed by another; nay, it would be of equal force even though it should be proved that it would be better for society that there should be no verbal promises.

It has been said that in applying Kant’s formula we must qualify it by introducing the consideration of the probability that our example or rule will be generally followed; and the instance of celibacy has been suggested, which, it is said, would be necessarily condemned as a crime if tested by Kant’s rule, pure and simple; for if all men practised celibacy there would be an end of the race, and, on the “greatest happiness” principle, to effect this would be the worst of crimes. Now, if a qualification were required, or admissible, Kant’s formula would be deprived of all scientific significance, and its application made dependent on private and uncertain opinion. As to the example of celibacy, Kant has himself indicated how he would dispose of it by the way in which he treats suicide. He does not show its unlawfulness by alleging that if everyone committed suicide the human race would come to an end, but by exposing the inconsistency in the principle of action which would lead to suicide. In every case it is the mental principle which is to be tested, not the mere external action. Bearing this in mind, we shall find no difficulty in the case of celibacy. It may proceed from motives which there would be no absurdity in supposing universal, because the circumstances which give them this particular direction could only be exceptional. But, suppose celibacy recommended on grounds which are in their own nature universal, e.g. as a condition of moral perfection, then Kant’s formula would properly apply, for moral perfection is an end to be aimed at by all. One might just as well say that Kant’s rule would make all killing criminal, whereas Kant would obviously require us to take into account the motive, self-defence, or other. On the other hand, apply Mr. Sidgwick’s qualification, and what would result? Why, that we might innocently kill, provided the action were not likely to be generally imitated! If occasional celibacy is justified only because there exists a natural passion which is sure to be usually powerful enough to prevent the example being followed, then we may equally justify occasional violence or murder on the ground that fear or benevolence will naturally prevent the action from being extensively imitated.

Kant’s view of the source of obligation in the Autonomy of the will appears to require qualification if we would avoid a contradiction. A law must be above the nature to which it is a law, and which is subject to it. A being which gave itself the moral law, and whose freedom, therefore, is Autonomy, would not be conscious of obligation or duty, since the moral law would coincide with its will. Kant draws the apparently self-contradictory conclusion that we, though willing the law, yet resist it. Even if this be

granted, it would follow, not that we should feel obliged, but that either no action at all would follow, or the more powerful side would prevail. That we condemn ourselves when we have violated the law is an important fact, on which Kant very strongly insists, but which his theory fails to explain. Is it not a far simpler and truer explanation to say that this self-condemnation, this humiliation in the presence of an unbending judge, is a proof that we have not given ourselves the law; that we are subjects of a higher power? There is, indeed, a sense in which Autonomy may be truly vindicated to man. The moral law is not a mere precept imposed upon us from without, nor is it forced upon us by our sensitive nature; it is a law prescribed to us, or, more correctly speaking, revealed to us, by our own Reason. But Reason is not our own in the sense in which our appetites or sensations are our own; it is not under our own control; it bears the stamp of universality and authority. Thus it declares itself impersonal: in other words, what Reason reveals we regard as valid for all beings possessed of intelligence, equal or superior to our own. Hence, many ethical writers, both ancient and modern, have insisted as strongly as Kant that the moral law is common to man with all rational creatures. And when Kant speaks of Autonomy, this is all that his argument requires. Accordingly, he sometimes speaks of rational creatures as the subjects of Reason, which is the supreme legislator.

As regards the sanctions of the moral law, which practically to imperfect creatures furnish the motive, these consist, according to Kant, in the happiness and misery which are the natural consequences of virtue and vice, and he thinks that when they are regarded as natural consequences, the dread of the misery will have more effect than if it were thought to be an arbitrary punishment. “The view into an illimitable future of happiness or misery is sufficient to serve as a motive to the virtuous to continue steadfast in well-doing, and to arouse in the vicious the condemning voice of conscience to check his evil course.” In this Kant agrees with Cumberland. Kant’s argument for immortality is in substance that it is necessary for a continued indefinite approximation to the ideal of the moral law. But since, as he maintains, we have ourselves to blame for not having attained this ideal, what right have we to expect such an opportunity? Having missed the true moment in his argument, which led to the existence of a Supreme Lawgiver, he arrived at this fundamental truth by a roundabout way, through the conception of the summum bonum. But this introduces a quite heterogeneous notion, viz., that of happiness. Happiness belongs to a man as a sensible creature, and all that he has a right to say is, that if Practical Reason had happiness to confer, it would confer it on virtue. How much more direct and convincing is the argument suggested by Butler’s brief words: “Consciousness of a rule or guide of action, in creatures who are capable of considering it as given them by their Maker, not only raises immediately a sense of duty, but also a sense of security in following it, and of danger in deviating from it. A direction of the Author of Nature, given to creatures capable of looking upon it as such, is plainly a command from him; and a command from him necessarily includes in it at least an implicit promise in case of obedience, or threatening in case of disobedience;” and since “his method of government is to reward and punish actions, his having annexed to some actions an inseparable sense of good desert, and to others of ill, this surely amounts to declaring upon whom his punishments shall be inflicted, and his rewards bestowed.”

Kant sees no mode of reconciling morality with the law of Causality, except by his distinction of noumena and phenomena. When the law of Causality is rightly understood there is no inconsistency. For the cause which it demands is an efficient cause, and the idea of an efficient cause involves the idea of mind. It is involved in the idea of matter, that it cannot originate (this Kant himself adopts as a first principle in his Metaphysics of Natural Philosophy); whereas it is the very idea of mind with will that it does originate. When we seek the cause of motion we are satisfied when we trace it to a will. True, we may then ask for the motive; but the nature of motive and that of efficient cause are heterogeneous.

Kant’s view of Freedom, however, does not involve anything of caprice or indeterminateness. Freedom, according to him, is not independence on law which we can consciously follow, but independence on the physical relation of causality, the not being determined by physical or sensible

causes. On this view the contradiction, which to Hobbes and others seemed to exist between the conception of freedom and that of the divine foreknowledge, would have little weight. A short consideration suffices to show that there is a fallacy involved in Hobbes' argument. Suppose a being perfectly wise and good, and at the same time free, then we should only require perfect knowledge of the circumstances of a particular case in order to predict his conduct, and that infallibly. If he were not free we could not do so. And the more nearly a being approaches such perfection, the more certainly could we predict his actions. If his goodness were perfect, but his knowledge imperfect, and if we knew how far his knowledge extended, we could still predict. It would be absurd to say that this would be a contradiction.

It is worthy of notice that Cudworth's conception of liberty corresponds closely with that of Kant. "The true liberty of a man, as it speaks pure perfection, is when by the right use of the faculty of free will, together with the assistance of Divine grace, he is habitually fixed in moral good;" "but when by the abuse of that faculty of free will men come to be habitually fixed in evil and sinful inclinations, then are they, as Boëthius well expresses it, propriæ libertati captivi — made captive and brought into bondage by their own free will." It may have been suggested to both of them by St. Paul, who represents sin as slavery, righteousness as freedom.

Kant is by no means happy in his treatment of the corruption of human nature. In order to escape the difficulty of reconciling responsibility with the innate corruption on which he so strongly dwells, he has recourse (as in the case of freedom) to the distinction between man noumenon and man phenomenon. The innate evil of human nature rests on an inversion of the natural order, the legislative will being subordinated to the sensibility. But how can this be reconciled with the self-given, and therefore self-willed law which makes good a duty? It is inconceivable that the pure supersensible essence could invest the sensational nature (the objects of which have for it no reality) with a preponderance over itself. A further contradiction appears to be involved in the relation of evil to freedom; for he states that freedom is as inseparably connected with the law of Practical Reason as the physical cause with the law of nature, so that freedom without the law of Practical Reason is a causality without law, which would be absurd; and yet, on the other hand, he regards freedom as an ability from which proceeds contradiction to the moral law.

A still more insuperable difficulty meets him when he attempts to answer the question, Is reformation possible? He replies: Yes; for it is a duty. You ought, therefore you can. How the return from evil to good is possible cannot indeed be comprehended, but the original fall from good to evil is equally incomprehensible, and yet is a fact. Now, freedom which belongs to the supersensible sphere (the sphere of noumena) cannot be determined by anything in the phenomenal world; consequently, if freedom has, apart from time, given the man a determination, then no event in time can produce a change. Nay, it would be a contradiction to suppose the removal of an act in the noumenal (supersensible) world by a succeeding act. Contrary or contradictory attributes cannot be attributed to the same subject except under the condition of time. If, therefore, the intelligent being is timeless, we cannot possibly attribute to it two decisions, of which one annuls the other. He is not even consistent, for he argues that it is not possible to destroy this radical corruption by human power, but only to overcome it. Why does he not conclude here, I ought to destroy it, therefore I can? Lastly, even if this "I can" were granted, it would be only a theoretical, not a practical possibility. If the man endowed with the faculties in their true subordination, with reason supreme, has yet not had strength or purity of will to remain so, what practical possibility is there that having this subordination perverted he can restore it? There is obviously an external aid necessary here. Not that anything wholly external could effect the change, which can only be produced by something operating on man's own moral nature; but there must be a moral leverage, an external fulcrum, a πονˆ στωˆ. Such aid, such leverage are provided by the Christian religion. It has introduced a new motive, perfectly original and unique, the overpowering force of which has been proved in many crucial instances; and no more complete theoretical proof of the absolute necessity of some such revelation could

be given than is supplied by the attempts of the profoundest philosopher of modern times to dispense with it.

Kant's own position with respect to Christianity is that of a Rationalist. He accepts the whole moral and spiritual teaching of the New Testament, because he finds it in accordance with reason, and this being so, he judges that it is a matter of no practical consequence whether its introduction was supernatural or not. He did not deny that Divine aid was required to make reformation possible, but he thought that no intellectual belief or knowledge of ours could be a condition of this aid, and, therefore, that all historical questions were adiaphora. But this is to take for granted, that if God gives such aid at all, it must be in a particular way. Butler's argument from analogy is conclusive against such assumptions. And, indeed, it is certain that the moral and the positive in Christianity cannot be thus kept apart. It is to the facts that the doctrines owe their life and motive power. It is these that supply the leverage, without which the most perfect moral teaching will fall dead on the ears at least of the masses of mankind.

Besides, as Butler shows, revealed facts may be the foundation of moral duties to those to whom the revelation has come.

It is remarkable that, although Kant was fond of reading English authors, and was influenced in his moral discussions by English moralists, Butler (who had written half a century before the publication of the Kritik) was wholly unknown to him. What is more remarkable is, that Butler has remained equally unknown to German writers up to the present day. Whilst German historians of moral philosophy are careful to note the merits of even Wollaston and Ferguson, they pass over Butler's name in silence. The reason of this silence, doubtless, is to be found in the title of his work. But although foreign philosophers could not be expected to look for a treatise on moral philosophy in a book called Fifteen Sermons, how is it that attention was not called to him by the notices in Mackintosh (who is largely cited, e. g. by I. H. Fichte), which showed the high estimation in which the work was held in England? It is certainly a curious and suggestive fact that writers, professedly and learnedly treating of English moral philosophers, should be wholly ignorant of the writer who holds by far the highest rank among them, whose work is the classical work, the text-book of the Universities, and with a wider circulation, probably, than the works of all the other moralists put together.

