The moral politician will always act upon the following principle:— "If certain defects which could not have been avoided are found in the political constitution or foreign relations of a state, it is a duty for all, especially for the rulers of the state, to apply their whole energy to correcting them as soon as possible, and to bringing the constitution and political relations on these points into conformity with the Law of Nature, as it is held up as a model before us in the idea of reason; and this they should do even at a sacrifice of their own interest." Now it is contrary to all politics — which is, in this particular, in agreement with morals — to dissever any of the links binding citizens together in the state or nations in cosmopolitan union, before a better constitution is there to take the place of what has been thus destroyed. And hence it would be absurd indeed to demand that every imperfection in political matters must be violently altered on the spot. But, at the same time, it may be required of a ruler at least that he should earnestly keep the maxim in mind which points to the necessity of such a change; so that he may go on constantly approaching the end to be realised, namely, the best possible constitution according to the laws of right. Even although it is still under despotic rule, in accordance with its constitution as then existing, a state may govern itself on republican lines, until the people gradually become capable of being influenced by the mere idea of the authority of law, just as if it had physical power. And they become accordingly capable of self-legislation, their faculty for which is founded on original right. But if, through the violence of revolution, the product of a bad government, a constitution more in accord with the spirit of law were attained even by unlawful means, it should no longer be held justifiable to bring the people back to the old constitution, although, while the revolution was going on, every one who took part in it by use of force or stratagem, may have been justly punished as a rebel. As regards the external relations of nations, a state cannot be asked to give up its constitution, even although that be a despotism (which is, at the same time, the strongest constitution where foreign enemies are concerned), so long as it runs the risk of being immediately swallowed up by other states. Hence, when such a proposal is made, the state whose constitution is in question must at least be allowed to defer acting upon it until a more convenient time.[148*]

It is always possible that moralists who rule despotically, and are at a loss in practical matters, will come into collision with the rules of political wisdom in many ways, by adopting measures without sufficient deliberation which show themselves afterwards to have been overestimated. When they thus offend against nature, experience must gradually lead them into a better track. But, instead of this being the case, politicians who are fond of moralising do all they can to make moral improvement impossible and

to perpetuate violations of law, by extenuating political principles which are antagonistic to the idea of right, on the pretext that human nature is not capable of good, in the sense of the ideal which reason prescribes.

These politicians, instead of adopting an open, straightforward way of doing things (as they boast), mix themselves up in intrigue. They get at the authorities in power and say what will please them; their sole bent is to sacrifice the nation, or even, if they can, the whole world, with the one end in view that their own private interest may be forwarded. This is the manner of regular jurists (I mean the journeyman lawyer not the legislator), when they aspire to politics. For, as it is not their business to reason too nicely over legislation, but only to enforce the laws of the country, every legal constitution in its existing form and, when this is changed by the proper authorities, the one which takes its place, will always seem to them the best possible. And the consequence is that everything is purely mechanical. But this adroitness in suiting themselves to any circumstances may lead them to the delusion that they are also capable of giving an opinion about the principles of political constitutions in general, in so far as they conform to ideas of right, and are therefore not empirical, but *a priori*. And they may therefore brag about their knowledge of men, — which indeed one expects to find, since they have to deal with so many — without really knowing the nature of man and what can be made of it, to gain which knowledge a higher standpoint of anthropological observation than theirs is required. Filled with ideas of this kind, if they trespass outside their own sphere on the boundaries of political and international law, looked upon as ideals which reason holds before us, they can do so only in the spirit of chicanery. For they will follow their usual method of making everything conform mechanically to compulsory laws despotically made and enforced, even here, where the ideas of reason recognise the validity of a legal compulsory force, only when it is in accordance with the principles of freedom through which a permanently valid constitution becomes first of all possible. The would-be practical man, leaving out of account this idea of reason, thinks that he can solve this problem empirically by looking to the way in which those constitutions which have best survived the test of time were established, even although the spirit of these may have been generally contrary to the idea of right. The principles which he makes use of here, although indeed he does not make them public, amount pretty much to the following sophistical maxims.

1. **Fac et excusa.** Seize the most favourable opportunity for arbitrary usurpation — either of the authority of the state over its own people or over a neighbouring people; the justification of the act and extenuation of the use of force will come much more easily and gracefully, when the deed is done, than if one has to think out convincing reasons for taking this step and first hear through all the objections which can be made against it. This is especially true in the first case mentioned, where the supreme power in the state also controls the legislature which we must obey without any reasoning about it. Besides, this show of audacity in a statesman even lends him a certain semblance of inward conviction of the justice of his action; and once he has got so far the god of success (*bonus eventus*) is his best advocate.

2. **Si fecisti, nega.** As for any crime you have committed, such as has, for instance, brought your people to despair and thence to insurrection, deny that it has happened owing to any fault of yours. Say rather that it is all caused by the insubordination of your subjects, or, in the case of your having usurped a neighbouring state, that human nature is to blame; for, if a man is not ready to use force and steal a march upon his neighbour, he may certainly count on the latter forestalling him and taking him prisoner.

3. **Divide et impera.** That is to say, if there are certain privileged persons, holding authority among the people, who have merely chosen you for their sovereign as *primus inter pares*, bring about a quarrel among them, and make mischief between them and the people. Now back up the people with a dazzling promise of greater freedom; everything will now depend unconditionally on your will. Or again, if there is a difficulty with foreign states, then to stir up dissension among them is a pretty sure means of subjecting first one and then the other to your sway, under the pretext of aiding the weaker.

It is true that now-a-days no body is taken in by these political maxims, for they are all familiar to

everyone. Moreover, there is no need of being ashamed of them, as if their injustice were too patent. For the great Powers never feel shame before the judgment of the common herd, but only before one another; so that as far as this matter goes, it is not the revelation of these guiding principles of policy that can make rulers ashamed, but only the unsuccessful use of them. For as to the morality of these maxims, politicians are all agreed. Hence there is always left political prestige on which they can safely count; and this means the glory of increasing their power by any means that offer.[149*]

* * *

In all these twistings and turnings of an immoral doctrine of expediency which aims at substituting a state of peace for the warlike conditions in which men are placed by nature, so much at least is clear; — that men cannot get away from the idea of right in their private any more than in their public relations; and that they do not dare (this is indeed most strikingly seen in the concept of an international law) to base politics merely on the manipulations of expediency and therefore to refuse all obedience to the idea of a public right. On the contrary, they pay all fitting honour to the idea of right in itself, even although they should, at the same time, devise a hundred subterfuges and excuses to avoid it in practice, and should regard force, backed up by cunning, as having the authority which comes from being the source and unifying principle of all right. It will be well to put an end to this sophistry, if not to the injustice it extenuates, and to bring the false advocates of the mighty of the earth to confess that it is not right but might in whose interest they speak, and that it is the worship of might from which they take their cue, as if in this matter they had a right to command. In order to do this, we must first expose the delusion by which they deceive themselves and others; then discover the ultimate principle from which their plans for a perpetual peace proceed; and thence show that all the evil which stands in the way of the realisation of that ideal springs from the fact that the political moralist begins where the moral politician rightly ends and that, by subordinating principles to an end or putting the cart before the horse, he defeats his intention of bringing politics into harmony with morals.

In order to make practical philosophy consistent with itself, we must first decide the following question: — In dealing with the problems of practical reason must we begin from its material principle — the end as the object of free choice — or from its formal principle which is based merely on freedom in its external relation? — from which comes the following law:— “Act so that thou canst will that thy maxim should be a universal law, be the end of thy action what it will.”[150*]

Without doubt, the latter determining principle of action must stand first; for, as a principle of right, it carries unconditional necessity with it, whereas the former is obligatory only if we assume the empirical conditions of the end set before us, — that is to say, that it is an end capable of being practically realised. And if this end — as, for example, the end of perpetual peace — should be also a duty, this same duty must necessarily have been deduced from the formal principle governing the maxims which guide external action. Now the first principle is the principle of the political moralist; the problems of constitutional, international and cosmopolitan law are mere technical problems (*problema technicum*). The second or formal principle, on the other hand, as the principle of the moral politician who regards it as a moral problem (*problema morale*), differs widely from the other principle in its methods of bringing about perpetual peace, which we desire not only as a material good, but also as a state of things resulting from our recognition of the precepts of duty.[151*]

To solve the first problem — that, namely, of political expediency — much knowledge of nature is required, that her mechanical laws may be employed for the end in view. And yet the result of all knowledge of this kind is uncertain, as far as perpetual peace is concerned. This we find to be so, whichever of the three departments of public law we take. It is uncertain whether a people could be better kept in obedience and at the same time prosperity by severity or by baits held out to their vanity; whether

they would be better governed under the sovereignty of a single individual or by the authority of several acting together; whether the combined authority might be better secured merely, say, by an official nobility or by the power of the people within the state; and, finally, whether such conditions could be long maintained. There are examples to the contrary in history in the case of all forms of government, with the exception of the only true republican constitution, the idea of which can occur only to a moral politician. Still more uncertain is a law of nations, ostensibly established upon statutes devised by ministers; for this amounts in fact to mere empty words, and rests on treaties which, in the very act of ratification, contain a secret reservation of the right to violate them. On the other hand, the solution of the second problem — the problem of political wisdom — forces itself, we may say, upon us; it is quite obvious to every one, and puts all crooked dealings to shame; it leads, too, straight to the desired end, while at the same time, discretion warns us not to drag in the conditions of perpetual peace by force, but to take time and approach this ideal gradually as favourable circumstances permit.

This may be expressed in the following maxim:— "Seek ye first the kingdom of pure practical reason and its righteousness, and the object of your endeavour, the blessing of perpetual peace, will be added unto you." For the science of morals generally has this peculiarity, — and it has it also with regard to the moral principles of public law, and therefore with regard to a science of politics knowable *a priori*, — that the less it makes a man's conduct depend on the end he has set before him, his purposed material or moral gain, so much the more, nevertheless, does it conform in general to this end. The reason for this is that it is just the universal will, given *a priori*, which exists in a people or in the relation of different peoples to one another, that alone determines what is lawful among men. This union of individual wills, however, if we proceed consistently in practice, in observance of the mechanical laws of nature, may be at the same time the cause of bringing about the result intended and practically realizing the idea of right. Hence it is, for example, a principle of moral politics that a people should unite into a state according to the only valid concepts of right, the ideas of freedom and equality; and this principle is not based on expediency, but upon duty. Political moralists, however, do not deserve a hearing, much and sophistically as they may reason about the existence, in a multitude of men forming a society, of certain natural tendencies which would weaken those principles and defeat their intention. They may endeavour to prove their assertion by giving instances of badly organised constitutions, chosen both from ancient and modern times, (as, for example, democracies without a representative system); but such arguments are to be treated with contempt, all the more, because a pernicious theory of this kind may perhaps even bring about the evil which it prophesies. For, in accordance with such reasoning, man is thrown into a class with all other living machines which only require the consciousness that they are not free creatures to make them in their own judgment the most miserable of all beings.

Fiat justitia, pereat mundus. This saying has become proverbial, and although it savours a little of boastfulness, is also true. We may translate it thus:— "Let justice rule on earth, although all the rogues in the world should go to the bottom." It is a good, honest principle of right cutting off all the crooked ways made by knavery or violence. It must not, however, be misunderstood as allowing anyone to exercise his own rights with the utmost severity, a course in contradiction to our moral duty; but we must take it to signify an obligation, binding upon rulers, to refrain from refusing to yield anyone his rights or from curtailing them, out of personal feeling or sympathy for others. For this end, in particular, we require, firstly, that a state should have an internal political constitution, established according to the pure principles of right; secondly, that a union should be formed between this state and neighbouring or distant nations for a legal settlement of their differences, after the analogy of the universal state. This proposition means nothing more than this: — Political maxims must not start from the idea of a prosperity and happiness which are to be expected from observance of such precepts in every state; that is, not from the end which each nation makes the object of its will as the highest empirical principle of political wisdom; but they must set out from the pure concept of the duty of right, from the "*ought*" whose principle is given

a priori through pure reason. This is the law, whatever the material consequences may be. The world will certainly not perish by any means, because the number of wicked people in it is becoming fewer. The morally bad has one peculiarity, inseparable from its nature; — in its purposes, especially in relation to other evil influences, it is in contradiction with itself, and counteracts its own natural effect, and thus makes room for the moral principle of good, although advance in this direction may be slow.

Hence objectively, in theory, there is no quarrel between morals and politics. But subjectively, in the self-seeking tendencies of men (which we cannot actually call their morality, as we would a course of action based on maxims of reason,) this disagreement in principle exists and may always survive; for it serves as a whetstone to virtue. According to the principle, *Tu ne cede malis, sed contra audentior ito*, the true courage of virtue in the present case lies not so much in facing the evils and self-sacrifices which must be met here as in firmly confronting the evil principle in our own nature and conquering its wiles. For this is a principle far more dangerous, false, treacherous and sophistical which puts forward the weakness in human nature as a justification for every transgression.

In fact the political moralist may say that a ruler and people, or nation and nation do *one another* no wrong, when they enter on a war with violence or cunning, although they do wrong, generally speaking, in refusing to respect the idea of right which alone could establish peace for all time. For, as both are equally wrongly disposed to one another, each transgressing the duty he owes to his neighbour, they are both quite rightly served, when they are thus destroyed in war. This mutual destruction stops short at the point of extermination, so that there are always enough of the race left to keep this game going on through all the ages, and a far-off posterity may take warning by them. The Providence that orders the course of the world is hereby justified. For the moral principle in mankind never becomes extinguished, and human reason, fitted for the practical realisation of ideas of right according to that principle, grows continually in fitness for that purpose with the ever advancing march of culture; while at the same time, it must be said, the guilt of transgression increases as well. But it seems that, by no theodicy or vindication of the justice of God, can we justify Creation in putting such a race of corrupt creatures into the world at all, if, that is, we assume that the human race neither will nor can ever be in a happier condition than it is now. This standpoint, however, is too high a one for us to judge from, or to theorise, with the limited concepts we have at our command, about the wisdom of that supreme Power which is unknowable by us. We are inevitably driven to such despairing conclusions as these, if we do not admit that the pure principles of right have objective reality — that is to say, are capable of being practically realised — and consequently that action must be taken on the part of the people of a state and, further, by states in relation to one another, whatever arguments empirical politics may bring forward against this course. Politics in the real sense cannot take a step forward without first paying homage to the principles of morals. And, although politics, *per se*, is a difficult art,[152*] in its union with morals no art is required; for in the case of a conflict arising between the two sciences, the moralist can cut asunder the knot which politics is unable to untie. Right must be held sacred by man, however great the cost and sacrifice to the ruling power. Here is no half-and-half course. We cannot devise a happy medium between right and expediency, a right pragmatically conditioned. But all politics must bend the knee to the principle of right, and may, in that way, hope to reach, although slowly perhaps, a level whence it may shine upon men for all time.

APPENDIX II

CONCERNING THE HARMONY OF POLITICS WITH MORALS ACCORDING TO THE TRANSCENDENTAL IDEA OF PUBLIC RIGHT

If I look at public right from the point of view of most professors of law, and abstract from its *matter* or its empirical elements, varying according to the circumstances given in our experience of individuals in a state or of states among themselves, then there remains the *form* of publicity. The possibility of this publicity, every legal title implies. For without it there could be no justice, which can only be thought as before the eyes of men; and, without justice, there would be no right, for, from justice only, right can come.

This characteristic of publicity must belong to every legal title. Hence, as, in any particular case that occurs, there is no difficulty in deciding whether this essential attribute is present or not, (whether, that is, it is reconcilable with the principles of the agent or not), it furnishes an easily applied criterion which is to be found *a priori* in the reason, so that in the particular case we can at once recognise the falsity or illegality of a proposed claim (*praetensio juris*), as it were by an experiment of pure reason.

Having thus, as it were, abstracted from all the empirical elements contained in the concept of a political and international law, such as, for instance, the evil tendency in human nature which makes compulsion necessary, we may give the following proposition as the *transcendental formula* of public right:— “All actions relating to the rights of other men are wrong, if the maxims from which they follow are inconsistent with publicity.”

This principle must be regarded not merely as ethical, as belonging to the doctrine of virtue, but also as juridical, referring to the rights of men. For there is something wrong in a maxim of conduct which I cannot divulge without at once defeating my purpose, a maxim which must therefore be kept secret, if it is to succeed, and which I could not publicly acknowledge without infallibly stirring up the opposition of everyone. This necessary and universal resistance with which everyone meets me, a resistance therefore evident *a priori*, can be due to no other cause than the injustice with which such a maxim threatens everyone. Further, this testing principle is merely negative; that is, it serves only as a means by which we may know when an action is unjust to others. Like axioms, it has a certainty incapable of demonstration; it is besides easy of application as appears from the following examples of public right.

1. — **Constitutional Law.** Let us take in the first place the public law of the state (*jus civitatis*), particularly in its application to matters within the state. Here a question arises which many think difficult to answer, but which the transcendental principle of publicity solves quite readily:— “Is revolution a legitimate means for a people to adopt, for the purpose of throwing off the oppressive yoke of a so-called tyrant (*non titulo, sed exercitio talis*)?” The rights of a nation are violated in a government of this kind, and no wrong is done to the tyrant in dethroning him. Of this there is no doubt. None the less, it is in the highest degree wrong of the subjects to prosecute their rights in this way; and they would be just as little justified in complaining, if they happened to be defeated in their attempt and had to endure the severest punishment in consequence.

A great many reasons for and against both sides of this question may be given, if we seek to settle it by a dogmatic deduction of the principles of right. But the transcendental principle of the publicity of public right can spare itself this diffuse argumentation. For, according to that principle, the people would ask themselves, before the civil contract was made, whether they could venture to publish maxims, proposing insurrection when a favourable opportunity should present itself. It is quite clear that if, when a constitution is established, it were made a condition that force may be exercised against the sovereign under certain circumstances, the people would be obliged to claim a lawful authority higher than his. But

in that case, the so-called sovereign would be no longer sovereign: or, if both powers, that of the sovereign and that of the people, were made a condition of the constitution of the state, then its establishment (which was the aim of the people) would be impossible. The wrongfulness of revolution is quite obvious from the fact that openly to acknowledge maxims which justify this step would make attainment of the end at which they aim impossible. We are obliged to keep them secret. But this secrecy would not be necessary on the part of the head of the state. He may say quite plainly that the ringleaders of every rebellion will be punished by death, even although they may hold that it was he who first transgressed the fundamental law. For, if a ruler is conscious of possessing irresistible sovereign power (and this must be assumed in every civil constitution, because a sovereign who has not power to protect any individual member of the nation against his neighbour has also not the right to exercise authority over him), then he need have no fear that making known the maxims which guide him will cause the defeat of his plans. And it is quite consistent with this view to hold that, if the people are successful in their insurrection, the sovereign must return to the rank of a subject, and refrain from inciting rebellion with a view to regaining his lost sovereignty. At the same time he need have no fear of being called to account for his former administration.[153*]

2. — **International Law.** There can be no question of an international law, except on the assumption of some kind of a law-governed state of things, the external condition under which any right can belong to man. For the very idea of international law, as public right, implies the publication of a universal will determining the rights and property of each individual nation; and this *status juridicus* must spring out of a contract of some sort which may not, like the contract to which the state owes its origin, be founded upon compulsory laws, but may be, at the most, the agreement of a permanent free association such as the federation of the different states, to which we have alluded above. For, without the control of law to some extent, to serve as an active bond of union among different merely natural or moral individuals, — that is to say, in a state of nature, — there can only be private law. And here we find a disagreement between morals, regarded as the science of right, and politics. The criterion, obtained by observing the effect of publicity on maxims, is just as easily applied, but only when we understand that this agreement binds the contracting states solely with the object that peace may be preserved among them, and between them and other states; in no sense with a view to the acquisition of new territory or power. The following instances of antinomy occur between politics and morals, which are given here with the solution in each case.

a. “When either of these states has promised something to another, (as, for instance, assistance, or a relinquishment of certain territory, or subsidies and such like), the question may arise whether, in a case where the safety of the state thus bound depends on its evading the fulfilment of this promise, it can do so by maintaining a right to be regarded as a double person: — firstly, as sovereign and accountable to no one in the state of which that sovereign power is head; and, secondly, merely as the highest official in the service of that state, who is obliged to answer to the state for every action. And the result of this is that the state is acquitted in its second capacity of any obligation to which it has committed itself in the first.” But, if a nation or its sovereign proclaimed these maxims, the natural consequence would be that every other would flee from it, or unite with other states to oppose such pretensions. And this is a proof that politics, with all its cunning, defeats its own ends, if the test of making principles of action public, which we have indicated, be applied. Hence the maxim we have quoted must be wrong.

b. “If a state which has increased its power to a formidable extent (*potentia tremenda*) excites anxiety in its neighbours, is it right to assume that, since it has the means, it will also have the will to oppress others; and does that give less powerful states a right to unite and attack the greater nation without any definite cause of offence?” A state which would here answer openly in the affirmative would only bring the evil about more surely and speedily. For the greater power would forestall those smaller nations, and their union would be but a weak reed of defence against a state which knew how to apply the maxim,

divide et impera. This maxim of political expediency then, when openly acknowledged, necessarily defeats the end at which it aims, and is therefore wrong.

c. "If a smaller state by its geographical position breaks up the territory of a greater, so as to prevent a unity necessary to the preservation of that state, is the latter not justified in subjugating its less powerful neighbour and uniting the territory in question with its own?" We can easily see that the greater state dare not publish such a maxim beforehand; for either all smaller states would without loss of time unite against it, or other powers would contend for this booty. Hence the impracticability of such a maxim becomes evident under the light of publicity. And this is a sign that it is wrong, and that in a very great degree; for, although the victim of an act of injustice may be of small account, that does not prevent the injustice done from being very great.

3. — **Cosmopolitan Law.** We may pass over this department of right in silence, for, owing to its analogy with international law, its maxims are easily specified and estimated.

* * *

In this principle of the incompatibility of the maxims of international law with their publicity, we have a good indication of the non-agreement between politics and morals, regarded as a science of right. Now we require to know under what conditions these maxims do agree with the law of nations. For we cannot conclude that the converse holds, and that all maxims which can bear publicity are therefore just. For anyone who has a decided supremacy has no need to make any secret about his maxims. The condition of a law of nations being possible at all is that, in the first place, there should be a law-governed state of things. If this is not so, there can be no public right, and all right which we can think of outside the law-governed state, — that is to say, in the state of nature, — is mere private right. Now we have seen above that something of the nature of a federation between nations, for the sole purpose of doing away with war, is the only rightful condition of things reconcilable with their individual freedom. Hence the agreement of politics and morals is only possible in a federative union, a union which is necessarily given *a priori*, according to the principles of right. And the lawful basis of all politics can only be the establishment of this union in its widest possible extent. Apart from this end, all political sophistry is folly and veiled injustice. Now this sham politics has a casuistry, not to be excelled in the best Jesuit school. It has its mental reservation (*reservatio mentalis*): as in the drawing up of a public treaty in such terms as we can, if we will, interpret when occasion serves to our advantage; for example, the distinction between the *status quo* in fact (*de fait*) and in right (*de droit*). Secondly, it has its probabilism; when it pretends to discover evil intentions in another, or makes, the probability of their possible future ascendency a lawful reason for bringing about the destruction of other peaceful states. Finally, it has its philosophical sin (*peccatum philosophicum*, *peccatillum*, *baggatelle*) which is that of holding it a trifle easily pardoned that a smaller state should be swallowed up, if this be to the gain of a nation much more powerful; for such an increase in power is supposed to tend to the greater prosperity of the whole world.[154*]

Duplicity gives politics the advantage of using one branch or the other of morals, just as suits its own ends. The love of our fellowmen is a duty: so too is respect for their rights. But the former is only conditional: the latter, on the other hand, an unconditional, absolutely imperative duty; and anyone who would give himself up to the sweet consciousness of well-doing must be first perfectly assured that he has not transgressed its commands. Politics has no difficulty in agreeing with morals in the first sense of the term, as ethics, to secure that men should give to superiors their rights. But when it comes to morals, in its second aspect, as the science of right before which politics must bow the knee, the politician finds it prudent to have nothing to do with compacts and rather to deny all reality to morals in this sense, and reduce all duty to mere benevolence. Philosophy could easily frustrate the artifices of a politics like this, which shuns the light of criticism, by publishing its maxims, if only statesmen would have the courage to

grant philosophers the right to ventilate their opinions.

With this end in view, I propose another principle of public right, which is at once transcendental and affirmative. Its formula would be as follows:— “All maxims which require publicity, in order that they may not fail to attain their end, are in agreement both with right and politics.”

For, if these maxims can only attain the end at which they aim by being published, they must be in harmony with the universal end of mankind, which is happiness; and to be in sympathy with this (to make the people contented with their lot) is the real business of politics. Now, if this end should be attainable only by publicity, or in other words, through the removal of all distrust of the maxims of politics, these must be in harmony with the right of the people; for a union of the ends of all is only possible in a harmony with this right.

I must postpone the further development and discussion of this principle till another opportunity. That it is a transcendental formula is quite evident from the fact that all the empirical conditions of a doctrine of happiness, or the *matter* of law, are absent, and that it has regard only to the *form* of universal conformity to law.

* * *

If it is our duty to realise a state of public right, if at the same time there are good grounds for hope that this ideal may be realised, although only by an approximation advancing *ad infinitum,* then perpetual peace, following hitherto falsely so-called conclusions of peace, which have been in reality mere cessations of hostilities, is no mere empty idea. But rather we have here a problem which gradually works out its own solution and, as the periods in which a given advance takes place towards the realisation of the ideal of perpetual peace will, we hope, become with the passing of time shorter and shorter, we must approach ever nearer to this goal.

FOOTNOTES

[1] Cf. his *Studies in Political and Social Ethics*, p, 170.

[2] For the inconsistency between the views expressed by Rousseau on this subject in the *Discourses* and in the *Contrat Social* (Cf. I. Chs. VI., VIII.) see Ritchie's *Natural Right*, Ch. III., p, 49; Caird's essay on Rousseau in his *Essays on Literature and Philosophy*, Vol. I.; and Morley's *Rousseau*, Vol. I., Ch. V.; Vol. II., Ch. XII.

[3] The theory that the golden age was identical with the state of nature, Professor D. G. Ritchie ascribes to Locke (see *Natural Right*, Ch. II.,). Locke, he says, "has an idea of a golden age" existing even after government has come into existence — a time when people did not need "to examine the original and rights of government." *Civil Government*, II., § 111. A little confusion on the part of his readers (perhaps in his own mind) makes it possible to regard the state of nature as itself the golden age, and the way is prepared for the favourite theory of the eighteenth century: —

"Nor think in nature's state they blindly trod;

The state of nature was the reign of God:

Self-love and social at her birth began,

Union the bond of all things and of man.

Pride then was not, nor arts that pride to aid;

Man walk'd with beast, joint tenant of the shade;

The same his table, and the same his bed;

No murder cloath'd him, and no murder fed."

Essay on Man, III., 147 *seq.*

In these lines of Pope's the state of nature is identified with the golden age of the Greek and Latin poets; and "the reign of God" is an equivalent for Locke's words, "has a law of nature to govern it."

[4] Cf. *Republic*, II. 369. "A state," says Socrates, "arises out of the needs of mankind: no one is self-sufficing, but all of us have many wants."

[5] See Hume's account of the origin of government (*Treatise*, III., Part II., Sect. VIII.). There are, he says, American tribes "where men live in concord and amity among themselves without any established government; and never pay submission to any of their fellows, except in time of war, when their captain enjoys a shadow of authority, which he loses after their return from the field, and the establishment of peace with the neighbouring tribes. This authority, however, instructs them in the advantages of government, and teaches them to have recourse to it, when either by the pillage of war, by commerce, or by any fortuitous inventions, their riches and possessions have become so considerable as to make them forget, on every emergence, the interest they have in the preservation of peace and justice.... Camps are the true mothers of cities; and as war cannot be administered, by reason of the suddenness of every exigency, without some authority in a single person, the same kind of authority naturally takes place in that civil government, which succeeds the military."

Cf. Cowper: *The Winter Morning Walk*: —

"...........and ere long,

When man was multiplied and spread abroad

In tribes and clans, and had begun to call

These meadows and that range of hills his own,

The tasted sweets of property begat

Desire of more; ....

....

Thus wars began on earth. These fought for spoil,

And those in self-defence. Savage at first

The onset, and irregular. At length

One eminent above the rest, for strength,

For stratagem, or courage, or for all,

Was chosen leader. Him they served in war,

And him in peace for sake of warlike deeds

Rev'renced no less.........

....

Thus kings were first invented."

[6] "Among uncivilised nations, there is but one profession honourable, that of arms. All the ingenuity and vigour of the human mind are exerted in acquiring military skill or address." Cf. Robertson's *History of Charles V.*, (*Works*, 1813, vol. V.) Sect. I. vii.

[7] Similarly we find that the original meaning of the Latin word "*hostis*" was "a stranger."

[8] In Aristotle we find the high-water mark of Greek thinking on this subject. "The object of military training," says he, (*Politics*, Bk. IV. Ch. XIV., Welldon's translation — in older editions Bk. VII.) "should be not to enslave persons who do not deserve slavery, but firstly to secure ourselves against becoming the slaves of others; secondly, to seek imperial power not with a view to a universal despotic authority, but for the benefit of the subjects whom we rule, and thirdly, to exercise despotic power over those who are deserving to be slaves. That the legislator should rather make it his object so to order his legislation upon military and other matters as to promote leisure and peace is a theory borne out by the facts of history." ... (*loc. cit.* Ch. XV.). "War, as we have remarked several times, has its end in peace."

Aristotle strongly condemns the Lacedæmonians and Cretans for regarding war and conquest as the sole ends to which all law and education should be directed. Also in non-Greek tribes like the Scythians, Persians, Thracians and Celts he says, only military power is admired by the people and encouraged by the state. "There was formerly too a law in Macedonia that any one who had never slain an enemy should wear the halter about his neck." Among the Iberians too, a military people, "it is the custom to set around the tomb of a deceased warrior a number of obelisks corresponding to the number of enemies he has killed.... Yet ... it may well appear to be a startling paradox that it should be the function of a Statesman to succeed in devising the means of rule and mastery over neighbouring peoples whether with or against

their own will. How can such action be worthy of a statesman or legislator, when it has not even the sanction of law?” (*op. cit*., IV. Ch. 2.)

We see that Aristotle disapproves of a glorification of war for its own sake, and regards it as justifiable only in certain circumstances. Methods of warfare adopted and proved in the East would not have been possible in Greece. An act of treachery, for example, such as that of Jael, (*Judges* IV. 17) which was extolled in songs of praise by the Jews, (*loc. cit.* V. 24) the Greek people would have been inclined to repudiate. The stories of Roman history, the behaviour of Fabricius, for instance, or Regulus and the honourable conduct of prisoners on various occasions released on parole, show that this consciousness of certain principles of honour in warfare was still more highly developed in Rome.

Socrates in the *Republic* (V. 469, 470) gives expression to a feeling which was gradually gaining ground in Greece, that war between Hellenic tribes was much more serious than war between Greeks and barbarians. In such civil warfare, he considered, the defeated ought not to be reduced to slavery, nor the slain despoiled, nor Hellenic territory devastated. For any difference between Greek and Greek is to “be regarded by them as discord only — a quarrel among friends, which is not to be called war”.... “Our citizens *i.e.* in the ideal republic should thus deal with their Hellenic enemies; and with barbarians as the Hellenes now deal with one another.” (V. 471.)

The views of Plato and Aristotle on this and other questions were in advance of the custom and practice of their time.

[9] “The Lord is a man of war,” said Moses (*Exodus* XV. 3). Cf. *Psalms* XXIV. 8. He is “mighty in battle.”

[10] This was bound up with the very essence of Islam; the devout Mussulman could suffer the existence of no unbeliever. Tolerance or indifference was an attitude which his faith made impossible. “When ye encounter the unbelievers,” quoth the prophet (*Koran*, ch. 47), “strike off their heads, until ye have made a great slaughter among them.... Verily if God pleased he could take vengeance on them without your assistance; but he commandeth you to fight his battles.”

The propagation of the faith by the sword was not only commanded by the Mohammedan religion: it was that religion itself.

[11] See *Acts* X. 28:— “Ye know that it is an unlawful thing for a man that is a Jew to keep company, or come unto one of another nation.”

[12] Neither, however, is there any which regards the soldier as a murderer.

[13] In the early centuries of our era Christians seem to have occasionally refused to serve in the army from religious scruples. But soldiers were not always required to change their profession after baptism. And in

Acts X., for example, nothing is said to indicate that the centurion, Cornelius, would have to leave the Roman army. See Tertullian: *De Corona* (Anti-Nicene Christian Library), .

14 There were so-called “Sacred Wars” in Greece, but these were due mainly to disputes caused by the Amphictyonic League. They were not religious, in the sense in which we apply the epithet to the Thirty Years’ war.

15 “The administration of justice among rude illiterate people, was not so accurate, or decisive, or uniform, as to induce men to submit implicitly to its determinations. Every offended baron buckled on his armour, and sought redress at the head of his vassals. His adversary met him in like hostile array. Neither of them appealed to impotent laws which could afford them no protection. Neither of them would submit points, in which their honour and their passions were warmly interested, to the slow determination of a judicial inquiry. Both trusted to their swords for the decision of the contest.” Robertson’s *History of Charles V.*, (*Works*, vol. V.) Sect. I., .

16 Erasmus in the “Ἰχθυοφαγία” (*Colloquies*, Bailey’s ed., Vol. II., p, 56) puts forward the suggestion that a general peace might be obtained in the Christian world, if the Emperor would remit something of his right and the Pope some part of his.

17 Cf. Robertson, *op. cit.*, Sect. III., , *seq.*

18 Robertson (*op. cit.*, Note XXI.,) quotes the following statement: “flamma, ferro, caede, possessiones ecclesiarum praelati defendebant.” (Guido Abbas ap. Du Cange, .)

19 J. A. Farrar, in a pamphlet, (reprinted from the *Gentleman’s Magazine*, vol. 257, 1884) on *War and Christianity*, quotes the following passage from Wycliffe in which he protests against this blot upon the Church and Christian professions.— “Friars now say that bishops can fight best of all men, and that it falleth most properly to them, since they are lords of all this world. They say Christ bade His disciples sell their coats, and buy them swords; but whereto, if not to fight? Thus friars make a great array, and stir up many men to fight. But Christ taught not His apostles to fight with a sword of iron, but with the sword of God’s Word, and which standeth in meekness of heart and in the prudence of man’s tongue.... If man-slaying in others be odious to God, much more in priests, who should be vicars of Christ.” See also the passage where Erasmus points out that King David was not permitted to build a temple to God, because he was a man of blood. “Nolo clericos ullo sanguine contaminari. Gravis impietas!” (*Opera*, IX., 370 B.)

This question had already been considered by Thomas Aquinas, who decided that the clergy ought not to be allowed to fight, because the practices of warfare, although right and meritorious in themselves, were not in accordance with a holy calling. (*Summa*, II. 2: Qu. 40.)

Aquinas held that war — excluding private war — is justifiable in a just cause. So too did Luther, (cf. his pamphlet: *Ob Kriegsleute auch in seligem Stande sein können?*) Calvin and Zwingli, the last of whom

died sword in hand.

With regard to the question of a fighting clergy, the passage quoted from Origen (p, 15, above) has considerable interest, Origen looks upon the active participation of priests in warfare as something which everyone would admit to be impossible.

[20] See also the *Querela Pacis*, 630 B., (*Opera*, IV.):— “Whosoever preaches Christ, preaches peace.” Erasmus even goes the length of saying that the most iniquitous peace is better than the most just war (*op. cit.*, 636 C).

[21] Cf. Robertson, *op. cit.*, Note XXI. and Sect. I., .

[22] It is uncertain in what year the *De Jure Belli* of Gentilis was published — a work to which Grotius acknowledges considerable indebtedness. Whewell, in the preface to his translation of Grotius, gives the date 1598, but some writers suppose it to have been ten years earlier.

[23] This came about in two ways. The Church of Rome discouraged the growth of national sentiment. At the Reformation the independence and unity of the different nations were for the first time recognised. That is to say, the Reformation laid the foundation for a science of international law. But, from another point of view, it not only made such a code of rules possible, it made it necessary. The effect of the Reformation was not to diminish the number of wars in which religious belief could play a part. Moreover, it displaced the Pope from his former position as arbiter in Europe without setting up any judicial tribunal in his stead.

[24] Cf. Cicero: *De Officiis*, I. xi. “Belli quidem aequitas sanctissime feciali populi Romani jure perscripta est.” (See the reference to Lawrence’s comments on this subject, above.)

“Wars,” says Cicero, “are to be undertaken for this end, that we may live in peace without being injured; but when we obtain the victory, we must preserve those enemies who behaved without cruelty or inhumanity during the war: for example, our forefathers received, even as members of their state, the Tuscans, the Æqui, the Volscians, the Sabines and the Hernici, but utterly destroyed Carthage and Numantia.... And, while we are bound to exercise consideration toward those whom we have conquered by force, so those should be received into our protection who throw themselves upon the honour of our general, and lay down their arms,” (*op. cit.*, I. xi., Bohn’s Translation).... “In engaging in war we ought to make it appear that we have no other view but peace.” (*op. cit.*, I. xxiii.)

In fulfilling a treaty we must not sacrifice the spirit to the letter (*De Officiis*, I. x). “There are also rights of war, and the faith of an oath is often to be kept with an enemy.” (*op. cit.*, III. xxix.)

This is the first statement by a classical writer in which the idea of justice being due to an enemy appears.

Cicero goes further. Particular states, he says, (*De Legibus*, I. i.) are only members of a whole governed by reason.

[25] The saying is attributed to Pompey:— "Shall I, when I am preparing for war, think of the laws?"

[26] This implied, however, the idea of a united Christendom as against the infidel, with which we may compare the idea of a united Hellas against Persia. In such things we have the germ not only of international law, but of the ideal of federation.

[27] See Maine's *Ancient Law*, p-53: p-101. Grotius wrongly understood "Jus Gentium," ("a collection of rules and principles, determined by observation to be common to the institutions which prevailed among the various Italian tribes") to mean "Jus *inter* gentes." The Roman expression for International Law was not "Jus Gentium," but "Jus Feciale."

"Having adopted from the Antonine jurisconsults," says Maine, "the position that the Jus Gentium and the Jus Naturæ were identical, Grotius, with his immediate predecessors and his immediate successors, attributed to the Law of Nature an authority which would never perhaps have been claimed for it, if "Law of Nations" had not in that age been an ambiguous expression. They laid down unreservedly that Natural Law is the code of states, and thus put in operation a process which has continued almost down to our own day, the process of engrafting on the international system rules which are supposed to have been evolved from the unassisted contemplation of the conception of Nature. There is, too, one consequence of immense practical importance to mankind which, though not unknown during the early modern history of Europe, was never clearly or universally acknowledged till the doctrines of the Grotian school had prevailed. If the society of nations is governed by Natural Law, the atoms which compose it must be absolutely equal. Men under the sceptre of Nature are all equal, and accordingly commonwealths are equal if the international state be one of nature. The proposition that independent communities, however different in size and power, are all equal in the view of the Law of Nations, has largely contributed to the happiness of mankind, though it is constantly threatened by the political tendencies of each successive age. It is a doctrine which probably would never have obtained a secure footing at all if International Law had not been entirely derived from the majestic claims of Nature by the Publicists who wrote after the revival of letters." (*Op. cit.*, .)

[28] The name "International Law" was first given to the law of nations by Bentham. (*Principles of Morals and Legislation, XIX.* § xxv.)

[29] In the Peace of Westphalia, 1648, the balance of power in Europe was recognised on the basis of terms such as these.

[30] Grotius, however, is a painstaking student of Scripture, and is willing to say something in favour of peace — not a permanent peace, that is to say, the idea of which would scarcely be likely to occur to anyone in the early years of the seventeenth century — but a plea for fewer, shorter wars. "If therefore," he says, "a peace sufficiently safe can be had, it is not ill secured by the condonation of offenses, and

damages, and expenses: especially among Christians, to whom the Lord has given his peace as his legacy. And so St. Paul, his best interpreter, exhorts us to live at peace with all men.... May God write these lessons — He who alone can — on the hearts of all those who have the affairs of Christendom in their hands.” (*De Jure Belli et Pacis*, III. Ch. XXV., Whewell’s translation.)

See also *op. cit.*, II., Ch. XXIII., Sect. VIII., where Grotius recommends that Congresses of Christian Powers should be held with a view to the peaceful settlement of international differences.

[31] Puffendorf’s best known work, *De Jure Naturæ et Gentium*, was published in 1672.

[32] *Le Droit des Gens* was published in 1758 and translated into English by Joseph Chitty in 1797, (2nd ed., 1834).

[33] *Mémoires ou Œconomies Royales D’Estat, Domestiques, Politiques et Militaires de Henri le Grand, par Maximilian de Bethune, Duc de Sully.*

[34] See *International Tribunals* (1899), *seq.* Penn’s *Essay towards the Present and Future Peace of Europe* was written about 1693, but is not included in all editions of his works.

[35] *Projet de traité pour rendre la paix perpétuelle entre les souverains chrétiens*. The first two volumes of this work were published in 1713 (trans. London, 1714); a third volume followed in 1717.

[36] The main articles of this and other peace projects are to be found in *International Tribunals*, published by the Peace Society.

[37] Professor Lorimer points out that Prussia, then the Duchy of Brandenburg, is not mentioned. (*Institutes of the Law of Nations*, II. Ch. VII., .)

[38] The same objection was raised by Leibniz (see his *Observations* on St. Pierre’s *Projet*) to the scheme of Henry IV., who, says Leibniz, thought more of overthrowing the house of Austria than of establishing a society of sovereigns.

[39] *Project*, Art. VI., Eng. trans. (1714), .

[40] St. Pierre was not blind to this aspect of the question. Among the critical objections which he anticipates to his plan is this, — that it promises too great an increase of strength to the house of France, and that therefore the author would have been wiser to conceal his nationality.

[41] St. Pierre, in what may be called an apology for the wording of the title of his book (above, , *note*), justifies his confidence in these words:— "The Pilot who himself seems uncertain of the Success of his Voyage is not likely to persuade the Passenger to embark.... I am persuaded, that it is not impossible to find out Means sufficient and practicable to settle an Everlasting Peace among Christians; and even believe, that the Means which I have thought of are of that Nature." (Preface to *Project*, Eng. trans., 1714.)

[42] *Leviathan*, I. Ch. V.

[43] See too Voltaire's allusion to St. Pierre in his *Dictionary*, under "Religion."

[44] Leibniz regarded the project of St. Pierre with an indifference, somewhat tinged with contempt. In a letter to Grimarest, (*Leibnit*. *Opera*, Dutens' ed., 1768, Vol. V., p, 66: in *Epist*., ed. Kortholt., Vol. III.,) he writes:— "I have seen something of M. de St. Pierre's plan for maintaining perpetual peace in Europe. It reminds me of an inscription outside of a churchyard which ran, '*Pax Perpetua*. For the dead, it is true, fight no more. But the living, are of another mind, and the mightiest among them have little respect for tribunals.'" This is followed by the ironical suggestion that a court of arbitration should be established at Rome of which the Pope should be made president; while at the same time the old spiritual authority should be restored to the Church, and excommunication be the punishment of non-compliance with the arbitral decree. "Such plans," he adds, "are as likely to succeed as that of M. de St. Pierre. But as we are allowed to write novels, why should we find fault with fiction which would bring back the golden age?" But see also *Observations sur le Projet d'une Paix Perpétuelle de M. l'Abbé de St. Pierre* (Dutens, V., esp.) and the letter to Remond de Montmort (*ibid*. p, 21) where Leibniz considers this project rather more seriously.

[45] "C'est un livre solide et sensé," says Rousseau (*Jugement sur la Paix Perpétuelle*), "et il est très important qu'il existe." This *Jugement* is appended to Rousseau's *Extrait du Projet de Paix Perpétuelle de Monsieur l'Abbé de Saint-Pierre*, 1761.

[46] Cf. Cowper: *The Winter Morning Walk*: —

"Great princes have great playthings. Some have play'd

At hewing mountains into men, and some

At building human wonders mountain high.

....

....

Some seek diversion in the tented field,

And make the sorrows of mankind their sport.

But war’s a game, which, were their subjects wise,

Kings should not play at. Nations would do well

T’extort their truncheons from the puny hands

Of heroes, whose infirm and baby minds

Are gratified with mischief, and who spoil,

Because men suffer it, their toy the world.”

[47] “Les troupes réglées, peste et dépopulation de l’Europe, ne sont bonnes qu’a deux fins: ou pour attaquer et conquérir les voisins, ou pour enchâiner et asservir les citoyens.” (*Gouvernement de Pologne*, Ch. XII.)

[48] Hobbes realises clearly that there probably never was such a state of war all over the world nor a state of nature conforming to a common type. The case is parallel to the use of the term “original contract” as an explanation of the manner in which the civil state came to be formed. (Cf. , *note*.)

See also Hume (*Inquiry concerning the Principles of Morals*, Sect. III. Part I.). “This *poetical* fiction of the *golden age* is, in some respects, of a piece with the *philosophical* fiction of the *state of nature*; only that the former is represented as the most charming and most peaceable condition, which can possibly be imagined; whereas the latter is painted out as a state of mutual war and violence, attended with the most extreme necessity.” This fiction of a state of nature as a state of war, says Hume, (in a note to this passage) is not the invention of Hobbes. Plato (*Republic*, II. III. IV.) refutes a hypothesis very like it, and Cicero (*Pro Sext*. l. 42) regards it as a fact universally acknowledged.

Cf. also Spinoza (*Tract*. *Pol*. c. ii. § 14): “Homines ex natura hostes.” And (c. v. § 2): “Homines civiles non nascuntur sed fiunt.” These expressions are to be understood, says Bluntschli (*Theory of the State*, IV. Ch. vi., , *note* a), “rather as a logical statement of what *would be* the condition of man apart from civil society, than as distinctly implying a historical theory.”

While starting from the same premises, Spinoza carries Hobbes' political theories to their logical conclusion. If we admit that right lies with might, then right is with the people in any revolution successfully carried out. (But see Hobbes' Preface to the *Philosophical Rudiments* and Kant's *Perpetual Peace*, , *note*.) Spinoza, in a letter, thus alludes to this point of difference:— "As regards political theories, the difference which you inquire about between Hobbes and myself, consists in this, that I always preserve natural right intact, and only allot to the chief magistrates in every state a right over their subjects commensurate with the excess of their power over the power of the subjects. This is what always takes place in the state of nature." (Epistle 50, *Works*, Bohn's ed., Vol. II.)

[49] The italics are mine. — Tr.

[50] Professor Paulsen (*Immanuel Kant*, 2nd ed., 1899, — Eng. trans.,) points out that pessimism and absolutism usually go together in the doctrines of philosophers. He gives as instances Hobbes, Kant and Schopenhauer.

Hobbes (*On Dominion*, Ch. X. 3, *seq*.) regarded an absolute monarchy as the only proper form of government, while in the opinion of Locke, (*On Civil Government*, II. Ch. VII. §§ 90, 91) it was no better than a state of nature. Kant would not have gone quite so far. As a philosopher, he upheld the sovereignty of the people and rejected a monarchy which was not governed in accordance with republican principles; as a citizen, he denied the right of resistance to authority. (Cf. *Perpetual Peace*, p, 188, *note*.)

[51] We find the same rule laid down as early as the time of Dante. Cf. *De Monarchia*, Bk. II. 9:— "When two nations quarrel they are bound to try in every possible way to arrange the quarrel by means of discussion: it is only when this is hopeless that they may declare war."

[52] Rousseau (*Contrat Social*: I. vi.) regards the social contract as tacitly implied in every actual society: its articles "are the same everywhere, and are everywhere tacitly admitted and recognised, even though they may never have found formal expression" in any constitution. In the same way he speaks of a state of nature "which no longer exists, which perhaps never has existed." (Preface to the *Discourse on the Causes of Inequality*.) But Rousseau's interpretation of these terms is, on the whole, literal in spite of these single passages. He speaks throughout the *Contrat Social*, as if history could actually record the signing and drawing up of such documents. Hobbes, Hooker, (*Ecclesiastical Polity*, I. sect. 10 — see also Ritchie: *Darwin and Hegel*, *seq*.) Hume and Kant use more careful language. "It cannot be denied," writes Hume, (*Of the Original Contract*) "that all government is, at first, founded on a contract and that the most ancient rude combinations of mankind were formed chiefly by that principle. In vain are we asked in what records this charter of our liberties is registered. It was not written on parchment, nor yet on leaves or barks of trees. It preceded the use of writing and all the other civilised arts of life. But we trace it plainly in the nature of man, and in the equality, or something approaching equality, which we find in all the individuals of that species."

This fine passage expresses admirably the views of Kant on this point. Cf. *Werke*, (Rosenkranz) IX. 160.

The original contract is merely an idea of reason, one of those ideas which we think into things in order to explain them.

Hobbes does not professedly make the contract historical, but in Locke's *Civil Government* (II. Ch. VIII. § 102) there is some attempt made to give it a historical basis. — By consent all were equal, "till by the same consent they set rulers over themselves. So that their politic societies all began from a voluntary union, and the mutual agreement of men freely acting in the choice of their governors, and forms of government."

Bluntschli points out (*Theory of the State*, IV. ix., and *note*) that the same theory of contract on which Hobbes' doctrine of an absolute government was based was made the justification of violent resistance to the government at the time of the French Revolution. The theory was differently applied by Hobbes, Locke and Rousseau. According to the first, men leave the "state of nature" when they surrender their rights to a sovereign, and return to that state during revolution. But, for Rousseau, this sovereign authority is the people: a revolution would be only a change of ministry. (See *Cont. Soc.*, III. Ch. xviii.) Again Locke holds revolution to be justifiable in all cases where the governments have not fulfilled the trust reposed by the people in them. (Cf. Kant's *Perpetual Peace*, , *note*).

[53] "If you unite many men," writes Rousseau, (*Cont. Soc.*, IV. I.) "and consider them as one body, they will have but one will; and that will must be to promote the common safety and general well-being of all." This *volonté générale*, the common element of all particular wills, cannot be in conflict with any of them. (*Op. cit.*, II. iii.)

[54] In Eng. trans., see .

[55] See .

[56] See .

[57] Unlike Hegel whose ideal was the Prussian state, as it was under Frederick the Great. An enthusiastic supporter of the power of monarchy, he showed himself comparatively indifferent to the progress of constitutional liberty.

[58] Isolated passages are sometimes quoted from Kant in support of a theory that the present treatise is at least half ironicalA and that his views on the question of perpetual peace did not essentially differ from those of Leibniz. "Even war," he says, (*Kritik d. Urteilskraft*, I. Book ii. § 28.) "when conducted in an orderly way and with reverence for the rights of citizens has something of the sublime about it, and the more dangers a nation which wages war in this manner is exposed to and can courageously overcome, the nobler does its character grow. While, on the other hand, a prolonged peace usually has the effect of giving free play to a purely commercial spirit, and side by side with this, to an ignoble self-seeking, to cowardice and effeminacy; and the result of this is generally a degradation of national character."

This is certainly an admission that war which does not violate the Law of Nations has a good side as well as a bad. We could look for no less in so clear-sighted and unprejudiced a thinker. Kant would have been the first to admit that under certain conditions a nation can have no higher duty than to wage war. War is necessary, but it is in contradiction to reason and the spirit of right. The "scourge of mankind," "making more bad men than it takes away," the "destroyer of every good," Kant calls it elsewhere. (*Theory of Ethics*, Abbott's trans., 4th ed., , *note*.)

A Cf. K. v. Stengel: *Der Ewige Friede*, Munich, 1899; also Vaihinger: *Kantstudien*, Vol. IV., .

[59] Cf. *Idea for a Universal History*, Pro; *Perpetual Peace*, p, 157.

[60] The immediate stimulus to Kant's active interest in this subject as a practical question was the Peace of Basle (1795) which ended the first stage in the series of wars which followed the French Revolution.

[61] It is *eine unausführbare Idee*. See the passage quoted from the *Rechtslehre*, , *note*.

[69] A large part of Kant's requirements as they are expressed in these Preliminary Articles has already been fulfilled. The first (Art. 1) is recognised in theory at least by modern international law. More cannot be said. A treaty of this kind is of necessity more or less forced by the stronger on the weaker. The formal ratification of peace in 1871 did not prevent France from longing for the day when she might win back Alsace-Lorraine and be revenged on Prussia. Not the treaty nor a consciousness of defeat has kept the peace west of the Rhine, but a reluctant respect for the fortress of Metz and the mighty army of united

Germany.

Articles 2 and 6 are already commonplaces of international law. Article 2 refers to practices which have not survived the gradual disappearance of dynastic war. Art. 6 is the basis of our modern law of war. Art. 3 has been fulfilled in the literal sense that the standing armies composed of mercenary troops to which Kant alludes exist no longer. But it is to be feared that Kant would not think that we have made things much better, nor regard our present system of progressive armaments as a step in the direction of perpetual peace. Art. 4 is not likely to be fulfilled in the near future. It is long since Cobden denounced the institution of National Debts — an institution which, as Kant points out, owes its origin to the English, the “commercial people” referred to in the text. Art. 5 no doubt came to Kant through Vattel. “No nation,” says the Swiss publicist, (*Law of Nations*, II. Ch. iv. § 54) “has the least right to interfere with the government of another,” unless, he adds, (Ch. v. § 70) in a case of anarchy or where the well-being of the human race demands it. This is a recognised principle of modern international law. Intervention is held to be justifiable only where the obligation to respect another’s freedom of action comes into conflict with the duty of self-preservation.

Puffendorf leaves much more room for the exercise of benevolence. The natural affinity and kinship between men is, says he, (*Les Devoirs de l’homme et du citoien*, II. Ch. xvi. § xi.) “a sufficient reason to authorise us to take up defence of every person whom one sees unjustly oppressed, when he implores our aid *and when we can do it conveniently*.” (The italics are mine. — Tr.)

[70] See . The main principle involved in this passage comes from Vattel (*op. cit*., II. Ch. viii. §§ 104, 105: Ch. ix. §§ 123, 125). A sovereign, he says, cannot object to a stranger entering his state who at the same time respects its laws. No one can be quite deprived of the right of way which has been handed down from the time when the whole earth was common to all men.

[71] See .

[72] Kant believed that, in the newly formed constitution of the United States, his ideal with regard to the external forms of the state as conforming to the spirit of justice was most nearly realised. Professor Paulsen draws attention, in the following passage, to the fact that Kant held the English government of the eighteenth century in very low esteem. (*Kant*, , *note*. See Eng. trans., , *note*.) It was not the English state, he says, which furnished Kant with an illustration of his theory:— “Rather in it he sees a form of despotism only slightly veiled, not Parliamentary despotism, as some people have thought, but monarchical despotism. Through bribery of the Commons and the Press, the King had actually absolute power, as was evident, above all, from the fact that he had often waged war without, and in defiance of, the will of the people. Kant has a very unfavourable opinion of the English state in every way. Among the collected notes written by him in the last ten years of the century and published by Reicke (*Lose Blätter*, I. 129) the following appears:— ‘The English nation (*gens*) regarded as a people (*populus*) and looked upon side by side with other races is, as a collection of individuals, of all mankind the most highly to be esteemed. But as a state, compared with other states, it is the most destructive, high-handed and tyrannical, and the most provocative of war among them all.’”

Kuno Fischer (*op. cit.*, Vol. V., I. Ch. 11, p, 151) to whom Professor Paulsen's reference may here perhaps allude, states that Kant's objection to the English constitution is that it was an oligarchy, Parliament being not only a legislative body, but through its ministers also executive in the interests of the ruling party or even of private individuals in that party. It seems more likely that what most offended a keen observer of the course of the American War of Independence was the arbitrary and ill-directed power of the king. But see the passage quoted by Fischer (p, 153) from the *Rechtslehre* (Part II. Sect. I.) which is, he says, unmistakeably directed against the English constitution and certain temporary conditions in the political history of the country.

[73] St. Pierre actually thought that his federation would prevent civil war. See *Project* (1714), .

[74] See .

[75] This was the ideal of Dante. Cf. *De Monarchia*, Bk. I. 54:— "We shall not find at any time except under the divine monarch Augustus, when a perfect monarchy existed, that the world was everywhere quiet."

Bluntschli (*Theory of the State*, I. Ch. ii., *seq.*) gives an admirable account of the different attempts made to realise a universal empire in the past — the Empire of Alexander the Great, based upon a plan of uniting the races of east and west; the Roman Empire which sought vainly to stamp its national character upon mankind; the Frankish Monarchy; the Holy Roman Empire which fell to pieces through the want of a central power strong enough to overcome the tendency to separation and nationalisation; and finally the attempt of Napoleon I., whose mistake was the same as that which wrecked the Roman Empire — a neglect of the strength of foreign national sentiment.

[76] Reason requires a State of nations. This is the ideal, and Kant's proposal of a federation of states is a practical substitute from which we may work to higher things. Kant, like Fichte, (*Werke*, VII. 467) strongly disapproves of a universal monarchy such as that of which Dante dreamed — a modern Roman Empire. The force of necessity, he says, will bring nations at last to become members of a cosmopolitan state, "or if such a state of universal peace proves (as has often been the case with too great states) a greater danger to freedom from another point of view, in that it introduces despotism of the most terrible kind, then this same necessity must compel the nations to enter a state which indeed has the form not of a cosmopolitan commonwealth under one sovereign, but of a federation regulated by legal principles determined by a common code of international law." (*Das mag in d. Theorie richtig sein*, *Werke*, (Rosenkranz) VII.,). Cf. also *Theory of Ethics*, (Abbott), , *note*; *Perpetual Peace*, p, 156.

[77] See the *Philosophie d. Rechts*, (*Werke*, Vol. VIII.) Part iii. § 324 and appendix.

[78] Cf. *Die Braut von Messina*: —

"Denn der Mensch verkümmert im Frieden,

Müssige Ruh' ist das Grab des Muths.

Das Gesetz ist der Freund des Schwachen,

Alles will es nur eben machen,

Möchte gerne die Welt verflachen;

Aber der Krieg lässt die Kraft erscheinen,

Alles erhebt er zum Ungemeinen,

Selber dem Feigen erzeugt er den Muth."

This passage perhaps scarcely gives a fair representation of Schiller's views on the question, which, if we judge from *Wilhelm Tell*, must have been very moderate. War, he says, in this oft-quoted passage, is sometimes a necessity. There is a limit to the power of tyranny and, when the burden becomes unbearable, an appeal to Heaven and the sword.

Wilhelm Tell: Act. II. Sc. 2.

"Nein, eine Grenze hat Tyrannenmacht.

Wenn der Gedrückte nirgends Recht kann finden,

Wenn unerträglich wird die Last greift er

Hinauf getrosten Muthes in den Himmel

Und holt herunter seine ew'gen Rechte,

Die droben hangen unveräusserlich

Und unzerbrechlich, wie die Sterne selbst —

Der alte Urstand der Natur kehrt wieder,

Wo Mensch dem Menschen gegenüber steht —

Zum letzten Mittel, wenn kein andres mehr

Verfangen will, ist ihm das Schwert gegeben.”

[79] Letter to Bluntschli, dated Berlin, 11th Dec., 1880 (published in Bluntschli’s *Gesammelte Kleine Schriften*, Vol. II.,).

[80] Cf. Tennyson’s *Maud*: Part I., vi. and xiii.

“Why do they prate of the blessings of Peace? we have made them a curse,

Pickpockets, each hand lusting for all that is not its own;

And lust of gain, in the spirit of Cain, is it better or worse

Than the heart of the citizen hissing in war on his own hearthstone?

For I trust if an enemy’s fleet came yonder round by the hill,

And the rushing battle-bolt sang from the three-decker out of the foam,

That the smooth-faced snub-nosed rogue would leap from his counter and till,

And strike, if he could, were it but with his cheating yardwand, home.”

See too Part III., ii. and iv.

“And it was but a dream, yet it lighten’d my despair

When I thought that a war would arise in defence of the right,

That an iron tyranny now should bend or cease,

The glory of manhood stand on his ancient height,

Nor Britain’s one sole God be the millionaire:

No more shall commerce be all in all, and Peace

Pipe on her pastoral hillock a languid note,

And watch her harvest ripen, her herd increase,

Nor the cannon-bullet rest on a slothful shore,

And the cobweb woven across the cannon’s throat

Shall shake its threaded tears in the wind no more.

Let it go or stay, so I wake to the higher aims

Of a land that has lost for a little her lust of gold,

And love of a peace that was full of wrongs and shames,

Horrible, hateful, monstrous, not to be told;

And hail once more to the banner of battle unroll’d!

Tho’ many a light shall darken, and many shall weep

For those that are crush’d in the clash of jarring claims,

For God's just wrath shall be wreak'd on a giant liar;

And many a darkness into the light shall leap,

And shine in the sudden making of splendid names,

And noble thought be freer under the sun,

And the heart of a people beat with one desire."

[81] Moltke strangely enough was, at an earlier period, of the opinion that war, even when it is successful, is a national misfortune. Cf. Kehrbach's preface to Kant's essay, *Zum Ewigen Frieden*, p. XVII.

[82] See his discussion on constitutional monarchy in Germany. (*Hist. u. Pol. Aufsätze*, Bd. III., *seq.*)

[83] See *Die Piccolomini*: Act. I. Sc. 4.

[84] An admirable short account of popular feeling on this matter is to be found in Lawrence's *Principles of International Law*, § 240.

[85] The first Peace Society was founded in London in 1816, and the first International Peace Congress held in 1843.

[86] In Eng. trans. see .

[87] See "A Plan for a Universal and Perpetual Peace" in the *Principles of International Law* (*Works*, Vol. II). One of the main principles advocated by Bentham in this essay (written between 1787 and 1789) is that every state should give up its colonies.

[88] See his *Kleine Schriften*.

[89] *Institutes of the Law of Nations* (1884), Vol. II., Ch. XIV.

[90] John Stuart Mill holds that the multiplication of federal unions would be a benefit to the world. See his *Considerations on Representative Government* (1865), Ch. XVII., where he discusses the conditions necessary to render such unions successful. But the Peace Society is scarcely justified, on the strength of

what is here, in including Mill among writers who have made definite proposals of peace or federation. (See *Inter. Trib.*)

[91] See what Lawrence says (*op. cit.*, § 241) of neutralisation and the limits of its usefulness as a remedy for war.

[92] Montesquieu: *Esprit des Lois*, X. Ch. 2. “The life of governments is like that of man. The latter has a right to kill in case of natural defence: the former have a right to wage war for their own preservation.”

See also Vattel (*Law of Nations*, II. Ch. XVIII. § 332):— “But if anyone would rob a nation of one of her essential rights, or a right without which she could not hope to support her national existence, — if an ambitious neighbour threatens the liberty of a republic, if he attempts to subjugate and enslave her, — she will take counsel only from her own courage. She will not even attempt the method of conferences, in the case of a contention so odious as this. She will, in such a quarrel, exert her utmost efforts, exhaust every resource and lavish her blood to the last drop if necessary. To listen to the slightest proposal in a matter of this kind is to risk everything.”

[93] The difficulties in the way of hard and fast judgments on a complicated problem of this kind are convincingly demonstrated in a recent essay by Professor D. G. Ritchie (*Studies in Political and Social Ethics*, Sonnenschein, 1902). Professor Ritchie considers in detail a number of concrete cases which occurred in the century between 1770 and 1870. “Let any one take the judgments he would pass on these or any similarly varied cases, and I think he will find that we do not restrict our approval to wars of self-defence, that we do not approve self-defence under all circumstances, that there are some cases in which we approve of absorption of smaller states by larger, that there are cases in which we excuse intervention of third parties in quarrels with which at first they had nothing to do, and that we sometimes approve war even when begun without the authority of any already existing sovereign. Can any principles be found underlying such judgments? In the first place we ought not to disguise from ourselves the fact that our judgments after the result are based largely on success. ... I think it will be found that our judgments on the wars of the century from 1770 to 1870 turn very largely on the question, Which of the conflicting forces was making for constitutional government and for social progress? or, to put it in wider terms, Which represented the higher civilisation? And thus it is that we may sometimes approve the rise of a new state and sometimes the absorption of an old.” (*Op. cit.*, p, 155.)

[94] See Fred. W. Holls: *The Peace Conference at the Hague*, Macmillan, 1900.

[95] The feeling of the Congress expressed itself thus cautiously:— “Messieurs les plénipotentiaires n’hésitent pas à exprimer, au nom de leur gouvernements, le voeu, que les Etats entre lesquels s’éléverait un dissentiment sérieux, avant d’en appeler aux armes, eussent recours, en tant que les circonstances l’admettraient, aux bons offices d’une puissance amie.”

[96] *Esprit des Lois*, XIII. Cha. “A new distemper has spread itself over Europe: it has infected our princes, and induces them to keep up an exorbitant number of troops. It has its redoublings, and of necessity

becomes contagious. For as soon as one prince augments what he calls his troops, the rest of course do the same: so that nothing is gained thereby but the public ruin. Each monarch keeps as many armies on foot as if his people were in danger of being exterminated: and they give the name of Peace to this general effort of all against all."

Montesquieu is of course writing in the days of mercenary troops; but the cost to the nation of our modern armies, both in time of peace and of war, is incomparably greater.

[97] Even St. Pierre was alive to this danger (*Projet*, Art. VIII: in the English translation of 1714,):— "The *European* Union shall endeavour to obtain in *Asia*, a *permanent* society like that of *Europe*, that Peace may be maintain'd There also; and especially that it may have no cause to fear any *Asiatic* Sovereign, either as to its tranquillity, or its Commerce in *Asia*."

[98] Bentham's suggestion would be useful here! See above, , *note*.

[99] The best thing for Europe might be that Russia (perhaps including China) should be regarded as a serious danger by all the civilised powers of the West. *That* would bring us nearer to the United States of Europe *and* America (for the United States, America, is Russia's neighbour on the East) than anything else.

[100] Trade in barbarous or savage countries is still increased by war, especially on the French and German plan which leaves no open door to other nations. Here the trade follows the flag. And war, of course, among civilised races causes small nations to disappear and their tariffs with them. *This* is beneficial to trade, but to a degree so trifling that it may here be neglected.

[101] Cf. also the civil war of 1847 in Switzerland.

[102] See *Werke*, VII., .

[103] The other he knew was impossible. Peace within the state meant decay and death. In the antagonism of nations, he saw nature's means of educating the race: it was a law of existence, a law of progress, and, as such, eternal.

[104] For a vivid picture of the material advantages offered by such a union and of the dismal future that may lie before an unfederated Europe, we cannot do better than read Mr. Andrew Carnegie's recent Rectorial Address to the students of St. Andrews University (Oct 1902). Unfortunately, Mr. Carnegie's enthusiasm stops here: he does not tell us by what means the difficulties at present in the way of a federation, industrial or political, are to be overcome.

[105] Professor D. G. Ritchie remarks that it is less an over-estimation of the value of peace than a too easy-going acceptance of abstract and unanalysed phrases about the rights of nations that injures the work of the Peace Society. Cf. his note on the principles of the Peace Congresses (*op. cit.*,).

[106] The day is past, when a nation could enjoy the exclusive advantages of its own inventions. Vattel naively recommends that we should keep the knowledge of certain kinds of trade, the building of war-ships and the like, to ourselves. Prudence, he says, prevents us from making an enemy stronger and the care of our own safety forbids it. (*Law of Nations*, II. Ch. I. § 16.)

[107] The text used in this translation is that edited by Kehrbach. Tr.

[108] I have seen something of M. de St. Pierre's plan for maintaining perpetual peace in Europe. It reminds me of an inscription outside of a churchyard, which ran "*Pax Perpetua*. For the dead, it is true, fight no more. But the living are of another mind, and the mightiest among them have little respect for tribunals." (Leibniz: *Letter to Grimarest*, quoted above, , note 44.) Tr.

[109] On the honourable interpretation of treaties, see Vattel (*op. cit.*, II. Ch. XVII., esp. §§ 263-296, 291). See also what he says of the validity of treaties and the necessity for holding them sacred (II. Ch. XII. §§ 157, 158: II. Ch. XV). Tr.

[110] "Even the smoothest way," says Hume, (*Of the Original Contract*) "by which a nation may receive a foreign master, by marriage or a will, is not extremely honourable for the people; but supposes them to be disposed of, like a dowry or a legacy, according to the pleasure or interest of their rulers." Tr.

[111] An hereditary kingdom is not a state which can be inherited by another state, but one whose sovereign power can be inherited by another physical person. The state then acquires a ruler, not the ruler as such (that is, as one already possessing another realm) the state.

[112] This has been one of the causes of the extraordinary admixture of races in the modern Austrian empire. Cf. the lines of Matthias Corvinus of Hungary (quoted in Sir W. Stirling Maxwell's *Cloister Life of Charles the Fifth*, Ch. I., *note*): —

"Bella gerant alii, tu, felix Austria, nube!

Nam quae Mars aliis, dat tibi regna Venus." Tr.

[113] A Bulgarian Prince thus answered the Greek Emperor who magnanimously offered to settle a quarrel with him, not by shedding the blood of his subjects, but by a duel:— "A smith who has tongs will not take the red-hot iron from the fire with his hands."

(This note is a-wanting in the second Edition of 1796. It is repeated in Art. II., see .) Tr.

[114] See Vattel: *Law of Nations*, II. Ch. IV. § 55. No foreign power, he says, has a right to judge the conduct and administration of any sovereign or oblige him to alter it. “If he loads his subjects with taxes, or if he treats them with severity, the nation alone is concerned; and no other is called upon to offer redress for his behaviour, or oblige him to follow more wise and equitable maxims.... But (*loc. cit.* § 56) when the bands of the political society are broken, or at least suspended, between the sovereign and his people, the contending parties may then be considered at two distinct powers; and, since they are both equally independent of all foreign authority, nobody has a right to judge them. Either may be in the right; and each of those who grant their assistance may imagine that he is giving his support to the better cause.” Tr.

[115] It has been hitherto doubted, not without reason, whether there can be laws of permission (*leges permissivæ*) of pure reason as well as commands (*leges præceptivæ*) and prohibitions (*leges prohibitivæ*). For law in general has a basis of objective practical necessity: permission, on the other hand, is based upon the contingency of certain actions in practice. It follows that a law of permission would enforce what cannot be enforced; and this would involve a contradiction, if the object of the law should be the same in both cases. Here, however, in the present case of a law of permission, the presupposed prohibition is aimed merely at the future manner of acquisition of a right — for example, acquisition through inheritance: the exemption from this prohibition (*i.e.* the permission) refers to the present state of possession. In the transition from a state of nature to the civil state, this holding of property can continue as a *bona fide*, if usurpatory, ownership, under the new social conditions, in accordance with a permission of the Law of Nature. Ownership of this kind, as soon as its true nature becomes known, is seen to be mere nominal possession (*possessio putativa*) sanctioned by opinion and customs in a natural state of society. After the transition stage is passed, such modes of acquisition are likewise forbidden in the subsequently evolved civil state: and this power to remain in possession would not be admitted if the supposed acquisition had taken place in the civilized community. It would be bound to come to an end as an injury to the right of others, the moment its illegality became patent.