The most striking peculiarity of Kant's moral theory is its connexion with his metaphysical system. It is in the moral law that he finds the means of establishing the existence, and to some extent the nature, of the supersensible reality. He has been charged with inconsistency in this. What he pulls down in the Critique of the Speculative Reason, he restores illogically, it is said, in that of the Practical Reason. The fact appears to be, that readers of the former work are apt to fall into two mistakes. First, they suppose that they have before them a complete system instead of a portion only; and secondly, they mistake the attitude of suspense with regard to the supersensible reality for a dogmatic negation of all knowledge thereof. When they come to the Practical works, they find the impression thus formed respecting Kant's attitude towards the supersensible contradicted. But the inconsistency is not between the two parts of Kant's system, but between his system as a whole and the impression derived from a partial view of it. That he limits his affirmation of the supersensible to its practical aspect is quite in accordance with the spirit of his philosophy. Nor is this limitation so very unlike that of the common-sense philosopher, Locke, who, in speaking of the limits of our faculties, says that men have reason to be well satisfied, since God hath given them "whatever is necessary for the conveniences of life, and the information of virtue;" adding, "How short soever their knowledge may come of an universal or perfect comprehension of whatsoever is, it yet secures their great concernments, that they have light enough to lead them to the knowledge of their Maker, and the sight of their own duties." (Essay, bk. 1. ch. i. § 5.)

IMMANUEL KANT by Robert Adamson

From 1911 Encyclopædia Britannica, Volume 15

KANT, IMMANUEL (1724-1804), German philosopher, was born at Königsberg on the 22nd of April 1724. His grandfather was an emigrant from Scotland, and the name Cant is not uncommon in the north of Scotland, whence the family is said to have come. His father was a saddler in Königsberg, then a stronghold of Pietism, to the strong influence of which Kant was subjected in his early years. In his tenth year he was entered at the Collegium Fredericianum with the definite view of studying theology. His inclination at this time was towards classics, and he was recognized, with his school-fellow, David Ruhnken, as among the most promising classical scholars of the college. His taste for the greater Latin authors, particularly Lucretius, was never lost, and he acquired at school an unusual facility in Latin composition. With Greek authors he does not appear to have been equally familiar. During his university course, which began in 1740, Kant was principally attracted towards mathematics and physics. The lectures on classics do not seem to have satisfied him, and, though he attended courses on theology, and even preached on one or two occasions, he appears finally to have given up the intention of entering the Church. The last years of his university studies were much disturbed by poverty. His father died in 1746, and for nine years he was compelled to earn his own living as a private tutor. Although he disliked the life and was not specially qualified for it — as he used to say regarding the excellent precepts of his *Pädagogik*, he was never able to apply them — yet he added to his other accomplishments a grace and polish which he displayed ever afterwards to a degree somewhat unusual in a philosopher by profession.

In 1755 Kant became tutor in the family of Count Kayserling. By the kindness of a friend named Richter, he was enabled to resume his university career, and in the autumn of that year he graduated as doctor and qualified as privatdocent. For fifteen years he continued to labour in this position, his fame as writer and lecturer steadily increasing. Though twice he failed to obtain a professorship at Königsberg, he steadily refused appointments elsewhere. The only academic preferment received by him during the lengthy probation was the post of under-librarian (1766). His lectures, at first mainly upon physics, gradually expanded until nearly all descriptions of philosophy were included under them.

In 1770 he obtained the chair of logic and metaphysics at Konigsberg, and delivered as his inaugural address the dissertation *De mundi sensibilis et intelligibilis forma et principiis*. Eleven years later appeared the *Kritik of Pure Reason*, the work towards which he had been steadily advancing, and of which all his later writings are developments. In 1783 he published the *Prolegomena*, intended as an introduction to the *Kritik*, which had been found to stand in need of some explanatory comment. A second edition of the *Kritik*, with some modifications, appeared in 1787, after which it remained unaltered.

In spite of its frequent obscurity, its novel terminology, and its declared opposition to prevailing systems, the Kantian philosophy made rapid progress in Germany. In the course of ten or twelve years from the publication of the *Kritik of Pure Reason*, it was expounded in all the leading universities, and it even penetrated into the schools of the Church of Rome. Such men as J. Schulz in Königsberg, J. G. Kiesewetter in Berlin, Jakob in Halle, Born and A. L. Heydenreich in Leipzig, K. L. Reinhold and E. Schmid in Jena, Buhle in Gottingen, Tennemann in Marburg, and Snell in Giessen, with many others, made it the basis of their philosophical teaching, while theologians like Tieftrunk, Stäudlin, and Ammon eagerly applied it to Christian doctrine and morality. Young men flocked to Königsberg as to a shrine of philosophy. The Prussian Government even undertook the expense of their support. Kant was hailed by some as a second Messiah. He was consulted as an oracle on all questions of casuistry — as, for

example, on the lawfulness of inoculation for the small-pox. This universal homage for a long time left Kant unaffected; it was only in his later years that he spoke of his system as the limit of philosophy, and resented all further progress. He still pursued his quiet round of lecturing and authorship, and contributed from time to time papers to the literary journals. Of these, among the most remarkable was his review of Herder's *Philosophy of History*, which greatly exasperated that author, and led to a violent act of retaliation some years after in his *Metakritik of Pure Reason*. Schiller at this period in vain sought to engage Kant upon his *Horen*. He remained true to the *Berlin Journal*, in which most of his criticisms appeared.

In 1792 Kant, in the full height of his reputation, was involved in a collision with the Government on the question of his religious doctrines. Naturally his philosophy had excited the declared opposition of all adherents of historical Christianity, since its plain tendency was towards a moral rationalism, and it could not be reconciled to the literal doctrines of the Lutheran Church. It would have been much better to permit his exposition of the philosophy of religion to enjoy the same literary rights as his earlier works, since Kant could not be interdicted without first silencing a multitude of theologians who were at least equally separated from positive Christianity. The Government, however, judged otherwise; and after the first part of his book, *On Religion within the Limits of Reason alone*, had appeared in the *Berlin Journal*, the publication of the remainder, which treats in a more rationalizing style of the peculiarities of Christianity, was forbidden. Kant, thus shut out from Berlin, availed himself of his local privilege, and, with the sanction of the theological faculty of his own university, published the full work in Königsberg. The Government, probably influenced as much by hatred and fear of the French Revolution, of which Kant was supposed to be a partisan, as by love of orthodoxy, resented the act; and a secret cabinet order was received by him intimating the displeasure of the king, Frederick William II., and exacting a pledge not to lecture or write at all on religious subjects in future. With this mandate Kant, after a struggle, complied, and kept his engagement till 1797, when the death of the king, according to his construction of his promise, set him free. This incident, however, produced a very unfavourable effect on his spirits. He withdrew in 1794 from society; next year he gave up all his classes but one public lecture on logic or metaphysics; and in 1797, before the removal of the interdict on his theological teaching, he ceased altogether his public labours, after an academic course of forty-two years. He previously, in the same year, finished his treatises on the *Metaphysics of Ethics*, which, with his *Anthropology*, completed in 1798, were the last considerable works that he revised with his own hand. His *Lectures on Logic*, on *Physical Geography*, on *Paedagogics*, were edited during his lifetime by his friends and pupils. By way of asserting his right to resume theological disquisition, he also issued in 1798 his *Strife of the Faculties*, in which all the strongest points of his work on religion were urged afresh, and the correspondence that had passed between himself and his censors was given to the world.

From the date of his retirement from the chair Kant declined in strength, and gave tokens of intellectual decay. His memory began to fail, and a large work at which he wrought night and day, on the connexion between physics and metaphysics, was found to be only a repetition of his already published doctrines. After 1802, finding himself attacked with a weakness in the limbs attended with frequent fits of falling, he mitigated the Spartan severity of his life, and consented to receive medical advice. A constant restlessness oppressed him; his sight gave way; his conversation became an extraordinary mixture of metaphors; and it was only at intervals that gleams of his former power broke out, especially when some old chord of association was struck in natural science or physical geography. A few days before his decease, with a great effort he thanked his medical attendant for his visits in the words, "I have not yet lost my feeling for humanity." On the 12th of February 1804 he died, having almost completed his eightieth year. His stature was small, and his appearance feeble. He was little more than five feet high; his breast was almost concave, and, like Schleiermacher, he was deformed in the right shoulder. His senses were quick and delicate; and, though of weak constitution, he escaped by strict regimen all serious illness.

His life was arranged with mechanical regularity; and, as he never married, he kept the habits of his studious youth to old age. His man-servant, who awoke him summer and winter at five o'clock, testified that he had not once failed in thirty years to respond to the call. After rising he studied for two hours, then lectured other two, and spent the rest of the forenoon, till one, at his desk. He then dined at a restaurant, which he frequently changed, to avoid the influx of strangers, who crowded to see and hear him. This was his only regular meal; and he often prolonged the conversation till late in the afternoon. He then walked out for at least an hour in all weathers, and spent the evening in lighter reading, except an hour or two devoted to the preparation of his next day's lectures, after which he retired between nine and ten to rest. In his earlier years he often spent his evenings in general society, where his knowledge and conversational talents made him the life of every party. He was especially intimate with the families of two English merchants of the name of Green and Motherby, where he found many opportunities of meeting ship-captains, and other travelled persons, and thus gratifying his passion for physical geography. This social circle included also the celebrated J. G. Hamann, the friend of Herder and Jacobi, who was thus a mediator between Kant and these philosophical adversaries.

Kant's reading was of the most extensive and miscellaneous kind. He cared comparatively little for the history of speculation, but his acquaintance with books of science, general history, travels and belles lettres was boundless. He was well versed in English literature, chiefly of the age of Queen Anne, and had read English philosophy from Locke to Hume, and the Scottish school. He was at home in Voltaire and Rousseau, but had little or no acquaintance with the French sensational philosophy. He was familiar with all German literature up to the date of his *Kritik*, but ceased to follow it in its great development by Goethe and Schiller. It was his habit to obtain books in sheets from his publishers Kanter and Nicolovius; and he read over for many years all the new works in their catalogue, in order to keep abreast of universal knowledge. He was fond of newspapers and works on politics; and this was the only kind of reading that could interrupt his studies in philosophy.

As a lecturer, Kant avoided altogether that rigid style in which his books were written. He sat behind a low desk, with a few jottings on slips of paper, or textbooks marked on the margin, before him, and delivered an extemporaneous address, opening up the subject by partial glimpses, and with many anecdotes or familiar illustrations, till a complete idea of it was presented. His voice was extremely weak, but sometimes rose into eloquence, and always commanded perfect silence. Though kind to his students, he refused to remit their fees, as this, he thought, would discourage independence. It was another principle that his chief exertions should be bestowed on the intermediate class of talent, as the geniuses would help themselves, and the dunces were beyond remedy.

Simple, honourable, truthful, kind-hearted and high-minded as Kant was in all moral respects, he was somewhat deficient in theregion of sentiment. He had little enthusiasm for the beauties of nature, and indeed never sailed out into the Baltic, or travelled more than 40 miles from Königsberg. Music he disregarded, and all poetry that was more than sententious prose. His ethics have been reproached with some justice as setting up too low an ideal for the female sex. Though faithful in a high degree to the duties of friendship, he could not bear to visit his friends in sickness, and after their death he repressed all allusion to their memory. His engrossing intellectual labours no doubt tended somewhat to harden his character; and in his zeal for rectitude of purpose he forgot the part which affection and sentiment must ever play in the human constitution.