I have wished here only by the way to draw the attention of teachers of the Law of Nature to the idea of a *lex permissiva* which presents itself spontaneously in any system of rational classification. I do so chiefly because use is often made of this concept in civil law with reference to statutes; with this difference, that the law of prohibition stands alone by itself, while permission is not, as it ought to be, introduced into that law as a limiting clause, but is thrown among the exceptions. Thus “this or that is forbidden”, — say, Nos. 1, 2, 3, and so on in an infinite progression, — while permissions are only added to the law incidentally: they are not reached by the application of some principle, but only by groping about among cases which have actually occurred. Were this not so, qualifications would have had to be brought into the formula of laws of prohibition which would have immediately transformed them into laws of permission. Count von Windischgrätz, a man whose wisdom was equal to his discrimination, urged this very point in the form of a question propounded by him for a prize essay. One must therefore regret that this ingenious problem has been so soon neglected and left unsolved. For the possibility of a formula similar to those of mathematics is the sole real test of a legislation that would be consistent. Without this, the so-called *jus certum* will remain forever a mere pious wish: we can have only general laws valid on the whole; no general laws possessing the universal validity which the concept law seems to demand.

[116] "From this diffidence of one another, there is no way for any man to secure himself, so reasonable, as anticipation; that is, by force, or wiles, to master the persons of all men he can, so long, till he see no other power great enough to endanger him: and this is no more than his own conservation requireth, and is generally allowed." (Hobbes: *Lev.* I. Ch. XIII.) Tr.

[117] Hobbes thus describes the establishment of the state. "A *commonwealth* is said to be *instituted*, when a *multitude* of men do agree, and *covenant, every one, with every one*, that to whatsoever *man*, or *assembly of men*, shall be given by the major part, the *right* to *present* the person of them all, that is to say, to be their *representative*; everyone, as well he that *voted for it*, as he that *voted against it*, shall *authorize* all the actions and judgments, of that man, or assembly of men, in the same manner, as if they were his own, to the end, to live peaceably amongst themselves, and be protected against other men." (*Lev.* II. Ch. XVIII.)

There is a covenant between them, "as if every man should say to every man, *I authorise and give up my right of governing myself, to this man, or to this assembly of men, on this condition, that thou give up thy right to him, and authorize all his actions in like manner*." (*Lev.* II. Ch. XVII.) Tr.

[118] It is usually accepted that a man may not take hostile steps against any one, unless the latter has already injured him by act. This is quite accurate, if both are citizens of a law-governed state. For, in becoming a member of this community, each gives the other the security he demands against injury, by means of the supreme authority exercising control over them both. The individual, however, (or nation) who remains in a mere state of nature deprives me of this security and does me injury, by mere proximity. There is perhaps no active (*facto*) molestation, but there is a state of lawlessness, (*status injustus*) which, by its very existence, offers a continual menace to me. I can therefore compel him, either to enter into relations with me under which we are both subject to law, or to withdraw from my neighbourhood. So that the postulate upon which the following articles are based is:— "All men who have the power to exert a mutual influence upon one another must be under a civil government of some kind."

A legal constitution is, according to the nature of the individuals who compose the state: —

(1) A constitution formed in accordance with the right of citizenship of the individuals who constitute a nation (*jus civitatis*).

(2) A constitution whose principle is international law which determines the relations of states (*jus gentium*).

(3) A constitution formed in accordance with cosmopolitan law, in as far as individuals and states, standing in an external relation of mutual reaction, may be regarded as citizens of one world-state (*jus cosmopoliticum*).

This classification is not an arbitrary one, but is necessary with reference to the idea of perpetual peace. For, if even one of these units of society were in a position physically to influence another, while yet remaining a member of a primitive order of society, then a state of war would be joined with these primitive conditions; and from this it is our present purpose to free ourselves.

[119] Lawful, that is to say, external freedom cannot be defined, as it so often is, as the right *Befugniss* "to do whatever one likes, so long as this does not wrong anyone else."B For what is this right? It is the possibility of actions which do not lead to the injury of others. So the explanation of a "right" would be something like this:— "Freedom is the possibility of actions which do not injure anyone. A man does not wrong another — whatever his action — if he does not wrong another": which is empty tautology. My external (lawful) freedom is rather to be explained in this way: it is the right through which I require not to obey any external laws except those to which I could have given my consent. In exactly the same way, external (legal) equality in a state is that relation of the subjects in consequence of which no individual can legally bind or oblige another to anything, without at the same time submitting himself to the law which ensures that he can, in his turn, be bound and obliged in like manner by this other.

The principle of lawful independence requires no explanation, as it is involved in the general concept of a constitution. The validity of this hereditary and inalienable right, which belongs of necessity to mankind, is affirmed and ennobled by the principle of a lawful relation between man himself and higher beings, if indeed he believes in such beings. This is so, because he thinks of himself, in accordance with these very principles, as a citizen of a transcendental world as well as of the world of sense. For, as far as my freedom goes, I am bound by no obligation even with regard to Divine Laws — which are apprehended by me only through my reason — except in so far as I could have given my assent to them; for it is through the law of freedom of my own reason that I first form for myself a concept of a Divine Will. As for the principle of equality, in so far as it applies to the most sublime being in the universe next to God — a being I might perhaps figure to myself as a mighty emanation of the Divine spirit, — there is no reason why, if I perform my duty in the sphere in which I am placed, as that aeon does in his, the duty of obedience alone should fall to my share, the right to command to him. That this principle of equality, (unlike the principle of freedom), does not apply to our relation to God is due to the fact that, to this Being alone, the idea of duty does not belong.

As for the right to equality which belongs to all citizens as subjects, the solution of the problem of the admissibility of an hereditary nobility hinges on the following question:— "Does social rank — acknowledged by the state to be higher in the case of one subject than another — stand above desert, or does merit take precedence of social standing?" Now it is obvious that, if high position is combined with good family, it is quite uncertain whether merit, that is to say, skill and fidelity in office, will follow as well. This amounts to granting the favoured individual a commanding position without any question of desert; and to that, the universal will of the people — expressed in an original contract which is the fundamental principle of all right — would never consent. For it does not follow that a nobleman is a man of noble character. In the case of the official nobility, as one might term the rank of higher magistracy — which one must acquire by merit — the social position is not attached like property to the person but to his office, and equality is not thereby disturbed; for, if a man gives up office, he lays down with it his official rank and falls back into the rank of his fellows.

B Hobbes' definition of freedom is interesting. See *Lev.* II. Ch. XXI.:— "A Freeman, *is he, that in those things, which by his strength and wit he is able to do, is not hindered to do what he has a will to.*" Tr.

[120] Cf. Cowper: *The Winter Morning Walk*: —

"But is it fit, or can it bear the shock

Of rational discussion, that a man,

Compounded and made up like other men

Of elements tumultuous, ...

....

Should when he pleases, and on whom he will,

Wage war, with any or with no pretence

Of provocation giv'n or wrong sustain'd,

And force the beggarly last doit, by means

That his own humour dictates, from the clutch

Of poverty, that thus he may procure

His thousands, weary of penurious life,

A splendid opportunity to die?"

....

....

“He deems a thousand or ten thousand lives

Spent in the purchase of renown for him,

An easy reckoning.” Tr.

[121] Cf. Hobbes: *On Dominion*, Ch. VII. § 1. “As for the difference of cities, it is taken from the difference of the persons to whom the supreme power is committed. This power is committed either to *one man*, or *council*, or some *one court* consisting of many men.” Tr.

[122] The lofty appellations which are often given to a ruler — such as the Lord’s Anointed, the Administrator of the Divine Will upon earth and Vicar of God — have been many times censured as flattery gross enough to make one giddy. But it seems to me without cause. Far from making a prince arrogant, names like these must rather make him humble at heart, if he has any intelligence — which we take for granted he has — and reflects that he has undertaken an office which is too great for any human being. For, indeed, it is the holiest which God has on earth — namely, the right of ruling mankind: and he must ever live in fear of injuring this treasure of God in some respect or other.

[123] Mallet du Pan boasts in his seemingly brilliant but shallow and superficial language that, after many years experience, he has come at last to be convinced of the truth of the well known saying of Pope *Essay on Man*, III. 303: —

“For Forms of Government let fools contest;

Whate’er is best administered is best.”

If this means that the best administered government is best administered, then, in Swift’s phrase, he has cracked a nut to find a worm in it. If it means, however, that the best conducted government is also the best kind of government, — that is, the best form of political constitution, — then it is utterly false: for examples of wise administration are no proof of the kind of government. Who ever ruled better than Titus and Marcus Aurelius, and yet the one left Domitian, the other Commodus, as his successor? This could not have happened where the constitution was a good one, for their absolute unfitness for the position was early enough known, and the power of the emperor was sufficiently great to exclude them.

[124] “For as amongst masterless men, there is perpetual war, of every man against his neighbour; no inheritance, to transmit to the son, nor to expect from the father; no propriety of goods, or lands; no security; but a full and absolute liberty in every particular man: so in states, and commonwealths not dependent on one another, every commonwealth, not every man, has an absolute liberty, to do what it shall judge, that is to say, what that man, or assembly that representeth it, shall judge most conducing to their benefit. But withal, they live in the condition of a perpetual war, and upon the confines of battle, with their

frontiers armed, and cannons planted against their neighbours round about.” (Hobbes: *Leviathan*, II. Ch. XXI.) Tr.

[125] But see , where Kant seems to speak of a State of nations as the ideal. Kant expresses himself, on this point, more clearly in the *Rechtslehre*, Part. II. § 61:— “The natural state of nations,” he says here, “like that of individual men, is a condition which must be abandoned, in order that they may enter a state regulated by law. Hence, before this can take place, every right possessed by these nations and every external “mine” and “thine” *id est*, symbol of possession which states acquire or preserve through war are merely *provisional*, and can become *peremptorily* valid and constitute a true state of peace only in a universal *union of states*, by a process analogous to that through which a people becomes a state. Since, however, the too great extension of such a State of nations over vast territories must, in the long run, make the government of that union — and therefore the protection of each of its members — impossible, a multitude of such corporations will lead again to a state of war. So that *perpetual peace*, the final goal of international law as a whole, is really an impracticable idea *eine unausführbare Idee*. The political principles, however, which are directed towards this end, (that is to say, towards the establishment of such unions of states as may serve as a continual approximation to that ideal), are not impracticable; on the contrary, as this approximation is required by duty and is therefore founded also upon the rights of men and of states, these principles are, without doubt, capable of practical realization.” Tr.

[126] A Greek Emperor who magnanimously volunteered to settle by a duel his quarrel with a Bulgarian Prince, got the following answer:— “A smith who has tongs will not pluck the glowing iron from the fire with his hands.”

[127] “Both sayings are very true: that *man to man is a kind of God*; and that *man to man is an arrant wolf*. The first is true, if we compare citizens amongst themselves; and the second, if we compare cities. In the one, there is some analogy of similitude with the Deity; to wit, justice and charity, the twin sisters of peace. But in the other, good men must defend themselves by taking to them for a sanctuary the two daughters of war, deceit and violence: that is, in plain terms, a mere brutal rapacity.” (Hobbes: Epistle Dedicatory to the *Philosophical Rudiments concerning Government and Society*.) Tr.

[128] “The strongest are still never sufficiently strong to ensure them the continual mastership, unless they find means of transforming force into right, and obedience into duty.

From the right of the strongest, right takes an ironical appearance, and is rarely established as a principle.” (*Contrat Social*, I. Ch. III.) Tr.

[129] “The natural state,” says Hobbes, (*On Dominion*, Ch. VII. § 18) “hath the same proportion to the civil, (I mean, liberty to subjection), which passion hath to reason, or a beast to a man.”

Locke speaks thus of man, when he puts himself into the state of war with another:— “having quitted reason, which God hath given to be the rule betwixt man and man, and the common bond whereby human kind is united into one fellowship and society; and having renounced the way of peace which that teaches,

and made use of the force of war, to compass his unjust ends upon another, where he has no right; and so revolting from his own kind to that of beasts, by making force, which is theirs, to be his rule of right, he renders himself liable to be destroyed by the injured person, and the rest of mankind that will join with him in the execution of justice, as any other wild beast, or noxious brute, with whom mankind can have neither society nor security." (*Civil Government*, Ch. XV. § 172.) Tr.

[130] Cf. Rousseau: *Gouvernement de Pologne*, Ch. V. Federate government is "the only one which unites in itself all the advantages of great and small states." Tr.

[131] On the conclusion of peace at the end of a war, it might not be unseemly for a nation to appoint a day of humiliation, after the festival of thanksgiving, on which to invoke the mercy of Heaven for the terrible sin which the human race are guilty of, in their continued unwillingness to submit (in their relations with other states) to a law-governed constitution, preferring rather in the pride of their independence to use the barbarous method of war, which after all does not really settle what is wanted, namely, the right of each state in a quarrel. The feasts of thanksgiving during a war for a victorious battle, the hymns which are sung — to use the Jewish expression— "to the Lord of Hosts" are not in less strong contrast to the ethical idea of a father of mankind; for, apart from the indifference these customs show to the way in which nations seek to establish their rights — sad enough as it is — these rejoicings bring in an element of exultation that a great number of lives, or at least the happiness of many, has been destroyed.

[132] Cf. *Aeneidos*, I. 294 *seq*.

"Furor impius intus,

Saeva sedens super arma, et centum vinctus aënis

Post tergum nodis, fremet horridus ore cruento." Tr.

[133] Cf. Vattel (*op. cit.*, II. ch. IX. § 123):— "The right of passage is also a remnant of the primitive state of communion, in which the entire earth was common to all mankind, and the passage was everywhere free to each individual according to his necessities. Nobody can be entirely deprived of this right." See also above, , *note*. Tr.

[134] In order to call this great empire by the name which it gives itself — namely, China, not Sina or a word of similar sound — we have only to look at Georgii: *Alphab. Tibet.*, p-654, particularly *note* b., below. According to the observation of Professor Fischer of St. Petersburg, there is really no particular name which it always goes by: the most usual is the word *Kin*, *i.e.* gold, which the inhabitants of Tibet call *Ser*. Hence the emperor is called the king of gold, *i.e.* the king of the most splendid country in the world. This word *Kin* may probably be *Chin* in the empire itself, but be pronounced *Kin* by the Italian missionaries on account of the gutturals. Thus we see that the country of the Seres, so often mentioned by the Romans, was China: the silk, however, was despatched to Europe across Greater Tibet, probably

through Smaller Tibet and Bucharia, through Persia and then on. This leads to many reflections as to the antiquity of this wonderful state, as compared with Hindustan, at the time of its union with Tibet and thence with Japan. On the other hand, the name Sina or Tschina which is said to be given to this land by neighbouring peoples leads to nothing.

Perhaps we can explain the ancient intercourse of Europe with Tibet — a fact at no time widely known — by looking at what Hesychius has preserved on the matter. I refer to the shout, Κουξ Ομπαξ (*Konx Ompax*), the cry of the Hierophants in the Eleusinian mysteries (cf. *Travels of Anacharsis the Younger*, Part V., , *seq.*). For, according to Georgii *Alph. Tibet.*, the word *Concioa* which bears a striking resemblance to *Konx* means God. *Pak-cio* (*ib.*) which might easily be pronounced by the Greeks like *pax* means *promulgator legis*, the divine principle permeating nature (called also, on , *Cencresi*). *Om*, however, which La Croze translates by *benedictus*, *i.e.* blessed, can when applied to the Deity mean nothing but beatified . Now P. Franc. Horatius, when he asked the Lhamas of Tibet, as he often did, what they understood by God (*Concioa*) always got the answer:— "it is the assembly of all the saints," *i.e.* the assembly of those blessed ones who have been born again according to the faith of the Lama and, after many wanderings in changing forms, have at last returned to God, to Burchane: that is to say, they are beings to be worshipped, souls which have undergone transmigration . So the mysterious expression *Konx Ompax* ought probably to mean the holy (*Konx*), blessed, (*Om*) and wise (*Pax*) supreme Being pervading the universe, the personification of nature. Its use in the Greek mysteries probably signified monotheism for the Epoptes, in distinction from the polytheism of the people, although elsewhere P. Horatius scented atheism here. How that mysterious word came by way of Tibet to the Greeks may be explained as above; and, on the other hand, in this way is made probable an early intercourse of Europe with China across Tibet, earlier perhaps than the communication with Hindustan. (There is some difference of opinion as to the meaning of the words κόγξ ὄμπαξ — according to Liddell and Scott, a corruption of κόγξ, ὁμοίως πάξ. Kant's inferences here seem to be more than far-fetched. Lobeck, in his *Aglaophamus* , gives a quite different interpretation which has, he says, been approved by scholars. And Whately (*Historic Doubts relative to Napoleon Bonaparte*, 3rd. ed., Postscript) uses Konx Ompax as a pseudonym. Tr.)

[135] In the mechanical system of nature to which man belongs as a sentient being, there appears, as the underlying ground of its existence, a certain *form* which we cannot make intelligible to ourselves except by thinking into the physical world the idea of an end preconceived by the Author of the universe: this predetermination of nature on the part of God we generally call Divine Providence. In so far as this providence appears in the origin of the universe, we speak of Providence as founder of the world (*providentia conditrix; semel jussit, semper parent*. Augustine). As it maintains the course of nature, however, according to universal laws of adaptation to preconceived ends, *i.e.* teleological laws we call it a ruling providence (*providentia gubernatrix*). Further, we name it the guiding providence (*providentia directrix*), as it appears in the world for special ends, which we could not foresee, but suspect only from the result. Finally, regarding particular events as divine purposes, we speak no longer of providence, but of dispensation (*directio extraordinaria*). As this term, however, really suggests the idea of miracles, although the events are not spoken of by this name, the desire to fathom dispensation, as such, is a foolish presumption in men. For, from one single occurrence, to jump at the conclusion that there is a particular principle of efficient causes and that this event is an end and not merely the natural *naturmechanische* sequence of a design quite unknown to us is absurd and presumptuous, in however pious and humble a spirit we may speak of it. In the same way to distinguish between a universal and a particular providence when regarding it *materialiter*, in its relation to actual objects in the world (to say, for instance, that there

may be, indeed, a providence for the preservation of the different species of creation, but that individuals are left to chance) is false and contradictory. For providence is called universal for the very reason that no single thing may be thought of as shut out from its care. Probably the distinction of two kinds of providence, *formaliter* or subjectively considered, had reference to the manner in which its purposes are fulfilled. So that we have ordinary providence (*e.g.* the yearly decay and awakening to new life in nature with change of season) and what we may call unusual or special providence (*e.g.* the bringing of timber by ocean currents to Arctic shores where it does not grow, and where without this aid the inhabitants could not live). Here, although we can quite well explain the physico-mechanical cause of these phenomena — in this case, for example, the banks of the rivers in temperate countries are over-grown with trees, some of which fall into the water and are carried along, probably by the Gulf Stream — we must not overlook the teleological cause which points to the providential care of a ruling wisdom above nature. But the concept, commonly used in the schools of philosophy, of a co-operation on the part of the Deity or a concurrence (*concursus*) in the operations going on in the world of sense, must be dropped. For it is, firstly, self-contradictory to couple the like and the unlike together (*gryphes jungere equis*) and to let Him who is Himself the entire cause of the changes in the universe make good any shortcomings in His own predetermining providence (which to require this must be defective) during the course of the world; for example, to say that the physician has restored the sick with the help of God — that is to say that He has been present as a support. For *causa solitaria non juvat*. God created the physician as well as his means of healing; and we must ascribe the result wholly to Him, if we will go back to the supreme First Cause which, theoretically, is beyond our comprehension. Or we can ascribe the result entirely to the physician, in so far as we follow up this event, as explicable in the chain of physical causes, according to the order of nature. Secondly, moreover, such a way of looking at this question destroys all the fixed principles by which we judge an effect. But, from the ethico-practical point of view which looks entirely to the transcendental side of things, the idea of a divine concurrence is quite proper and even necessary: for example, in the faith that God will make good the imperfection of our human justice, if only our feelings and intentions are sincere; and that He will do this by means beyond our comprehension, and therefore we should not slacken our efforts after what is good. Whence it follows, as a matter of course, that no one must attempt to explain a good action as a mere event in time by this *concursus*; for that would be to pretend a theoretical knowledge of the supersensible and hence be absurd.

[136] *Id est*, which we cannot dissever from the idea of a creative skill capable of producing them. Tr.

[137] See preface, p. ix. above.

[138] Of all modes of livelihood the life of the hunter is undoubtedly most incompatible with a civilised condition of society. Because, to live by hunting, families must isolate themselves from their neighbours, soon becoming estranged and spread over widely scattered forests, to be before long on terms of hostility, since each requires a great deal of space to obtain food and raiment.

God’s command to Noah not to shed blood (I. *Genesis*, IX. 4-6)

4. “But flesh with the life thereof, which is the blood thereof, shall ye not eat.

5. And surely your blood of your lives will I require; at the hand of every beast will I require it, and at the hand of man; at the hand of every man's brother will I require the life of man.

6. Whoso sheddeth man's blood, by man shall his blood be shed: for in the image of God made he man."

is frequently quoted, and was afterwards — in another connection it is true — made by the baptised Jews a condition to which Christians, newly converted from heathendom, had to conform. Cf. *Acts* XV. 20; XXI. 25. This command seems originally to have been nothing else than a prohibition of the life of the hunter; for here the possibility of eating raw flesh must often occur, and, in forbidding the one custom, we condemn the other.

[139] About 1000 English miles.

[140] The question might be put:— "If it is nature's will that these Arctic shores should not remain unpopulated, what will become of their inhabitants, if, as is to be expected, at some time or other no more driftwood should be brought to them? For we may believe that, with the advance of civilisation, the inhabitants of temperate zones will utilise better the wood which grows on the banks of their rivers, and not let it fall into the stream and so be swept away." I answer: the inhabitants of the shores of the River Obi, the Yenisei, the Lena will supply them with it through trade, and take in exchange the animal produce in which the seas of Arctic shores are so rich — that is, if nature has first of all brought about peace among them.

[141] Cf. *Enc. Brit.* (9th ed.), art. "Indians", in which there is an allusion to "Fuegians, the *Pescherais*" of some writers. Tr.

[142] Rousseau uses these terms in speaking of democracy. (*Cont. Soc.*, III. Ch. 4.) "If there were a nation of Gods, they might be governed by a democracy: but so perfect a government will not agree with men."

But he writes elsewhere of republican governments (*op. cit.*, II. Ch. 6):— "All lawful governments are republican." And in a footnote to this passage:— "I do not by the word 'republic' mean an aristocracy or democracy only, but in general all governments directed by the public will which is the law. If a government is to be lawful, it must not be confused with the sovereign power, but be considered as the administrator of that power: and then monarchy itself is a republic." This language has a close affinity with that used by Kant. (Cf. above, .) Tr.

[143] See above, , *note*, esp. reference to *Theory of Ethics*. Tr.

[144] Difference of religion! A strange expression, as if one were to speak of different kinds of morality. There may indeed be different historical forms of belief, — that is to say, the various means which have been used in the course of time to promote religion, — but they are mere subjects of learned investigation, and do not really lie within the sphere of religion. In the same way there are many religious works — the

Zendavesta, *Veda*, *Koran* etc. — but there is only one religion, binding for all men and for all times. These books are each no more than the accidental mouthpiece of religion, and may be different according to differences in time and place.

[145] Montesquieu speaks thus in praise of the English state:— "As the enjoyment of liberty, and even its support and preservation, consists in every man's being allowed to speak his thoughts and to lay open his sentiments, a citizen in this state will say or write whatever the laws do not expressly forbid to be said or written." (*Esprit des Lois*, XIX. Ch. 27.) Hobbes is opposed to all free discussion of political questions and to freedom as a source of danger to the state. Tr.

[146] Kant is thinking here not of the sword of justice, in the moral sense, but of a sword which is symbolical of the executive power of the actual law. Tr.

[147] Cf. Aristotle: *Politics*, (Welldon's trans.) IV. Ch. XIV. "The same principles of morality are best both for individuals and States."

Among the ancients the connection between politics and morals was never questioned, although there were differences of opinion as to which science stood first in importance. Thus, while Plato put politics second to morals, Aristotle regarded politics as the chief science and ethics as a part of politics. This connection between the sciences was denied by Machiavelli, who lays down the dictum that, in the relations of sovereigns and states, the ordinary rules of morality do not apply. See *The Prince*, Ch. XVIII. "A Prince," he says, "and most of all a new Prince, cannot observe all those rules of conduct in respect of which men are accounted good, being frequently obliged, in order to preserve his Princedom, to act in opposition to good faith, charity, humanity, and religion. He must therefore keep his mind ready to shift as the winds and tides of Fortune turn, and, as I have already said, he ought not to quit good courses if he can help it, but should know how to follow evil courses if he must."

Hume thought that laxer principles might be allowed to govern states than private persons, because intercourse between them was not so "necessary and advantageous" as between individuals. "There is a system of morals," he says, "calculated for princes, much more free than that which ought to govern private persons," (*Treatise*, III., Part II., Sect. IX.) Tr.

[148] These are *permissive* laws of reason which allow us to leave a system of public law, when it is tainted by injustice, to remain just as it is, until everything is entirely revolutionised through an internal development, either spontaneous, or fostered and matured by peaceful influences. For any legal constitution whatsoever, even although it conforms only slightly with the spirit of law is better than none at all — that is to say, anarchy, which is the fate of a precipitate reform. Hence, as things now are, the wise politician will look upon it as his duty to make reforms on the lines marked out by the ideal of public law. He will not use revolutions, when these have been brought about by natural causes, to extenuate still greater oppression than caused them, but will regard them as the voice of nature, calling upon him to make such thorough reforms as will bring about the only lasting constitution, a lawful constitution based on the principles of freedom.

[149] It is still sometimes denied that we find, in members of a civilised community, a certain depravity rooted in the nature of man;C and it might, indeed, be alleged with some show of truth that not an innate corruptness in human nature, but the barbarism of men, the defect of a not yet sufficiently developed culture, is the cause of the evident antipathy to law which their attitude indicates. In the external relations of states, however, human wickedness shows itself incontestably, without any attempt at concealment. Within the state, it is covered over by the compelling authority of civil laws. For, working against the tendency every citizen has to commit acts of violence against his neighbour, there is the much stronger force of the government which not only gives an appearance of morality to the whole state (*causae non causae*), but, by checking the outbreak of lawless propensities, actually aids the moral qualities of men considerably, in their development of a direct respect for the law. For every individual thinks that he himself would hold the idea of right sacred and follow faithfully what it prescribes, if only he could expect that everyone else would do the same. This guarantee is in part given to him by the government; and a great advance is made by this step which is not deliberately moral, towards the ideal of fidelity to the concept of duty for its own sake without thought of return. As, however, every man's good opinion of himself presupposes an evil disposition in everyone else, we have an expression of their mutual judgment of one another, namely, that when it comes to hard facts, none of them are worth much; but whence this judgment comes remains unexplained, as we cannot lay the blame on the nature of man, since he is a being in the possession of freedom. The respect for the idea of right, of which it is absolutely impossible for man to divest himself, sanctions in the most solemn manner the theory of our power to conform to its dictates. And hence every man sees himself obliged to act in accordance with what the idea of right prescribes, whether his neighbours fulfil their obligation or not.

C This depravity of human nature is denied by Rousseau, who held that the mind of man was naturally inclined to virtue, and that good civil and social institutions are all that is required. (*Discourse on the Sciences and Arts*, 1750.) Kant here takes sides with Hobbes against Rousseau. See Kant's *Theory of Ethics*, Abbott's trans. (4th ed., 1889), *seq.* — esp. and *note*. Cf. also Hooker's *Ecclesiastical Polity*, I. § 10:— "Laws politic, ordained for external order and regiment amongst men, are never framed as they should be, unless presuming the will of man to be inwardly obstinate, rebellious, and averse from all obedience to the sacred laws of his nature; in a word, unless presuming man to be, in regard of his depraved mind, little better than a wild beast, they do accordingly provide, notwithstanding, so to frame his outward actions, that they be no hindrance unto the common good, for which societies are instituted." Tr.

[150] With regard to the meaning of the moral law and its significance in the Kantian system of ethics, see Abbott's translation of the *Theory of Ethics* (1889), p, 45, 54, 55, 119, 282. Tr.

[151] See Abbott's trans., p, 34. Tr.

[152] Matthew Arnold defines politics somewhere as the art of "making reason and the will of God prevail" — an art, one would say, difficult enough. Tr.

[153] "When a king has dethroned himself," says Locke, (*On Civil Government*, Ch. XIX. § 239) "and put himself in a state of war with his people, what shall hinder them from prosecuting him who is no king, as they would any other man, who has put himself into a state of war with them?" ... "The legislative being only a fiduciary power to act for certain ends, there remains still *in the people a supreme power to remove or alter the legislative*." (*Op. cit.*, Ch. XIII. § 149.) And again, (*op. cit.*, Ch. XI. § 134.) we find the words, "... over whom *i.e.* society no body can have a power to make laws, but by their own consent, and by authority received from them." Cf. also Ch. XIX. § 228 *seq*.

Hobbes represents the opposite point of view. "How many kings," he wrote, (Preface to the *Philosophical Rudiments concerning Government and Society*) "and those good men too, hath this one error, that a tyrant king might lawfully be put to death, been the slaughter of! How many throats hath this false position cut, that a prince for some causes may by some certain men be deposed! And what bloodshed hath not this erroneous doctrine caused, that kings are not superiors to, but administrators for the multitude!" This "erroneous doctrine" Kant received from Locke through Rousseau. He advocated, or at least practised as a citizen, a doctrine of passive obedience to the state. A free press, he held, offered the only lawful outlet for protest against tyranny. But, in theory, he was an enemy to absolute monarchy. Tr.

[154] We can find the voucher for maxims such as these in Herr Hofrichter Garve's essay, *On the Connection of Morals with Politics*, 1788. This worthy scholar confesses at the very beginning that he is unable to give a satisfactory answer to this question. But his sanction of such maxims, even when coupled with the admission that he cannot altogether clear away the arguments raised against them, seems to be a greater concession in favour of those who shew considerable inclination to abuse them, than it might perhaps be wise to admit.

METAPHYSICS OF MORALS: THE PHILOSOPHY OF LAW

bey Friedrich Nicolovius.
1797.

The first edition's title page

‘But next to a new History of Law, what we most require is a new Philosophy of Law.’

— Sir Henry Sumner Maine.

TRANSLATOR'S PREFACE.

Kant's Science of Right is a complete exposition of the Philosophy of Law, viewed as a rational investigation of the fundamental Principles of Jurisprudence. It was published in 1796, as the First Part of his Metaphysic of Morals, the promised sequel and completion of the Foundation for a Metaphysic of Morals, published in 1785. The importance and value of the great thinker's exposition of the Science of Right, both as regards the fundamental Principles of his own Practical Philosophy and the general interest of the Philosophy of Law, were at once recognised. A second Edition, enlarged by an Appendix, containing Supplementary Explanations of the Principles of Right, appeared in 1798. The work has since then been several times reproduced by itself, as well as incorporated in all the complete editions of Kant's Works. It was immediately rendered into Latin by Born in 1798, and again by König in 1800. It was translated into French by Professor Tissot in 1837, of which translation a second revised Edition has appeared. It was again translated into French by M. Barni, preceded by an elaborate analytical introduction, in 1853. With the exception of the Preface and Introductions, the work now appears translated into English for the first time.

Kant's Science of Right was his last great work of an independent kind in the department of pure Philosophy, and with it he virtually brought his activity as a master of thought to a close. It fittingly crowned the rich practical period of his later philosophical teaching, and he shed into it the last effort of his energy of thought. Full of years and honours he was then deliberately engaged, in the calm of undisturbed and unwearied reflection, in gathering the finally matured fruit of all the meditation and learning of his life. His three immortal Critiques of the Pure Reason (1781), the Practical Reason (1788), and the Judgment (1790), had unfolded all the theoretical Principles of his Critical Philosophy, and established his claim to be recognised as at once the most profound and the most original thinker of the modern world. And as the experience of life deepened around and within him, towards the sunset, his interest had been more and more absorbed and concentrated in the Practical. For to him, as to all great and comprehensive thinkers, Philosophy has only its beginning in the theoretical explanation of things; its chief end is the rational organization and animation and guidance of the higher life in which all things culminate. Kant had carried with him through all his struggle and toil of thought, the cardinal faith in God, Freedom, and Immortality, as an inalienable possession of Reason, and he had beheld the human Personality transfigured and glorified in the Divine radiance of the primal Ideas. But he had further to contemplate the common life of Humanity in its varied ongoings and activities, rising with the innate right of mastery from the bosom of Nature and asserting its lordship in the arena of the mighty world that it incessantly struggles to appropriate and subdue to itself. In the natural chaos and conflict of the social life of man, as presented in the multitudinous and ever-changing mass of the historic organism, he had also to search out the Principles of order and form, to vindicate the rationality of the ineradicable belief in human Causation, and to quicken anew the lively hope of a higher issue of History. The age of the Revolution called and inspired him to his task. With keen vision he saw a new world suddenly born before him, as the blood-stained product of a motion long toiling in the gloom, and all old things thus passing away; and he knew that it was only the pure and the practical Reason, in that inmost union which constitutes the birthright of Freedom, that could regulate and harmonize the future order of this strongest offspring of time. And if it was not given to him to work out the whole cycle of the new rational ideas, he at least touched upon them all, and he has embodied the cardinal Principle of the System in his Science of Right as the philosophical Magna Charta of the age of political Reason and the permanent foundation of all true Philosophy of Law.

Thus produced, Kant's Science of Right constituted an epoch in jural speculation, and it has

commanded the homage of the greatest thinkers since. Fichte, with characteristic ardour and with eagle vision, threw his whole energy of soul into the rational problem of Right, and if not without a glance of scorn at the sober limitations of the 'old Lectures' of the aged professor, he yet acknowledges in his own more aerial flight the initial safety of this more practical guidance. In those early days of eager search and high aspiration, Hegel, stirred to the depths by Kant, and Fichte, and Schelling, wrote his profound and powerful essay on the Philosophy of Right, laden with an Atlantean burden of thought and strained to intolerable rigidity and severity of form, but his own highest achievement only aimed at a completer integration of the Principles differentiated by Kant. It was impossible that the rational evangel of universal freedom and the seer-like vision of a world, hitherto groaning and travailing in pain but now struggling into the perfection of Eternal Peace and Good-will, should find a sympathetic response in Schopenhauer, notwithstanding all his admiration of Kant; but the racy cynicism of the great Pessimist rather subsides before him into mild lamentation than seeks the usual refuge from its own vacancy and despair in the wilful caustic of scorching invective and reproach. Schleiermacher, the greatest theologian and moralist of the Century, early discerned the limitations of the à priori formalism, and supplemented it by the comprehensive conceptions of the primal dominion and the new order of creation, but he owed his critical and dialectical ethicality mainly to Kant. Krause, the leader of the latest and largest thought in this sphere — at once intuitive, radical, and productive in his faculty, analytic, synthetic, and organic in his method, and real, ideal, and historic in his product — caught again the archetypal perfectibility of the human reflection of the Divine, and the living conditions of the true progress of humanity. The dawn of the thought of the new age in Kant rises above the horizon to the clear day, full-orbed and vital, in Krause. All the continental thinkers and schools of the century in this sphere of Jurisprudence, whatever be their distinctive characteristics or tendencies, have owned or manifested their obligations to the great master of the Critical Philosophy.

The influence of the Kantian Doctrine of Right has thus been vitally operative in all the subsequent progress of jural and political science. Kant, here as in every other department of Philosophy, summed up the fragmentary and critical movement of the Eighteenth Century, and not only spoke its last word, but inaugurated a method which was to guide and stimulate the highest thought of the future. With an unwonted blending of speculative insight and practical knowledge, an ideal universality of conception and a sure grasp of the reality of experience, his effort, in its inner depth, vitality, and concentration, contrasts almost strangely with the trivial formalities of the Leibnitzio-Wolffian Rationalists on the one hand, and with the pedantic tediousness of the Empiricists of the School of Grotius on the other. Thomasius and his School, the expounders of the Doctrine of Right as an independent Science, were the direct precursors of the formal method of Kant's System. Its firm and clear outline implies the substance of many an operose and now almost unreadable tome; and it is alive throughout with the quick, keen spirit of the modern world. Kant's unrivalled genius for distinct division and systematic form, found full and appropriate scope in this sphere of thought. He had now all his technical art as an expounder of Philosophy in perfect control, and after the hot rush through the first great Critique he had learned to take his time. His exposition thus became simplified, systematized, and clarified throughout to utmost intelligibility. Here, too, the cardinal aim of his Method was to wed speculative thought and empirical fact, to harmonize the abstract universality of Reason with the concrete particularities of Right, and to reconcile the free individuality of the citizen with the regulated organism of the State. And the least that can be said of his execution is, that he has rescued the essential principle of Right from the debasement of the antinomian naturalism and arbitrary politicality of Hobbes as well as from the extravagance of the lawless and destructive individualism of Rousseau, while conceding and even adopting what is substantially true in the antagonistic theories of these epochal thinkers; and he has thereby given the birthright of Freedom again, full-reasoned and certiorated, as 'a possession for ever' to modern scientific thought. With widest and

furthest vision, and with a wisdom incomparably superior to the reactionary excitement of the great English Orator, he looked calmly beyond ‘the red fool-fury of the Seine’ and all the storm and stress of the time, to the sure realization of the one increasing purpose that runs through the ages. The burden of years chilled none of his sympathies nor dimmed any of his hopes for humanity; nor did any pessimistic shadow or murmur becloud his strong poetic thought, or disturb ‘the mystical lore’ of his eventide. And thus at the close of all his thinking, he made the Science of Right the very corner-stone of the social building of the race, and the practical culmination of all Religion and all Philosophy.

It is not meant that everything presented here by Kant is perfect or final. On the contrary, there is probably nothing at all in his whole System of Philosophy — whose predominant characteristics are criticism, initiation, movement — that could be intelligently so regarded; and the admitted progress of subsequent theories of Right, as briefly indicated above, may be considered as conceding so much. It must be further admitted of Kant’s Science of Right that it presents everywhere abundant opening and even provocation for ‘Metacriticism’ and historical anticriticism, which have certainly not been overlooked or neglected. But it is meant withal that the Philosophy of Jurisprudence has really flourished in the Nineteenth Century only where Kant’s influence has been effective, and that the higher altitudes of jural science have only come into sight where he has been taken as a guide. The great critical thinker set the problem of Right anew to the pure Speculative Reason, and thus accomplished an intellectual transformation of juridical thought corresponding to the revolutionary enthusiasm of liberty in the practical sphere. It is only from this point of view that we can rightly appreciate or estimate his influence and significance. The all-embracing problem of the modern metamorphosis of the institutions of Society in the free State, lies implicitly in his apprehension. And in spite of his negative aspect, which has sometimes entirely misled superficial students, his solution, although betimes tentative and hesitating, is in the main faithful to the highest ideal of humanity, being foundationed on the eternity of Right and crowned by the universal security and peace of the gradually realized Freedom of mankind. As Kant saved the distracted and confused thought of his time from utter scepticism and despair, and set it again with renewed youth and enthusiasm on its way, so his spirit seems to be rising again upon us in this our hour of need, with fresh healing in his wings. Our Jurists must therefore also join the ever increasing throng of contemporary thinkers in the now general return to Kant. Their principles are even more conspicuously at hazard than any others, and the whole method of their science, long dying of intellectual inanition and asphyxia, must seek the conditions of a complete renovation. It is only thus, too, that the practical Politician will find the guidance of real principle in this agitated and troubled age in which the foundations of Government as well as of Right are so daringly scrutinised and so manifestly imperilled, and in which he is driven by the inherent necessary implication of local politics to face the inevitable issue of world-wide complications and the universal problem of human solidarity. And thus only, as it now appears, will it be possible to find a Principle that will at once be true to the most liberal tendency of the time, and yet do justice to its most conservative necessities.

Of criticism and comment, blind adulation and unjust depreciation of Kant’s system of Right, there has been, as already hinted, abundance and even more than enough. Every philosophical Jurist has had to define more or less explicitly his attitude towards the Kantian standpoint. The original thinkers of the dogmatic Schools — Fichte, Schelling, Hegel, and Krause, — have made it the starting-point of their special efforts, and have elaborated their own conceptions by positive or negative reference to it. The recent Theological School of Stahl and Baader, De Maistre and Bonald, representing the Protestant and Papal reaction from the modern autonomy of Reason, has yet left the Kantian principle unshaken, and has at the best only formulated its doctrine of a universal Divine order in more specific Christian terms. The Historical School of Hugo and Savigny and Puchta, — which is also that of Bentham, Austin and Buckle, Sir George C. Lewis and Sir Henry Sumner Maine, and Herbert Spencer, — with all its apparent antagonism, has only so far supplemented the rational universality of Kant by the necessary counterpart of

an historical Phenomenology of the rise and development of the positive legal institutions, as the natural evolution and verification in experience of the juridical conceptions. The conspicuous want of a criterion of Right in the application of the mere historical Method to the manifold, contingent, and variable institutions of human society, has been often signalized; and the representatives of the School have been driven again, especially in their advocacy of political liberalism, upon the rational principles of Freedom.

The Civil Jurists who have carried the unreasoning admiration of the Roman Law almost to the idolatry of its letter, and who are too apt to ignore the movement of two thousand years and all the aspirations of the modern Reason, could not be expected to be found in sympathy with the Rational Method of Kant. Their multiplied objections to the details of his exposition, from Schmitthenner to the present day, are, however, founded upon an entire misapprehension of the purpose of his form. For while Kant rightly recognised the Roman Law as the highest embodiment of the juridical Reason of the ancient world, and therefore expounded his own conceptions by constant reference to it, he clearly discerned its relativity and its limitations; and he accordingly aims at unfolding everywhere through its categories the juridical idea in its ultimate purity. In Kant the juridical Idea first attains its essential self-realization and productivity, and his system of Private Right is at once freer and more concrete than the Systems of Hobbes and Rousseau, because it involves the ancient civil system, corrected and modernized by regard to its rational and universal principles. This consideration alone will meet a host of petty objections, and guard the student against expecting to find in this most philosophical exposition of the Principles of Right a mere elementary text-book of the Roman Law.

In England, Kant’s Science of Right seems as yet to have been little studied, and it has certainly exerted but little influence on English Juridical Science. This has no doubt been mainly due to the traditional habit of the national mind, and the complete ascendancy during the present century of the Utilitarian School of Bentham. The criterion of Utility found a ready application to the more pressing interests of Political and Legal Reform, and thus responding to the practical legislative spirit of the time, its popular plausibilities completely obscured or superseded all higher rational speculation. By Austin the system was methodically applied to the positive determination of the juridical conceptions; under aid of the resources of the German Historical School, with the result that Right was made the mere ‘creature’ of positive law, and the whole Rational Method pretentiously condemned as irrational ‘jargon.’ In Austin we have only the positive outcome of Hobbes and Hume and Bentham. The later forms of this legal positivism have not been fruitful in scientific result, and the superficiality and infutility of the standpoint are becoming more and more apparent. Nor does the Utilitarian Principle, with all its seeming justice and humanity, appear capable of longer satisfying the popular mind with its deepening Consciousness of Right, or of resolving the more fundamental political problems that are again coming into view. In this connection we may quote and apply the authority of Sir Henry Sumner Maine when he says: ‘There is such widespread dissatisfaction with existing theories of jurisprudence, and so general a conviction that they do not really solve the questions they pretend to dispose of, as to justify the suspicion that some line of inquiry necessary to a perfect result has been incompletely followed, or altogether omitted by their authors.’ The present unsatisfactory condition of the Science of Right in England — if not in Scotland — could not be better indicated.

In these circumstances, no other alternative is left for us but a renewed and deepened appeal to the universal principle of Reason, as the essential condition of all true progress and certainty. And in the present dearth of philosophical origination and the presence of the unassimilated products of well-nigh a century of thought, it seems as if the prosecution of this Method of all methods can only now be fruitfully carried on by a return to Kant and advance through his System. Enough has perhaps already been said to indicate the recognised importance of the Kantian standpoint, and even to point to the rich fields of

thought and inquiry that open everywhere around it to the student. Into these fields it was the original intention of the translator to attempt to furnish some more definite guidance by illustrative comment and historical reference in detail, but this intention must be abandoned meanwhile, and all the more readily as it must be reckoned at the most but a duty of subordinate obligation and of secondary importance. The Translation is therefore sent forth by itself in reliance upon its intelligibility as a faithful rendering of the original, and in the hope that it will prove at once a help to the Students and an auxiliary to the Masters of our present juridical science.

Edinburgh, January 1887.

BIBLIOGRAPHICAL NOTE.

Röder remarks (i. 254) that by far the most of the later philosophical writers on Natural Right— 'nomen illis legio!' — follow the system of Kant and Fichte, which is in the main identical in principle with that of Thomasius. It was impossible to refer to them in detail in these prefatory remarks, but it may be useful to quote the following as the more important works on the subject from this standpoint since the appearance of Kant's Rechtslehre: —

Mellin, Grundlegung zur Metaphysik der Rechte, 1796.

P. J. A. Feuerbach, Kritik des natürlichen Rechts, 1796.

H. Stephani, Grundlinien der Rechtswissenschaft, 1797.

Ph. Schmutz, Erklärung der Rechte des Menschen u. des Bürgers, 1798. Handbuch der Rechtsphilosophie, 1807.

R. Gerstäcker, Metaphysik des Rechts, 1802.

L. Bendavid, Versuch einer Rechtslehre, 1802.

K. H. v. Gros, Lehrbuch des Naturrechts, 1802. 6 Ausg. 1841.

Friès, Philosophische Rechtslehre u. Kritik aller positiven Gesetz Gebung, 1803.

L. N. Jacob, Philosophische Rechtslehre, 2 A. 1802.

K. S. Zachariä, Anfangsgründe der Philosoph. Privatrechts, 1804. Philosophische Rechtslehre o. Naturrecht u. Staatslehre, 1819. Vierzig Bucher vom Staate, 1839-43.

Chr. Weiss, Lehrbuch der Philosophie des Rechts, 1804.

Bauer, Lehrbuch des Naturrechts, 1808. 3 Ausg. 1825.

J. C. F. Meister, Lehrbuch des Naturrechts, 1809.

Dresch, Systematische Entwickelung der Grundbegriffe u. Grundprinzipien des gesammten Privatrechts, Staatsrechts, und Volkerrechts, 1810, 1822.

V. Zeiller, Naturrecht, 1813.

W. F. Krug, Dikäologie oder philosophische Rechtslehre, 1817, 1830.

Eschenmeyer, Normalrecht, 2 Thle. 1819.

S. Beck, Lehrbuch des Naturrechts, 1820.

V. Droste-Hülshoff, Lehrbuch des Naturrechts o. der Rechtsphilosophie, 1823, 1831.

Pölitz, Natur- und Volkerrecht, Staats- und Staatenrecht, 1823, 1825.

J. Haus, Elementa doctrinæ philosophiæ sive juris naturalis. Gondavi, 1824.

K. von Rotteck, Lehrbuch des Vernunftrechts und der Staatswissenschaft, 4 Bde. 1829-34, 1841.

Ant. Virozsil, Epitome juris naturalis. Pesthini, 1839.

F. Fischer, Naturrecht und natürliche Staatslehre, 1848.

G. Schilling, Lehrbuch des Naturrechts, 1859.

Besides these a considerable number of similar German works might be referred to by Schaumann, Heydenreich, Klein, A. Thomas, Weiss, J. K. Schmid, T. M. Zachariä, Stöckhardt, E. Reinhold, Schnabel, Pfitzer, and others.

Of the French works, from the Kantian standpoint, may be quoted (Ahrens, i. 326): —

M. Bussart, Elements de droit naturel privé. Fribourg en Suisse, 1836.

V. Belime, Philosophie du droit. Paris, 1844, 4 ed. 1881.

In Italy, where the Philosophy of Law has been cultivated ‘with great zeal and intelligence’ (Ahrens, i. 327; Röder, Krit. Zeitschrift für Rechtswiss. xv. 1, 2, 3), the Kantian system has been ably discussed by Mancini, Mamiani, Rosmini, Poli, and others. Its chief representatives have been —

Baroli, Diritto naturale privato e publico, 6 vol. Cremona, 1837.

Tolomei, Corso elementare di diritto naturale, 2 ed. Padova, 1855.

Soria di Crispan, Filosofia di diritto publico. (Philosophie du droit public. Brux. 1853-4.) Transl. into French.

Rosmini-Serbati, Filosofia del diritto, 1841. (In part Kantian.)

[Since writing the foregoing Preface there has come to hand the important work, ‘La Vita del Diritto, nei suoi rapporti colla Vita Sociale: Studio comparativo di Filosofia Giuridica. Per Giusseppe Carle, Professore ordinario di Filosofia de Diritto nella R. Universita di Torino.’ Its comprehensive method and profound insight add to the already ample evidence of the ‘great zeal and intelligence’ with which the Philosophy of Law is now being cultivated by the countrymen of Vico, the natural successors of Antistius Labeo, and Papinian. Professor Carle points out the relation of Kant not only to Rosmini, but also to Mamiani and others. His view of the importance and influence of the Kantian System is in accord with the brief indications ventured in these Prefatory hints. It is impossible to quote his exposition here, but attention may be directed to P. ii. L. i. Cap. ii. § 3, ‘Emmanuele Kant come iniziatore del metodo rationale nello studio del diritto naturale;’ and L. ii. Cap. v. ‘Ulteriore svolgimento,’ etc. — Tr.]

PREFATORY EXPLANATIONS.

The Metaphysic of Morals, as constituting the System of Practical Philosophy, was to follow the 'Critique of the Practical Reason,' as it now does. It falls into two parts: (1) The Metaphysical Principles of Jurisprudence as the Science of Right, and (2) The Metaphysical Principles of Ethics as the Science of Virtue. The whole System forms a counterpart to the 'Metaphysical Principles of the Science of Nature,' which have been already discussed in a separate work (1786). The General Introduction to the 'Metaphysic of Morals' bears mainly on its form in both the Divisions; and the Definitions and Explanations it contains exhibit and, to some extent, illustrate the formal Principles of the whole System.

The Science of Right as a philosophical exposition of the fundamental Principles of Jurisprudence, thus forms the First Part of the Metaphysic of Morals. Taken here by itself — apart from the special Principles of Ethics as the Science of Virtue which follows it — it has to be treated as a System of Principles that originate in Reason; and, as such, it might be properly designated 'The Metaphysic of Right.' But the conception of Right, purely rational in its origin though it be, is also applicable to cases presented in experience; and, consequently, a Metaphysical System of Rights must take into consideration the empirical variety and manifoldness of these cases in order that its Divisions may be complete. For completeness and comprehensiveness are essential and indispensable to the formation of a rational system. But, on the other hand, it is impossible to obtain a complete survey of all the details of experience, and where it may be attempted to approach this, the empirical conceptions embracing those details cannot form integral elements of the system itself, but can only be introduced in subordinate observations, and mainly as furnishing examples illustrative of the General Principles. The only appropriate designation for the First Part of a Metaphysic of Morals, will, therefore, be The Metaphysical Principles of the Science of Right. And, in regard to the practical application to cases, it is manifest that only an approximation to systematic treatment is to be expected, and not the attainment of a System complete in itself. Hence the same method of exposition will be adopted here as was followed in the former work on 'The Metaphysical Principles of the Science of Nature.' The Principles of Right which belong to the rational system will form the leading portions of the text, and details connected with Rights which refer to particular cases of experience, will be appended occasionally in subordinate remarks. In this way a distinction will be clearly made between what is a Metaphysical or rational Principle, and what refers to the empirical Practice of Right.

Towards the end of the work, I have treated several sections with less fulness of detail than might have been expected when they are compared with what precedes them. But this has been intentionally done, partly because it appears to me that the more general principles of the later subjects may be easily deduced from what has gone before; and, also, partly because the details of the Principles of Public Right are at present subjected to so much discussion, and are besides so important in themselves, that they may well justify delay, for a time, of a final and decisive judgment regarding them.

PROLEGOMENA. GENERAL INTRODUCTION TO THE METAPHYSIC OF MORALS.

I.: The Relation of the Faculties of the Human Mind to the Moral Laws.

The Practical Faculty of Action. — The active Faculty of the Human Mind, as the Faculty of Desire in its widest sense, is the Power which man has, through his mental representations, of becoming the cause of objects corresponding to these representations. The capacity of a Being to act in conformity with his own representations, is what constitutes the Life of such a Being.

The Feeling of Pleasure or Pain. — It is to be observed, first, that with Desire or Aversion there is always connected Pleasure or Pain, the susceptibility for which is called Feeling. But the converse does not always hold. For there may be a Pleasure connected, not with the desire of an object, but with a mere mental representation, it being indifferent whether an object corresponding to the representation exist or not. And, second, the Pleasure or Pain connected with the object of desire does not always precede the activity of Desire; nor can it be regarded in every case as the cause, but it may as well be the Effect of that activity. The capacity of experiencing Pleasure or Pain on the occasion of a mental representation, is called 'Feeling,' because Pleasure and Pain contain only what is subjective in the relations of our mental activity. They do not involve any relation to an object that could possibly furnish a knowledge of it as such; they cannot even give us a knowledge of our own mental state. For even Sensations, considered apart from the qualities which attach to them on account of the modifications of the Subject, — as, for instance, in reference to Red, Sweet, and such like, — are referred as constituent elements of knowledge to Objects, whereas Pleasure or Pain felt in connection with what is red or sweet, express absolutely nothing that is in the Object, but merely a relation to the Subject. And for the reason just stated, Pleasure and Pain considered in themselves cannot be more precisely defined. All that can be further done with regard to them is merely to point out what consequences they may have in certain relations, in order to make the knowledge of them available practically.

Practical Pleasure, Interest, Inclination. — The Pleasure, which is necessarily connected with the activity of Desire, when the representation of the object desired affects the capacity of Feeling, may be called Practical Pleasure. And this designation is applicable whether the Pleasure is the cause or the effect of the Desire. On the other hand, that Pleasure which is not necessarily connected with the Desire of an object, and which, therefore, is not a pleasure in the existence of the object, but is merely attached to a mental representation alone, may be called Inactive Complacency, or mere Contemplative Pleasure. The Feeling of this latter kind of Pleasure, is what is called Taste. Hence, in a System of Practical Philosophy, the Contemplative Pleasure of Taste will not be discussed as an essential constituent conception, but need only be referred to incidentally or episodically. But as regards Practical Pleasure, it is otherwise. For the determination of the activity of the Faculty of Desire or Appetency, which is necessarily preceded by this Pleasure as its cause, is what properly constitutes Desire in the strict sense of the term. Habitual Desire, again, constitutes Inclination; and the connection of Pleasure with the activity of Desire, in so far as this connection is judged by the Understanding to be valid according to a general Rule holding good at least for the individual, is what is called Interest. Hence, in such a case, the Practical Pleasure is an Interest of the Inclination of the individual. On the other hand, if the Pleasure can only follow a preceding determination of the Faculty of Desire, it is an Intellectual Pleasure, and the interest in the object must be called a rational Interest; for were the Interest sensuous, and not based only upon pure Principles of

Reason, Sensation would necessarily be conjoined with the Pleasure, and would thus determine the activity of the Desire. Where an entirely pure Interest of Reason must be assumed, it is not legitimate to introduce into it an Interest of Inclination surreptitiously. However, in order to conform so far with the common phraseology, we may allow the application of the term ‘Inclination’ even to that which can only be the object of an ‘Intellectual’ Pleasure in the sense of a habitual Desire arising from a pure Interest of Reason. But such Inclination would have to be viewed, not as the Cause, but as the Effect of the rational Interest; and we might call it the non-sensuous or rational Inclination (propensio intellectualis). — Further, Concupiscence is to be distinguished from the activity of Desire itself, as a stimulus or incitement to its determination. It is always a sensuous state of the mind, which does not itself attain to the definiteness of an act of the Power of Desire.

The Will generally as Practical Reason. — The activity of the Faculty of Desire may proceed in accordance with Conceptions; and in so far as the Principle thus determining it to action is found in the mind, and not in its object, it constitutes a Power of acting or not acting according to liking. In so far as the activity is accompanied with the Consciousness of the Power of the action to produce the Object, it forms an act of Choice; if this consciousness is not conjoined with it, the Activity is called a Wish. The Faculty of Desire, in so far as its inner Principle of determination as the ground of its liking or Predilection lies in the Reason of the Subject, constitutes the Will. The Will is therefore the Faculty of active Desire or Appetency, viewed not so much in relation to the action — which is the relation of the act of Choice — as rather in relation to the Principle that determines the power of Choice to the action. It has, in itself, properly no special Principle of determination, but in so far as it may determine the voluntary act of Choice, it is the Practical Reason itself.

The Will as the Faculty of Practical Principles. — Under the Will, taken generally, may be included the volitional act of Choice, and also the mere act of Wish, in so far as Reason may determine the Faculty of Desire in its activity. The act of Choice that can be determined by pure Reason, constitutes the act of Free-will. That act which is determinable only by Inclination as a sensuous impulse or stimulus would be irrational brute Choice (arbitrium brutum). The human act of Choice, however, as human, is in fact affected by such impulses or stimuli, but is not determined by them; and it is, therefore, not pure in itself when taken apart from the acquired habit of determination by Reason. But it may be determined to action by the pure Will. The Freedom of the act of volitional Choice, is its independence of being determined by sensuous impulses or stimuli. This forms the negative conception of the Free-will. The positive Conception of Freedom is given by the fact that the Will is the capability of Pure Reason to be practical of itself. But this is not possible otherwise than by the Maxim of every action being subjected to the condition of being practicable as a universal Law. Applied as Pure Reason to the act of Choice, and considered apart from its objects, it may be regarded as the Faculty of Principles; and, in this connection, it is the source of Practical Principles. Hence it is to be viewed as a lawgiving Faculty. But as the material upon which to construct a Law is not furnished to it, it can only make the form of the Maxim of the act of Will, in so far as it is available as a universal Law, the supreme Law and determining Principle of the Will. And as the Maxims, or Rules of human action derived from subjective causes, do not of themselves necessarily agree with those that are objective and universal, Reason can only prescribe this supreme Law as an absolute Imperative of prohibition or command.

The Laws of Freedom as Moral, Juridical, and Ethical. — The Laws of Freedom, as distinguished from the Laws of Nature, are moral Laws. So far as they refer only to external actions and their lawfulness, they are called Juridical; but if they also require that, as Laws, they shall themselves be the determining Principles of our actions, they are Ethical. The agreement of an action with Juridical Laws, is its Legality; the agreement of an action with Ethical Laws, is its Morality. The Freedom to which the former laws refer, can only be Freedom in external practice; but the Freedom to which the latter laws refer, is Freedom in the internal as well as the external exercise of the activity of the Will in so far as it is

determined by Laws of Reason. So, in Theoretical Philosophy, it is said that only the objects of the external senses are in Space, but all the objects both of internal and external sense are in Time; because the representations of both, as being representations, so far belong all to the internal sense. In like manner, whether Freedom is viewed in reference to the external or the internal action of the Will, its Laws, as pure practical Laws of Reason for the free activity of the Will generally, must at the same time be inner Principles for its determination, although they may not always be considered in this relation.

II.: The Idea and Necessity of a Metaphysic of Morals.

The Laws of Nature Rational and also Empirical. — It has been shown in The Metaphysical Principles of the Science of Nature, that there must be Principles à priori for the Natural Science that has to deal with the objects of the external senses. And it was further shown that it is possible, and even necessary, to formulate a System of these Principles under the name of a 'Metaphysical Science of Nature,' as a preliminary to Experimental Physics regarded as Natural Science applied to particular objects of experience. But this latter Science, if care be taken to keep its generalizations free from error, may accept many propositions as universal on the evidence of experience, although if the term 'Universal' be taken in its strict sense, these would necessarily have to be deduced by the Metaphysical Science from Principles à priori. Thus Newton accepted the principle of the Equality of Action and Reaction as established by experience, and yet he extended it as a universal Law over the whole of material Nature. The Chemists go even farther, grounding their most general Laws regarding the combination and decomposition of the materials of bodies wholly upon experience; and yet they trust so completely to the Universality and Necessity of those laws, that they have no anxiety as to any error being found in propositions founded upon experiments conducted in accordance with them.

Moral Laws à priori and Necessary. — But it is otherwise with Moral Laws. These, in contradistinction to Natural Laws, are only valid as Laws, in so far as they can be rationally established à priori and comprehended as necessary. In fact, conceptions and judgments regarding ourselves and our conduct have no moral significance, if they contain only what may be learned from experience; and when any one is, so to speak, misled into making a Moral Principle out of anything derived from this latter source, he is already in danger of falling into the coarsest and most fatal errors.

If the Philosophy of Morals were nothing more than a Theory of Happiness (Eudæmonism), it would be absurd to search after Principles à priori as a foundation for it. For however plausible it may sound to say that Reason, even prior to experience, can comprehend by what means we may attain to a lasting enjoyment of the real pleasures of life, yet all that is taught on this subject à priori is either tautological, or is assumed wholly without foundation. It is only Experience that can show what will bring us enjoyment. The natural impulses directed towards nourishment, the sexual instinct, or the tendency to rest and motion, as well as the higher desires of honour, the acquisition of knowledge, and such like, as developed with our natural capacities, are alone capable of showing in what those enjoyments are to be found. And, further, the knowledge thus acquired, is available for each individual merely in his own way; and it is only thus he can learn the means by which he has to seek those enjoyments. All specious rationalizing à priori, in this connection, is nothing at bottom but carrying facts of Experience up to generalizations by induction (secundum principia generalia non universalia); and the generality thus attained is still so limited that numberless exceptions must be allowed to every individual in order that he may adapt the choice of his mode of life to his own particular inclinations and his capacity for pleasure. And, after all, the individual has really to acquire his Prudence at the cost of his own suffering or that of his neighbours.

But it is quite otherwise with the Principles of Morality. They lay down Commands for every one

without regard to his particular inclinations, and merely because and so far as he is free, and has a practical Reason. Instruction in the Laws of Morality is not drawn from observation of oneself or of our animal nature, nor from perception of the course of the world in regard to what happens, or how men act. But Reason commands how we ought to act, even although no example of such action were to be found; nor does Reason give any regard to the Advantage which may accrue to us by so acting, and which Experience could alone actually show. For, although Reason allows us to seek what is for our advantage in every possible way, and although, founding upon the evidence of Experience, it may further promise that greater advantages will probably follow on the average from the observance of her commands than from their transgression, especially if Prudence guides the conduct, yet the authority of her precepts as Commands does not rest on such considerations. They are used by Reason only as Counsels, and by way of a counterpoise against seductions to an opposite course, when adjusting beforehand the equilibrium of a partial balance in the sphere of Practical Judgment, in order thereby to secure the decision of this Judgment, according to the due weight of the à priori Principles of a pure Practical Reason.

The Necessity of a Metaphysic of Morals.— 'Metaphysics' designates any System of Knowledge à priori that consists of pure Conceptions. Accordingly a Practical Philosophy not having Nature, but the Freedom of the Will for its object, will presuppose and require a Metaphysic of Morals. It is even a Duty to have such a Metaphysic; and every man does, indeed, possess it in himself, although commonly but in an obscure way. For how could any one believe that he has a source of universal Law in himself, without Principles à priori? And just as in a Metaphysic of Nature there must be principles regulating the application of the universal supreme Principles of Nature to objects of Experience, so there cannot but be such principles in the Metaphysic of Morals; and we will often have to deal objectively with the particular nature of man as known only by Experience, in order to show in it the consequences of these universal Moral Principles. But this mode of dealing with these Principles in their particular applications will in no way detract from their rational purity, or throw doubt on their à priori origin. In other words, this amounts to saying that a Metaphysic of Morals cannot be founded on Anthropology as the Empirical Science of Man, but may be applied to it.

Moral Anthropology. — The counterpart of a Metaphysic of Morals, and the other member of the Division of Practical Philosophy, would be a Moral Anthropology, as the Empirical Science of the Moral Nature of Man. This Science would contain only the subjective conditions that hinder or favour the realization in practice of the universal moral Laws in human Nature, with the means of propagating, spreading, and strengthening the Moral Principles, — as by the Education of the young and the instruction of the people, — and all other such doctrines and precepts founded upon experience and indispensable in themselves, although they must neither precede the metaphysical investigation of the Principles of Reason, nor be mixed up with it. For, by doing so, there would be a great danger of laying down false, or at least very flexible Moral Laws, which would hold forth as unattainable what is not attained only because the Law has not been comprehended and presented in its purity, in which also its strength consists. Or, otherwise, spurious and mixed motives might be adopted instead of what is dutiful and good in itself; and these would furnish no certain Moral Principles either for the guidance of the Judgment or for the discipline of the heart in the practice of Duty. It is only by Pure Reason, therefore, that Duty can and must be prescribed.

Practical Philosophy in relation to Art. — The higher Division of Philosophy, under which the Division just mentioned stands, is into Theoretical Philosophy and Practical Philosophy. Practical Philosophy is just Moral Philosophy in its widest sense, as has been explained elsewhere. All that is practicable and possible, according to Natural Laws, is the special subject of the activity of Art, and its precepts and rules entirely depend on the Theory of Nature. It is only what is practicable according to Laws of Freedom that can have Principles independent of Theory, for there is no Theory in relation to what passes

beyond the determinations of Nature. Philosophy therefore cannot embrace under its practical Division a technical Theory, but only a morally practical Doctrine. But if the dexterity of the Will in acting according to Laws of Freedom, in contradistinction to Nature, were to be also called an Art, it would necessarily indicate an Art which would make a System of Freedom possible like the System of Nature. This would truly be a Divine Art, if we were in a position by means of it to realize completely what Reason prescribes to us, and to put the Idea into practice.

III.: The Division of a Metaphysic of Morals.

Two Elements involved in all Legislation. — All Legislation, whether relating to internal or external action, and whether prescribed à priori by mere Reason or laid down by the Will of another, involves two Elements: — 1st, a Law which represents the action that ought to happen as necessary objectively, thus making the action a Duty; 2nd, a Motive which connects the principle determining the Will to this action with the Mental representation of the Law subjectively, so that the Law makes Duty the motive of the Action. By the first element, the action is represented as a Duty, in accordance with the mere theoretical knowledge of the possibility of determining the activity of the Will by practical Rules. By the second element, the Obligation so to act, is connected in the Subject with a determining Principle of the Will as such.

Division of Duties into Juridical and Ethical. — All Legislation, therefore, may be differentiated by reference to its Motive-principle. The Legislation which makes an Action a Duty, and this Duty at the same time a Motive, is ethical. That Legislation which does not include the Motive-principle in the Law, and consequently admits another Motive than the idea of Duty itself, is juridical. In respect of the latter, it is evident that the motives distinct from the idea of Duty, to which it may refer, must be drawn from the subjective (pathological) influences of Inclination and of Aversion, determining the voluntary activity, and especially from the latter: because it is a Legislation which has to be compulsory, and not merely a mode of attracting or persuading. The agreement or non-agreement of an action with the Law, without reference to its Motive, is its Legality; and that character of the action in which the idea of Duty arising from the Law, at the same time forms the Motive of the Action, is its Morality.

Duties specially in accord with a Juridical Legislation, can only be external Duties. For this mode of Legislation does not require that the idea of the Duty, which is internal, shall be of itself the determining Principle of the act of Will; and as it requires a motive suitable to the nature of its laws, it can only connect what is external with the Law. Ethical Legislation, on the other hand, makes internal actions also Duties, but not to the exclusion of the external, for it embraces everything which is of the nature of Duty. And just because ethical Legislation includes within its Law the internal motive of the action as contained in the idea of Duty, it involves a characteristic which cannot at all enter into the Legislation that is external. Hence, Ethical Legislation cannot as such be external, not even when proceeding from a Divine Will, although it may receive Duties which rest on an external Legislation as Duties, into the position of motives, within its own Legislation.

Jurisprudence and Ethics distinguished. — From what has been said, it is evident that all Duties, merely because they are duties, belong to Ethics; and yet the Legislation upon which they are founded is not on that account in all cases contained in Ethics. On the contrary, the Law of many of them lies outside of Ethics. Thus Ethics commands that I must fulfil a promise entered into by Contract, although the other party might not be able to compel me to do so. It adopts the Law ‘pacta sunt servanda,’ and the Duty corresponding to it, from Jurisprudence or the Science of Right, by which they are established. It is not in Ethics, therefore, but in Jurisprudence, that the principle of the Legislation lies, that ‘promises made and accepted must be kept.’ Accordingly, Ethics specially teaches that if the Motive-principle of external compulsion which Juridical Legislation connects with a Duty is even let go, the idea of Duty alone is

sufficient of itself as a Motive. For were it not so, and were the Legislation itself not juridical, and consequently the Duty arising from it not specially a Duty of Right as distinguished from a Duty of Virtue, then Fidelity in the performance of acts, to which the individual may be bound by the terms of a Contract, would have to be classified with acts of Benevolence and the Obligation that underlies them, which cannot be correct. To keep one's promise is not properly a Duty of Virtue, but a Duty of Right; and the performance of it can be enforced by external Compulsion. But to keep one's promise, even when no Compulsion can be applied to enforce it, is, at the same time, a virtuous action, and a proof of Virtue. Jurisprudence as the Science of Right, and Ethics as the Science of Virtue, are therefore distinguished not so much by their different Duties, as rather by the difference of the Legislation which connects the one or the other kind of motive with their Laws.

Ethical Legislation is that which cannot be external, although the Duties it prescribes may be external as well as internal. Juridical Legislation is that which may also be external. Thus it is an external duty to keep a promise entered into by Contract; but the injunction to do this merely because it is a duty, without regard to any other motive, belongs exclusively to the internal Legislation. It does not belong thus to the ethical sphere as being a particular kind of duty or a particular mode of action to which we are bound, — for it is an external duty in Ethics as well as in Jurisprudence, — but it is because the Legislation in the case referred to is internal, and cannot have an external Lawgiver, that the Obligation is reckoned as belonging to Ethics. For the same reason, the Duties of Benevolence, although they are external Duties as Obligations to external actions, are, in like manner, reckoned as belonging to Ethics, because they can only be enjoined by Legislation that is internal. — Ethics has no doubt its own peculiar Duties, — such as those towards oneself, — but it has also Duties in common with Jurisprudence, only not under the same mode of Obligation. In short, the peculiarity of Ethical Legislation is to enjoin the performance of certain actions merely because they are Duties, and to make the Principle of Duty itself — whatever be its source or occasion — the sole sufficing motive of the activity of the Will. Thus, then, there are many ethical Duties that are directly such; and the inner Legislation also makes the others — all and each of them — indirectly Ethical.

The Deduction of the Division of a System is the proof of its completeness as well as of its continuity, so that there may be a logical transition from the general conception divided to the members of the Division, and through the whole series of the subdivisions without any break or leap in the arrangement (divisio per saltum). Such a Division is one of the most difficult conditions for the architect of a System to fulfil. There is even some doubt as to what is the highest Conception that is primarily divided into Right and Wrong (aut fas aut nefas). It is assuredly the conception of the activity of the Free-will in general. In like manner, the expounders of Ontology start from 'Something' and 'Nothing,' without perceiving that these are already members of a Division for which the highest divided conception is awanting, and which can be no other than that of 'Thing' in general.