On the 12th of February 1904, the hundredth anniversary of Kant's death, a Kantian society (*Kantgesellschaft*) was formed at Halle under the leadership of Professor H. Vaihinger to promote Kantian studies. In 1909 it had an annual membership of 191; it supports the periodical *Kantstudien* (founded 1896; see Bibliography, *ad init.*).

The Writings of Kant

No other thinker of modern times has been throughout his work so penetrated with the fundamental conceptions of physical science; no other has been able to hold with such firmness the balance between empirical and speculative ideas. Beyond all question much of the influence which the critical philosophy has exercised and continues to exercise must be ascribed to this characteristic feature in the training of its great author.

The early writings of Kant are almost without exception on questions of physical science. It was only by degrees that philosophical problems began to engage his attention, and that the main portion of his literary activity was turned towards them. The following are the most important of the works which bear directly on physical science.

1. *Gedanken von der wahren Schätzung der lebendigen Kräfte* (1747); an essay dealing with the famous dispute between the Cartesians and Leibnitzians regarding the expression for the *amount of a force*. According to the Cartesians, this quantity was directly proportional to velocity; according to their opponents, it varied with the square of the velocity. The dispute has now lost its interest, for physicists have learned to distinguish accurately the two quantities which are vaguely included under the expression amount of force, and consequently have been able to show in what each party was correct and in what it was in error. Kant's essay, with some fallacious explanations and divisions, criticizes acutely the arguments of the Leibnitzians, and concludes with an attempt to show that both modes of expression are correct when correctly limited and interpreted.

2. *Whether the Earth in its Revolution has experienced some Change since the Earliest Times* (1754; ed. and trans., W. Hastie, 1900, *Kant's Cosmogony*; cf. Lord Kelvin in *The Age of the Earth*, 1897,). In this brief essay Kant throws out a notion which has since been carried out, in ignorance of Kant's priority, by Delaunay (l865) and Adams. He points out that the action of the moon in raising the waters of the earth must have a secondary effect in the slight retardation of the earth's motion, and refers to a similar cause the fact that the moon turns always the same face to the earth.

3. *Allgemeine Naturgeschichte und Theorie des Himmels*, published anonymously in 1755 (4th ed. 1808; republished H. Ebert, 1890). In this remarkable work Kant, proceeding from the Newtonian conception of the solar system, extends his consideration to the entire sidereal system, points out how the whole may be mechanically regarded, and throws out the important speculation which has since received the title of the nebular hypothesis. In some details, such *e.g.* as the regarding of the motion of the entire solar system as portion of the general cosmical mechanism, he had predecessors, among others Thomas Wright of Durham, but the work as a whole contains a wonderfully acute anticipation of much that was afterwards carried out by Herschel and Laplace. The hypothesis of the original nebular condition of the system, with the consequent explanation of the great phenomena of planetary formations and movements of the satellites and rings, is unquestionably to be assigned to Kant. (On this question see discussion in W. Hastie's *Kant's Cosmogony*, as above.)

4. *Meditationum quarundam de igne succincta delineatio* (1755): an inaugural dissertation, containing little beyond the notion that bodies operate on one another through the medium of a uniformly diffused, elastic and subtle matter (ether) which is the underlying substance of heat and light. Both heat and light are regarded as vibrations of this diffused ether.

5. *On the Causes of Earthquakes* (1755); *Description of the Earthquake of 1755* (1756); *Consideration of some Recently Experienced Earthquakes* (1756).

6. *Explanatory Remarks on the Theory of the Winds* (1756). In this brief tract, Kant, apparently in entire ignorance of the explanation given in 1735 by Hadley, points out how the varying velocity of rotation of the successive zones of the earth's surface furnishes a key to the phenomena of periodic winds. His theory is in almost entire agreement with that now received. See the parallel statements from Kant's tract and Dove's essay on the influence of the rotation of the earth on the flow of its atmosphere (1835), given in Zöllner's work, *Ueber die Natur der Cometen*, p-482.

7. *On the Different Races of Men* (1775); *Determination of the Notion of a Human Race* (1785); *Conjectural Beginning of Human History* (1786): three tracts containing some points of interest as regards the empirical grounds for Kant’s doctrine of teleology. Reference will be made to them in the notice of the *Kritik of Judgment*.

8. *On the Volcanoes in the Moon* (1785); *On the Influence of the Moon on the Weather* (1794). The second of these contains a remarkable discussion of the relation between the centre of the moon’s figure and its centre of gravity. From the difference between these Kant is led to conjecture that the climatic conditions of the side of the moon turned from us must be altogether unlike those of the face presented to us. His views have been restated by Hansen.

9. *Lectures on Physical Geography* (1822): published from notes of Kant’s lectures, with the approval of the author.

Consideration of these works is sufficient to show that Kant’s mastery of the science of his time was complete and thorough, and that his philosophy is to be dealt with as having throughout a reference to general scientific conceptions. For more detailed treatment of his importance in science, reference may be made to Zöllner’s essay on “Kant and his Merits on Natural Science” contained in the work on the *Nature of Comets* (p-484); to Dietrich, *Kant and Newton*, Schultze, *Kant and Darwin*; Reuschle’s careful analysis of the scientific works in the *Deutsche Vierteljahrs-Schrift* (1868); W. Hastie’s introduction to *Kant’s Cosmogony* (1900), which summarizes criticism to that date; and articles in *Kant-Studien* (1896 foll.).

The notice of the philosophical writings of Kant need not be more than bibliographical, as in the account of his philosophy it will be necessary to consider at some length the successive stages in the development of his thought. Arranged chronologically these works are as follows: —

1755. *Principiorum primorum cognitionis metaphysicae novae dilucidatio.*

1756. *Metaphysicae cum geometria junctae usus in philosophia naturali, cujus specimen I. continet monadologiam physicam.*

1762. *Die falsche Spitzfindigkeit der vier syltogistischen Figuren*, “The False Subtlety of the Four Syllogistic Figures” (trans. T. K. Abbott, Kant’s *Introduction to Logic and his Essay on the Mistaken Subtilty of the Figures*, 1885).

1763. *Versuch den Begriff der negativen Grössen in die Weltweisheit einzuführen*, “Attempt to introduce the Notion of Negative Quantities into Philosophy.”

1763. *Der einzig mögliche Beweisgrund zu einer Demonstration des Daseins Gottes*, “The only possible Foundation for a Demonstration of the Existence of God.”

1764. *Beobachtungen über das Gefühl des Schönen und Erhabenen* (Riga, 1771; Konigsberg, 1776).

1764. *Untersuchung über die Deutlichkeit der Grundsätze der natürlichen Theologie und Moral*, “Essay on the Evidence (Clearness) of the Fundamental Propositions of Natural Theology and Ethics.”

1766. *Träume eines Geistersehers, erläutert durch Träume der Metaphysik*, “Dreams of a Ghost-seer (or Clairvoyant), explained by the Dreams of Metaphysic” (Eng. trans. E. F. Goerwitz, with introd. by F. Sewall, 1900).

1768. *Von dem ersten Grunde des Unterschiedes der Gegenden im Raum*, “Foundation for the Distinction of Positions in Space.”

The above may all be regarded as belonging to the precritical period of Kant’s development. The following introduce the notions and principles characteristic of the critical philosophy.

1770. *De mundi sensibilis et intelligibilis forma et principiis*.

1781. *Kritik der reinen Vernunft*, “Kritik of Pure Reason” (revised ed. 1787; ed. Vaihinger, 1881 foll, and B. Erdmann, 1900; Eng. trans., F. Max Müller, 1896, 2nd ed. 1907, and J. M. D. Meiklejohn, 1854).

1783. *Prolegomena zu einer jeden künftigen Metaphysik die als Wissenschaft wird auftreten können*, “Prolegomena to all Future Metaphysic which may present itself as Science” (ed. B. Erdmann, 1878; Eng. trans. J. P. Mahaffy and J. H. Bernard, 2nd ed. 1889; Belfort Bax, 1883 and Paul Carus, 1902; and cf. M. Apel, *Kommentar* zu Kants Prolegomena, *1908)*.

1784. *Idee zu einer allgemeinen Geschichte im weltbürgerlicher Absicht*, “Notion of a Universal History in a Cosmopolitan Sense.” With this may be coupled the review of Herder in 1785.

1785. *Grundlegung zur Metaphysik der Sitten, “Foundations of* the Metaphysic of Ethics” (see T. K. Abbott, *Fundamental Principles of the Metaphysic of Ethics*, 3rd ed. 1907).

1786. *Metaphysische Anfangsgründe der Naturwissenschaft*, “Metaphysical Elements of Natural Science” (ed. A. Höfler, 1900; trans. Belfort Bax, *Prolegomena and Metaphysical Foundations*, 1883).

1788. *Ueber den Gebrauch teleologischer Prinzipien in der Philosophie*, “On the Employment of Teleological Principles in Philosophy.”

1788. *Kritik der praktischen Vernunft*, “Kritik of Practical Reason” (trans. T. K. Abbott, ed. 1898).

1790. *Kritik der Urtheilskraft*, “Kritik of Judgment” (trans. with notes J. H. Bernard, 1892).

1790. *Ueber eine Entdeckung, nach der alle neue Kritik der reinen Vernunft durch eine ältere entbehrlich gemacht werden soll*, “On a Discovery by which all the recent Critique of Pure Reason is

superseded by a more ancient” (*i.e.* by Leibnitz’s philosophy).

1791. *Ueber die wirklichen Fortschritte der Metaphysik seit Leibnitz und Wolff*, “On the Real Advances of Metaphysics since Leibnitz and Wolff”; and *Ueber das Misslingen aller philosophischen Versuche in der Theodicee*.

1793. *Die Religion innerhalb der Grenzen der blossen Vernunft*, “Religion within the Bounds of Reason only” (Eng. trans. J. W. Semple, 1838).

1794. *Ueber Philosophie überhaupt*, “On Philosophy generally,” and *Das Ende aller Dinge*.

1795. *Zum ewigen Frieden* (Eng. trans., M. Campbell Smith, 1903).

1797. *Metaphysische Anfangsgründe der Rechtslehre* (trans. W. Hastie), and *Metaphysische Anfangsgründe der Tugendlehre*.

1798. *Der Streit der Facultäten*, “Contest of the Faculties.”

1798. *Anthropologie in pragmatischer Hinsicht*.

The Kantian Philosophy.

Historians are accustomed to divide the general current of speculation into epochs or periods marked by the dominance of some single philosophic conception with its systematic evolution. Perhaps in no case is the character of an epoch more clearly apparent than in that of the critical philosophy. The great work of Kant absolutely closed the lines of speculation along which the philosophical literature of the 18th century had proceeded, and substituted for them a new and more comprehensive method of regarding the essential problems of thought, a method which has prescribed the course of philosophic speculation in the present age. The critical system has thus a two-fold aspect. It takes up into itself what had characterized the previous efforts of modern thought, shows the imperfect nature of the fundamental notions therein employed, and offers a new solution of the problems to which these notions had been applied. It opens up a new series of questions upon which subsequent philosophic reflection has been directed, and gives to them the form, under which it is possible that they should be fruitfully regarded. A work of this kind is essentially epoch-making.

In any complete account of the Kantian system it is therefore necessary that there should be constant reference, on the one hand, to the peculiar character of the preceding 18th-century philosophy, and, on the other hand, to the problems left for renewed treatment to more modern thought. Fortunately the development of the Kantian system itself furnishes such treatment as is necessary of the former reference. For the critical philosophy was a work of slow growth. In the early writings of Kant we are able to trace with great definiteness the successive stages through which he passed from the notions of the preceding philosophy to the new and comprehensive method which gives its special character to the critical work.

Scarcely any great mind, it has been said with justice, ever matured so slowly. In the early essays we find the principles of the current philosophies, those of Leibnitz and English empiricism, applied in various directions to those problems which serve as tests of their truth and completeness; we note the appearance of the difficulties or contradictions which manifest the one-sidedness or imperfection of the principle applied; and we can trace the gradual growth of the new conceptions which were destined, in the completed system, to take the place of the earlier method. To understand the Kantian work it is indispensable to trace the history of its growth in the mind of its author.

Of the two preceding stages of modern philosophy, only the second, that of Locke and Leibnitz, seems to have influenced practically the course of Kant's speculation. With the Cartesian movement as a whole he shows little acquaintance and no sympathy, and his own philosophic conception is never brought into relation with the systematic treatment of metaphysical problems characteristic of the Cartesian method. The fundamental question for philosophic reflection presented itself to him in the form which it had assumed in the hands of Locke and his successors in England, of Leibnitz and the Leibnitzian school in Germany. The transition from the Cartesian movement to this second stage of modern thought had doubtless been natural and indeed necessary. Nevertheless the full bearings of the philosophic question were somewhat obscured by the comparatively limited fashion in which it was then regarded. The tendency towards what may be technically called subjectivism, a tendency which differentiates the modern from the ancient method of speculation, is expressed in Locke and Leibnitz in a definite and peculiar fashion. However widely the two systems differ in details, they are at one in a certain fundamental conception which dominates the whole course of their philosophic construction. They are throughout individualist, *i.e.* they accept as given fact the existence of the concrete thinking subject, and endeavour to show how this subject, as an individual conscious being, is related to the wider universe of which he forms part. In dealing with such a problem, there are evidently two lines along which investigation may proceed. It may be asked how the individual mind comes to know himself and the system of things with which he is connected, how the varied contents of his experience are to be accounted for, and what certainty attaches to his subjective consciousness of things. Regarded from the individualist point of view, this line of inquiry becomes purely psychological, and the answer may be presented as it was presented by Locke, in the fashion of a natural history of the growth of conscious experience in the mind of the subject. Or, it may be further asked how is the individual really connected with the system of things apparently disclosed to him in conscious experience? what is the precise significance of the existence which he ascribes both to himself and to the objects of experience? what is the nature of the relation between himself as one part of the system, and the system as a whole? This second inquiry is specifically metaphysical in bearing and the kind of answer furnished to it by Leibnitz on the one hand by Berkeley on the other, is in fact prescribed or determined beforehand by the fundamental conception of the individualist method with which both begin their investigations. So soon as we make clear to ourselves the essential nature of this method, we are able to discern the specific difficulties or perplexities arising in the attempt to carry it out systematically, and thus to note with precision the special problems presented to Kant at the outset of his philosophic reflections.

Consider, first, the application of the method on its psychological side, as it appears in Locke. Starting with the assumption of conscious experience as the content or filling-in of the individual mind, Locke proceeds to explain its genesis and nature by reference to the real universe of things and its mechanical operation upon the mind. The result of the interaction of mind, *i.e.* the individual mind, and the system of things, is conscious experience, consisting of ideas, which may be variously compounded, divided, compared, or dealt with by the subjective faculties or powers with which the entity, Mind, is supposed to be endowed. Matter of fact and matter of knowledge are thus at a stroke dissevered. The very notion of relation between mind and things leads at once to the counter notion of the absolute restriction of mind to its own subjective nature. That Locke was unable to reconcile these opposed notions is not surprising;

that the difficulties and obscurities of the *Essay* arise from the impossibility of reconciling them is evident on the slightest consideration of the main positions of that work. Of these difficulties the philosophies of Berkeley and Hume are systematic treatments, In Berkeley we find the resolute determination to accept only the one notion, that of mind as restricted to its own conscious experience, and to attempt by this means to explain the nature of the external reality to which obscure reference is made. Any success in the attempt is due only to the fact that Berkeley introduces alongside of his individualist notion a totally new conception, that of mind itself as not in the same way one of the matters of conscious experience, but as capable of reflection upon the whole of experience and of reference to the supreme mind as the ground of all reality. It is only in Hume that we have definitely and completely the evolution of the individualist notion as groundwork of a theory of knowledge; and it is in his writings, therefore, that we may expect to find the fundamental difficulty of that notion clearly apparent. It is not a little remarkable that we should find in Hume, not only the sceptical dissolution of all fixity of cognition, which is the inevitable result of the individualist method, but also the clearest consciousness of the very root of the difficulty. The systematic application of the doctrine that conscious experience consists only of isolated objects of knowledge, impressions or ideas, leads Hume to distinguish between truths reached by analysis and truths which involve real connexion of the objects of knowledge. The first he is willing to accept without further inquiry, though it is an error to suppose, as Kant seems to have supposed, that he regarded mathematical propositions as coming under this head (see Hume); with respect to the second, he finds himself, and confesses that he finds himself, hopelessly at fault. No real connexions between isolated objects of experience are perceived by us. No single matter of fact necessarily implies the existence of any other. In short, if the difficulty be put in its ultimate form, no existence thought as a distinct individual can transcend itself, or imply relation to any other existence. If the parts of conscious experience are regarded as so many distinct things, there is no possibility of connecting them other than contingently, if at all. If the individual mind be really thought as individual, it is impossible to explain how it should have knowledge or consciousness at all. “In short,” says Hume, “there are two principles which I cannot render consistent, nor is it in my power to renounce either of them, viz. *that all our distinct perceptions are distinct existences*, and *that the mind never perceives any real connexion among distinct existences*. Did our perceptions either inhere in something simple or individual, or did the mind perceive some real connexion among them, there would be no difficulty in the case” (App. to *Treatise of Human Nature*).

Thus, on the one hand, the individualist conception, when carried out to its full extent, leads to the total negation of all real cognition. If the real system of things, to which conscious experience has reference, be regarded as standing in casual relation to this experience there is no conceivable ground for the extension to reality of the notions which somehow are involved in thought. The same result is apparent, on the other hand, when we consider the theory of knowledge implied in the Leibnitzian individualism. The metaphysical conception of the monads, each of which is the universe *in nuce*, presents insuperable difficulties when the connexion or interdependence of the monads is in question, and these difficulties obtrude themselves when the attempt is made to work put a consistent doctrine of cognition. For the whole mass of cognisable fact, the *mundus intelligibilis*, is contained *impliciter* in each monad, and the several modes of apprehension can only be regarded as so many stages in the developing consciousness of the monad. Sense and understanding, real connexion of facts and analysis of notions, are not, therefore, distinct in kind, but differ only in degree. The same fundamental axioms, the logical principles of identity and sufficient reason, are applicable in explanation of all given propositions. It is true that Leibnitz himself did not work out any complete doctrine of knowledge, but in the hands of his successors the theory took definite shape in the principle that the whole work of cognition is in essence analytical. The process of analysis might be complete or incomplete. For finite intelligences there was an inevitable incompleteness so far as knowledge of matters of fact was concerned. In respect to them, the final result was found in a series of irreducible notions or categories, the *prima possibilia*, the analysis and

elucidation of which was specifically the business of philosophy or metaphysics.

It will be observed that, in the Leibnitzian as in the empirical individualism, the fundamental notion is still that of the abstract separation of the thinking subject from the materials of conscious experience. From this separation arise all the difficulties in the effort to develop the notion systematically, and in tracing the history of Kant's philosophical progress we are able to discern the gradual perception on his part that here was to be found the ultimate cause of the perplexities which became apparent in considering the subordinate doctrines of the system. The successive essays which have already been enumerated as composing Kant's precritical work are not to be regarded as so many imperfect sketches of the doctrines of the *Kritik*, nor are we to look in them for anticipations of the critical view. They are essentially tentative, and exhibit with unusual clearness the manner in which the difficulties of a received theory force on a wider and more comprehensive view. There can be no doubt that some of the special features of the *Kritik* are to be found in these precritical essays, *e.g.* the doctrine of the *Aesthetik* is certainly foreshadowed in the *Dissertation* of 1770; the *Kritik*, however, is no patchwork, and what appears in the *Dissertation* takes an altogether new form when it is wrought into the more comprehensive conception of the later treatise.

The particular problem which gave the occasion to the first of the precritical writings is, in an imperfect or particular fashion, the fundamental question to which the *Kritik* is an answer. What is the nature of the distinction between knowledge gained by analysis of notions and knowledge of matters of fact? Kant seems never to have been satisfied with the Wolffian identification of logical axioms and of the principle of sufficient reason. The tract on the *False Subtlety of the Four Syllogistic Figures*, in which the view of thought or reason as analytic is clearly expressed, closes with the significant division of judgments into those which rest upon the logical axioms of identity and contradiction and those for which no logical ground can be shown. Such immediate or indemonstrable judgments, it is said, abound in our experience. They are, in fact, as Kant presently perceived, the foundations for all judgments regarding real existence. It was impossible that the question regarding their nature and legitimacy and their distinction from analytic judgments should not present itself to him. The three tracts belonging to the years 1763-1764 bring forward in the sharpest fashion the essential opposition between the two classes of judgments. In the *Essay on Negative Quantities*, the fundamental thought is the total distinction in kind between logical opposition (the contradictoriness of notions, which Kant always viewed as formed, definite products of thought) and real opposition. For the one adequate explanation is found in the logical axiom of analytical thinking; for the other no such explanation is to be had. Logical ground and real ground are totally distinct. "I can understand perfectly well," says Kant, "how a consequence follows from its reason according to the law of identity, since it is discoverable by mere analysis of the notion contained in it. . . . But how something follows from another thing and not according to the law of identity, this I should gladly have made clear to me. . . . How shall I comprehend that, since something is, something else should be?" Real things, in short, are distinct existences, and, as distinct, not necessarily or logically connected in thought. "I have," he proceeds, "reflected on the nature of our knowledge in relation to our judgment of reason and consequent, and I intend to expound fully the result of my reflections. It follows from them that the relation of a real ground to that which is thereby posited or denied cannot be expressed by a judgment but only by means of a notion, which by analysis may certainly be reduced to yet simpler notions of real grounds, but yet in such a way that the final resort of all our cognition in this regard must be found in simple and irreducible notions of real grounds, the relation of which to their consequents cannot be made clear."

The striking similarity between Kant's expressions in this *Essay* and the remarks with which Hume introduces his analysis of the notion of cause has led to the supposition that at this period of his philosophical career Kant was definitely under the influence of the earlier empirical thinker. Consideration of the whole passage is quite sufficient to show the groundlessness of this supposition. The

difficulty with which Kant is presented was one arising inevitably from reflection upon the Leibnitzian theory of knowledge, and the solution does not in any way go beyond that theory. It is a solution, in fact, which must have been impossible had the purport of Hume’s empirical doctrine been present to Kant’s mind. He is here at the point at which he remained for many years, accepting without any criticism certain fundamental notions as required for real cognition. His ideal of metaphysic is still that of complete analysis of given notions. No glimmering of the further question, Whence come these notions and with what right do we apply them in cognition? is yet apparent. Any direct influence from Hume must be referred to a later period in his career.