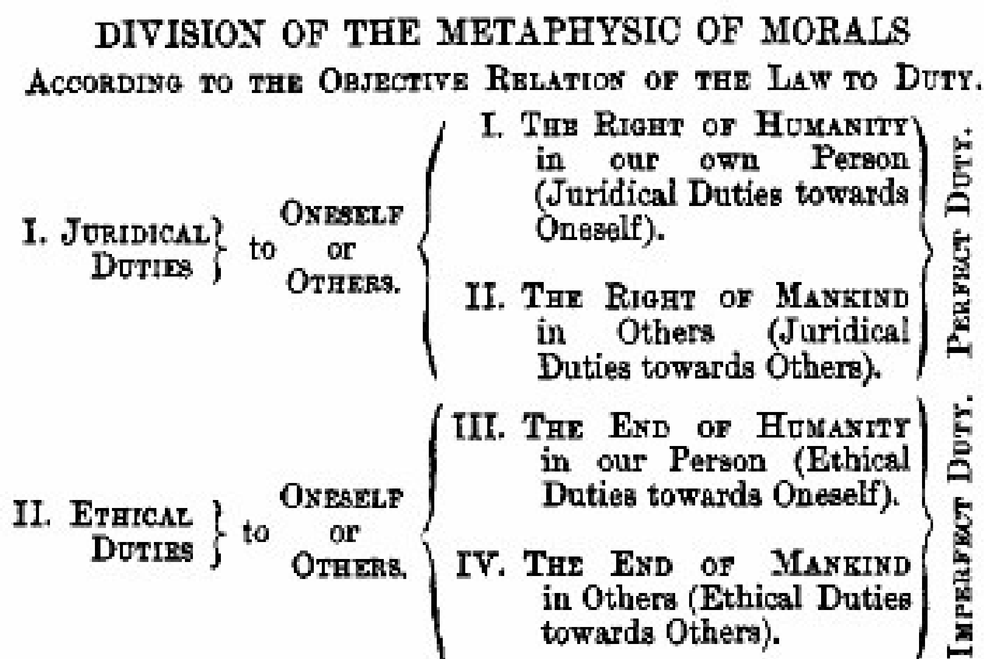
GENERAL DIVISIONS OF THE METAPHYSIC OF MORALS.

I.: Division of the Metaphysic of Morals as a System of Duties generally.

All Duties are either Duties of Right, that is, Juridical Duties (Officia Juris), or Duties of Virtue, that is, Ethical Duties (Officia Virtutis s. ethica). Juridical Duties are such as may be promulgated by external Legislation; Ethical Duties are those for which such legislation is not possible. The reason why the latter cannot be properly made the subject of external Legislation is because they relate to an End or final purpose, which is itself, at the same time, embraced in these Duties, and which it is a Duty for the individual to have as such. But no external Legislation can cause any one to adopt a particular intention, or to propose to himself a certain purpose; for this depends upon an internal condition or act of the mind itself. However, external actions conducive to such a mental condition may be commanded, without its being implied that the individual will of necessity make them an End to himself.

But why, then, it may be asked, is the Science of Morals or Moral Philosophy, commonly entitled — especially by Cicero — the Science of Duty and not also the Science of Right, since Duties and Rights refer to each other? The reason is this. We know our own Freedom — from which all Moral Laws and consequently all Rights as well as all Duties arise — only through the Moral Imperative, which is an immediate injunction of Duty; whereas the conception of Right as a ground of putting others under Obligation has afterwards to be developed out of it.

In the Doctrine of Duty, Man may and ought to be represented in accordance with the nature of his faculty of Freedom, which is entirely supra-sensible. He is, therefore, to be represented purely according to his Humanity as a Personality independent of physical determinations (homo noumenon), in distinction from the same person as a Man modified with these determinations (homo phenomenon). Hence the conceptions of Right and End when referred to Duty, in view of this twofold quality, give the following Division: —



II.: Division of the Metaphysic of Morals according to Relations of Obligation.

As the Subjects between whom a relation of Right to Duty is apprehended — whether it actually exist or not — admit of being conceived in various juridical relations to each other, another Division may be proposed from this point of view, as follows: —

DIVISION possible according to the Subjective Relation of those who bind under Obligations, and those who are bound under Obligations.

1.

The juridical Relation of Man to Beings who have neither Right nor Duty.

Vacat. — There is no such Relation. For such Beings are irrational, and they neither put us under Obligation, nor can we be put under Obligation by them.

2.

The juridical Relation of Man to Beings who have both Rights and Duties.

Adest. — There is such a Relation. For it is the Relation of Men to Men.

3.

The juridical Relation of Man to Beings who have only Duties and no Rights.

Vacat. — There is no such Relation. For such Beings would be Men without juridical Personality, as Slaves or Bondsmen.

4.

The juridical Relation of Man to a Being who has only Rights and no Duties — (God).

Vacat. — There is no such Relation in mere Philosophy, because such a Being is not an object of possible experience.

A real relation between Right and Duty is therefore found, in this scheme, only in No. 2. The reason why such is not likewise found in No. 4 is, because it would constitute a transcendent Duty, that is, one to which no corresponding subject can be given that is external and capable of imposing Obligation. Consequently the Relation from the theoretical point of view is here merely ideal; that is, it is a Relation to an object of thought which we form for ourselves. But the conception of this object is not entirely empty. On the contrary, it is a fruitful conception in relation to ourselves and the maxims of our inner morality, and therefore in relation to practice generally. And it is in this bearing, that all the Duty involved and practicable for us in such a merely ideal relation lies.

III.: Division of the Metaphysic of Morals.

AS A SYSTEM OF DUTIES GENERALLY.

According to the constituent Principles and the Method of the System.

I. PRINCIPLES,
- I. DUTIES OF RIGHT,
  - I. Private Right.
  - II. Public Right.
- II. DUTIES OF VIRTUE, ETC.—And so on, including all that refers not only to the Materials, but also to the Architectonic Form of a scientific system of Morals, when the Metaphysical investigation of the elements has completely traced out the Universal Principles constituting the whole.

II. METHOD,
- I. DIDACTICS.
- II. ASCETICS.

IV.: General preliminary Conceptions defined and explained.

(Philosophia practica universalis.)

Freedom. — The conception of Freedom is a conception of pure Reason. It is therefore transcendent in so far as regards Theoretical Philosophy; for it is a conception for which no corresponding instance or example can be found or supplied in any possible experience. Accordingly Freedom is not presented as an object of any theoretical knowledge that is possible for us. It is in no respect a constitutive, but only a regulative conception; and it can be accepted by the Speculative Reason as at most a merely negative Principle. In the practical sphere of Reason, however, the reality of Freedom may be demonstrated by certain Practical Principles which, as Laws, prove a causality of the Pure Reason in the process of determining the activity of the Will, that is independent of all empirical and sensible conditions. And thus there is established the fact of a pure Will existing in us as the source of all moral conceptions and laws.

Moral Laws and Categorical Imperatives. — On this positive conception of Freedom in the practical relation certain unconditional practical Laws are founded, and they specially constitute Moral Laws. In relation to us as human beings, with an activity of Will modified by sensible influences so as not to be conformable to the pure Will, but as often contrary to it, these Laws appear as Imperatives commanding or prohibiting certain actions; and as such they are Categorical or Unconditional Imperatives. Their categorical and unconditional character distinguishes them from the Technical Imperatives which express the prescriptions of Art, and which always command only conditionally. According to these Categorical Imperatives, certain actions are allowed or disallowed as being morally possible or impossible; and certain of them or their opposites are morally necessary and obligatory. Hence, in reference to such actions, there arises the conception of a Duty whose observance or transgression is accompanied with a Pleasure or Pain of a peculiar kind, known as Moral Feeling. We do not, however, take the Moral Feelings or Sentiments into account, in considering the practical Laws of Reason. For they do not form the foundation or principle of practical Laws of Reason, but only the subjective Effects that arise in the mind on the occasion of our voluntary activity being determined by these Laws. And while they neither add to nor take from the objective validity or influence of the moral Laws in the judgment of Reason, such Sentiments may vary according to the differences of the individuals who experience them.

The following Conceptions are common to Jurisprudence and Ethics as the two main Divisions of the Metaphysic of Morals.

Obligation. — Obligation is the Necessity of a free Action when viewed in relation to a Categorical Imperative of Reason.

An Imperative is a practical Rule by which an Action, otherwise contingent in itself, is made necessary. It is distinguished from a practical Law, in that such a Law, while likewise representing the Action as necessary, does not consider whether it is internally necessary as involved in the nature of the Agent —

say as a holy Being — or is contingent to him, as in the case of Man as we find him; for, where the first condition holds good, there is in fact no Imperative. Hence an Imperative is a Rule which not only represents but makes a subjectively contingent action necessary; and it, accordingly, represents the Subject as being (morally) necessitated to act in accordance with this Rule. — A Categorical or Unconditional Imperative is one which does not represent the action in any way mediately through the conception of an End that is to be attained by it; but it presents the action to the mind as objectively necessary by the mere representation of its form as an action, and thus makes it necessary. Such Imperatives cannot be put forward by any other practical Science than that which prescribes Obligations, and it is only the Science of Morals that does this. All other Imperatives are technical, and they are altogether conditional. The ground of the possibility of Categorical Imperatives, lies in the fact that they refer to no determination of the activity of the Will by which a purpose might be assigned to it, but solely to its Freedom.

The Allowable. — Every Action is allowed (licitum) which is not contrary to Obligation; and this Freedom not being limited by an opposing Imperative, constitutes a Moral Right as a warrant or title of action (facultas moralis). From this it is at once evident what actions are disallowed or illicit (illicita).

Duty. — Duty is the designation of any Action to which any one is bound by an obligation. It is therefore the subject-matter of all Obligation. Duty as regards the Action concerned, may be one and the same, and yet we may be bound to it in various ways.

The Categorical Imperative, as expressing an Obligation in respect to certain actions, is a morally practical Law. But because Obligation involves not merely practical Necessity expressed in a Law as such, but also actual Necessitation, the Categorical Imperative is a Law either of Command or Prohibition, according as the doing or not doing of an action is represented as a Duty. An Action which is neither commanded nor forbidden, is merely allowed, because there is no Law restricting Freedom, nor any Duty in respect of it. Such an Action is said to be morally indifferent (indifferens, adiaphoron, res meræ facultatis). It may be asked whether there are such morally indifferent actions; and if there are, whether in addition to the preceptive and prohibitive Law (lex præceptiva et prohibitiva, lex mandati et vetiti), there is also required a Permissive Law (lex permissiva), in order that one may be free in such relations to act, or to forbear from acting, at his pleasure? If it were so, the moral Right in question would not, in all cases, refer to actions that are indifferent in themselves (adiaphora); for no special Law would be required to establish such a Right, considered according to Moral Laws.

Act; Agent. — An Action is called an Act — or moral Deed — in so far as it is subject to Laws of Obligation, and consequently in so far as the Subject of it is regarded with reference to the Freedom of his choice in the exercise of his Will. The Agent — as the actor or doer of the deed — is regarded as, through the act, the Author of its effect; and this effect, along with the action itself, may be imputed to him, if he previously knew the Law, in virtue of which an Obligation rested upon him.

Person; Imputation. — A Person is a Subject who is capable of having his actions imputed to him. Moral Personality is, therefore, nothing but the Freedom of a rational Being under Moral Laws; and it is to be distinguished from psychological Freedom as the mere faculty by which we become conscious of ourselves in different states of the Identity of our existence. Hence it follows that a Person is properly subject to no other Laws than those he lays down for himself, either alone or in conjunction with others.

Thing. — A Thing is what is incapable of being the subject of Imputation. Every object of the free activity of the Will, which is itself void of freedom, is therefore called a Thing (res corporealis).

Right and Wrong. — Right or Wrong applies, as a general quality, to an Act (rectum aut minus rectum), in so far as it is in accordance with Duty or contrary to Duty (factum licitum aut illicitum), no matter what may be the subject or origin of the Duty itself. An act that is contrary to Duty is called a Transgression (reatus).

Fault; Crime. — An unintentional Transgression of a Duty, which is, nevertheless, imputable to a Person, is called a mere Fault (culpa). An intentional Transgression — that is, an act accompanied with the consciousness that it is a Transgression — constitutes a Crime (dolus).

Just and Unjust. — Whatever is juridically in accordance with External Laws, is said to be Just (Jus, iustum); and whatever is not juridically in accordance with external Laws, is Unjust (unjustum).

Collision of Duties. — A Collision of Duties or Obligations (collisio officiorum s. obligationum) would be the result of such a relation between them that the one would annul the other, in whole or in part. Duty and Obligation, however, are conceptions which express the objective practical Necessity of certain actions, and two opposite Rules cannot be objective and necessary at the same time; for if it is a Duty to act according to one of them, it is not only no Duty to act according to an opposite Rule, but to do so would even be contrary to Duty. Hence a Collision of Duties and Obligations is entirely inconceivable (obligationes non colliduntur). There may, however, be two grounds of Obligation (rationes obligandi), connected with an individual under a Rule prescribed for himself, and yet neither the one nor the other may be sufficient to constitute an actual Obligation (rationes obligandi non obligantes); and in that case the one of them is not a Duty. If two such grounds of Obligation are actually in collision with each other, Practical Philosophy does not say that the stronger Obligation is to keep the upper hand (fortior obligatio vincit), but that the stronger ground of Obligation is to maintain its place (fortior obligandi ratio vincit).

Natural and Positive Laws. — Obligatory Laws for which an external Legislation is possible, are called generally External Laws. Those External Laws, the obligatoriness of which can be recognised by Reason à priori even without an external Legislation, are called Natural Laws. Those Laws, again, which are not obligatory without actual External Legislation, are called Positive Laws. An External Legislation, containing pure Natural Laws, is therefore conceivable; but in that case a previous Natural Law must be presupposed to establish the authority of the Lawgiver by the Right to subject others to Obligation through his own act of Will.

Maxims. — The Principle which makes a certain action a Duty, is a Practical Law. The Rule of the Agent or Actor, which he forms as a Principle for himself on subjective grounds, is called his Maxim. Hence, even when the Law is one and invariable, the Maxims of the Agent may yet be very different.

The Categorical Imperative. — The Categorical Imperative only expresses generally what constitutes Obligation. It may be rendered by the following Formula: ‘Act according to a Maxim which can be adopted at the same time as a Universal Law.’ Actions must therefore be considered, in the first place, according to their subjective Principle; but whether this principle is also valid objectively, can only be known by the criterion of the Categorical Imperative. For Reason brings the principle or maxim of any action to the test, by calling upon the Agent to think of himself in connection with it as at the same time laying down a Universal Law, and to consider whether his action is so qualified as to be fit for entering into such a Universal Legislation.

The simplicity of this Law, in comparison with the great and manifold Consequences which may be drawn from it, as well as its commanding authority and supremacy without the accompaniment of any visible motive or sanction, must certainly at first appear very surprising. And we may well wonder at the power of our Reason to determine the activity of the Will by the mere idea of the qualification of a Maxim for the universality of a practical Law, especially when we are taught thereby that this practical Moral Law first reveals a property of the Will which the Speculative Reason would never have come upon either by Principles à priori, or from any experience whatever; and even if it had ascertained the fact, it could never have theoretically established its possibility. This practical Law, however, not only discovers the fact of that property of the Will, which is Freedom, but irrefutably establishes it. Hence it will be less surprising to find that the Moral Laws are undemonstrable, and yet apodictic, like the mathematical Postulates; and that they, at the same time, open up before us a whole field of practical knowledge, from which Reason, on its theoretical side, must find itself entirely excluded with its

speculative idea of Freedom and all such ideas of the Supersensible generally.

The conformity of an Action to the Law of Duty constitutes its Legality; the conformity of the Maxim of the Action with the Law constitutes its Morality. A Maxim is thus a subjective Principle of Action, which the individual makes a Rule for himself as to how in fact he will act.

On the other hand, the Principle of Duty is what Reason absolutely, and therefore objectively and universally, lays down in the form of a Command to the individual, as to how he ought to act.

The Supreme Principle of the Science of Morals accordingly is this: 'Act according to a Maxim which can likewise be valid as a Universal Law.' — Every Maxim which is not qualified according to this condition, is contrary to Morality.

Laws arise from the Will, viewed generally as Practical Reason; Maxims spring from the activity of the Will in the process of Choice. The latter in Man, is what constitutes free-will. The Will which refers to nothing else than mere Law, can neither be called free nor not free; because it does not relate to actions immediately, but to the giving of a Law for the Maxim of actions; it is therefore the Practical Reason itself. Hence as a Faculty, it is absolutely necessary in itself, and is not subject to any external necessitation. It is, therefore, only the act of Choice in the voluntary process, that can be called free.

The Freedom of the act of Will, however, is not to be defined as a Liberty of Indifference (libertas indifferentiæ), that is, as a capacity of choosing to act for or against the Law. The voluntary process, indeed, viewed as a phenomenal appearance, gives many examples of this choosing in experience; and some have accordingly so defined the free-will. For Freedom, as it is first made knowable by the Moral Law, is known only as a negative Property in us, as constituted by the fact of not being necessitated to act by sensible principles of determination. Regarded as a noumenal reality, however, in reference to Man as a pure rational Intelligence, the act of the Will cannot be at all theoretically exhibited; nor can it therefore be explained how this power can act necessitatingly in relation to the sensible activity in the process of Choice, or consequently in what the positive quality of Freedom consists. Only thus much we can see into and comprehend, that although Man, as a Being belonging to the world of Sense, exhibits — as experience shows — a capacity of choosing not only conformably to the Law but also contrary to it, his Freedom as a rational Being belonging to the world of Intelligence cannot be defined by reference merely to sensible appearances. For sensible phenomena cannot make a supersensible object — such as free-will is — intelligible; nor can Freedom ever be placed in the mere fact that the rational Subject can make a choice in conflict with his own Lawgiving Reason, although experience may prove that it happens often enough, notwithstanding our inability to conceive how it is possible. For it is one thing to admit a proposition as based on experience, and another thing to make it the defining Principle and the universal differentiating mark of the act of free-will, in its distinction from the arbitrium brutum s. servum; because the empirical proposition does not assert that any particular characteristic necessarily belongs to the conception in question, but this is requisite in the process of Definition. — Freedom in relation to the internal Legislation of Reason, can alone be properly called a Power; the possibility of diverging from the Law thus given, is an incapacity or want of Power. How then can the former be defined by the latter? It could only be by a Definition which would add to the practical conception of the free-will, its exercise as shown by experience; but this would be a hybrid Definition which would exhibit the conception in a false light.

Law; Legislator. — A morally practical Law is a proposition which contains a Categorical Imperative or Command. He who commands by a Law (imperans) is the Lawgiver or Legislator. He is the Author of the Obligation that accompanies the Law, but he is not always the Author of the Law itself. In the latter case, the Law would be positive, contingent, and arbitrary. The Law which is imposed upon us à priori and unconditionally by our own Reason, may also be expressed as proceeding from the Will of a Supreme Lawgiver or the Divine Will. Such a Will as Supreme can consequently have only Rights and not Duties;

and it only indicates the idea of a moral Being whose Will is Law for all, without conceiving of Him as the Author of that Will.

Imputation; Judgment; Judge. — Imputation, in the moral sense, is the Judgment by which any one is declared to be the Author or free Cause of an action which is then regarded as his moral fact or deed, and is subjected to Law. When the Judgment likewise lays down the juridical consequences of the Deed, it is judicial or valid (imputatio judiciaria s. valida); otherwise it would be only adjudicative or declaratory (imputatio dijudicatoria). — That Person — individual or collective — who is invested with the Right to impute actions judicially, is called a Judge or a Court (judex s. forum).

Merit and Demerit. — When any one does, in conformity with Duty, more than he can be compelled to do by the Law, it is said to be meritorious (meritum). What is done only in exact conformity with the Law, is what is due (debitum). And when less is done than can be demanded to be done by the Law, the result is moral Demerit (demeritum) or Culpability.

Punishment; Reward. — The juridical Effect or Consequence of a culpable act of Demerit is Punishment (poena); that of a meritorious act is Reward (præmium), assuming that this Reward was promised in the Law and that it formed the motive of the action. The coincidence or exact conformity of conduct to what is due, has no juridical effect. — Benevolent Remuneration (remuneratio s. repensio benefica) has no place in juridical Relations.

The good or bad Consequences arising from the performance of an obligated action — as also the Consequences arising from failing to perform a meritorious action — cannot be imputed to the Agent (modus imputationis tollens).

The good Consequences of a meritorious action — as also the bad Consequences of a wrongful action — may be imputed to the Agent (modus imputationis poneus).

The degree of the Imputability of Actions is to be reckoned according to the magnitude of the hindrances or obstacles which it has been necessary for them to overcome. The greater the natural hindrances in the sphere of sense, and the less the moral hindrance of Duty, so much the more is a good Deed imputed as meritorious. This may be seen by considering such examples as rescuing a man who is an entire stranger from great distress, and at very considerable sacrifice. — Conversely, the less the natural hindrance, and the greater the hindrance on the ground of Duty, so much the more is a Transgression imputable as culpable. — Hence the state of mind of the Agent or Doer of a deed makes a difference in imputing its consequences, according as he did it in passion or performed it with coolness and deliberation.

INTRODUCTION to THE SCIENCE OF RIGHT.

GENERAL DEFINITIONS AND DIVISIONS.

A.: What the Science of Right is.

The Science of Right has for its object the Principles of all the Laws which it is possible to promulgate by external legislation. Where there is such a legislation, it becomes in actual application to it, a system of positive Right and Law; and he who is versed in the knowledge of this System is called a Jurist or Jurisconsult (jurisconsultus). A practical Jurisconsult (jurisperitus), or a professional Lawyer, is one who is skilled in the knowledge of positive external Laws, and who can apply them to cases that may occur in experience. Such practical knowledge of positive Right, and Law, may be regarded as belonging to Jurisprudence (Jurisprudentia) in the original sense of the term. But the theoretical knowledge of Right

and Law in Principle, as distinguished from positive Laws and empirical cases, belongs to the pure Science of Right (Jurisscientia). The Science of Right thus designates the philosophical and systematic knowledge of the Principles of Natural Right. And it is from this Science that the immutable Principles of all positive Legislation must be derived by practical Jurists and Lawgivers.

B.: What is Right?

This question may be said to be about as embarrassing to the Jurist as the well-known question, 'What is Truth?' is to the Logician. It is all the more so, if, on reflection, he strives to avoid tautology in his reply, and recognise the fact that a reference to what holds true merely of the laws of some one country at a particular time, is not a solution of the general problem thus proposed. It is quite easy to state what may be right in particular cases (quid sit juris), as being what the laws of a certain place and of a certain time say or may have said; but it is much more difficult to determine whether what they have enacted is right in itself, and to lay down a universal Criterion by which Right and Wrong in general, and what is just and unjust, may be recognised. All this may remain entirely hidden even from the practical Jurist until he abandon his empirical principles for a time, and search in the pure Reason for the sources of such judgments, in order to lay a real foundation for actual positive Legislation. In this search his empirical Laws may, indeed, furnish him with excellent guidance; but a merely empirical system that is void of rational principles is, like the wooden head in the fable of Phædrus, fine enough in appearance, but unfortunately it wants brain.

The conception of Right, — as referring to a corresponding Obligation which is the moral aspect of it, — in the first place, has regard only to the external and practical relation of one Person to another, in so far as they can have influence upon each other, immediately or mediately, by their Actions as facts. 2. In the second place, the conception of Right does not indicate the relation of the action of an individual to the wish or the mere desire of another, as in acts of benevolence or of unkindness, but only the relation of his free action to the freedom of action of the other. 3. And, in the third place, in this reciprocal relation of voluntary actions, the conception of Right does not take into consideration the matter of the act of Will in so far as the end which any one may have in view in willing it, is concerned. In other words, it is not asked in a question of Right whether any one on buying goods for his own business realizes a profit by the transaction or not; but only the form of the transaction is taken into account, in considering the relation of the mutual acts of Will. Acts of Will or voluntary Choice are thus regarded only in so far as they are free, and as to whether the action of one can harmonize with the Freedom of another, according to a universal Law.

Right, therefore, comprehends the whole of the conditions under which the voluntary actions of any one Person can be harmonized in reality with the voluntary actions of every other Person, according to a universal Law of Freedom.

C.: Universal Principle of Right.

'Every Action is right which in itself, or in the maxim on which it proceeds, is such that it can co-exist along with the Freedom of the Will of each and all in action, according to a universal Law.'

If, then, my action or my condition generally can co-exist with the freedom of every other, according to a universal Law, any one does me a wrong who hinders me in the performance of this action, or in the maintenance of this condition. For such a hindrance or obstruction cannot co-exist with Freedom according to universal Laws.

It follows also that it cannot be demanded as a matter of Right, that this universal Principle of all

maxims shall itself be adopted as my maxim, that is, that I shall make it the maxim of my actions. For any one may be free, although his Freedom is entirely indifferent to me, or even if I wished in my heart to infringe it, so long as I do not actually violate that freedom by my external action. Ethics, however, as distinguished from Jurisprudence, imposes upon me the obligation to make the fulfilment of Right a maxim of my conduct.

The universal Law of Right may then be expressed, thus: 'Act externally in such a manner that the free exercise of thy Will may be able to co-exist with the Freedom of all others, according to a universal Law.' This is undoubtedly a Law which imposes obligation upon me; but it does not at all imply and still less command that I ought, merely on account of this obligation, to limit my freedom to these very conditions. Reason in this connection says only that it is restricted thus far by its Idea, and may be likewise thus limited in fact by others; and it lays this down as a Postulate which is not capable of further proof. As the object in view is not to teach Virtue, but to explain what Right is, thus far the Law of Right, as thus laid down, may not and should not be represented as a motive-principle of action.

D.: Right is conjoined with the Title or Authority to compel.

The resistance which is opposed to any hindrance of an effect, is in reality a furtherance of this effect, and is in accordance with its accomplishment. Now, everything that is wrong is a hindrance of freedom, according to universal Laws; and Compulsion or Constraint of any kind is a hindrance or resistance made to Freedom. Consequently, if a certain exercise of Freedom is itself a hindrance of the Freedom that is according to universal Laws, it is wrong; and the compulsion or constraint which is opposed to it is right, as being a hindering of a hindrance of Freedom, and as being in accord with the Freedom which exists in accordance with universal Laws. Hence, according to the logical principle of Contradiction, all Right is accompanied with an implied Title or warrant to bring compulsion to bear on any one who may violate it in fact.

E.: Strict Right may be also represented as the possibility of a universal reciprocal Compulsion in harmony with the Freedom of all according to universal Laws.

This proposition means that Right is not to be regarded as composed of two different elements — Obligation according to a Law, and a Title on the part of one who has bound another by his own free choice, to compel him to perform. But it imports that the conception of Right may be viewed as consisting immediately in the possibility of a universal reciprocal Compulsion, in harmony with the Freedom of all. As Right in general has for its object only what is external in actions, Strict Right, as that with which nothing ethical is intermingled, requires no other motives of action than those that are merely external; for it is then pure Right, and is unmixed with any prescriptions of Virtue. A strict Right, then, in the exact sense of the term, is that which alone can be called wholly external. Now such Right is founded, no doubt, upon the consciousness of the Obligation of every individual according to the Law; but if it is to be pure as such, it neither may nor should refer to this consciousness as a motive by which to determine the free act of the Will. For this purpose, however, it founds upon the principle of the possibility of an external Compulsion, such as may co-exist with the freedom of every one according to universal Laws. Accordingly, then, where it is said that a Creditor has a right to demand from a Debtor the payment of his debt, this does not mean merely that he can bring him to feel in his mind that Reason obliges him to do this; but it means that he can apply an external compulsion to force any such one so to pay, and that this compulsion is quite consistent with the Freedom of all, including the parties in question, according to a universal Law. Right and the Title to compel, thus indicate the same thing.

The Law of Right, as thus enunciated, is represented as a reciprocal Compulsion necessarily in accordance with the Freedom of every one, under the principle of a universal Freedom. It is thus, as it were, a representative Construction of the conception of Right, by exhibiting it in a pure intuitive perception à priori, after the analogy of the possibility of the free motions of bodies under the physical Law of the Equality of Action and Reaction. Now, as in pure Mathematics, we cannot deduce the properties of its objects immediately from a mere abstract conception, but can only discover them by figurative construction or representation of its conceptions; so it is in like manner with the Principle of Right. It is not so much the mere formal Conception of Right, but rather that of a universal and equal reciprocal Compulsion as harmonizing with it, and reduced under general laws, that makes representation of that conception possible. But just as those conceptions presented in Dynamics are founded upon a merely formal representation of pure Mathematics as presented in Geometry, Reason has taken care also to provide the Understanding as far as possible with intuitive presentations à priori in behoof of a Construction of the conception of Right. The Right in geometrical lines (rectum) is opposed as the Straight to that which is Curved, and to that which is Oblique. In the first opposition there is involved an inner quality of the lines of such a nature that there is only one straight or right Line possible between two given points. In the second case, again, the positions of two intersecting or meeting Lines are of such a nature that there can likewise be only one line called the Perpendicular, which is not more inclined to the one side than the other, and it divides space on either side into two equal parts. After the manner of this analogy, the Science of Right aims at determining what every one shall have as his own with mathematical exactness; but this is not to be expected in the ethical Science of Virtue, as it cannot but allow a certain latitude for exceptions. But without passing into the sphere of Ethics, there are two cases — known as the equivocal Right of Equity and Necessity — which claim a juridical decision, yet for which no one can be found to give such a decision, and which, as regards their relation to Rights, belong, as it were, to the 'Intermundia' of Epicurus. These we must at the outset take apart from the special exposition of the Science of Right, to which we are now about to advance; and we may consider them now by way of supplement to these introductory Explanations, in order that their uncertain conditions may not exert a disturbing influence on the fixed Principles of the proper doctrine of Right.

F.: Supplementary Remarks on Equivocal Right.

(Jus æquivocum.)

With every Right, in the strict acceptation (jus strictum), there is conjoined a Right to compel. But it is possible to think of other Rights of a wider kind (jus latum) in which the Title to compel cannot be determined by any law. Now there are two real or supposed Rights of this kind — Equity and the Right of Necessity. The first alleges a Right that is without compulsion; the second adopts a compulsion that is without Right. This equivocalness, however, can be easily shown to rest on the peculiar fact that there are cases of doubtful Right, for the decision of which no Judge can be appointed.

I.: EQUITY.

Equity (Æquitas), regarded objectively, does not properly constitute a claim upon the moral Duty of benevolence or beneficence on the part of others; but whoever insists upon anything on the ground of Equity, founds upon his Right to the same. In this case, however, the conditions are awanting that are requisite for the function of a Judge in order that he might determine what or what kind of satisfaction can be done to this claim. When one of the partners of a Mercantile Company, formed under the condition of Equal profits, has, however, done more than the other members, and in consequence has also lost more, it is in accordance with Equity that he should demand from the Company more than merely an equal share of

advantage with the rest. But, in relation to strict Right, — if we think of a Judge considering his case, — he can furnish no definite data to establish how much more belongs to him by the Contract; and in case of an action at law, such a demand would be rejected. A domestic servant, again, who might be paid his wages due to the end of his year of service in a coinage that became depreciated within that period, so that it would not be of the same value to him as it was when he entered on his engagement, cannot claim by Right to be kept from loss on account of the unequal value of the money if he receives the due amount of it. He can only make an appeal on the ground of Equity, — a dumb goddess who cannot claim a hearing of Right, — because there was nothing bearing on this point in the Contract of Service, and a Judge cannot give a decree on the basis of vague or indefinite conditions.

Hence it follows, that a Court of Equity for the decision of disputed questions of Right, would involve a contradiction. It is only where his own proper Rights are concerned, and in matters in which he can decide, that a Judge may or ought to give a hearing to Equity. Thus, if the Crown is supplicated to give an indemnity to certain persons for loss or injury sustained in its service, it may undertake the burden of doing so, although, according to strict Right, the claim might be rejected on the ground of the pretext that the parties in question undertook the performance of the service occasioning the loss, at their own risk.

The Dictum of Equity may be put thus: 'The strictest Right is the greatest Wrong' (summum jus summa injuria). But this evil cannot be obviated by the forms of Right although it relates to a matter of Right; for the grievance that it gives rise to can only be put before a 'Court of Conscience' (forum poli), whereas every question of Right must be taken before a Civil Court (forum soli).

II.: THE RIGHT OF NECESSITY.

The so-called Right of Necessity (Jus necessitatis) is the supposed Right or Title, in case of the danger of losing my own life, to take away the life of another who has, in fact, done me no harm. It is evident that, viewed as a doctrine of Right, this must involve a contradiction. For this is not the case of a wrongful aggressor making an unjust assault upon my life, and whom I anticipate by depriving him of his own (jus inculpatæ tutelæ); nor consequently is it a question merely of the recommendation of moderation which belongs to Ethics as the Doctrine of Virtue, and not to Jurisprudence as the Doctrine of Right. It is a question of the allowableness of using violence against one who has used none against me.

It is clear that the assertion of such a Right is not to be understood objectively as being in accordance with what a Law would prescribe, but merely subjectively, as proceeding on the assumption of how a sentence would be pronounced by a Court in the case. There can, in fact, be no Criminal Law assigning the penalty of death to a man who, when shipwrecked and struggling in extreme danger for his life, and in order to save it, may thrust another from a plank on which he had saved himself. For the punishment threatened by the Law could not possibly have greater power than the fear of the loss of life in the case in question. Such a Penal Law would thus fail altogether to exercise its intended effect; for the threat of an Evil which is still uncertain — such as Death by a judicial sentence — could not overcome the fear of an Evil which is certain, as Drowning is in such circumstances. An act of violent self-preservation, then, ought not to be considered as altogether beyond condemnation (inculpabile); it is only to be adjudged as exempt from punishment (impunibile). Yet this subjective condition of impunity, by a strange confusion of ideas, has been regarded by Jurists as equivalent to objective lawfulness.

The Dictum of the Right of Necessity is put in these terms, 'Necessity has no Law' (Necessitas non habet legem). And yet there cannot be a necessity that could make what is wrong lawful.

It is apparent, then, that in judgments relating both to 'Equity' and 'the Right of Necessity,' the Equivocations involved arise from an interchange of the objective and subjective grounds that enter into the application of the Principles of Right, when viewed respectively by Reason or by a Judicial Tribunal.

What one may have good grounds for recognising as Right in itself, may not find confirmation in a Court of Justice; and what he must consider to be wrong in itself, may obtain recognition in such a Court. And the reason of this is, that the conception of Right is not taken in the two cases in one and the same sense.

DIVISION OF THE SCIENCE OF RIGHT.

A.: General Division of the Duties of Right.

(Juridical Duties.)

In this Division we may very conveniently follow Ulpian, if his three Formulæ are taken in a general sense, which may not have been quite clearly in his mind, but which they are capable of being developed into or of receiving. They are the following: —

1. Honeste vive. 'Live rightly.' Juridical Rectitude, or Honour (Honestas juridica), consists in maintaining one's own worth as a man in relation to others. This Duty may be rendered by the proposition, 'Do not make thyself a mere Means for the use of others, but be to them likewise an End.' This Duty will be explained in the next Formula as an Obligation arising out of the Right of Humanity in our own Person (Lex justi).

2. Neminem læde. 'Do Wrong to no one.' This Formula may be rendered so as to mean, 'Do no Wrong to any one, even if thou shouldst be under the necessity, in observing this Duty, to cease from all connection with others and to avoid all Society' (Lex juridica).

3. Suum cuique tribue. 'Assign to every one what is his own.' This may be rendered, 'Enter, if Wrong cannot be avoided, into a Society with others in which every one may have secured to him what is his own.' — If this Formula were to be simply translated, 'Give every one his own,' it would express an absurdity, for we cannot give any one what he already has. If it is to have a definite meaning, it must therefore run thus, 'Enter into a state in which every one can have what is his own secured against the action of every other' (Lex justitiæ).

These three classical Formulæ, at the same time, represent principles which suggest a Division of the System of Juridical Duties into Internal Duties, External Duties, and those Connecting Duties which contain the latter as deduced from the Principle of the former by subsumption.

B.: Universal Division of Rights.

I.: Natural Right and Positive Right.

The System of Rights, viewed as a scientific System of Doctrines, is divided into Natural Right and Positive Right. Natural Right rests upon pure rational Principles à priori; Positive or Statutory Right is what proceeds from the Will of a Legislator.

II.: Innate Right and Acquired Right.

The System of Rights may again be regarded in reference to the implied Powers of dealing morally with others as bound by Obligations, that is, as furnishing a legal Title of action in relation to them. Thus viewed, the System is divided into Innate Right and Acquired Right. Innate Right is that Right which belongs to every one by Nature, independent of all juridical acts of experience. Acquired Right is that Right which is founded upon such juridical acts.

Innate Right may also be called the ‘Internal Mine and Thine’ (Meum vel Tuum internum); for External Right must always be acquired.

There is only one Innate Right, the Birthright of Freedom.

Freedom is Independence of the compulsory Will of another; and in so far as it can co-exist with the Freedom of all according to a universal Law, it is the one sole original, inborn Right belonging to every man in virtue of his Humanity. There is, indeed, an innate Equality belonging to every man which consists in his Right to be independent of being bound by others to anything more than that to which he may also reciprocally bind them. It is, consequently, the inborn quality of every man in virtue of which he ought to be his own master by Right (sui juris). There is, also, the natural quality of Justness attributable to a man as naturally of unimpeachable Right (justi), because he has done no Wrong to any one prior to his own juridical actions. And, further, there is also the innate Right of Common Action on the part of every man so that he may do towards others what does not infringe their Rights or take away anything that is theirs unless they are willing to appropriate it; such as merely to communicate thought, to narrate anything, or to promise something whether truly and honestly, or untruly and dishonestly (veriloquium aut falsiloquium), for it rests entirely upon these others whether they will believe or trust in it or not. But all these Rights or Titles are already included in the Principle of Innate Freedom, and are not really distinguished from it, even as dividing members under a higher species of Right.

The reason why such a Division into separate Rights has been introduced into the System of Natural Right viewed as including all that is innate, was not without a purpose. Its object was to enable proof to be more readily put forward in case of any controversy arising about an Acquired Right, and questions emerging either with reference to a fact that might be in doubt, or, if that were established, in reference to a Right under dispute. For the party repudiating an obligation, and on whom the burden of proof (onus probandi) might be incumbent, could thus methodically refer to his Innate Right of Freedom as specified under various relations in detail, and could therefore found upon them equally as different Titles of Right.

In the relation of Innate Right, and consequently of the Internal ‘Mine’ and ‘Thine,’ there is therefore not Rights, but only one Right. And, accordingly, this highest Division of Rights into Innate and Acquired, which evidently consists of two members extremely unequal in their contents, is properly placed in the Introduction; and the subdivisions of the Science of Right may be referred in detail to the External Mine and Thine.

C.: Methodical Division of the Science of Right.

The highest Division of the System of Natural Right should not be — as it is frequently put — into ‘Natural Right’ and ‘Social Right,’ but into Natural Right and Civil Right. The first constitutes Private Right; the second, Public Right. For it is not the ‘Social state’ but the ‘Civil state’ that is opposed to the ‘State of Nature;’ for in the ‘State of Nature’ there may well be Society of some kind, but there is no ‘civil’ Society, as an Institution securing the Mine and Thine by public laws. It is thus that Right, viewed under reference to the state of Nature, is specially called Private Right. The whole of the Principles of Right will therefore fall to be expounded under the two subdivisions of Private Right and Public Right.

PART FIRST. PRIVATE RIGHT.

PRIVATE RIGHT. THE SYSTEM OF THOSE LAWS WHICH REQUIRE NO EXTERNAL PROMULGATION.

PRIVATE RIGHT. THE PRINCIPLES OF THE EXTERNAL MINE AND THINE GENERALLY.

CHAPTER FIRST. Of the Mode of having anything External as one’s own.

1.: The meaning of ‘Mine’ in Right.

(Meum Juris.)

Anything is ‘Mine’ by Right, or is rightfully Mine, when I am so connected with it, that if any other Person should make use of it without my consent, he would do me a lesion or injury. The subjective condition of the use of anything, is Possession of it.

An external thing, however, as such could only be mine, if I may assume it to be possible that I can be wronged by the use which another might make of it when it is not actually in my possession. Hence it would be a contradiction to have anything External as one’s own, were not the conception of Possession capable of two different meanings, as sensible Possession that is perceivable by the senses, and rational Possession that is perceivable only by the Intellect. By the former is to be understood a physical Possession, and by the latter, a purely juridical Possession of the same object.

The description of an Object as ‘external to me’ may signify either that it is merely ‘different and distinct from me as a Subject,’ or that it is also ‘a thing placed outside of me, and to be found elsewhere in space or time.’ Taken in the first sense, the term Possession signifies ‘rational Possession;’ and, in the second sense, it must mean ‘Empirical Possession.’ A rational or intelligible Possession, if such be possible, is Possession viewed apart from physical holding or detention (detentio).

2.: Juridical Postulate of the Practical Reason.

It is possible to have any external object of my Will as Mine. In other words, a Maxim to this effect — were it to become law — that any object on which the Will can be exerted must remain objectively in itself without an owner, as ‘res nullius,’ is contrary to the Principle of Right.

For an object of any act of my Will, is something that it would be physically within my power to use. Now, suppose there were things that by right should absolutely not be in our power, or, in other words, that it would be wrong or inconsistent with the freedom of all, according to universal Law, to make use of them. On this supposition, Freedom would so far be depriving itself of the use of its voluntary activity, in thus putting useable objects out of all possibility of use. In practical relations, this would be to annihilate them, by making them res nullius, notwithstanding the fact that acts of Will in relation to such things would formally harmonize, in the actual use of them, with the external freedom of all according to universal Laws. Now the pure practical Reason lays down only formal Laws as Principles to regulate the exercise of the Will; and therefore abstracts from the matter of the act of Will, as regards the other qualities of the object, which is considered only in so far as it is an object of the activity of the Will. Hence the practical Reason cannot contain, in reference to such an object, an absolute prohibition of its use, because this would involve a contradiction of external freedom with itself. — An object of my free Will, however, is one which I have the physical capability of making some use of at will, since its use stands in my power (in potentia). This is to be distinguished from having the object brought under my disposal (in potestatem meam reductum), which supposes not a capability merely, but also a particular act of the free-will. But in order to consider something merely as an object of my Will as such, it is sufficient to be conscious that I have it in my power. It is therefore an assumption à priori of the practical Reason, to regard and treat every object within the range of my free exercise of Will as objectively a possible Mine

or Thine.

This Postulate may be called ‘a Permissive Law’ of the practical Reason, as giving us a special title which we could not evolve out of the mere conceptions of Right generally. And this Title constitutes the Right to impose upon all others an obligation, not otherwise laid upon them, to abstain from the use of certain objects of our free Choice, because we have already taken them into our possession. Reason wills that this shall be recognised as a valid Principle, and it does so as practical Reason; and it is enabled by means of this Postulate à priori to enlarge its range of activity in practice.

3.: Possession and Ownership.

Any one who would assert the Right to a thing as his, must be in possession of it as an object. Were he not its actual possessor or owner, he could not be wronged or injured by the use which another might make of it without his consent. For, should anything external to him, and in no way connected with him by Right, affect this object, it could not affect himself as a Subject, nor do him any wrong, unless he stood in a relation of Ownership to it.

4.: Exposition of the Conception of the External Mine and Thine.

There can only be three external Objects of my Will in the activity of Choice:

A Corporeal Thing external to me;

The Free-will of another in the performance of a particular act (præstatio);

The State of another in relation to myself.

These correspond to the categories of Substance, Causality, and Reciprocity; and they form the practical relations between me and external objects, according to the Laws of Freedom.

A. I can only call a corporeal thing or an object in space ‘mine,’ when, even although not in physical possession of it, I am able to assert that I am in possession of it in another real non-physical sense. Thus, I am not entitled to call an apple mine merely because I hold it in my hand or possess it physically; but only when I am entitled to say, ‘I possess it, although I have laid it out of my hand, and wherever it may lie.’ In like manner, I am not entitled to say of the ground, on which I may have laid myself down, that therefore it is mine; but only when I can rightly assert that it still remains in my possession, although I may have left the spot. For any one who, in the former appearances of empirical possession, might wrench the apple out of my hand, or drag me away from my resting-place, would, indeed, injure me in respect of the inner ‘Mine’ of Freedom, but not in respect of the external ‘Mine,’ unless I could assert that I was in the possession of the Object, even when not actually holding it physically. And if I could not do this, neither could I call the apple or the spot mine.

B. I cannot call the performance of something by the action of the Will of another ‘Mine,’ if I can only say ‘it has come into my possession at the same time with a promise’ (pactum re initum); but only if I am able to assert ‘I am in possession of the Will of the other, so as to determine him to the performance of a particular act, although the time for the performance of it has not yet come.’ In the latter case, the promise belongs to the nature of things actually held as possessed, and as an ‘active obligation’ I can reckon it mine; and this holds good not only if I have the thing promised — as in the first case — already in my possession, but even although I do not yet possess it in fact. Hence, I must be able to regard myself in thought as independent of that empirical form of possession that is limited by the condition of time, and as being nevertheless in possession of the object.

C. I cannot call a Wife, a Child, a Domestic, or, generally, any other Person ‘mine’ merely because I command them at present as belonging to my household, or because I have them under control, and in my power and possession. But I can call them mine, if, although they may have withdrawn themselves from

my control and I do not therefore possess them empirically, I can still say ‘I possess them by my mere Will, provided they exist anywhere in space or time; and, consequently, my possession of them is purely juridical.’ They belong, in fact, to my possessions, only when and so far as I can assert this as a matter of Right.

5.: Definition of the conception of the external Mine and Thine.

Definitions are nominal or real. A nominal Definition is sufficient merely to distinguish the object defined from all other objects, and it springs out of a complete and definite exposition of its conception. A real Definition further suffices for a Deduction of the conception defined, so as to furnish a knowledge of the reality of the object. — The nominal Definition of the external ‘Mine’ would thus be: ‘The external Mine is anything outside of myself, such that any hindrance of my use of it at will, would be doing me an injury or wrong as an infringement of that Freedom of mine which may coexist with the freedom of all others according to a universal Law.’ The real Definition of this conception may be put thus: ‘The external Mine is anything outside of myself, such that any prevention of my use of it would be a wrong, although I may not be in possession of it so as to be actually holding it as an object.’ — I must be in some kind of possession of an external object, if the object is to be regarded as mine; for, otherwise, any one interfering with this object would not, in doing so, affect me; nor, consequently, would he thereby do me any wrong. Hence, according to § 4, a rational Possession (possessio noumenon) must be assumed as possible, if there is to be rightly an external ‘Mine and Thine.’ Empirical Possession is thus only phenomenal possession or holding (detention) of the object in the sphere of sensible appearance (possessio phenomenon), although the object which I possess is not regarded in this practical relation as itself a Phenomenon, — according to the exposition of the Transcendental Analytic in the Critique of Pure Reason — but as a Thing in itself. For in the Critique of Pure Reason the interest of Reason turns upon the theoretical knowledge of the Nature of Things, and how far Reason can go in such knowledge. But here Reason has to deal with the practical determination of the action of the Will according to Laws of Freedom, whether the object is perceivable through the senses or merely thinkable by the pure Understanding. And Right, as under consideration, is a pure practical conception of the Reason in relation to the exercise of the Will under Laws of Freedom.

And, hence, it is not quite correct to speak of ‘possessing’ a Right to this or that object, but it should rather be said that an object is possessed in a purely juridical way; for a Right is itself the rational possession of an Object, and to ‘possess a possession,’ would be an expression without meaning.

6.: Deduction of the conception of a purely juridical Possession of an External Object.

(Possessio noumenon.)

The question, ‘How is an external Mine and Thine possible?’ resolves itself into this other question, ‘How is a merely juridical or rational Possession possible?’ And this second question resolves itself again into a third, ‘How is a synthetic proposition in Right possible à priori?’

All Propositions of Right — as juridical propositions — are Propositions à priori, for they are practical Laws of Reason (Dictamina rationis). But the juridical Proposition à priori respecting empirical Possession is analytical; for it says nothing more than what follows by the principle of Contradiction, from the conception of such possession; namely, that if I am the holder of a thing in the way of being physically connected with it, any one interfering with it without my consent — as, for instance, in wrenching an apple out of my hand — affects and detracts from my freedom as that which is internally Mine; and consequently the maxim of his action is in direct contradiction to the Axiom of Right. The proposition expressing the principle of an empirical rightful Possession, does not therefore go beyond the

Right of a Person in reference to himself.

On the other hand, the Proposition expressing the possibility of the Possession of a thing external to me, after abstraction of all the conditions of empirical possession in space and time — consequently presenting the assumption of the possibility of a Possessio Noumenon — goes beyond these limiting conditions; and because this Proposition asserts a possession even without physical holding, as necessary to the conception of the external Mine and Thine, it is synthetical. And thus it becomes a problem for Reason to show how such a Proposition, extending its range beyond the conception of empirical possession, is possible à priori.

In this manner, for instance, the act of taking possession of a particular portion of the soil, is a mode exercising the private free-will without being an act of usurpation. The possessor founds upon the innate Right of common possession of the surface of the earth, and upon the universal Will corresponding à priori to it, which allows a private Possession of the soil; because what are mere things would be otherwise made in themselves and by a Law, into unappropriable objects. Thus a first appropriator acquires originally by primary possession a particular portion of the ground; and by Right (jure) he resists every other person who would hinder him in the private use of it, although while the 'state of Nature' continues, this cannot be done by juridical means (de jure), because a public Law does not yet exist.

And although a piece of ground should be regarded as free, or declared to be such, so as to be for the public use of all without distinction, yet it cannot be said that it is thus free by nature and originally so, prior to any juridical act. For there would be a real relation already incorporated in such a piece of ground by the very fact that the possession of it was denied to any particular individual; and as this public freedom of the ground would be a prohibition of it to every particular individual, this presupposes a common possession of it which cannot take effect without a Contract. A piece of ground, however, which can only become publicly free by contract, must actually be in the possession of all those associated together, who mutually interdict or suspend each other, from any particular or private use of it.

This original Community of the soil and of the things upon it (communio fundi originaria), is an idea which has objective and practical Juridical reality, and is entirely different from the idea of a primitive community of things which is a fiction. For the latter would have had to be founded as a form of Society, and must have taken its rise from a Contract by which all renounced the Right of Private Possession, so that by uniting the property owned by each into a whole, it was thus transformed into a common possession. But had such an event taken place, History must have presented some evidence of it. To regard such a procedure as the original mode of taking possession, and to hold that the particular possessions of every individual may and ought to be grounded upon it, is evidently a contradiction.

Possession (possessio) is to be distinguished from habitation as mere residence (sedes); and the act of taking possession of the soil in the intention of acquiring it once for all, is also to be distinguished from settlement or domicile (incolatus), which is a continuous private Possession of a place that is dependent on the presence of the individual upon it. We have not here to deal with the question of domiciliary settlement, as that is a secondary juridical act which may follow upon possession, or may not occur at all; for as such it could not involve an original possession, but only a secondary possession derived from the consent of others.

Simple physical Possession, or holding of the soil, involves already certain relations of Right to the thing, although it is certainly not sufficient to enable me to regard it as Mine. Relative to others, so far as they know, it appears as a first possession in harmony with the law of external freedom; and, at the same time, it is embraced in the universal original possession which contains à priori the fundamental principle of the possibility of a private possession. Hence to disturb the first occupier or holder of a portion of the soil in his use of it, is a lesion or wrong done to him. The first taking of Possession has therefore a Title of Right (titulus possessionis) in its favour, which is simply the principle of the original common possession; and the saying that 'It is well for those who are in possession' (beati possidentes), when one

is not bound to authenticate his possession, is a principle of Natural Right that establishes the juridical act of taking possession, as a ground of acquisition upon which every first possessor may found.

It has been shown in the Critique of Pure Reason that in theoretical Principles à priori, an intuitional Perception à priori must be supplied in connection with any given conception; and, consequently, were it a question of a purely theoretical Principle, something would have to be added to the conception of the possession of an object to make it real. But in respect of the practical Principle under consideration, the procedure is just the converse of the theoretical process; so that all the conditions of perception which form the foundation of empirical possession must be abstracted or taken away in order to extend the range of the juridical Conception beyond the empirical sphere, and in order to be able to apply the Postulate, that every external object of the free activity of my Will, so far as I have it in my power, although not in the possession of it, may be reckoned as juridically Mine.

The possibility of such a possession, with consequent Deduction of the conception of a non-empirical possession, is founded upon the juridical Postulate of the Practical Reason, that 'It is a juridical Duty so to act towards others that what is external and useable may come into the possession or become the property of some one.' And this Postulate is conjoined with the exposition of the Conception that what is externally one's own, is founded upon a possession, that is not physical. The possibility of such a possession, thus conceived, cannot, however, be proved or comprehended in itself, because it is a rational conception for which no empirical perception can be furnished; but it follows as an immediate consequence from the Postulate that has been enunciated. For, if it is necessary to act according to that juridical Principle, the rational or intelligible condition of a purely juridical possession must also be possible. It need astonish no one, then, that the theoretical aspect of the Principles of the external Mine and Thine, is lost from view in the rational sphere of pure Intelligence, and presents no extension of Knowledge; for the conception of Freedom upon which they rest does not admit of any theoretical Deduction of its possibility, and it can only be inferred from the practical Law of Reason, called the Categorical Imperative, viewed as a fact.

7.: Application of the Principle of the Possibility of an external Mine and Thine to Objects of Experience.

The conception of a purely juridical Possession, is not an empirical conception dependent on conditions of Space and Time, and yet it has practical reality. As such it must be applicable to objects of experience, the knowledge of which is independent of the conditions of Space and Time. The rational process by which the conception of Right is brought into relation to such objects so as to constitute a possible external Mine and Thine, is as follows. The Conception of Right, being contained merely in Reason, cannot be immediately applied to objects of experience, so as to give the conception of an empirical Possession, but must be applied directly to the mediating conception in the Understanding, of Possession in general; so that, instead of physical holding (Detentio) as an empirical representation of possession, the formal conception or thought of 'Having,' abstracted from all conditions of Space and Time, is conceived by the mind, and only as implying that an object is in my power and at my disposal (in potestate mea positum esse). In this relation, the term 'external' does not signify existence in another place than where I am, nor my resolution and acceptance at another time than the moment in which I have the offer of a thing: it signifies only an object different from or other than myself. Now the practical Reason by its Law of Right wills, that I shall think the Mine and Thine in application to objects, not according to sensible conditions, but apart from these and from the Possession they indicate; because they refer to determinations of the activity of the Will that are in accordance with the Laws of Freedom. For it is only a conception of the Understanding that can be brought under the rational Conception of Right. I may therefore say that I possess a field, although it is in quite a different place from that on which I actually find myself. For the question here is not concerning an intellectual relation to the object, but I have the

thing practically in my power and at my disposal, which is a conception of Possession realized by the Understanding and independent of relations of space; and it is mine, because my Will in determining itself to any particular use of it, is not in conflict with the Law of external Freedom. Now it is just in abstraction from physical possession of the object of my free-will in the sphere of sense, that the Practical Reason wills that a rational possession of it shall be thought, according to intellectual conceptions which are not empirical, but contain à priori the conditions of rational possession. Hence it is in this fact, that we found the ground of the validity of such a rational conception of possession (possessio noumenon) as the principle of a universally valid Legislation. For such a Legislation is implied and contained in the expression, 'This external object is mine,' because an Obligation is thereby imposed upon all others in respect of it, who would otherwise not have been obliged to abstain from the use of this object.

The mode, then, of having something External to myself as Mine, consists in a specially juridical connection of the Will of the Subject with that object, independently of the empirical relations to it in Space and in Time, and in accordance with the conception of a rational possession. — A particular spot on the earth is not externally Mine because I occupy it with my body; for the question here discussed refers only to my external Freedom, and consequently it affects only the possession of myself, which is not a thing external to me, and therefore only involves an internal Right. But if I continue to be in possession of the spot, although I have taken myself away from it and gone to another place, only under that condition is my external Right concerned in connection with it. And to make the continuous possession of this spot by my person a condition of having it as mine, must either be to assert that it is not possible at all to have anything External as one's own, which is contrary to the Postulate in § 2, or to require, in order that this external Possession may be possible, that I shall be in two places at the same time. But this amounts to saying that I must be in a place and also not in it, which is contradictory and absurd.

This position may be applied to the case in which I have accepted a promise; for my Having and Possession in respect of what has been promised, become established on the ground of external Right. This Right is not to be annulled by the fact that the promiser having said at one time, 'This thing shall be yours,' again at a subsequent time says, 'My will now is that the thing shall not be yours.' In such relations of rational Right the conditions hold just the same as if the promiser had, without any interval of time between them, made the two declarations of his Will, 'This shall be yours,' and also 'This shall not be yours;' which manifestly contradicts itself.

The same thing holds, in like manner, of the Conception of the juridical possession of a Person as belonging to the 'Having' of a subject, whether it be a Wife, a Child, or a Servant. The relations of Right involved in a household, and the reciprocal possession of all its members, are not annulled by the capability of separating from each other in space; because it is by juridical relations that they are connected, and the external 'Mine' and 'Thine,' as in the former cases, rests entirely upon the assumption of the possibility of a purely rational possession, without the accompaniment of physical detention or holding of the object.

Reason is forced to a Critique of its juridically Practical Function in special reference to the conception of the external Mine and Thine, by the Antinomy of the propositions enunciated regarding the possibility of such a form of Possession. For these give rise to an inevitable Dialectic, in which a Thesis and an Antithesis set up equal claims to the validity of two conflicting Conditions. Reason is thus compelled, in its practical function in relation to Right, — as it was in its theoretical function, — to make a distinction between Possession as a phenomenal appearance presented to the senses, and that Possession which is rational and thinkable only by the Understanding.

Thesis. — The Thesis, in this case, is, 'It is possible to have something external as mine, although I am not in possession of it.'

Antithesis. — The Antithesis is, 'It is not possible to have anything external as mine, if I am not in

possession of it.’

Solution. — The Solution is, ‘Both Propositions are true;’ the former when I mean empirical Possession (possessio phænomenon), the latter when I understand by the same term, a purely rational Possession (possessio noumenon).

But the possibility of a rational possession, and consequently of an external Mine and Thine, cannot be comprehended by direct insight, but must be deduced from the Practical Reason. And in this relation it is specially noteworthy that the Practical Reason without intuitional perceptions, and even without requiring such an element à priori, can extend its range by the mere elimination of empirical conditions, as justified by the law of Freedom, and can thus establish synthetical Propositions à priori. The proof of this in the practical connection, as will be shown afterwards, can be adduced in an analytical manner.

8.: To have anything External as one’s own is only possible in a Juridical or Civil State of Society under the regulation of a public legislative Power.

If, by word or deed, I declare my Will that some external thing shall be mine, I make a declaration that every other person is obliged to abstain from the use of this object of my exercise of Will; and this imposes an Obligation which no one would be under, without such a juridical act on my part. But the assumption of this Act, at the same time involves the admission that I am obliged reciprocally to observe a similar abstention towards every other in respect of what is externally theirs; for the Obligation in question arises from a universal Rule regulating the external juridical relations. Hence I am not obliged to let alone what another person declares to be externally his, unless every other person likewise secures me by a guarantee that he will act in relation to what is mine, upon the same Principle. This guarantee of reciprocal and mutual abstention from what belongs to others, does not require a special juridical act for its establishment, but is already involved in the Conception of an external Obligation of Right, on account of the universality and consequently the reciprocity of the obligatoriness arising from a universal Rule. — Now a single Will, in relation to an external and consequently contingent Possession, cannot serve as a compulsory Law for all, because that would be to do violence to the Freedom which is in accordance with universal Laws. Therefore it is only a Will that binds every one, and as such a common, collective, and authoritative Will, that can furnish a guarantee of security to all. But the state of men under a universal, external, and public Legislation, conjoined with authority and power, is called the Civil state. There can therefore be an external Mine and Thine only in the Civil state of Society.

Consequence. — It follows, as a Corollary, that if it is juridically possible to have an external object as one’s own, the individual Subject of possession must be allowed to compel or constrain every person, with whom a dispute as to the Mine or Thine of such a possession may arise, to enter along with himself into the relations of a Civil Constitution.

9.: There may, however, be an external Mine and Thine found as a fact in the state of Nature, but it is only provisory.

Natural Right in the state of a Civil Constitution, means the forms of Right which may be deduced from Principles à priori as the conditions of such a Constitution. It is therefore not to be infringed by the statutory laws of such a Constitution; and accordingly the juridical Principle remains in force, that, ‘Whoever proceeds upon a Maxim by which it becomes impossible for me to have an object of the exercise of my Will as Mine, does me a lesion or injury.’ For a Civil Constitution is only the juridical condition under which every one has what is his own merely secured to him, as distinguised from its being specially assigned and determined to him. — All Guarantee, therefore, assumes that every one to

whom a thing is secured, is already in possesion of it as his own. Hence, prior to the Civil Constitution — or apart from it — an external Mine and Thine must be assumed as possible, and along with it a Right to compel every one with whom we could come into any kind of intercourse, to enter with us into a constitution in which what is Mine or Thine can be secured. — There may thus be a Possession in expectation or in preparation for such a state of security, as can only be established on the Law of the Common Will; and as it is therefore in accordance with the possibility of such a state, it constitutes a provisory or temporary juridical Possession; whereas that Possession which is found in reality in the Civil state of Society will be a peremptory or guaranteed Possession. — Prior to entering into this state, for which he is naturally prepared, the individual rightfully resists those who will not adapt themselves to it, and who would disturb him in his provisory possession; because if the Will of all except himself were imposing upon him an obligation to withdraw from a certain possession, it would still be only a one-sided or unilateral Will, and consequently it would have just as little legal Title — which can be properly based only on the universalized Will — to contest a claim of Right; as he would have to assert it. Yet he has the advantage on his side, of being in accord with the conditions requisite to the introduction and institution of a civil form of Society. In a word, the mode in which anything external may be held as one's own in the state of Nature, is just physical possession with a presumption of Right thus far in its favour, that by union of the Wills of all in a public Legislation, it will be made juridical; and in this expectation it holds comparatively, as a kind of potential juridical Possession.

This Prerogative of Right, as arising from the fact of empirical possession, is in accordance with the Formula, 'It is well for those who are in possession' (Beati possidentes). It does not consist in the fact that because the Possessor has the presumption of being a rightful man, it is unnecessary for him to bring forward proof that he possesses a certain thing rightfully, for this position applies only to a case of disputed Right. But it is because it accords with the Postulate of the Practical Reason, that every one is invested with the faculty of having as his own any external object upon which he has exerted his Will; and, consequently, all actual possession is a state whose rightfulness is established upon that Postulate by an anterior act of Will. And such an act, if there be no prior possession of the same object by another opposed to it, does, therefore, provisionally justify and entitle me, according to the Law of external Freedom, to restrain any one who refuses to enter with me into a state of public legal Freedom, from all pretension to the use of such an object. For such a procedure is requisite, in conformity with the Postulate of Reason, in order to subject to my proper use a thing which would otherwise be practically annihilated, as regards all proper use of it.

PRIVATE RIGHT

CHAPTER SECOND. The Mode of acquiring anything External.

10.: The general Principle of External Acquisition.

I acquire a thing when I act (efficio) so that it becomes mine. — An external thing is originally mine, when it is mine even without the intervention of a juridical Act. An Acquisition is original and primary, when it is not derived from what another had already made his own.

There is nothing External that is as such originally mine; but anything external may be originally acquired when it is an object that no other person has yet made his. — A state in which the Mine and Thine are in common, cannot be conceived as having been at any time original. Such a state of things would have to be acquired by an external juridical Act, although there may be an original and common possession of an external object. Even if we think hypothetically of a state in which the Mine and Thine would be originally in common as a 'Communio mei et tui originaria,' it would still have to be distinguished from a primeval communion (Communio primæva) with things in common, sometimes supposed to be founded in the first period of the relations of Right among men, and which could not be regarded as based upon Principles like the former, but only upon History. Even under that condition the historic Communio, as a supposed primeval Community would always have to be viewed as acquired and derivative (Communio derivativa).

The Principle of external Acquisition, then, may be expressed thus: 'Whatever I bring under my power according to the Law of external Freedom, of which as an object of my free activity of Will I have the capability of making use according to the Postulate of the Practical Reason, and which I will to become mine in conformity with the Idea of a possible united common Will, is mine.'

The practical Elements (Momenta attendenda) constitutive of the process of original Acquisition are: —

Prehension or Seizure of an object which belongs to no one; for if it belonged already to some one the act would conflict with the Freedom of others that is according to universal Laws. This is the taking possession of an object of my free activity of Will in Space and Time; the Possession, therefore, into which I thus put myself is sensible or physical possession (possessio phenomenon);

Declaration of the possession of this object by formal designation and the act of my free-will in interdicting every other person from using it as his;

Appropriation, as the act, in Idea, of an externally legislative common Will, by which all and each are obliged to respect and act in conformity with my act of Will.

The validity of the last element in the process of Acquisition, as that on which the conclusion that 'the external object is mine' rests, is what makes the possession valid as a purely rational and juridical possession (possessio noumenon). It is founded upon the fact that as all these Acts are juridical, they consequently proceed from the Practical Reason, and therefore in the question as to what is Right, abstraction may be made of the empirical conditions involved, and the conclusion 'the external object is mine' thus becomes a correct inference from the external fact of sensible possession to the internal Right of rational Possession.

The original primary Acquisition of an external object of the action of the Will, is called Occupancy. It can only take place in reference to Substances or Corporeal Things. Now when this Occupation of an external object does take place, the Act presupposes as a condition of such empirical possession, its Priority in time before the act of any other who may also be willing to enter upon occupation of it. Hence the legal maxim, 'qui prior tempore, potior jure.' Such Occupation as original or primary is, further, the effect only of a single or unilateral Will; for were a bilateral or twofold Will requisite for it, it would be

derived from a Contract of two or more persons with each other, and consequently it would be based upon what another or others had already made their own. — It is not easy to see how such an act of free-will as this would be, could really form a foundation for every one having his own. — However, the first Acquisition of a thing is on that account not quite exactly the same as the original Acquisition of it. For the Acquisition of a public juridical state by union of the Wills of all in a universal Legislation, would be such an original Acquisition, seeing that no other of the kind could precede it, and yet it would be derived from the particular Wills of all the individuals, and consequently become all-sided or omnilateral; for a properly primary Acquisition can only proceed from an individual or unilateral Will.

Division of the Subject of the Acquisition of the external Mine and Thine.

In respect of the Matter or Object of Acquisition, I acquire either a Corporeal Thing (Substance), or the Performance of something by another (Causality), or this other as a Person in respect of his state, so far as I have a Right to dispose of the same (in a relation of Reciprocity with him).

In respect of the Form or Mode of Acquisition, it is either a Real Right (jus reale), or a Personal Right (jus personale), or a Real-Personal Right (jus realiter personale), to the possession, although not to the use, of another Person as if he were a Thing.

In respect of the Ground of Right or the Title (titulus) of Acquisition — which, properly, is not a particular member of the Division of Rights, but rather a constituent element of the mode of exercising them — any thing External is acquired by a certain free Exercise of Will that is either unilateral, as the act of a single Will (facto), or bilateral, as the act of two Wills (pacto), or omnilateral, as the act of all the Wills of a Community together (lege).

FIRST SECTION. Principles of Real Right.

11.: What is a Real Right?

The usual Definition of Real Right, or 'Right in a Thing' (jus reale, jus in re), is that 'it is a Right as against every possessor of it.' This is a correct Nominal Definition. But what is it that entitles me to claim an external object from any one who may appear as its possessor, and to compel him, per vindicationem, to put me again, in place of himself, into possession of it? Is this external juridical relation of my Will a kind of immediate relation to an external thing? — If so, whoever might think of his Right as referring not immediately to Persons but to Things, would have to represent it, although only in an obscure way, somewhat thus. A Right on one side has always a Duty corresponding to it on the other, so that an external thing, although away from the hands of its first Possessor, continues to be still connected with him by a continuing obligation; and thus it refuses to fall under the claim of any other possessor, because it is already bound to another. In this way my Right, viewed as a kind of good Genius accompanying a thing and preserving it from all external attack, would refer an alien possessor always to me! It is, however, absurd to think of an obligation of Persons towards Things, and conversely; although it may be allowed in any particular case, to represent the juridical relation by a sensible image of this kind, and to express it in this way.

The Real Definition would run thus: 'Right in a Thing is a Right to the Private Use of a Thing, of which I am in possession — original or derivative — in common with all others.' For this is the one condition under which it is alone possible that I can exclude every other possessor from the private use of the Thing (jus contra quemlibet hujus rei possessorem). For, except by presupposing such a common collective possession, it cannot be conceived how, when I am not in actual possession of a thing, I could be injured

or wronged by others who are in possession of it and use it. — By an individual act of my own Will I cannot oblige any other person to abstain from the use of a thing in respect of which he would otherwise be under no obligation; and, accordingly, such an Obligation can only arise from the collective Will of all united in a relation of common possession. Otherwise, I would have to think of a Right in a Thing, as if the Thing had an Obligation towards me, and as if the Right as against every Possessor of it had to be derived from this Obligation in the Thing, which is an absurd way of representing the subject.

Further, by the term 'Real Right' (jus reale) is meant not only the 'Right in a Thing' (jus in re), but also the constitutive principle of all the Laws which relate to the real Mine and Thine. — It is, however, evident that a man entirely alone upon the earth could properly neither have nor acquire any external thing as his own; because between him as a Person and all external Things as material objects, there could be no relations of Obligation. There is therefore, literally, no direct Right in a Thing, but only that Right is to be properly called 'real' which belongs to any one as constituted against a Person, who is in common possession of things with all others in the Civil state of Society.

12.: The First Acquisition of a Thing can only be that of the Soil.

By the Soil is understood all habitable Land. In relation to everything that is moveable upon it, it is to be regarded as a Substance, and the mode of the existence of the Moveables is viewed as an Inherence in it. And just as, in the theoretical acceptation, Accidents cannot exist apart from their Substances, so, in the practical relation, Moveables upon the Soil cannot be regarded as belonging to any one unless he is supposed to have been previously in juridical possession of the Soil so that it is thus considered to be his.

For, let it be supposed that the Soil belongs to no one. Then I would be entitled to remove every moveable thing found upon it from its place, even to total loss of it, in order to occupy that place, without infringing thereby on the freedom of any other; there being, by the hypothesis, no possessor of it at all. But everything that can be destroyed, such as a Tree, a House, and such like — as regards its matter at least — is moveable; and if we call a thing which cannot be moved without destruction of its form an immoveable, the Mine and Thine in it is not understood as applying to its substance, but to that which is adherent to it, and which does not essentially constitute the thing itself.

13.: Every part of the Soil may be originarily acquired; and the Principle of the possibility of such Acquisition is the original Community of the Soil generally.