The prize essay *On the Principles of Natural Theology and Morals* brings forward the same fundamental opposition — though in a special form. Here, for the first time, appears definitely the distinction between synthesis and analysis, and in the distinction is found the reason for the superior certainty and clearness of mathematics as opposed to philosophy. Mathematics, Kant thinks, proceeds synthetically, for in it the notions are constructed. Metaphysics, on the other hand, is analytical in method; in it the notions are given, and by analysis they are cleared up. It is to be observed that the description of mathematics as synthetic is not an anticipation of the critical doctrine on the same subject. Kant does not, in this place, raise the question as to the reason for assuming that the arbitrary syntheses of mathematical construction have any reference to reality. The deeper significance of synthesis has not yet become apparent.

In the *Only Possible Ground of Proof for the Existence of God*, the argument, though largely Leibnitzian, advances one step farther towards the ultimate inquiry. For there Kant states as precisely as in the critique of speculative theology his fundamental doctrine that real existence is not a predicate to be added in thought to the conception of a possible subject. So far as subjective thought is concerned, possibility, not real existence, is contained in any judgment.

The year 1765 was marked by the publication of Leibnitz’s posthumous *Nouveaux Essais*, in which his theory of knowledge is more fully stated than in any of his previous tracts. In all probability Kant gave some attention to this work, though no special reference to it occurs in his writings, and it may have assisted to give additional precision to his doctrine. In the curious essay, *Dreams of a Clairvoyant*, published 1766, he emphasizes his previously reached conclusion that connexions of real fact are mediated in our thought by ultimate notions, but adds that the significance and warrant for such notions can be furnished only by experience. He is inclined, therefore, to regard as the function of metaphysics the complete statement of these ultimate, indemonstrable notions, and therefore the determination of the limits to knowledge by their means. Even at this point, where he approximates more closely to Hume than to any other thinker, the difficulty raised by Hume does not seem to occur to him. He still appears to think that experience does warrant the employment of such notions, and when there is taken into account his correspondence with Lambert during the next few years, one would be inclined to say that the *Architektonik* of the latter represents most completely Kant’s idea of philosophy.

On another side Kant had been shaking himself free from the principles of the Leibnitzian philosophy. According to Leibnitz, space, the order of coexisting things, resulted from the relations of monads to one another. But Kant began to see that such a conception did not accord with the manner in which we determine directions or positions in space. In the curious little essay, *On the Ground of distinguishing Particular Divisions in Space*, he pointed out that the idea of space as a whole is not deducible from the experience of particular spaces, or particular relations of objects in space, that we only cognize relations in space by reference to space as a whole, and finally that definite positions involve reference to space as a given whole.

The whole development of Kant’s thought up to this point is intelligible when regarded from the Leibnitzian point of view, with which he started. There appears no reason to conclude that Hume at this time exercised any direct influence. One may go still further, and add that even in the *Dissertation* of

1770, generally regarded as more than foreshadowing the *Kritik*, the really critical question is not involved. A brief notice of the contents of this tract will suffice to show how far removed Kant yet was from the methods and principles of the critical or transcendental philosophy. Sense and understanding, according to the *Dissertation*, are the two sources of knowledge. The objects of the one are things of sense or *phenomena*; the objects of the other are *noumena*. These are absolutely distinct, and are not to be regarded as differing only in degree. In *phenomena* we distinguish matter, which is given by sense, and form, which is the law of the order of sensations. Such form is twofold — the order of space and time. Sensations formed by space and time compose the world of appearance, and this when treated by the understanding, according to logical rules, is experience. But the logical use of the understanding is not its only use. Much more important is the *real* use, by which are produced the pure notions whereby we think things as they are. These pure notions are the laws of the operation of the intellect; they are *leges intellectus*.

Apart, then, from the expanded treatment of space and time as subjective forms, we find in the *Dissertation* little more than the very precise and definite formulation of the slowly growing opposition to the Leibnitzian doctrines. That the pure intellectual notions should be defended as springing from the nature of intellect is not out of harmony with the statement of the *Träume eines Geistersehers*, for there the pure notions were allowed to exist, but were not held to have validity for actual things except on grounds of experience. Here they are supposed to exist, dissevered from experience, and are allowed validity as determinations of things in themselves.

The stage which Kant had now reached in his philosophical development was one of great significance. The doctrine of knowledge expressed in the *Dissertation* was the final form which the Wolffian rationalism could assume for him, and, though many of the elements of the *Kritik* are contained therein, it was not really in advance of the Wolffian theory. The doctrine of space and time as forms of sense-perception, the reference of both space and time and the pure intellectual notions to the laws of the activity of mind itself, the distinction between sense and understanding as one of kind, not of degree, with the correlative distinction between phenomena and noumena, — all of these reappear, though changed and modified, in the *Kritik*. But, despite this resemblance, it seems clear that, so far as the *Dissertation* is concerned, the way had only been prepared for the true critical inquiry, and that the real import of Hume's sceptical problem had not yet dawned upon Kant. From the manner, however, in which the doctrine of knowledge had been stated in the *Dissertation*, the further inquiry had been rendered inevitable. It had become quite impossible for Kant to remain longer satisfied with the ambiguous position assigned to a fundamental element of his doctrine of knowledge, the so-called pure intellectual notions. Those notions, according to the *Dissertation*, had no function save in relation to things-in-themselves, *i.e.* to objects which are not directly or immediately brought into relation to our faculty of cognition. They did not serve as the connecting links of formed experience; on the contrary, they were supposed to be absolutely dissevered from all experience which was possible for intelligence like ours. In his previous essays, Kant, while likewise maintaining that such pure, irreducible notions existed, had asserted in general terms that they applied to experience, and that their applicability or justification rested on experience itself, but had not raised the question as to the ground of such justification. Now, from another side, the supreme difficulty was presented — how could such notions have application to any objects whatsoever? For some time the correlative difficulty, how *objects* of sense-perception were possible, does not seem to have suggested itself to Kant. In the *Dissertation* sense-perception had been taken as receptivity of representations of objects, and experience as the product of the treatment of such representations by the logical or analytical processes of understanding. Some traces of this confused fashion of regarding sense-perceptions are left even in the *Kritik*, specially perhaps in the *Aesthetik*, and they give rise to much of the ambiguity which unfortunately attaches to the more developed theory of cognition. So soon, however, as the critical question was put, On what rests the reference of representations in us to the object or thing? in

other words, How do we come to have knowledge of objects at all? it became apparent that the problem was one of perfect generality, and applied, not only to cognition through the pure notions, but to sense-perceptions likewise. It is in the statement of this general problem that we find the new and characteristic feature of Kant's work.

There is thus no reason to doubt the substantial accuracy of Kant's reference to the particular occasion or cause of the critical inquiry. Up to the stage indicated by the *Dissertation* he had been attempting, in various ways, to unite two radically divergent modes of explaining cognition — that which would account for the content of experience by reference to affection from things without us, and that which viewed the intellect itself as somehow furnished with the means of pure, rational cognition. He now discovered that Hume's sceptical analysis of the notion of cause was really the treatment of one typical or crucial instance of the much more general problem. If experience, says Hume, consists solely of states of mind somehow given to us, each of which exists as an effect, and therefore as distinct from others, with what right do we make the common assumption that parts of experience are necessarily connected? The only possible answer, drawn from the premises laid down, must be that there is no warrant for such an assumption. Necessity for thought, as Kant had been willing to admit and as Hume also held, involves or implies something more than is given in experience — for that which is given is contingent — and rests upon an a priori or pure notion. But a priori notions, did they exist, could have no claim to regulate experience. Hume, therefore, for his part, rejected entirely the notion of cause as being fictitious and delusive, and professed to account for the habit of regarding experience as necessarily connected by reference to arbitrarily formed custom of thinking. Experience, as given, contingent material, had a certain uniformity, and recurring uniformities generated in us the habit of regarding things as necessarily connected. That such a resort to experience for explanation could lead to no valid conclusion has been already noted as evident to Hume himself.

The dogmatic or individualist conception of experience had thus proved itself inadequate to the solution of Hume's difficulty regarding the notion of cause, — a difficulty which Kant, erroneously, had thought to be the only case contemplated by his predecessor. The perception of its inadequacy in this respect, and the consequent generalization of Hume's problem, are the essential features of the new critical method. For Kant was now prepared to formulate his general inquiry in a definite fashion. His long-continued reflection on the Wolffian doctrine of knowledge had made clear to him that synthetic connexion, the essence of real cognition, was not contained in the products of thinking as a formal activity of mind operating on material otherwise supplied. On the other hand, Hume's analysis enabled him to see that synthetic connexion was not contained in experience regarded as given material. Thus neither the formal nor the material aspect of conscious experience, when regarded from the individualist point of view, supplied any foundation for real knowledge, whether a priori or empirical. An absolutely new conception of experience was necessary, if the fact of cognition was to be explained at all, and the various modes in which Kant expresses the business of his critical philosophy were merely different fashions of stating the one ultimate problem, differing according to the particular aspect of knowledge which he happened to have in view. To inquire how synthetic a priori judgments are possible, or how far cognition extends, or what worth attaches to metaphysical propositions, is simply to ask, in a specific form, what elements are necessarily involved in experience of which the subject is conscious. How is it possible for the individual thinking subject to connect together the parts of his experience in the mode we call cognition?

The problem of the critical philosophy is, therefore, the complete analysis of experience from the point of view of the conditions under which such experience is possible for the conscious subject. The central ideas are thus self-consciousness, as the supreme condition under which experience is subjectively possible, and the manifold details of experience as a varied and complex whole. The solution of the problem demanded the utmost care in keeping the due balance between these ideas; and it can hardly be

said that Kant was perfectly successful. He is frequently untrue to the more comprehensive conception which dominates his work as a whole. The influence of his previous philosophical training, nay, even the unconscious influence of terminology, frequently induces in his statements a certain laxity and want of clearness. He selects definitely for his starting point neither the idea of self-consciousness nor the details of experience, but in his actual procedure passes from one to the other, rarely, if ever, taking into full consideration the weighty question of their relation to one another. Above all, he is continuously under the influence of the individualist notion which he had done so much to explode. The conception of conscious experience, which is the net result of the *Kritik*, is indefinitely profounder and richer than that which had ruled the 18th century philosophizing, but for Kant such experience still appears as somehow the arbitrary product of the relation between the individual conscious subject and the realm of real facts. When he is actually analysing the conditions of knowledge, the influence of the individualist conception is not prominent; the conditions are stated as quite general, as conditions of knowledge. But so soon as the deeper, metaphysical problems present themselves, the shadow of the old doctrine reappears. Knowledge is regarded as a mechanical product, part furnished by the subject, part given to the subject, and is thus viewed as mechanically divisible into a priori and a posteriori, into pure and empirical, necessary and contingent. The individual as an agent, conscious of universal moral law, is yet regarded as in a measure opposed to experience, and the Kantian ethical code remains purely formal. The ultimate relation between intelligence and natural fact, expressed in the notion of end, is thought as problematic or contingent. The difficulties or obscurities of the Kantian system, of which the above are merely the more prominent, may all be traced to the one source, the false or at least inadequate idea of the individual. The more thorough explanation of the relation between experience as critically conceived and the individual subject was the problem left by Kant for his successors.