The first Clause of this Proposition is founded upon the Postulate of the Practical Reason (§ 2); the second is established by the following Proof.

All Men are originally and before any juridical act of Will in rightful possession of the Soil; that is, they have a Right to be wherever Nature or Chance has placed them without their will. Possession (possessio), which is to be distinguished from residential settlement (sedes) as a voluntary, acquired, and permanent possession, becomes common possession, on account of the connection with each other of all the places on the surface of the Earth as a globe. For, had the surface of the earth been an infinite plain, men could have been so dispersed upon it that they might not have come into any necessary communion with each other, and a state of social Community would not have been a necessary consequence of their existence upon the Earth. — Now that Possession proper to all men upon the earth which is prior to all their particular juridical acts, constitutes an original possession in common (Communio possessionis originaria). The conception of such an original, common Possession of things is not derived from experience, nor is it dependent on conditions of time, as is the case with the imaginary and indemonstrable fiction of a primæval Community of possession in actual history. Hence it is a practical

conception of Reason, involving in itself the only Principle according to which Men may use the place they happen to occupy on the surface of the Earth, in accordance with Laws of Right.

14.: The juridical Act of this original Acquisition is Occupancy.

The Act of taking possession (apprehensio), as being at its beginning the physical appropriation of a corporeal thing in space (possessionis physicæ), can accord with the Law of the external Freedom of all, under no other condition than that of its Priority in respect of Time. In this relation it must have the characteristic of a first act in the way of taking possession, as a free exercise of Will. The activity of Will, however, as determining that the thing — in this case a definite separate place on the surface of the Earth — shall be mine, being an act of Appropriation, cannot be otherwise in the case of original Acquisition than individual or unilateral (voluntas unilateralis s. propria). Now, Occupancy is the Acquisition of an external object by an individual act of Will. The original Acquisition of such an object as a limited portion of the Soil, can therefore only be accomplished by an act of Occupation.

The possibility of this mode of Acquisition cannot be intuitively apprehended by pure Reason in any way, nor established by its Principles, but is an immediate consequence from the Postulate of the Practical Reason. The Will as practical Reason, however, cannot justify external Acquisition otherwise than only in so far as it is itself included in an absolutely authoritative Will, with which it is united by implication; or, in other words, only in so far as it is contained within a union of the Wills of all who come into practical relation with each other. For an individual, unilateral Will — and the same applies to a Dual or other particular Will — cannot impose on all an Obligation which is contingent in itself. This requires an omnilateral or universal Will, which is not contingent, but à priori, and which is therefore necessarily united and legislative. Only in accordance with such a Principle can there be agreement of the active free-will of each individual with the freedom of all, and consequently Rights in general, or even the possibility of an external Mine and Thine.

15.: It is only within a Civil Constitution that anything can be acquired peremptorily, whereas in the State of Nature Acquisition can only be provisory.

A Civil Constitution is objectively necessary as a Duty, although subjectively its reality is contingent. Hence, there is connected with it a real natural Law of Right, to which all external Acquisition is subjected.

The empirical Title of Acquisition has been shown to be constituted by the taking physical possession (Apprehensio physica) as founded upon an original community of Right in all to the Soil. And because a possession in the phenomenal sphere of sense, can only be subordinated to that Possession which is in accordance with rational conceptions of right, there must correspond to this physical act of possession a rational mode of taking possession by elimination of all the empirical conditions in Space and Time. This rational form of possession establishes the proposition, that ‘whatever I bring under my power in accordance with Laws of external Freedom, and will that it shall be mine, becomes mine.’

The rational Title of Acquisition can therefore only lie originally in the Idea of the Will of all united implicitly, or necessarily to be united, which is here tacitly assumed as an indispensable Condition (Conditio sine qua non). For by a single Will there cannot be imposed upon others an obligation by which they would not have been otherwise bound. — But the fact formed by Wills actually and universally united in a Legislation, constitutes the Civil state of Society. Hence, it is only in conformity with the idea of a Civil state of Society, or in reference to it and its realization, that anything External can be acquired. Before such a state is realized, and in anticipation of it, Acquisition, which would otherwise be derived,

is consequently only provisory. The Acquisition, which is peremptory, finds place only in the Civil state.

Nevertheless, such provisory Acquisition is real Acquisition. For, according to the Postulate of the juridically Practical Reason, the possibility of Acquisition in whatever state men may happen to be living beside one another, and therefore in the State of Nature as well, is a Principle of Private Right. And in accordance with this Principle, every one is justified or entitled to exercise that compulsion by which it alone becomes possible to pass out of the state of Nature, and to enter into that state of Civil Society which alone can make all Acquisition peremptory.

It is a question as to how far the right of taking possession of the Soil extends? The answer is, So far as the capability of having it under one's power extends, that is, just as far as he who wills to appropriate it can defend it, as if the Soil were to say, 'If you cannot protect me, neither can you command me.' In this way the controversy about what constitutes a free or closed Sea must be decided. Thus, within the range of a cannon-shot no one has a right to intrude on the coast of a country that already belongs to a certain State, in order to fish or gather amber on the shore, or such like. — Further, the question is put, 'Is Cultivation of the Soil, by building, agriculture, drainage, etc., necessary in order to its Acquisition?' No. For, as these processes as forms of specification are only Accidents, they do not constitute objects of immediate possession, and can only belong to the Subject in so far as the substance of them has been already recognised as his. When it is a question of the first Acquisition of a thing, the cultivation or modification of it by labour forms nothing more than an external sign of the fact that it has been taken into possession, and this can be indicated by many other signs that cost less trouble. — Again, 'May any one be hindered in the Act of taking possession, so that neither one nor other of two Competitors shall acquire the Right of Priority, and the Soil in consequence may remain for all time free as belonging to no one?' Not at all. Such a hindrance cannot be allowed to take place, because the second of the two, in order to be enabled to do this, would himself have to be upon some neighbouring Soil, where he also, in this manner, could be hindered from being, and such absolute Hindering would involve a Contradiction. It would, however, be quite consistent with the Right of Occupation, in the case of a certain intervening piece of the Soil, to let it lie unused as a neutral ground for the separation of two neighbouring States; but under such a condition, that ground would actually belong to them both in common, and would not be without an owner (res nullius), just because it would be used by both in order to form a separation between them. — Again, 'May one have a thing as his, on a Soil of which no one has appropriated any part as his own?' Yes. In Mongolia, for example, any one may let lie whatever baggage he has, or bring back the horse that has run away from him into his possession as his own, because the whole Soil belongs to the people generally, and the use of it accordingly belongs to every individual. But that any one can have a moveable thing on the soil of another as his own, is only possible by Contract. — Finally, there is the question: 'May one of two neighbouring Nations or Tribes resist another when attempting to impose upon them a certain mode of using a particular Soil; as, for instance, a tribe of hunters making such an attempt in relation to a pastoral people, or the latter to agriculturists and such like?' Certainly. For the mode in which such peoples or tribes may settle themselves upon the surface of the earth, provided they keep within their own boundaries, is a matter of mere pleasure and choice on their own part (res meræ facultatis).

As a further question, it may be asked: Whether, when neither Nature nor Chance, but merely our own Will, brings us into the neighbourhood of a people that gives no promise of a prospect of entering into Civil Union with us, we are to be considered entitled in any case to proceed with force in the intention of founding such a Union, and bringing into a juridical state such men as the savage American Indians, the Hottentots, and the New Hollanders; Or — and the case is not much better — whether we may establish Colonies by deceptive purchase, and so become owners of their soil, and, in general, without regard to their first possession, make use at will of our superiority in relation to them? Further, may it not be held that Nature herself, as abhorring a vacuum, seems to demand such a procedure, and that large regions in other Continents, that are now magnificently peopled, would otherwise have remained unpossessed by

civilised inhabitants, and might have for ever remained thus, so that the end of Creation would have so far been frustrated? It is almost unnecessary to answer; for it is easy to see through all this flimsy veil of injustice, which just amounts to the Jesuitism of making a good End justify any Means. This mode of acquiring the Soil is, therefore, to be repudiated.

The Indefiniteness of external acquirable objects in respect of their Quantity, as well as their Quality, makes the problem of the sole primary external Acquisition of them one of the most difficult to solve. There must, however, be some one first Acquisition of an external object; for every Acquisition cannot be derivative. Hence, the problem is not to be given up as insoluble, or in itself as impossible. If it is solved by reference to the Original Contract, unless this Contract is extended so as to include the whole human race, Acquisition under it would still remain but provisional.

16.: Exposition of the Conception of a Primary Acquisition of the Soil.

All men are originally in a common collective possession of the Soil of the whole Earth (Communio fundi originaria), and they have naturally each a Will to use it (lex justi). But on account of the opposition of the free Will of one to that of the other in the sphere of action, which is inevitable by nature, all use of the soil would be prevented did not every will contain at the same time a Law for the regulation of the relation of all Wills in action, according to which a particular possession can be determined to every one upon the common soil. This is the juridical Law (lex juridica). But the distributive Law of the Mine and Thine, as applicable to each individual on the soil, according to the Axiom of external Freedom, cannot proceed otherwise than from a primarily united Will à priori — which does not presuppose any juridical act as requisite for this union. This Law can only take form in the Civil State (lex justitiæ distributivæ); as it is in this state alone that the united common Will determines what is right, what is rightful, and what is the constitution of Right. In reference to this state, however, — and prior to its establishment and in view of it, — it is provisorily a Duty for every one to proceed according to the Law of external Acquisition; and accordingly it is a juridical procedure on the part of the Will to lay every one under Obligation to recognise the act of possessing and appropriating, although it be only unilaterally. Hence a provisory Acquisition of the Soil, with all its juridical consequences, is possible in the state of Nature.

Such an Acquisition, however, requires and also obtains the favour of a Permissive Law (Lex permissiva), in respect of the determination of the limits of juridically possible Possession. For it precedes the juridical state, and as merely introductory to it is not yet peremptory; and this favour does not extend farther than the date of the consent of the other co-operators in the establishment of the Civil State. But if they are opposed to entering into the Civil State, as long as this opposition lasts it carries all the effect of a guaranteed juridical Acquisition with it, because the advance from the state of nature to the Civil State is founded upon a Duty.

17.: Deduction of the Conception of the original Primary Acquisition.

We have found the Title of Acquisition in a universal original community of the Soil, under the conditions of an external Acquisition in space; and the Mode of Acquisition is contained in the empirical fact of taking possession (Apprehensio), conjoined with the Will to have an external object as one's own. It is further necessary to unfold from the Principles of the pure juridically Practical Reason involved in the conception, the juridical Acquisition proper of an object, — that is, the external Mine and Thine that follows from the two previous conditions, as Rational Possession (possessio noumenon).

The juridical Conception of the external Mine and Thine, so far as it involves the category of Substance, cannot by 'that which is external to me' mean merely 'in a place other than that in which I am;' for it is a rational conception. As under the conceptions of the Reason only intellectual conceptions can be

embraced, the expression in question can only signify ‘something that is different and distinct from me’ according to the idea of a non-empirical Possession through, as it were, a continuous activity in taking possession of an external object; and it involves only the notion of ‘having something in my power,’ which indicates the connection of an object with myself, as a subjective condition of the possibility of making use of it. This forms a purely intellectual conception of the Understanding. Now we can leave out or abstract from the sensible conditions of Possession, as relations of a Person to objects which have no obligation. This process of elimination just gives the rational relation of a Person to Persons; and it is such that he can bind them all by an obligation in reference to the use of things through his act of Will, so far as it is conformable to the Axiom of Freedom, the Postulate of Right, and the universal Legislation of the common Will conceived as united à priori. This is therefore the rational intelligible possession of things as by pure Right, although they are objects of sense.

It is evident that the first modification, limitation, or transformation generally of a portion of the Soil cannot of itself furnish a Title to its Acquisition, since possession of an Accident does not form a ground for legal possession of the Substance. Rather, conversely, the inference as to the Mine and Thine must be drawn from ownership of the Substance according to the rule, ‘Accessarium sequitur suum principale.’ Hence one who has spent labour on a piece of ground that was not already his own, has lost his effort and work to the former Owner. This position is so evident of itself, that the old opinion to the opposite effect, that is still spread far and wide, can hardly be ascribed to any other than the prevailing illusion which unconsciously leads to the Personification of things; and, then, as if they could be bound under an obligation by the labour bestowed upon them to be at the service of the person who does the labour, to regard them as his by immediate Right. Otherwise it is probable that the natural question — already discussed — would not have been passed over with so light a tread, namely, ‘How is a Right in a thing possible?’ For, Right as against every possible possessor of a Thing, means only the claim of a particular Will to the use of an object so far as it may be included in the All-comprehending universal Will, and can be thought as in harmony with its law.

As regards bodies situated upon a piece of ground which is already mine, if they otherwise belong to no other Person, they belong to me without my requiring any particular juridical act for the purpose of this Acquisition; they are mine not facto, but lege. For they may be regarded as Accidents inhering in the Substance of the Soil, and they are thus mine jure rei meæ. To this Category also belongs everything which is so connected with anything of mine, that it cannot be separated from what is mine without altering it substantially. Examples of this are Gilding on an object, Mixture of a material belonging to me with other things, Alluvial deposit, or even Alteration of the adjoining bed of a stream or river in my favour so as to produce an increase of my land, etc. By the same principles the question must also be decided as to whether the acquirable Soil may extend farther than the existing land, so as even to include part of the bed of the Sea, with the Right to fish on my own shores, to gather Amber and such like. So far as I have the mechanical capability from my own Site, as the place I occupy, to secure my Soil from the attack of others — and, therefore, as far as Cannon can carry from the shore — all is included in my possession, and the sea is thus far closed (mare clausum). But as there is no Site for Occupation upon the wide sea itself, possible possession cannot be extended so far, and the open sea is free (mare liberum). But in the case of men, or things that belong to them, becoming stranded on the Shore, since the fact is not voluntary, it cannot be regarded by the owner of the shore as giving him a Right of Acquisition. For shipwreck is not an act of Will, nor is its result a lesion to him; and things which may have come thus upon his Soil, as still belonging to some one, are not to be treated as being without an Owner or Res nullius. On the other hand, a River, so far as possession of the bank reaches, may be originally acquired, like any other piece of ground, under the above restrictions, by one who is in possession of both its banks.

Property.

An external Object, which, in respect of its Substance, can be claimed by some one as his own, is called the Property (dominium) of that Person to whom all the Rights in it as a thing belong, like the Accidents inhering in a Substance, and which, therefore, he as the Proprietor (dominus) can dispose of at will (jus disponendi de re sua). But from this it follows at once, that such an object can only be a Corporeal Thing towards which there is no direct personal Obligation. Hence a man may be his own Master (sui juris) but not the Proprietor of himself (sui dominus), so as to be able to dispose of himself at will, to say nothing of the possibility of such a relation to other men; because he is responsible to Humanity in his own person. This point, however, as belonging to the Right of Humanity as such, rather than to that of individual men, would not be discussed at its proper place here, but is only mentioned incidentally for the better elucidation of what has just been said. It may be further observed that there may be two full Proprietors of one and the same thing, without there being a Mine and Thine in common, but only in so far as they are common Possessors of what belongs only to one of them as his own. In such a case the whole Possession without the Use of the thing, belongs to one only of the Co-proprietors (condomini); while to the other belongs all the Use of the thing along with its Possession. The former as the direct Proprietor (dominus directus), therefore, restricts the latter as the Proprietor in use (dominus utilis) to the condition of a certain continuous performance, with reference to the thing itself, without limiting him in the use of it.

SECOND SECTION. Principles of Personal Right.

18.: Nature and Acquisition of Personal Right.

The possession of the active free-will of another person, as the power to determine it by my Will to a certain action, according to Laws of Freedom, is a form of Right relating to the external Mine and Thine, as affected by the Causality of another. It is possible to have several such Rights in reference to the same Person or to different persons. The Principle of the System of Laws, according to which I can be in such possession, is that of Personal Right, and there is only one such Principle.

The Acquisition of a Personal Right can never be primary or arbitrary; for such a mode of acquiring it would not be in accordance with the Principle of the harmony of the freedom of my will with the freedom of every other, and it would therefore be wrong. Nor can such a Right be acquired by means of any unjust act of another (facto injusti alterius), as being itself contrary to Right; for if such a wrong as it implies were perpetrated on me, and I could demand satisfaction from the other, in accordance with Right, yet in such a case I would only be entitled to maintain undiminished what was mine, and not to acquire anything more than what I formerly had.

Acquisition by means of the action of another, to which I determine his Will according to Laws of Right, is therefore always derived from what that other has as his own. This derivation, as a Juridical act, cannot be effected by a mere negative relinquishment or renunciation of what is his (per derelictionem aut renunciationem); because such a negative Act would only amount to a cessation of his Right, and not to the acquirement of a Right on the part of another. It is therefore only by positive Transference (translatio), or Conveyance, that a Personal Right can be acquired; and this is only possible by means of a common Will, through which objects come into the power of one or other, so that as one renounces a particular thing which he holds under the common Right, the same object when accepted by another, in consequence of a positive act of Will, becomes his. Such transference of the Property of one to another is termed its Alienation. The act of the united Wills of two Persons, by which what belonged to one passes to the other, constitutes Contract.

19.: Acquisition by Contract.

In every Contract there are four Juridical Acts of Will involved; two of them being preparatory Acts, and two of them constitutive Acts. The two Preparatory Acts, as forms of treating in the Transaction, are Offer (oblatio) and Approval (approbatio); the two Constitutive Acts, as the forms of concluding the transaction, are Promise (promissum) and Acceptance (acceptatio). For an offer cannot constitute a Promise before it can be judged that the thing offered (oblatum) is something that is agreeable to the Party to whom it is offered, and this much is shown by the first two declarations; but by them alone there is nothing as yet acquired.

Further, it is neither by the particular Will of the Promiser nor that of the Acceptor that the property of the former passes over to the latter. This is effected only by the combined or united Wills of both, and consequently so far only as the Will of both is declared at the same time or simultaneously. Now, such simultaneousness is impossible by empirical acts of declaration, which can only follow each other in time, and are never actually simultaneous. For if I have promised, and another person is now merely willing to accept, during the interval before actual Acceptance, however short it may be, I may retract my offer, because I am thus far still free; and, on the other side, the Acceptor, for the same reason, may likewise hold himself not to be bound, up till the moment of Acceptance, by his counter-declaration following upon the Promise. — The external Formalities or Solemnities (solemnia) on the conclusion of a Contract, — such as shaking hands or breaking a straw (stipula) laid hold of by two persons, — and all the various modes of confirming the Declarations on either side, prove in fact the embarrassment of the contracting parties as to how and in what way they may represent Declarations, which are always successive, as existing simultaneously at the same moment; and these forms fail to do this. They are, by their very nature, Acts necessarily following each other in time, so that when the one Act is, the other either is not yet or is no longer.

It is only the philosophical Transcendental Deduction of the Conception of Acquisition by Contract, that can remove all these difficulties. In a juridical external relation, my taking possession of the free-will of another, as the cause that determined it to a certain Act, is conceived at first empirically by means of the declaration and counter-declaration of the free-will of each of us in time, as the sensible conditions of taking possession; and the two juridical Acts must necessarily be regarded as following one another in time. But because this relation, viewed as juridical, is purely Rational in itself, the Will as a law-giving faculty of Reason represents this possession as intelligible or rational (possessio noumenon), in accordance with conceptions of Freedom and under abstraction of those empirical conditions. And now, the two Acts of Promise and Acceptance are not regarded as following one another in time, but, in the manner of a pactum re initum, as proceeding from a common Will, which is expressed by the term 'at the same time,' or 'simultaneous,' and the object promised (promissum) is represented, under elimination of empirical conditions, as acquired according to the Law of the pure Practical Reason.

That this is the true and only possible Deduction of the idea of Acquisition by Contract, is sufficiently attested by the laborious yet always futile striving of writers on Jurisprudence — such as Moses Mendelssohn in his Jerusalem — to adduce a proof of its rational possibility. — The question is put thus: 'Why ought I to keep my Promise?' for it is assumed as understood by all that I ought to do so. It is, however, absolutely impossible to give any further proof of the Categorical Imperative implied; just as it is impossible for the Geometrician to prove by rational Syllogisms that in order to construct a Triangle, I must take three Lines — so far an Analytical Proposition — of which three Lines any two together must be greater than the third — a Synthetical Proposition, and like the former à priori. It is a Postulate of the Pure Reason that we ought to abstract from all the sensible conditions of Space and Time in reference to the conception of Right; and the theory of the possibility of such Abstraction from these conditions without taking away the reality of the Possession, just constitutes the Transcendental Deduction of the Conception

of Acquisition by Contract. It is quite akin to what was presented under the last Title, as the Theory of Acquisition by Occupation of the external object.

20.: What is acquired by Contract?

But what is that, designated as ‘External,’ which I acquire by Contract? As it is only the Causality of the active Will of another, in respect of the Performance of something promised to me, I do not immediately acquire thereby an external Thing, but an Act of the Will in question, whereby a Thing is brought under my power so that I make it mine. — By the Contract, therefore, I acquire the Promise of another, as distinguished from the Thing promised; and yet something is thereby added to my Having and Possession. I have become the richer in possession (locupletior) by the Acquisition of an active Obligation that I can bring to bear upon the Freedom and Capability of another. — This my Right, however, is only a personal Right, valid only to the effect of acting upon a particular physical Person and specially upon the Causality of his Will, so that he shall perform something for me. It is not a Real Right upon that Moral Person, which is identified with the Idea of the united Will of All viewed à priori, and through which alone I can acquire a Right valid against every Possessor of the Thing. For, it is in this that all Right in a Thing consists.

The Transfer or transmission of what is mine to another by Contract, takes place according to the Law of Continuity (Lex Continui). Possession of the object is not interrupted for a moment during this Act; for, otherwise, I would acquire an object in this state as a Thing that had no Possessor, and it would thus be acquired originally; which is contrary to the idea of a Contract. — This Continuity, however, implies that it is not the particular Will of either the Promiser or the Acceptor, but their united Will in common, that transfers what is mine to another. And hence it is not accomplished in such a manner that the Promiser first relinquishes (derelinquit) his Possession for the benefit of another, or renounces his Right (renunciat), and thereupon the other at the same time enters upon it; or conversely. The Transfer (translatio) is therefore an Act in which the object belongs for a moment at the same time to both, just as in the parabolic path of a projectile the object on reaching its highest point may be regarded for a moment as at the same time both rising and falling, and as thus passing in fact from the ascending to the falling motion.

21.: Acceptance and Delivery.

A thing is not acquired in a case of Contract by the Acceptance (acceptatio) of the Promise, but only by the Delivery (traditio) of the object promised. For all Promise is relative to Performance; and if what was promised is a Thing, the Performance cannot be executed otherwise than by an act whereby the Acceptor is put by the Promiser into possession of the Thing; and this is Delivery. Before the Delivery and the Reception of the Thing, the Performance of the act required has not yet taken place; the Thing has not yet passed from the one person to the other, and consequently has not been acquired by that other. Hence the Right arising from a Contract, is only a Personal Right; and it only becomes a Real Right by Delivery.

A Contract upon which Delivery immediately follows (pactum re initum) excludes any interval of time between its conclusion and its execution; and as such it requires no further particular act in the future by which one person may transfer to another what is his. But if there is a time — definite or indefinite — agreed upon between them for the Delivery, the question then arises, Whether the Thing has already before that time become the Acceptor’s by the Contract, so that his Right is a Right in the Thing; or whether a further special Contract regarding the Delivery alone must be entered upon, so that the Right that is acquired by mere Acceptance is only a Personal Right, and thus it does not become a Right in the Thing until Delivery? That the relation must be determined according to the latter alternative, will be

clear from what follows.

Suppose I conclude a Contract about a Thing that I wish to acquire, — such as a Horse, — and that I take it immediately into my Stable, or otherwise into my possession; then it is mine (vi pacti re initi), and my Right is a Right in the Thing. But if I leave it in the hands of the Seller without arranging with him specially in whose physical possession or holding (detentio) this Thing shall be before my taking possession of it (apprehensio), and consequently before the actual change of possession, the Horse is not yet mine; and the Right which I acquire is only a Right against a particular Person — namely, the Seller of the Horse — to be put into possession of the object (poscendi traditionem) as the subjective condition of any use of it at my will. My Right is thus only a Personal Right to demand from the Seller the performance of his promise (præstatio) to put me into possession of the thing. Now, if the Contract does not contain the condition of Delivery at the same time, — as a pactum re initum, — and consequently an interval of time intervenes between the conclusion of the Contract and the taking possession of the object of acquisition, I cannot obtain possession of it during this interval otherwise than by exercising the particular juridical activity called a possessory Act (actum possessorium) which constitutes a special Contract. This Act consists in my saying, 'I will send to fetch the horse,' to which the Seller has to agree. For it is not self-evident or universally reasonable, that any one will take a Thing destined for the use of another into his charge at his own risk. On the contrary, a special Contract is necessary for this arrangement, according to which the Alienator of a thing continues to be its owner during a certain definite time, and must bear the risk of whatever may happen to it; while the Acquirer can only be regarded by the Seller as the Owner, when he has delayed to enter into possession beyond the date at which he agreed to take delivery. Prior to the Possessory Act, therefore, all that is acquired by the Contract is only a Personal Right; and the Acceptor can acquire an external Thing only by Delivery.

THIRD SECTION. Principles of Personal Right that is Real in Kind.

(Jus realiter personale.)

22.: Nature of Personal Right of a Real Kind.

Personal Right of a real kind is the Right to the possession of an external object as a Thing, and to the use of it as a Person. — The Mine and Thine embraced under this Right relate specially to the Family and Household; and the relations involved are those of free beings in reciprocal real interaction with each other. Through their relations and influence as Persons upon one another, in accordance with the principle of external Freedom as the cause of it, they form a Society composed as a whole of members standing in community with each other as Persons; and this constitutes the Household. — The mode in which this social status is acquired by individuals, and the functions which prevail within it, proceed neither by arbitrary individual action (facto), nor by mere Contract (pacto), but by Law (lege). And this Law as being not only a Right, but also as constituting Possession in reference to a Person, is a Right rising above all mere Real and Personal Right. It must, in fact, form the Right of Humanity in our own Person; and, as such, it has as its consequence a natural Permissive Law, by the favour of which such Acquisition becomes possible to us.

23.: What is acquired in the Household?

The Acquisition that is founded upon this Law is, as regards its objects, threefold. The Man acquires a Wife; the Husband and Wife acquire Children, constituting a Family; and the Family acquire Domestics.

All these objects, while acquirable, are inalienable; and the Right of Possession in these objects is the most strictly personal of all Rights.

THE RIGHTS OF THE FAMILY AS A DOMESTIC SOCIETY.

TITLE FIRST. Conjugal Right. (Husband and Wife.)

24.: The Natural Basis of Marriage.

The domestic Relations are founded on Marriage, and Marriage is founded upon the natural Reciprocity or intercommunity (commercium) of the Sexes. This natural union of the sexes proceeds either according to the mere animal Nature (vaga libido, venus vulgivaga, fornicatio), or according to Law. The latter is Marriage (matrimonium), which is the Union of two Persons of different sex for life-long reciprocal possession of their sexual faculties. — The End of producing and educating children may be regarded as always the End of Nature in implanting mutual desire and inclination in the sexes; but it is not necessary for the rightfulness of marriage that those who marry should set this before themselves as the End of their Union, otherwise the Marriage would be dissolved of itself when the production of children ceased.

And even assuming that enjoyment in the reciprocal use of the sexual endowments is an end of marriage, yet the Contract of Marriage is not on that account a matter of arbitrary will, but is a Contract necessary in its nature by the Law of Humanity. In other words, if a man and a woman have the will to enter on reciprocal enjoyment in accordance with their sexual nature, they must necessarily marry each other; and this necessity is in accordance with the juridical Laws of Pure Reason.

25.: The Rational Right of Marriage.

For, this natural 'Commercium' — as a 'usus membrorum sexualium alterius' — is an enjoyment for which the one person is given up to the other. In this relation the human individual makes himself a 'res,' which is contrary to the Right of Humanity in his own Person. This, however, is only possible under the one condition, that as the one Person is acquired by the other as a res, that same Person also equally acquires the other reciprocally, and thus regains and re-establishes the rational Personality. The Acquisition of a part of the human organism being, on account of its unity, at the same time the acquisition of the whole Person, it follows that the surrender and acceptation of, or by, one sex in relation to the other, is not only permissible under the condition of Marriage, but is further only really possible under that condition. But the Personal Right thus acquired is at the same time, real in kind; and this characteristic of it is established by the fact that if one of the married Persons run away or enter into the possession of another, the other is entitled, at any time, and incontestably, to bring such a one back to the former relation, as if that Person were a Thing.

26.: Monogamy and Equality in Marriage.

For the same reasons, the relation of the Married Persons to each other is a relation of Equality as regards the mutual possession of their Persons, as well as of their Goods. Consequently Marriage is only truly realized in Monogamy; for in the relation of Polygamy the Person who is given away on the one side, gains only a part of the one to whom that Person is given up, and therefore becomes a mere res. But in respect of their Goods, they have severally the Right to renounce the use of any part of them, although only by a special Contract.

From the Principle thus stated, it also follows that Concubinage is as little capable of being brought under a Contract of Right, as the hiring of a person on any one occasion, in the way of a pactum fornicationis. For, as regards such a Contract as this latter relation would imply, it must be admitted by all that any one who might enter into it could not be legally held to the fulfilment of their promise if they wished to resile from it. And as regards the former, a Contract of Concubinage would also fall as a pactum turpe; because as a Contract of the hire (locatio, conductio), of a part for the use of another, on account of the inseparable unity of the members of a Person, any one entering into such a Contract would be actually surrendering as a res to the arbitrary Will of another. Hence any party may annul a Contract like this if entered into with any other, at any time and at pleasure; and that other would have no ground, in the circumstances, to complain of a lesion of his Right. The same holds likewise of a morganatic or 'left-hand' Marriage contracted in order to turn the inequality in the social status of the two parties to advantage in the way of establishing the social supremacy of the one over the other; for, in fact, such a relation is not really different from Concubinage, according to the principles of Natural Right, and therefore does not constitute a real Marriage. Hence the question may be raised as to whether it is not contrary to the Equality of married Persons when the Law says in any way of the Husband in relation to the Wife, 'he shall be thy master,' so that he is represented as the one who commands, and she as the one who obeys. This, however, cannot be regarded as contrary to the natural Equality of a human pair, if such legal Supremacy is based only upon the natural superiority of the faculties of the Husband compared with the Wife, in the effectuation of the common interest of the household; and if the Right to command, is based merely upon this fact. For this Right may thus be deduced from the very duty of Unity and Equality in relation to the End involved.

27.: Fulfilment of the Contract of Marriage.

The Contract of Marriage is completed only by conjugal cohabitation. A Contract of two Persons of different sex, with the secret understanding either to abstain from conjugal cohabitation or with the consciousness on either side of incapacity for it, is a simulated Contract; it does not constitute a marriage, and it may be dissolved by either of the parties at will. But if the incapacity only arises after marriage, the Right of the Contract is not annulled or diminished by a contingency that cannot be legally blamed.

The Acquisition of a Spouse either as a Husband or as a Wife, is therefore not constituted facto — that is, by Cohabitation — without a preceding Contract; nor even pacto — by a mere Contract of Marriage, without subsequent Cohabitation; but only lege, that is, as a juridical consequence of the obligation that is formed by two Persons entering into a sexual Union solely on the basis of a reciprocal Possession of each other, which Possession at the same time is only effected in reality by the reciprocal 'usus facultatum sexualium alterius.'

RIGHTS OF THE FAMILY AS A DOMESTIC SOCIETY.

TITLE SECOND. Parental Right. (Parent and Child.)

28.: The Relation of Parent and Child.

From the Duty of Man towards himself — that is, towards the Humanity in his own Person — there thus arises a personal Right on the part of the Members of the opposite sexes, as Persons, to acquire one another really and reciprocally by Marriage. In like manner, from the fact of Procreation in the union thus

constituted, there follows the Duty of preserving and rearing Children as the Products of this Union. Accordingly Children, as Persons, have, at the same time, an original congenital Right — distinguished from mere hereditary Right — to be reared by the care of their Parents till they are capable of maintaining themselves; and this provision becomes immediately theirs by Law, without any particular juridical Act being required to determine it.

For what is thus produced is a Person, and it is impossible to think of a Being endowed with personal Freedom as produced merely by a physical process. And hence, in the practical relation, it is quite a correct and even a necessary Idea to regard the act of generation as a process by which a Person is brought without his consent into the world, and placed in it by the responsible free will of others. This Act, therefore, attaches an obligation to the Parents to make their Children — as far as their power goes — contented with the condition thus acquired. Hence Parents cannot regard their Child as, in a manner, a Thing of their own making, for a Being endowed with Freedom cannot be so regarded. Nor, consequently, have they a Right to destroy it as if it were their own property, or even to leave it to chance; because they have brought a Being into the world who becomes in fact a Citizen of the world, and they have placed that Being in a state which they cannot be left to treat with indifference, even according to the natural conceptions of Right.

We cannot even conceive how it is possible that God can create free Beings; for it appears as if all their future actions, being predetermined by that first act, would be contained in the chain of natural necessity, and that, therefore, they could not be free. But as men we are free in fact, as is proved by the Categorical Imperative in the moral and practical relation as an authoritative decision of Reason; yet reason cannot make the possibility of such a relation of Cause to Effect conceivable from the theoretical point of view, because they are both suprasensible. All that can be demanded of Reason under these conditions, would merely be to prove that there is no Contradiction involved in the conception of a Creation of free beings; and this may be done by showing that Contradiction only arises when, along with the Category of Causality, the Condition of Time is transferred to the relation of suprasensible Things. This condition, as implying that the cause of an effect must precede the effect as its reason, is inevitable in thinking the relation of objects of sense to one another; and if this conception of Causality were to have objective reality given to it in the theoretical bearing, it would also have to be referred to the suprasensible sphere. But the Contradiction vanishes when the pure Category, apart from any sensible conditions, is applied from the moral and practical point of view, and consequently as in a non-sensible relation to the conception of Creation.

The philosophical Jurist will not regard this investigation, when thus carried back even to the ultimate Principles of the Transcendental Philosophy, as an unnecessary subtlety in a Metaphysic of Morals, or as losing itself in aimless obscurity, when he takes into consideration the difficulty of the problem to be solved, and also the necessity of doing justice in this inquiry to the ultimate relations of the Principles of Right.

29.: The Rights of the Parent.

From the Duty thus indicated, there further necessarily arises the Right of the Parents to the Management and Training of the Child, so long as it is itself incapable of making proper use of its body as an Organism, and of its mind as an Understanding. This involves its nourishment and the care of its Education. This includes, in general, the function of forming and developing it practically, that it may be able in the future to maintain and advance itself, and also its moral Culture and Development, the guilt of neglecting it falling upon the Parents. All this training is to be continued till the Child reaches the period of Emancipation (emancipatio), as the age of practicable self-support. The Parents then virtually renounce the parental Right to command, as well as all claim to repayment for their previous care and trouble; for

which care and trouble, after the process of Education is complete, they can only appeal to the Children by way of any claim, on the ground of the Obligation of Gratitude as a Duty of Virtue.

From the fact of Personality in the Children, it further follows that they can never be regarded as the Property of the Parents, but only as belonging to them by way of being in their possession, like other things that are held apart from the possession of all others and that can be brought back even against the will of the Subjects. Hence the Right of the Parents is not a purely Real Right, and it is not alienable (jus personalissimum). But neither is it a merely Personal Right; it is a Personal Right of a real kind, that is, a Personal Right that is constituted and exercised after the manner of a Real Right.