In any detailed exposition of the critical system it would be requisite in the first place to state with some fullness the precise nature of the problems immediately before Kant, and in the second place to follow with some closeness the successive stages of the system as presented in the three main works, the *Kritik of Pure Reason*, the *Kritik of Practical Reason* and the *Kritik of Judgment*, with the more important of the minor works, the *Metaphysic of Nature* and the *Metaphysic of Ethics*. It would be necessary, also, in any such expanded treatment, to bring out clearly the Kantian classification of the philosophical sciences, and to indicate the relation between the critical or transcendental investigation of the several faculties and the more developed sciences to which that investigation serves as introduction. As any detailed statement of the critical system, however compressed, would be beyond the limits of the present article, it is proposed here to select only the more salient doctrines, and to point out in connexion with them what advance had been effected by Kant, and what remained for subsequent efforts at complete solution of the problems raised by him. Much that is of interest and value must necessarily be omitted in any sketch of so elaborate a system, and for all points of special interpretation reference must needs be made to the many elaborate dissertations on or about the Kantian philosophy.

The doctrine from which Kant starts in his critical or transcendental investigation of knowledge is that to which the slow development of his thought had led him. The essence of cognition or knowledge was a synthetic act, an act of combining in thought the detached elements of experience. Now synthesis was explicable neither by reference to pure thought, the logical or elaborative faculty, which in Kant’s view remained analytic in function, nor by reference to the effects of external real things upon our faculties of cognition. For, on the one hand, analysis or logical treatment applied only to objects of knowledge as already given in synthetic forms, and, on the other hand, real things could yield only isolated effects and not the combination of these effects in the forms of cognitive experience. If experience is to be matter of knowledge for the conscious subject, it must be regarded as the conjoint product of given material and synthetic combination. Form and matter may indeed be regarded separably and dealt with in isolation for purposes of critical inquiry, but in experience they are necessarily and inseparably united. The problem of

the *Kritik* thus becomes for Kant the complete statement of the elements necessarily involved in synthesis, and of the subjective processes by which these elements are realized in our individual consciousness. He is not asking, with Locke, whence the details of experience arise; he is not attempting a natural history of the growth of experience in the individual mind; but he is endeavouring to state exhaustively what conditions are necessarily involved in any fact of knowledge, *i.e.* in any synthetic combination of parts of experience by the conscious subject.

So far as the elements necessarily involved in conscious experience are concerned, these may be enumerated briefly thus: — given data of sense, inner or outer; the forms of perception, *i.e.* space and time; the forms of thought, *i.e.* the categories; the ultimate condition of knowledge, the identity of the pure ego or self. The ego or self is the central unity in reference to which alone is any part of experience cognizable. But the consciousness of self is the foundation of knowledge only when related to given material. The ego has not in itself the element of difference, and the essence of knowledge is the consciousness of unity in difference. For knowledge, therefore, it is necessary that difference should be *given* to the ego. The modes under which it is possible for such given difference to become portion of the conscious experience of the ego, the modes under which the isolated data can be synthetically combined so as to form a cognizable whole, make up the form of cognition, and upon this form rests the possibility of any a priori or rational knowledge.

The notion of the ego as a purely logical unity, containing in itself no element of difference, and having only analytical identity, is fundamental in the critical system, and lies at the root of all its difficulties and perplexities. To say that the ego as an individual does not *produce* the world of experience is by no means the same as to say that the ego is pure unity without element of difference. In the one case we are treating the ego as one of the objects of experience and denying of it productive efficacy; in the second case we are dealing with the unity of the ego as a condition of knowledge, of any experience whatsoever. In this second sense, it is wholly wrong to assert that the ego is pure identity, pure unity. The unity and identity of the ego, so regarded, are taken in abstraction, *i.e.* as dissevered from the more complex whole of which they are necessary elements. When the ego is taken as a condition of knowledge, its unity is not more important than the difference necessarily correlated with it. That the ego as a thing should not produce difference is quite beside the mark. The consequences of the abstract separation which Kant so draws between the ego and the world of experience are apparent throughout his whole system. Assuming at the outset an opposition between the two, self and matter of knowledge, he is driven by the exigencies of the problem of reconciliation to insert term after term as means of bringing them together, but never succeeds in attaining a junction which is more than mechanical. To the end, the ego remains, partly the pure logical ego, partly the concrete individual spirit, and no explanation is afforded of the relation between them. It is for this reason that the system of forms of perception and categories appears so contingent and haphazard. No attempt is made to show how or why the difference supplied for the pure logical ego should present, itself necessarily under these forms. They are regarded rather as portions of the subjective mechanism of the individual consciousness. The mind or self appears as though it were endowed with a complex machinery by which alone it could act upon the material supplied to it. Such a crude conception is far, indeed, from doing justice to Kant’s view, but it undoubtedly represents the underlying assumption of many of his cardinal doctrines. The philosophy of Fichte is historically interesting as that in which the deficiencies of Kant’s fundamental position were first discerned and the attempt made to remedy them.

Unfortunately for the consistency of the *Kritik*, Kant does not attempt to work out systematically the elements involved in knowledge before considering the subjective processes by which knowledge is realized in consciousness. He mixes up the two inquiries, and in the general division of his work depends rather upon the results of previous psychology than upon the lines prescribed by his own new conception of experience. He treats the elements of cognition separately in connexion with the several subjective processes involved in knowledge, viz. sense and understanding. Great ambiguity is the natural result of

this procedure. For it was not possible for Kant to avoid the misleading connotation of the terms employed by him. In strictness, sense, understanding, imagination and reason ought to have had their, functions defined in close relation to the elements of knowledge with which they are severally connected, and as these elements have no existence as separate facts, but only as factors in the complex organic whole, it might have been possible to avoid the error of supposing that each subjective process furnished a distinct, separately cognizable portion of a mechanical whole. But the use of separate terms, such as sense and understanding, almost unavoidably led to phraseology only interpretable as signifying that each furnished a specific kind of knowledge, and all Kant's previous training contributed to strengthen this erroneous view. Especially noteworthy is this in the case of the categories. Kant insists upon treating these as *Begriffe*, notions, and assigns to them certain characteristics of notions. But it is readily seen, and in the *Logik* Kant shows himself fully aware of the fact, that these pure connective links of experience, general aspects of objects of intelligible experience, do not resemble concepts formed by the so-called logical or elaborative processes from representations of completed objects. Nothing but harm can follow from any attempt to identify two products which differ so entirely. So, again, the *Aesthetik* is rendered extremely obscure and difficult by the prevalence of the view, already noted as obtaining in the *Dissertation*, that sense is a faculty receiving representations of objects. Kant was anxious to avoid the error of Leibnitz, who had taken sense and understanding to differ in degree only, not in kind; but in avoiding the one error he fell into another of no less importance.

The consideration of the several elements which in combination make up the fact of cognition, or perception, as it may be called, contains little or nothing bearing on the origin and nature of the given data of sense, inner or outer. The manifold of sense, which plays so important a part in the critical theory of knowledge, is left in an obscure and perplexed position. So much is clear, however, that according to Kant sense is not to be regarded as receptive of representations of objects. The data of sense are mere *stimuli*, not partial or confused representations. The sense-manifold is not to be conceived as having, *per se*, any of the qualities of objects as actually cognized; its parts are not cognizable *per se*, nor can it with propriety be said to be received successively or simultaneously. When we apply predicates to the sense-manifold regarded in isolation, we make that which is only a factor in the experience of objects into a separate, independent object, and use our predicates transcendently. Kant is not always in his language faithful to his view of the sense-manifold, but the theory as a whole, together with his own express definitions, is unmistakable. On the origin of the data of sense, Kant's remarks are few and little satisfactory. He very commonly employs the term *affection* of the faculty of sense as expressing the mode of origin, but offers no further explanation of a term which has significance only when interpreted after a somewhat mechanical fashion. Unquestionably certain of his remarks indicate the view that the origin is to be sought in things-in-themselves, but against hasty misinterpretations of such remarks there are certain cautions to be borne in mind. The relation between phenomena and noumena in the Kantian system does not in the least resemble that which plays so important a part in modern psychology — between the subjective results of sense affection and the character of the objective conditions of such affection. Kant has pointedly declared that it would be a gross absurdity to suppose that in his view separate, distinct things-in-themselves existed corresponding to the several objects of perception. And, finally, it is not at all difficult to understand why Kant should say that the affection of sense originated in the action of things-in-themselves, when we consider what was the thing-in-itself to which he was referring. The thing-in-itself to which the empirical order and relations of sense-experience are referred is the divine order, which is not matter of knowledge, but involved in oitf practical or moral beliefs. Critics who limit their view to the *Kritik of Pure Reason*, and there, in all probability, to the first or constructive portion of the work, must necessarily fail to interpret the doctrines of the Kantian system, which do not become clear or definite till the system has been developed. Reason was, for Kant, an organic whole; the speculative and moral aspects are never severed; and the solution of problems which appear at first sight to belong solely

to the region of speculative thought may be found ultimately to depend upon certain characteristics of our nature as practical.

Data of sense-affection do not contain in themselves synthetic combination. The first conditions of such combination are found by Kant in the universal forms under which alone sense-phenomena manifest themselves in experience. These universal forms of perception, space and time, are necessary, a priori, and in characteristic features resembling intuitions, not notions. They occupy, therefore, a peculiar position, and one section of the *Kritik*, the *Aesthetik*, is entirely devoted to the consideration of them. It is important to observe that it is only through the a priori character of these perceptive forms that rational science of nature is at all possible. Kant is here able to resume, with fresh insight, his previous discussions regarding the synthetic character of mathematical propositions. In his early essays he had rightly drawn the distinction between mathematical demonstration and philosophic proof, referring the certainty of the first to the fact that the constructions were synthetic in character and entirely determined by the action of constructive imagination. It had not then occurred to him to ask, With what right do we assume that the conclusions arrived at from arbitrary constructions in mathematical matter have applicability to objects of experience? Might not mathematics be a purely imaginary science? To this question he is now enabled to return an answer. Space and time, the two essential conditions of sense-perception, are not data given by things, but universal forms of intellect into which all data of sense must be received. Hence, whatever is true of space and time regarded by imagination as objects, *i.e.* quantitative constructions, must be true of the objects making up our sense-experience. The same forms and the same constructive activity of imagination are involved in mathematical synthesis and in the constitution of objects of sense-experience. The foundation for pure or rational mathematics, there being included under this the pure science of movement, is thus laid in the critical doctrine of space and time.

The *Aesthetik* isolates sense-perception, and considers its forms as though it were an independent, complete faculty. A certain confusion, arising from this, is noticeable in the *Analytik* when the necessity for justifying the position of the categories is under discussion, but the real difficulty in which Kant was involved by his doctrine of space and time has its roots even deeper than the erroneous isolation of sensibility. He has not in any way “deduced “ space and time, but, proceeding from the ordinary current view of sense-experience, has found these remaining as residuum after analysis. The relation in which they stand to the categories or pure notions is ambiguous; and, when Kant has to consider the fashion in which category and data of sense are to be brought together, he merely places side by side as a priori elements the pure connective notions and the pure forms of perception, and finds it, apparently, only a matter of contingent convenience that they should harmonize with one another and so render cognition possible. To this point also Fichte was the first to call attention.

Affection of sense, even when received into the pure forms of perception, is not matter of knowledge. For cognition there is requisite synthetic combination, and the intellectual function through which such combination takes place. The forms of intellectual function Kant proceeds to enumerate with the aid of the commonly received logical doctrines. For this reference to logic he has been severely blamed, but the precise nature of the debt due to the commonly accepted logical classification is very generally misconceived. Synthetic combination, Kant points out, is formally expressed in a judgment, which is the act of uniting representations. At the foundation of the judgments which express the types of synthetic combination, through which knowledge is possible, lie the pure general notions, the abstract aspect of the conditions under which objects are cognizable in experience. General logic has also to deal with the union of representations, though its unity is analytic merely, not synthetic. But the same intellectual function which serves to give unity in the analytic judgments of formal logic serves to give unity to the synthetic combinations of real perception. It appeared evident, then, to Kant that in the forms of judgment, as they are stated in the common logic, there must be found the analogues of the types of judgment which are involved in transcendental logic, or in the theory of real cognition. His view of the ordinary logic was

wide and comprehensive, though in his restriction of the science to pure form one can trace the influence of his earlier training, and it is no small part of the value of the critical philosophy that it has revived the study of logic and prepared the way for a more thorough consideration of logical doctrines. The position assigned to logic by Kant is not, in all probability, one which can be defended; indeed, it is hard to see how Kant himself, in consistency with the critical doctrine of knowledge, could have retained many of the older logical theorems, but the precision with which the position was stated, and the sharpness with which logic was marked off from cognate philosophic disciplines, prepared the way for the more thoughtful treatment of the whole question.

Formal logic thus yields to Kant the list of the general notions, pure intellectual predicates, or categories, through which alone experience is possible for a conscious subject. It has already been noted how serious was the error involved in the description of these as notions, without further attempt to clear up their precise significance. Kant, indeed, was mainly influenced by his strong opposition to the Leibnitzian rationalism, and therefore assigns the categories to understanding, the logical faculty, without consideration of the question, — which might have been suggested by the previous statements of the *Dissertation*, — what relation these categories held to the empirical notions formed by comparison, abstraction and generalization when directed upon representations of objects. But when the categories are described as notions, *i.e.* formed products of thought, there rises of necessity the problem which had presented itself to Kant at every stage of his pre-critical thinking, — with what right can we assume that these notions apply to objects of experience? The answer which he proceeds to give altogether explodes the definition of the categories as formed products of thought, and enables us to see more clearly the nature of the new conception of experience which lies in the background of all the critical work.

The unity of the ego, which has been already noted as an element entering into the synthesis of cognition, is a unity of a quite distinct and peculiar kind. That the ego to which different parts of experience are presented must be the same ego, if there is to be cognition at all, is analytically evident; but the peculiarity is that the ego must be conscious of its own unity and identity, and this unity of self-consciousness is only possible in relation to difference not contained in the ego but given to it. The unity of apperception, then, as Kant calls it, is only possible in relation to synthetic unity of experience itself, and the forms of this synthetic unity, the cate- gories, are, therefore, on the one hand, necessary as forms in which self-consciousness is realized, and, on the other hand, restricted in their application and validity to the data of given sense, or the particular element of experience. Thus experience presents itself as the organic combination of the particular of sense with the individual unity of the ego through the universal forms of the categories. Reference of representations to the unity of the object, synthetic unity of apperception, and subsumption of data of sense under the categories, are thus three sides or aspects of the one fundamental fact.

In this deduction of the categories, as Kant calls it, there appears for the first time an endeavour to connect together into one organic whole the several elements entering into experience. It is evident, however, that much was wanting before this essential task could be regarded as complete. Kant has certainly brought together self-consciousness, the system of the categories and data of sense. He has shown that the conditions of self-consciousness are the conditions of possible experience. But he has not shown, nor did he attempt to show, how it was that the conditions of self-consciousness are the very categories arrived at by consideration of the system of logical judgments. He does endeavour to show, but with small success, how the junction of category and data of sense is brought about, for according to his scheme these stood, to a certain extent at least, apart from and independent of one another. The failure to effect an organic combination of the several elements was the natural consequence of the false start which had been made.

The mode in which Kant endeavours to show how the several portions of cognition are subjectively realized brings into the clearest light the inconsistencies and imperfections of his doctrine. Sense had

been assumed as furnishing the particular of knowledge, understanding as furnishing the universal; and it had been expressly declared that the particular was cognizable only in and through the universal. Still, each was conceived as somehow in itself complete and finished. Sense and understanding had distinct functions, and there was wanting some common term, some intermediary which should bring them into conjunction. Data of sense as purely particular could have nothing in common with the categories as purely universal. But data of sense had at least one universal aspect, — their aspect as the particular of the general forms, space and time. Categories were in themselves abstract and valueless, serviceable only when restricted to possible objects of experience. There was thus a common ground on which category and intuition were united in one, and an intermediate process whereby the universal of the category might be so far individualized as to comprehend the particular of sense. This intermediate process — which is really the junction of understanding and sense — Kant calls productive imagination, and it is only through productive imagination that knowledge or experience is actually realized in our subjective consciousness. The specific forms of productive imagination are called *schemata*, and upon the nature of the schema Kant gives much that has proved of extreme value for subsequent thought.

Productive imagination is thus the concrete element of knowledge, and its general modes are the abstract expression of the a priori laws of all possible experience. The categories are restricted in their applicability to the schema, *i.e.* to the pure forms of conjunction of the manifold in time, and in the modes of combination of schemata and categories we have the foundation for the rational sciences of mathematics and physics. Perception or real cognition is thus conceived as a complex fact, involving data of sense and pure perceptive forms, determined by the category and realized through productive imagination in the schema. The system of principles which may be deduced from the consideration of the mode in which understanding and sense are united by productive imagination is the positive result of the critical theory of knowledge, and some of its features are remarkable enough to deserve attention. According to his usual plan, Kant arranges these principles in conformity with the table of the categories, dividing the four classes, however, into two main groups, the mathematical and the dynamical. The mathematical principles are the abstract expression of the necessary mode in which data of sense are determined by the category in the form of intuitions or representations of objects; the dynamical are the abstract expression of the modes in which the existence of objects of intuition is determined. The mathematical principles are constitutive, *i.e.* express determinations of the objects themselves; the dynamical are regulative, *i.e.* express the conditions under which objects can form parts of real experience. Under the mathematical principles come the general rules which furnish the ground for the application of quantitative reasoning to real facts of experience. For as data of sense are only possible objects when received in the forms of space and time, and as space and time are only cognized when determined in definite fashion by the understanding through the schema of number (quantity) or degree (quality), all intuitions are extensive quantities and contain a real element, that of sense, which has degree. Under the dynamical principles, the general modes in which the existence of objects are determined, fall the analogies of experience, or general rules according to which the existence of objects in relation to one another can be determined, and the postulates of experience, the general rules according to which the existence of objects for us or our own subjective existence can be determined. The analogies of experience rest upon the order of perceptions in time, *i.e.* their permanence, succession or coexistence, and the principles are respectively those of substance, causality and reciprocity. It is to be observed that Kant in the expression of these analogies reaches the final solution of the difficulty which had so long pressed upon him, the difficulty as to the relation of the pure connective notions to experience. These notions are not directly applicable to experience, nor do we find in experience anything corresponding to the pure intellectual notions of substance, cause and reciprocity. But experience is for us the combination of data of sense in the forms of productive imagination, forms determined by the pure intellectual notions, and accordingly experience is possible for us only as in modes corresponding to the notions. The

permanent in time is substance in any possible experience, and no experience is possible save through the determination of all changes as in relation to a permanent in time. Determined sequence is the causal relation in any possible experience, and no experience is possible save through the determination of perceived changes as in relation to a determined order in time. So with coexistence and reciprocity.

The postulates of experience are general expressions of the significance of existence in the experience of a conscious subject. The element of reality in such experience must always be given by intuition, and, so far as determination of existence is assumed, external intuition is a necessary condition of inner intuition. The existence of external things is as certain as the existence of the concrete subject, and the subject cannot cognise himself as existing save in relation to the world of facts of external perception. Inner and outer reality are strictly correlative elements in the experience of the conscious subject.

Throughout the positive portion of his theory of cognition, Kant has been beset by the doctrine that the categories, as finished, complete notions, have an import or significance transcending the bounds of possible experience. Morever, the manner in which space and time had been treated made it possible for him to regard these as contingent forms, necessary for intelligences like ours, but not to be viewed as absolutely necessary. The real meaning of these peculiarities is hardly ever expressed by him, though it is clear that the solution of the matter is to be found in the inadequacy of the positive theory to meet the demands of reason for completed explanation. But the conclusion to which he was led was one of the greatest importance for the after development of his system. Cognition is necessarily limited. The categories are restricted in their application to elements of possible experience to that which is presented in intuition, and all intuition is for the ego contingent. But to assert that cognition is limited and its matter contingent is to form the idea of an intelligence for whom cognition would not be limited and for whom the data of intuition would not be given, contingent facts, but necessarily produced along with the pure categories. This idea of an intuitive understanding is the definite expression for the complete explanation which reason demands, and it involves the conception of a realm of objects for such an understanding, a realm of objects which, in opposition to the *phenomena* of our relative and limited experience, may be called *noumena* or things-in-themselves. The *noumenon*, therefore, is in one way the object of a non-sensuous intuition, but more correctly is the expression of the limited and partial character of our knowledge. The idea of a noumenon is thus a limiting notion.

Assuredly, the difficult section of the *Kritik*, on the ground of the distinction between phenomena and noumena, would not have led to so much misconception as it has done, had Kant then brought forward what lies at the root of the distinction, his doctrine of reason and its functions. Understanding, as has been seen, is the faculty of cognition strictly so called; and within its realm, that of space, time and matter, positive knowledge is attainable. But the ultimate conception of understanding, that of the world of objects, quantitatively determined, and standing in relation of mutual reciprocity to one another, is not a final ground of explanation. We are still able and necessitated to reflect upon the whole world of phenomena as thus cognized, and driven to inquire after its significance. In our reflection we necessarily treat the objects, not as phenomena, as matters of positive, scientific knowledge, but as things-in-themselves, as noumena. The distinction between phenomena and noumena is, therefore, nothing but the expression of the distinction between understanding and reason, a distinction which, according to Kant, is merely subjective.

The specific function of reason is the effort after completed explanation of the experience presented in cognition. But in such effort there are no notions to be employed other than the categories, and these, as has already been seen, have validity only in reference to objects of possible experience. We may expect, then, to find the transcendent employment of the categories leading into various difficulties and inconsistencies. The criticism of reason in its specific aspect throws fresh light on the limits to human knowledge and the significance of experience.

Experience has presented itself as the complex result of relation between the ego or subject and the

world of phenomena. Reason may therefore attempt a completed explanation either of the ego or of the world of phenomena or of the total relation between them. The three inquiries correspond to the subjects of the three ancient metaphysical sciences, rational psychology, rational cosmology, rational theology. It is readily seen, in regard to the first of them, that all attempts to determine the nature of the ego as a simple, perdurable, immaterial substance rest upon a confusion between the ego as pure logical unity and the ego as object of intuition, and involve a transcendent use of the categories of experience. It profits not to apply such categories to the soul, for no intuition corresponding to them is or can be given. The idea of the soul must be regarded as transcendent. So too when we endeavour, with the help of the categories of quantity, quality, relation and modality, to determine the nature and relation of parts of the world, we find that reason is landed in a peculiar difficulty. Any solution that can be given is top narrow for the demands of reason and too wide for the restrictions of understanding. The transcendent employment of the categories leads to antinomy, or equally balanced statements of apparently contradictory results. Due attention to the relation between understanding and reason enables us to solve the antinomies and to discover their precise origin and significance. Finally, the endeavour to find in the conception of God, as the supreme reality, the explanation of experience, is seen to lead to no valid conclusion. There is not any intuition given whereby we might show the reality of our idea of a Supreme Being. So far as knowledge is concerned, God remains a transcendental ideal.

The criticism of the transcendental ideas, which is also the examination of the claims of metaphysic to rank as a science, yields a definite and intelligible result. These ideas, the expression of the various modes in which unity of reason may be sought, have no objects corresponding to them in the sphere of cognition. They have not, therefore, like the categories, any constitutive value, and all attempts at metaphysical construction with the notions or categories of science must be resigned as of necessity hopeless. But the ideas are not, on that account, destitute of all value. They are supremely significant, as indicating the very essence of the function of reason. The limits of scientific cognition become intelligible, only when the sphere of understanding is subjected to critical reflexion and compared with the possible sphere of reason, that is, the sphere of rationally complete cognition. The ideas, therefore, in relation to knowledge strictly so called, have *regulative* value, for they furnish the general precepts for extension and completion of knowledge, and, at the same time, since they spring from reason itself, they have a real value in relation to reason as the very inmost nature of intelligence. Self-consciousness cannot be regarded as merely a mechanically determined result. Free reflection upon the whole system of knowledge is sufficient to indicate that the sphere of intuition, with its rational principles, does not exhaust conscious experience. There still remains, over and above the realm of nature, the realm of free, self-conscious spirit; and, within this sphere, it may be anticipated that the ideas will acquire a significance richer and deeper than the merely regulative import which they possess in reference to cognition.

Where, then, are we to look for this realm of free self-consciousness? Not in the sphere of cognition, where objects are mechanically determined, but in that of will or of reason as practical. That reason is practical or prescribes ends for itself is sufficiently manifest from the mere fact of the existence of the conception of morality or duty, a conception which can have no corresponding object within the sphere of intuition, and which is theoretically, or in accordance with the categories of understanding, incognizable. The presence of this conception is the datum upon which may be founded a special investigation of the conditions of reason as practical, a *Kritik* of pure practical reason, and the analysis of it yields the statement of the formal prescripts of morality.

The realization of duty is impossible for any being which is not thought as free, *i.e.* capable of self-determination. Freedom, it is true, is theoretically not an object of cognition, but its impossibility is not thereby demonstrated. The theoretical proof rather serves as useful aid towards the more exact determination of the nature and province of self-determination, and of its relation to the whole concrete

nature of humanity. For in man self-determination and mechanical determination by empirical motives coexist, and only in so far as he belongs and is conscious of belonging both to the sphere of sense and to the sphere of reason does moral obligation become possible for him. The supreme end prescribed by reason in its practical aspect, namely, the complete subordination of the empirical side of nature to the prescripts of morality, demands, as conditions of its possible realization, the permanence of ethical progress in the moral agent, the certainty of freedom in self-determination, and the necessary harmonizing of the spheres of sense and reason through the intelligent author or ground of both. These conditions, the postulates of practical reason, are the concrete expressions of the three transcendental ideas, and in them we have the full significance of the ideas for reason. Immortality of the soul, positive freedom of will, and the existence of an intelligent ground of things are speculative ideas practically warranted, though theoretically neither demonstrable nor comprehensible.

Thus reason as self-determining supplies notions of freedom; reason as determined supplies categories of understanding. Union between the two spheres, which seem at first sight disparate, is found in the necessary postulate that reason shall be realized, for its realization is only possible in the sphere of sense. But such a union, when regarded in abstracto, rests upon, or involves, a notion of quite a new order, that of the adaptation of nature to reason, or, as it may be expressed, that of end in nature. Understanding and reason thus coalesce in the faculty of *judgment*, which mediates between, or brings together, the universal and particular elements in conscious experience. Judgment is here merely reflective; that is to say, the particular element is given, so determined as to be possible material of knowledge, while the universal, not necessary for cognition, is supplied by reason itself. The empirical details of nature, which are not determined by the categories of understanding, are judged as being arranged or ordered by intelligence, for in no other fashion could nature, in its particular, contingent aspect, be thought as forming a complete, consistent, intelligible whole.

The investigation of the conditions under which adaptation of nature to intelligence is conceivable and possible makes up the subject of the third great *Kritik*, the *Kritik of Judgment*, a work presenting unusual difficulties to the interpreter of the Kantian system. The general principle of the adaptation of nature to our faculties of cognition has two specific applications, with the second of which it is more closely connected than with the first. In the first place, the adaptation may be merely subjective, when the empirical condition for the exercise of judgment is furnished by the feeling of pleasure or pain; such adaptation is aesthetic. In the second place, the adaptation may be objective or logical, when empirical facts are given of such a kind that their possibility can be conceived only through the notion of the end realized in them; such adaptation is teleological, and the empirical facts in question are organisms.

Aesthetics, or the scientific consideration of the judgments resting on the feelings of pleasure and pain arising from the harmony or want of harmony between the particular of experience and the laws of understanding, is the special subject of the *Kritik of Judgment*, but the doctrine of teleology there unfolded is the more important for the complete view of the critical system. For the analysis of the teleological judgment and of the consequences flowing from it leads to the final statement of the nature of experience as conceived by Kant. The phenomena of organic production furnish data for a special kind of judgment, which, however, involves or rests upon a quite general principle, that of the contingency of the particular element in nature and its subjectively necessary adaptation to our faculty of cognition. The notion of contingency arises, according to Kant, from the fact that understanding and sense are distinct, that understanding does not determine the particular of sense, and, consequently, that the principle of the adaptation of the particular to our understanding is merely supplied by reason on account of the peculiarity or limited character of understanding. End in nature, therefore, is a subjective or problematic conception, implying the limits of understanding, and consequently resting upon the idea of an understanding constituted unlike ours — of an intuitive understanding in which particular and universal should be given together. The idea of such an understanding is, for cognition, transcendent, for no

corresponding fact of intuition is furnished, but it is realized with practical certainty in relation to reason as practical. For we are, from practical grounds, compelled with at least practical necessity to ascribe a certain aim or end to this supreme understanding. The moral law, or reason as practical, prescribes the realization of the highest good, and such realization implies a higher order than that of nature. We must, therefore, regard the supreme cause as a moral cause, and nature as so ordered that realization of the moral end is in it possible. The final conception of the Kantian philosophy is, therefore, that of ethical teleology. As Kant expresses it in a remarkable passage of the *Kritik*, "The systematic unity of ends in this world of intelligences, which, although as mere nature it is to be called only the world of sense, can yet as a system of freedom be called an intelligible, *i.e.* moral world (*regnum gratiae*), leads inevitably to the teleological unity of all things which constitute this great whole according to universal natural laws, just as the unity of the former is according to universal and necessary moral laws, and unites the practical with the speculative reason. The world must be represented as having originated from an idea, if it is to harmonize with that use of reason without which we should hold ourselves unworthy of reason — viz. the moral use, which rests entirely on the idea of the supreme good. Hence all natural research tends towards the form of a system of ends, and in its highest development would be a physico-theology. But this, since it arises from the moral order as a unity grounded in the very essence of freedom and not accidentally instituted by external commands, establishes the teleology of nature on grounds which a priori must be inseparably connected with the inner possibility of things. The teleology of nature is thus made to rest on a transcendental theology, which takes the ideal of supreme ontological perfection as a principle of systematic unity, a principle which connects all things according to universal and necessary natural laws, since they all have their origin in the absolute necessity of a single primal being" ().

Bibliography. — Editions and works of reference are exceedingly numerous. Since 1896 an indispensable guide is the periodical review *Kantstudien* (Hamburg and Berlin, thrice yearly), edited by Hans Vaihinger and Bruno Bauch, which contains admirable original articles and notices of all important books on Kant and Kantianism. It has reproduced a number of striking portraits of Kant. For books up to 1887 see Erich Adickes in *Philosophical Review* (Boston, 1892 foll.); for 1890-1894 R. Reicke's *Kant Bibliographie* (1895). See also in general the latest edition of Ueberweg's *Grundriss der Geschichte der Philosophie*.

Editions. — Complete editions of Kant's works are as follows: (1) G. Hartenstein (Leipzig, 1838-1839, 10 vols.); (2) K. Rosenkranz and F. W. Schubert (Leipzig, 1838-1840, 12 vols., the 12th containing a history of the Kantian school); (3) G. Hartenstein, "in chronological order" (Leipzig, 1867-1869, 8 vols.); (4) Kirchmann (in the "Philosophische Bibliothek," Berlin, 1868-1873, 8 vols. and supplement); (5) under the auspices of the Königlich Preussische Akademie der Wissenschaften a new collected edition was begun in 1900 (vol. ii., 1906) in charge of a number of editors. It was planned in four sections: Works, Letters, MSS. Remains and *Vorlesungen*. There are also useful editions of the three *Kritiks* by Kehrbach, and critical editions of the *Prolegomena* and *Kritik der reinen Vernunft* by B. Erdmann (see also his *Beiträge zur Geschichte und Revision des Textes von Kants Kritik der reinen Vernunft* (1900). A useful selection (in English) is that of John Watson, *The Philosophy of Kant* (Glasgow, 1888).

Translations. — There are translations in all the principal languages. The chief English translators are J. P. Mahaffy, W. Hastie, T. K. Abbott, J. H. Bernard and Belfort Bax. Their versions have been mentioned in the section on "Works" above.

Biographical. — Schubert in the 11th vol. of Rosenkranz's edition; Borowski, *Darstellung des Lebens una Charakters Kants* (Königsberg, 1804); Wasianski, *Kant in seinen letzten Lebensjahren* (Königsberg, 1804); Stuckenberg, *The Life of Immanuel Kant* (1882); Rudolf Reicke, *Kants Briefwechsel* (1900). See also several of the critical works below. On Kant's portraits see D. Minden, *Ueber Portraits und Abbildungen Imm. Kants* (1868) and cf. frontispieces of *Kantstudien* (as above).

Critical (in alphabetical order of authors). — R. Adamson, *Philosophy of Kant* (1879; Germ. trans., 1880); Felix Adler, *A Critique of Kant's Ethics* (1908); S. The Delphi Classics Catalogue

We are proud to present a listing of our complete catalogue of English titles, with new titles being added every month. Buying direct from our website means you can make great savings and take advantage of our instant Updates service. You can even purchase an entire series (Super Set) at a special discounted price.

Only from our website can readers purchase the special *Parts Edition* of our Complete Works titles. When you buy a Parts Edition, you will receive a folder of your chosen author's works, with each novel, play, poetry collection, non-fiction book and more divided into its own special volume. This allows you to read individual novels etc. and to know precisely where you are in an eBook. For more information, please visit our *Parts Edition* page.