It is therefore evident that the Title of a Personal Right of a Real Kind must necessarily be added, in the Science of Right, to the Titles of Real Right and Personal Right, the Division of Rights into these two being not complete. For, if the Right of the Parents to the Children were treated as if it were merely a Real Right to a part of what belongs to their house, they could not found only upon the Duty of the Children to return to them in claiming them when they run away, but they would be then entitled to seize them and to impound them like things or runaway cattle.

RIGHTS OF THE FAMILY AS A DOMESTIC SOCIETY.

TITLE THIRD. Household Right. (Master and Servant.)

30.: Relation and Right of the Master of a Household.

The Children of the House, who, along with the Parents, constitute a Family, attain majority, and become Masters of Themselves (majorennes, sui juris), even without a Contract of release from their previous state of Dependence, by their actually attaining to the capability of self-maintenance. This attainment arises, on the one hand, as a state of natural Majority, with the advance of years in the general course of Nature; and, on the other hand, it takes form, as a state in accordance with their own natural condition. They thus acquire the Right of being their own Masters, without the interposition of any special juridical act, and therefore merely by Law (lege); and they owe their Parents nothing by way of legal debt for their Education, just as the parents, on their side, are now released from their Obligations to the Children in the same way. Parents and Children thus gain or regain their natural Freedom; and the domestic society, which was necessary according to the Law of Right, is thus naturally dissolved.

Both Parties, however, may resolve to continue the Household, but under another mode of Obligation. It may assume the form of a relation between the Head of the House as its Master, and the other members as domestic Servants, male or female; and the connection between them in this new regulated domestic economy (societas herilis) may be determined by Contract. The Master of the House, actually or virtually, enters into Contract with the Children, now become major and masters of themselves; or, if there be no Children in the Family, with other free Persons constituting the membership of the Household; and thus there is established a domestic relationship not founded on social equality, but such that one commands as Master, and another obeys as Servant (Imperantis et subjecti Domestici).

The Domestics or Servants may then be regarded by the Master of the household, as thus far his. As regards the form or mode of his Possession of them, they belong to him as if by a Real Right; for if any of them run away, he is entitled to bring them again under his power by a unilateral act of his will. But as regards the matter of his Right, or the use he is entitled to make of such persons as his Domestics, he is not entitled to conduct himself towards them as if he was their proprietor or owner (dominus servi); because they are only subjected to his power by Contract, and by a Contract under certain definite restrictions. For

a Contract by which the one party renounced his whole freedom for the advantage of the other, ceasing thereby to be a person and consequently having no duty even to observe a Contract, is self-contradictory, and is therefore of itself null and void. The question as to the Right of Property in relation to one who has lost his legal personality by a Crime, does not concern us here.

This Contract, then, of the Master of a Household with his Domestics, cannot be of such a nature that the use of them could ever rightly become an abuse of them; and the judgment as to what constitutes use or abuse in such circumstances is not left merely to the Master, but is also competent to the Servants, who ought never to be held in bondage or bodily servitude as Slaves or Serfs. Such a Contract cannot, therefore, be concluded for life, but in all cases only for a definite period, within which one party may intimate to the other a termination of their connection. Children, however, including even the children of one who has become enslaved owing to a Crime, are always free. For every man is born free, because he has at birth as yet broken no Law; and even the cost of his education till his maturity, cannot be reckoned as a debt which he is bound to pay. Even a Slave, if it were in his power, would be bound to educate his children without being entitled to count and reckon with them for the cost; and in view of his own incapacity for discharging this function, the Possessor of a Slave, therefore, enters upon the Obligation which he has rendered the Slave himself unable to fulfil.

Here, again, as under the first two Titles, it is clear that there is a Personal Right of a Real kind, in the relation of the Master of a House to his Domestics. For he can legally demand them as belonging to what is externally his, from any other possessor of them; and he is entitled to fetch them back to his house, even before the reasons that may have led them to run away, and their particular Right in the circumstances, have been judicially investigated. [See Sup plementary Explanations, I. II. III.]

SYSTEMATIC DIVISION Of all the Rights capable of being acquired by Contract.

31.: Division of Contracts. Juridical Conceptions of Money and A Book.

It is reasonable to demand that a metaphysical Science of Right shall completely and definitely determine the members of a logical Division of its Conceptions à priori, and thus establish them in a genuine System. All empirical Division, on the other hand, is merely fragmentary Partition, and it leaves us in uncertainty as to whether there may not be more members still required to complete the whole sphere of the divided Conception. A Division that is made according to a Principle à priori may be called, in contrast to all empirical Partitions, a dogmatic Division.

Every Contract, regarded in itself objectively, consists of two juridical Acts: the Promise and its Acceptance. Acquisition by the latter, unless it be a pactum re initum which requires Delivery, is not a part, but the juridically necessary Consequence of the Contract. Considered again subjectively, or as to whether the Acquisition, which ought to happen as a necessary Consequence according to Reason, will also follow, in fact, as a physical Consequence, it is evident that I have no Security or Guarantee that this will happen by the mere Acceptance of a Promise. There is therefore something externally required connected with the mode of the Contract, in reference to the certainty of Acquisition by it; and this can only be some element completing and determining the Means necessary to the attainment of Acquisition as realizing the purpose of the Contract. And in his connection and behoof, three Persons are required to intervene — the Promiser, the Acceptor, and the Cautioner or Surety. The importance of the Cautioner is evident; but by his intervention and his special Contract with the Promiser, the Acceptor gains nothing in respect of the Object, but the means of Compulsion that enable him to obtain what is his own.

According to these rational Principles of logical Division, there are properly only three pure and simple Modes of Contract. There are, however, innumerable mixed and empirical Modes, adding statutory and conventional Forms to the Principles of the Mine and Thine that are in accordance with rational Laws. But they lie outside of the circle of the Metaphysical Science of Right, whose Rational Modes of Contract can alone be indicated here.

All Contracts are founded upon a purpose of Acquisition, and are either

A. Gratuitous Contracts, with unilateral Acquisition; or

B. Onerous Contracts, with reciprocal Acquisition; or

C. Cautionary Contracts, with no Acquisition, but only Guarantee of what has been already acquired. These Contracts may be gratuitous on the one side, and yet, at the same time, onerous on the other.

The Gratuitous Contracts (pacta gratuita) are —

1. Depositation (depositum), involving the Preservation of some valuable deposited in Trust.

2. Commodate (commodatum), a Loan of the use of a Thing.

3. Donation (donatio), a free Gift.

The Onerous Contracts, are Contracts either of Permutation or of Hiring.

I. Contracts of Permutation or Reciprocal Exchange (permutatio late sic dicta):

1. Barter, or strictly real Exchange (permutatio stricte sic dicta). Goods exchanged for Goods.

2. Purchase and Sale (emptio venditio). Goods exchanged for Money.

3. Loan (mutuum). Loan of a fungible under condition of its being returned in kind: Corn for Corn, or Money for Money.

II. Contracts of Letting and Hiring (locatio conductio):

1. Letting of a Thing on Hire to another person who is to make use of it (locatio rei). If the Thing can only be restored in specie, it may be the subject of an Onerous Contract combining the consideration of Interest with it (pactum usurarium).

2. Letting of Work on Hire (locatio operæ). Consent to the use of my Powers by another for a certain Price (merces). The Worker under this Contract is a hired Servant (mercenarius).

3. Mandate (mandatum). The Contract of Mandate is an engagement to perform or execute a certain business in place and in name of another person. If the action is merely done in the place of another, but not, at the same time, in his name, it is performance without Commission (gestio negotii); but if it is (rightfully) performed in name of the other, it constitutes Mandate, which as a Contract of Procuration is an onerous Contract (mandatum onerosum).

The Cautionary Contracts (cautiones) are: —

1. Pledge (pignus). Caution by a Moveable deposited as security.

2. Suretyship (fidejussio). Caution for the fulfilment of the promise of another.

3. Personal Security (præstatio obsidis). Guarantee of Personal Performance.

This List of all the modes in which the property of one Person may be transferred or conveyed to another, includes conceptions of certain objects or Instruments required for such transference (translatio). These appear to be entirely empirical, and it may therefore seem questionable whether they are entitled to a place in a Metaphysical Science of Right. For, in such a Science the Divisions must be made according to Principles à priori; and hence the matter of the juridical relation, which may be conventional, ought to be left out of account, and only its Form should be taken into consideration.

Such conceptions may be illustrated by taking the instance of Money, in contradistinction from all other exchangeable things as Wares and Merchandise; or by the case of a Book. And considering these as illustrative examples in this connection, it will be shown that the conception of Money as the greatest and most useable of all the Means of human intercommunication through Things, in the way of Purchase and Sale in commerce, as well as that of Books as the greatest Means of carrying on the interchange of Thought, resolve themselves into relations that are purely intellectual and rational. And hence it will be

made evident that such Conceptions do not really detract from the purity of the given Scheme of pure Rational Contracts, by empirical admixture.

Illustration of Relations of Contract by the Conceptions of Money and A Book.

I.: What is Money?

Money is a thing which can only be made use of, by being alienated or exchanged. This is a good Nominal Definition, as given by Achenwall; and it is sufficient to distinguish objects of the Will of this kind from all other objects. But it gives us no information regarding the rational possibility of such a thing as money is. Yet we see thus much by the Definition: (1) that the Alienation in this mode of human intercommunication and exchange is not viewed as a Gift, but is intended as a mode of reciprocal Acquisition by an Onerous Contract; and (2) that it is regarded as a mere means of carrying on Commerce, universally adopted by the people, but having no value as such of itself, in contrast to other Things as mercantile Goods or Wares which have a particular value in relation to special wants existing among the people. It therefore represents all exchangeable things.

A bushel of Corn has the greatest direct value as a means of satisfying human wants. Cattle may be fed by it; and these again are subservient to our nourishment and locomotion, and they even labour in our stead. Thus by means of corn men are multiplied and supported, who not only act again in reproducing such natural products, but also by other artificial products they can come to the relief of all our proper wants. Thus are men enabled to build dwellings, to prepare clothing, and to supply all the ingenious comforts and enjoyments which make up the products of industry. — On the other hand, the value of Money is only indirect. It cannot be itself enjoyed, nor be used directly for enjoyment; it is, however, a Means towards this, and of all outward things it is of the highest utility.

We may found a Real Definition of Money provisionally upon these considerations. It may thus be defined as the universal means of carrying on the Industry of men in exchanging intercommunications with each other. Hence national Wealth, in so far as it can be acquired by means of Money, is properly only the sum of the Industry or applied Labour with which men pay each other, and which is represented by the Money in circulation among the people.

The Thing which is to be called Money must, therefore, have cost as much Industry to produce it, or even to put it into the hands of others, as may be equivalent to the Industry or Labour required for the acquisition of the Goods or Wares or Merchandise, as natural or artificial products, for which it is exchanged. For if it were easier to procure the material which is called Money than the goods that are required, there would be more Money in the market than goods to be sold; and because the Seller would then have to expend more labour upon his goods than the Buyer on the equivalent, the Money coming in to him more rapidly, the Labour applied to the preparation of goods and Industry generally, with the industrial productivity which is the source of the public Wealth, would at the same time dwindle and be cut down. — Hence Bank Notes and Assignations are not to be regarded as Money although they may take its place by way of representing it for a time; because it costs almost no Labour to prepare them, and their value is based merely upon the opinion prevailing as to the further continuance of the previous possibility of changing them into Ready Money. But on its being in any way found out that there is not Ready Money in sufficient quantity for easy and safe conversion of such Notes or Assignations, the opinion gives way, and a fall in their value becomes inevitable. Thus the industrial Labour of those who work the Gold and Silver Mines in Peru and Mexico — especially on account of the frequent failures in the application of fruitless efforts to discover new veins of these precious metals — is probably even greater than what is expended in the manufacture of Goods in Europe. Hence such mining Labour, as unrewarded in the

circumstances, would be abandoned of itself, and the countries mentioned would in consequence soon sink into poverty, did not the Industry of Europe, stimulated in turn by these very metals, proportionally expand at the same time so as constantly to keep up the zeal of the Miners in their work by the articles of luxury thereby offered to them. It is thus that the concurrence of Industry with Industry, and of Labour with Labour, is always maintained.

But how is it possible that what at the beginning constituted only Goods or Wares, at length became Money? This has happened wherever a Sovereign as a great and powerful consumer of a particular substance, which he at first used merely for the adornment and decoration of his servants and court, has enforced the tribute of his subjects in this kind of material. Thus it may have been Gold, or Silver, or Copper, or a species of beautiful shells called Cowries, or even a sort of mat called Makutes, as in Congo; or Ingots of Iron, as in Senegal; or Negro Slaves, as on the Guinea Coast. When the Ruler of the country demanded such things as imposts, those whose Labour had to be put in motion to procure them were also paid by means of them, according to certain regulations of commerce then established, as in a Market or Exchange. As it appears to me, it is only thus that a particular species of goods came to be made a legal means of carrying on the industrial labour of the Subjects in their commerce with each other, and thereby forming the medium of the national Wealth. And thus it practically became Money.

The Rational Conception of Money, under which the empirical conception is embraced, is therefore that of a thing which, in the course of the public permutation or Exchange of possessions (permutatio publica), determines the Price of all the other things that form products or Goods — under which term even the Sciences are included, in so far as they are not taught gratis to others. The quantity of it among a people constitutes their Wealth (opulentia). For Price (pretium) is the public judgment about the Value of a thing, in relation to the proportionate abundance of what forms the universal representative means in circulation for carrying on the reciprocal interchange of the products of Industry or Labour. The precious metals, when they are not merely weighed but also stamped or provided with a sign indicating how much they are worth, form legal Money, and are called Coin.

According to Adam Smith, ‘Money has become, in all civilised nations, the universal instrument of Commerce, by the intervention of which Goods of all kinds are bought and sold or exchanged for one another.’ — This Definition expands the empirical conception of Money to the rational idea of it, by taking regard only to the implied form of the Reciprocal Performances in the Onerous Contracts, and thus abstracting from their matter. It is thus conformable to the conception of Right in the Permutation and Exchange of the Mine and Thine generally (commutatio late sic dicta). The Definition, therefore, accords with the representation in the above Synopsis of a Dogmatic Division of Contracts à priori, and consequently with the Metaphysical Principle of Right in general.

II.: What is a Book?

A Book is a Writing which contains a Discourse addressed by some one to the Public, through visible signs of Speech. It is a matter of indifference to the present considerations whether it is written by a pen or imprinted by types, and on few or many pages. He who speaks to the Public in his own name, is the Author. He who addresses the writing to the Public in the name of the Author, is the Publisher. When a Publisher does this with the permission or authority of the Author, the act is in accordance with Right, and he is the rightful Publisher; but if this is done without such permission or authority, the act is contrary to Right, and the Publisher is a counterfeiter or unlawful Publisher. The whole of a set of Copies of the original Document, is called an Edition.

The unauthorized Publishing of Books is contrary to the Principles of Right, and is rightly prohibited.

A Writing is not an immediate direct presentation of a conception, as is the case, for instance, with an Engraving that exhibits a Portrait, or a Bust or Caste by a Sculptor. It is a Discourse addressed in a particular form to the Public; and the Author may be said to speak publicly by means of his Publisher. The Publisher, again, speaks by the aid of the Printer as his workman (operarius), yet not in his own name, — for otherwise he would be the Author, — but in the name of the Author; and he is only entitled to do so in virtue of a Mandate given him to that effect by the Author. — Now the unauthorized Printer and Publisher speaks by an assumed authority in his Publication; in the name indeed of the Author, but without a Mandate to that effect (gerit se mandatarium absque mandato). Consequently such an unauthorized Publication is a wrong committed upon the authorized and only lawful Publisher, as it amounts to a pilfering of the Profits which the latter was entitled and able to draw from the use of his proper Right (furtum usus). Unauthorized Printing and Publication of Books is therefore forbidden — as an act Counterfeit and Piracy — on the ground of Right.

There seems, however, to be an impression that there is a sort of common Right to print and publish Books; but the slightest reflection must convince any one that this would be a great injustice. The reason of it is found simply in the fact that a Book, regarded from one point of view, is an external product of mechanical art (opus mechanicum), that can be imitated by any one who may be in rightful possession of a Copy; and it is therefore his by a Real Right. But from another point of view, a Book is not merely an external Thing, but is a Discourse of the Publisher to the public, and he is only entitled to do this publicly under the Mandate of the Author (præstatio operæ); and this constitutes a Personal Right. The error underlying the impression referred to, therefore, arises from an interchange and confusion of these two kinds of Right in relation to Books.

Confusion of Personal Right and Real Right.

The confusion of Personal Right with Real Right may be likewise shown by reference to a difference of view in connection with another Contract, falling under the head of Contracts of Hiring (B. II. 1), namely, the Contract of Lease (jus incolatus). The question is raised as to whether a Proprietor when he has sold a house or a piece of ground held on lease, before the expiry of the period of Lease, was bound to add the condition of the continuance of the Lease to the Contract of Purchase; or whether it should be held that ‘Purchase breaks Hire,’ of course under reservation of a period of warning determined by the nature of the subject in use. — In the former view, a house or farm would be regarded as having a Burden lying upon it, constituting a Real Right acquired in it by the Lessee; and this might well enough be carried out by a clause merely indorsing or ingrossing the Contract of Lease in the Deed of Sale. But as it would no longer then be a simple Lease, another Contract would properly be required to be conjoined, a matter which few Lessors would be disposed to grant. The proposition, then, that ‘Purchase breaks Hire’ holds in principle; for the full Right in a Thing as a Property, overbears all Personal Right which is inconsistent with it. But there remains a Right of Action to the Lessee, on the ground of a Personal Right for indemnification on account of any loss arising from breaking of the Contract. [See Supplementary Explanations, IV.]

EPISODICAL SECTION. The Ideal Acquisition of external Objects of the Will.

32.: The Nature and Modes of Ideal Acquisition.

I call that mode of Acquisition ideal which involves no Causality in time, and which is founded upon a mere Idea of pure reason. It is nevertheless actual, and not merely imaginary Acquisition; and it is not called real only because the Act of Acquisition is not empirical. This character of the Act arises from the

peculiarity that the Person acquiring, acquires from another who either is not yet, and who can only be regarded as a possible Being, or who is just ceasing to be, or who no longer is. Hence such a mode of attaining to Possession is to be regarded as a mere practical Idea of Reason.

There are three Modes of Ideal Acquisition: —

Acquisition by Usucapion;

Acquisition by Inheritance or Succession;

Acquisition by Undying Merit (meritum immortale), or the Claim by Right to a good name at Death.

These three Modes of Acquisition can, as a matter of fact, only have effect in a public juridical state of existence, but they are not founded merely upon the Civil Constitution or upon arbitrary Statutes; they are already contained à priori in the conception of the state of Nature, and are thus necessarily conceivable prior to their empirical manifestation. The Laws regarding them in the Civil Constitution ought to be regulated by that rational Conception.

33.: I. Acquisition by Usucapion.

(Acquisitio per Usucapionem.)

I may acquire the Property of another merely by long possession and use of it (Usucapio). Such Property is not acquired, because I may legitimately presume that his Consent is given to this effect (per consensum præsumptum); nor because I can assume that as he does not oppose my Acquisition of it, he has relinquished or abandoned it as his (rem derelictam). But I acquire it thus, because even if there were any one actually raising a claim to this Property as its true Owner, I may exclude him on the ground of my long Possession of it, ignore his previous existence, and proceed as if he existed during the time of my Possession as a mere abstraction, although I may have been subsequently apprized of his reality as well as of his claim. This Mode of Acquisition is not quite correctly designated Acquisition by Prescription (per præscriptionem); for the exclusion of all other claimants is to be regarded as only the Consequence of the Usucapion; and the process of Acquisition must have gone before the Right of Exclusion. The rational possibility of such a Mode of Acquisition, has now to be proved.

Any one who does not exercise a continuous possessory activity (actus possessorius) in relation to a Thing as his, is regarded with good Right as one who does not at all exist as its Possessor. For he cannot complain of lesion so long as he does not qualify himself with a Title as its Possessor. And even if he should afterwards lay claim to the Thing when another has already taken possession of it, he only says he was once on a time Owner of it, but not that he is so still, or that his Possession has continued without interruption as a juridical fact. It can, therefore, only be by a juridical process of Possession, that has been maintained without interruption and is proveable by documentary fact, that any one can secure for himself what is his own after ceasing for a long time to make use of it.

For, suppose that the neglect to exercise this possessory activity had not the effect of enabling another to found upon his hitherto lawful, undisputed and bona fide Possession, an irrefragable Right to continue in its possession so that he may regard the thing that is thus in his Possession as acquired by him. Then no Acquisition would ever become peremptory and secured, but all Acquisition would only be provisory and temporary. This is evident on the ground that there are no historical Records available to carry the investigation of a Title back to the first Possessor and his act of Acquisition. — The Presumption upon which Acquisition by Usucapion is founded is, therefore, not merely its conformity to Right as allowed and just, but also the presumption of its being Right (præsumtio juris et de jure), and its being assumed to be in accordance with compulsory Laws (suppositio legalis). Any one who has neglected to embody his possessory Act in a documentary Title, has lost his Claim to the Right of being Possessor for the time; and the length of the period of his neglecting to do so — which need not necessarily be particularly defined — can be referred to only as establishing the certainty of this neglect. And it would contradict the Postulate

of the Juridically Practical Reason to maintain that one hitherto unknown as a Possessor, and whose possessory activity has at least been interrupted, whether by or without fault of his own, could always at any time reacquire a Property; for this would be to make all Ownership uncertain (Dominia rerum incerta facere).

But if he is a member of the Commonwealth or Civil Union, the State may maintain his Possession for him vicariously, although it may be interrupted as private Possession; and in that case the actual Possessor will not be able to prove a Title of Acquisition even from a first occupation, nor to found upon a Title of Usucapion. But in the state of Nature Usucapion is universally a rightful ground of holding, not properly as a juridical mode of requiring a Thing, but as a ground for maintaining oneself in possession of it where there are no Juridical Acts. A release from juridical claims is commonly also called Acquisition. The Prescriptive Title of the older Possessor, therefore, belongs to the sphere of Natural Right (est juris naturæ). [See Supplementary Explanations, VI.]

34.: II. Acquisition by Inheritance.

(Acquisitio hæreditatis.)

Inheritance is constituted by the transfer (translatio) of the Property or goods of one who is dying to a Survivor, through the consent of the Will of both. The Acquisition of the Heir who takes the Estate (hæredis instituti) and the Relinquishment of the Testator who leaves it, being the acts that constitute the Exchange of the Mine and Thine, take place in the same moment of time — in articulo mortis — and just when the Testator ceases to be. There is therefore no special Act of Transfer (translatio) in the empirical sense; for that would involve two successive acts, by which the one would first divest himself of his Possession, and the other would thereupon enter into it. Inheritance as constituted by a simultaneous double Act is, therefore, an ideal Mode of Acquisition. Inheritance is inconceivable in the State of Nature without a Testamentary Disposition (dispositio ultimæ voluntatis); and the question arises as to whether this mode of Acquisition is to be regarded as a Contract of Succession, or a unilateral Act instituting an Heir by a Will (testamentum). The determination of this question depends on the further question, Whether and How, in the very same moment in which one individual ceases to be, there can be a transition of his Property to another Person. Hence the problem as to how a mode of Acquisition by Inheritance is possible, must be investigated independently of the various possible forms in which it is practically carried out, and which can have place only in a Commonwealth.

‘It is possible to acquire by being instituted or appointed Heir in a Testamentary Disposition.’ For the Testator Caius promises and declares in his last Will to Titius, who knows nothing of this Promise, to transfer to him his Estate in case of death, but thus continuing as long as he lives sole Owner of it. Now by a mere unilateral act of Will, nothing can in fact be transmitted to another person, as in addition to the Promise of the one party there is required Acceptance (acceptatio) on the part of the other, and a simultaneous bilateral act of Will (voluntas simultanea) which, however, is here awanting. So long as Caius lives, Titius cannot expressly accept in order to enter on Acquisition, because Caius has only promised in case of death; otherwise the Property would be for a moment at least in common possession, which is not the Will of the Testator. — However, Titius acquires tacitly a special Right to the Inheritance as a Real Right. This is constituted by the sole and exclusive Right to accept the Estate (jus in re jacente), which is therefore called at that point of time a hæreditas jacens. Now as every man — because he must always gain and never lose by it — necessarily, although tacitly, accepts such a Right, and as Titius after the death of Caius is in this position, he may acquire the succession as Heir by Acceptance of the Promise. And the Estate is not in the meantime entirely without an Owner (res nullius), but is only in abeyance or vacant (vacua); because he has exclusively the Right of Choice as to whether he will actually make the Estate bequeathed to him, his own or not.

Hence Testaments are valid according to mere Natural Right (sunt juris naturæ). This assertion, however, is to be understood in the sense that they are capable and worthy of being introduced and sanctioned in the Civil state, whenever it is instituted. For it is only the Common Will in the Civil state that maintains the possession of the Inheritance or Succession, while it hangs between Acceptance or Rejection and specially belongs to no particular individual. [See Supplementary Explanations, VII.]

35.: III. The continuing Right of a good Name after Death.

(Bona fama Defuncti.)

It would be absurd to think that a dead Person could possess anything after his death, when he no longer exists in the eye of the Law, if the matter in question were a mere Thing. But a good Name is a congenital and external, although merely ideal possession, which attaches inseparably to the individual as a Person. Now we can and must abstract here from all consideration as to whether the Persons cease to be after death or still continue as such to exist; because in considering their juridical relation to others, we regard Persons merely according to their humanity and as rational Beings (homo noumenon). Hence any attempt to bring the Reputation or good Name of a Person into evil and false repute after death, is always questionable, even although a well-founded charge may be allowed — for to that extent the brocard 'De mortuis nil nisi bene' is wrong. Yet to spread charges against one who is absent and cannot defend himself, shows at least a want of magnanimity.

By a blameless life and a death that worthily ends it, it is admitted that a man may acquire a (negatively) good reputation constituting something that is his own, even when he no longer exists in the world of sense as a visible Person (homo phænomenon). It is further held that his Survivors and Successors — whether relatives or strangers — are entitled to defend his good Name as a matter of Right, on the ground that unproved accusations subject them all to the danger of similar treatment after death. Now that a Man when dead can yet acquire such a Right is a peculiar and, nevertheless, an undeniable manifestation in fact, of the à priori law-giving Reason thus extending its Law of Command or Prohibition beyond the limits of the present life. If some one then spreads a charge regarding a dead person that would have dishonoured him when living, or even made him despicable, any one who can adduce a proof that this accusation is intentionally false and untrue, may publicly declare him who thus brings the dead person into ill repute to be a Calumniator, and affix dishonour to him in turn. This would not be allowable unless it were legitimate to assume that the dead person was injured by the accusation, although he is dead, and that a certain just satisfaction was done to him by an Apology, although he no longer sensibly exists. A Title to act the part of the Vindicator of the dead person does not require to be established; for every one necessarily claims this of himself, not merely as a Duty of Virtue regarded ethically, but as a Right belonging to him in virtue of his Humanity. Nor does the Vindicator require to show any special personal damage, accruing to him as a friend or relative, from a stain on the character of the Deceased, to justify him in proceeding to censure it. That such a form of ideal Acquisition, and even a Right in an individual after death against survivors, is thus actually founded, cannot, therefore, be disputed, although the possibility of such a Right is not capable of logical Deduction.

There is no ground for drawing visionary inferences from what has just been stated, to the presentiment of a future life and invisible relations to departed souls. For the considerations connected with this Right, turn on nothing more than the purely moral and juridical Relation which subsists among men even in the present life, as Rational Beings. Abstraction is, however, made from all that belongs physically to their existence in Space and Time; that is, men are considered logically apart from these physical concomitants of their nature, not as to their state when actually deprived of them, but only in so far as being spirits they are in a condition that might realize the injury done them by Calumniators. Any one who may falsely say

something against me a hundred years hence, injures me even now. For in the pure juridical Relation, which is entirely rational and suprasensible, abstraction is made from the physical conditions of Time, and the Calumniator is as culpable as if he had committed the offence in my lifetime; only this will not be tried by a Criminal Process, but he will only be punished with that loss of honour he would have caused to another, and this is inflicted upon him by Public Opinion according to the Lex talionis. Even a Plagiarism from a dead Author, although it does not tarnish the honour of the Deceased, but only deprives him of a part of his property, is yet properly regarded as a lesion of his human Right.

CHAPTER THIRD. Acquisition conditioned by the Sentence of a Public Judicatory.

36.: How and what Acquisition is subjectively conditioned by the Principle of a Public Court.

Natural Right, understood simply as that Right which is not statutory, and which is knowable purely à priori, by every man's Reason, will include Distributive Justice as well as Commutative Justice. It is manifest that the latter as constituting the Justice that is valid between Persons in their reciprocal relations of intercourse with one another, must belong to Natural Right. But this holds also of Distributive Justice, in so far as it can be known à priori; and Decisions or Sentences regarding it, must be regulated by the Law of Natural Right.

The Moral Person who presides in the sphere of Justice and administers it, is called the Court of Justice, and as engaged in the process of official duty, the Judicatory; the Sentence delivered in a case, is the Judgment (judicium). All this is to be here viewed à priori, according to the rational Conditions of Right, without taking into consideration how such a Constitution is to be actually established or organized, for which particular Statutes, and consequently empirical Principles, are requisite.

The question, then, in this connection, is not merely 'What is right in itself? in the sense in which every man must determine it by the Judgment of Reason; but 'What is Right as applied to this case?' that is, what is right and just as viewed by a Court? The rational and the judicial points of view, are therefore to be distinguished; and there are four Cases in which the two forms of Judgment have a different and opposite issue. And yet they may coexist with each other, because they are delivered from two different, yet respectively true points of view: the one from regard to Private Right, the other from the Idea of Public Right. They are: I. The Contract of Donation (pactum donationis), II. The Contract of Loan (commodatum), III. The Action of Real Revindication (vindicatio), and IV. Guarantee by Oath (juramentum).

It is a common error on the part of the Jurist to fall here into the fallacy of begging the question, by a tacit assumption (vitium subreptionis). This is done by assuming as objective and absolute the juridical Principle which a Public Court of Justice is entitled and even bound to adopt in its own behoof, and only from the subjective purpose of qualifying itself to decide and judge upon all the Rights pertaining to individuals. It is therefore of no small importance to make this specific difference intelligible, and to draw attention to it.

37.: I. The Contract of Donation.

(Pactum donationis.)

The Contract of Donation signifies the gratuitous alienation (gratis) of a Thing or Right that is Mine. It involves a relation between me as the Donor (donans), and another Person as the Donatory (donatarius), in accordance with the Principle of Private Right, by which what is mine is transferred to the latter, on his acceptance of it, as a Gift (donum). However, it is not to be presumed that I have voluntarily bound myself thereby so as to be compelled to keep my Promise, and that I have thus given away my Freedom gratuitously, and, as it were, to that extent thrown myself away. Nemo suum jactare præsumitur. But this is what would happen, under such circumstances, according to the principle of Right in the Civil state; for in this sphere the Donatory can compel me, under certain conditions, to perform my Promise. If, then, the

case comes before a Court, according to the conditions of Public Right, it must either be presumed that the Donor has consented to such Compulsion, or the Court would give no regard, in the Sentence, to the consideration as to whether he intended to reserve the Right to resile from his Promise or not; but would only refer to what is certain, namely, the condition of the Promise and the Acceptance of the Donatory. Although the Promiser, therefore, thought — as may easily be supposed — that he could not be bound by his Promise in any case, if he 'rued' it before it was actually carried out, yet the Court assumes that he ought expressly to have reserved this condition if such was his mind; and if he did not make such an express reservation, it will be held that he can be compelled to implement his Promise. And this Principle is assumed by the Court, because the administration of Justice would otherwise be endlessly impeded, or even made entirely impossible.

38.: II. The Contract of Loan.

(Commodatum.)

In the Contract of Commodate-Loan (commodatum) I give some one the gratuitous use of something that is mine. If it is a Thing that is given on Loan, the contracting Parties agree that the Borrower will restore the very same thing to the power of the Lender. But the Receiver of the Loan (commodatarius) cannot, at the same time, assume that the Owner of the Thing lent (commodans) will take upon himself all risk (casus) of any possible loss of it, or of its useful quality, that may arise from having given it into the possession of the Receiver. For it is not to be understood of itself, that the Owner, besides the use of the Thing, which he has granted to the Receiver, and the detriment that is inseparable from such use, also gives a Guarantee or Warrandice against all damage that may arise from such use. On the contrary, a special Accessory Contract would have to be entered into for this purpose. The only question, then, that can be raised is this: Is it incumbent on the Lender or the Borrower to add expressly the condition of undertaking the risk that may accrue to the Thing lent; or, if this is not done, which of the Parties is to be presumed to have consented and agreed to guarantee the property of the Lender, up to restoration of the very same Thing or its equivalent? Certainly not the Lender; because it cannot be presumed that he has gratuitously agreed to give more than the mere use of the Thing, so that he cannot be supposed to have also undertaken the risk of loss of his property. But this may be assumed on the side of the Borrower; because he thereby undertakes and performs nothing more than what is implied in the Contract.

For example, I enter a house when overtaken by a shower of rain, and ask the Loan of a cloak. But through accidental contact with colouring matter, it becomes entirely spoiled while in my possession; or on entering another house, I lay it aside and it is stolen. Under such circumstances, everybody would think it absurd for me to assert that I had no further concern with the cloak but to return it as it was, or, in the latter case, only to mention the fact of the theft; and that, in any case, anything more required would be but an act of Courtesy in expressing sympathy with the Owner on account of his loss, seeing he can claim nothing on the ground of Right. — It would be otherwise, however, if on asking the use of an article, I discharged myself beforehand from all responsibility, in case of its coming to grief among my hands, on the ground of my being poor, and unable to compensate any incidental loss. No one could find such a condition superfluous or ludicrous, unless the Borrower were, in fact, known to be a well-to-do and well-disposed man; because in such a case it would almost be an insult not to act on the presumption of generous compensation for any loss sustained.

Now by the very nature of this Contract, the possible damage (casus) which the Thing lent may undergo cannot be exactly determined in any Agreement. Commodate is therefore an uncertain Contract (pactum incertum), because the consent can only be so far presumed. The Judgment, in any case, deciding upon whom the incidence of any loss must fall, cannot therefore be determined from the conditions of the Contract in itself, but only by the Principle of the Court before which it comes, and which can only

consider what is certain in the Contract; and the only thing certain is always the fact as to the possession of the Thing as property. Hence the Judgment passed in the state of Nature, will be different from that given by a Court of Justice in the Civil state. The Judgment from the standpoint of Natural Right will be determined by regard to the inner rational quality of the Thing, and will run thus: 'Loss arising from damage accruing to a Thing lent falls upon the Borrower' (casum sentit commodatarius); whereas the Sentence of a Court of Justice in the Civil state will run thus: 'The Loss falls upon the Lender' (casum sentit dominus). The latter Judgment turns out differently from the former as the Sentence of the mere sound Reason, because a Public Judge cannot found upon presumptions as to what either party may have thought; and thus the one who has not obtained release from all loss in the Thing by a special Accessory Contract, must bear the loss. — Hence the difference between the Judgment as the Court must deliver it, and the form in which each individual is entitled to hold it for himself by his private Reason, is a matter of importance, and is not to be overlooked in the consideration of Juridical Judgments.

39.: III. The Revindication of what has been Lost.

(Vindicatio.)

It is clear from what has been already said that a Thing of mine which continues to exist, remains mine although I may not be in continuous occupation of it; and that it does not cease to be mine without a Juridical Act of dereliction or alienation. Further, it is evident that a Right in this Thing (jus reale) belongs in consequence to me (jus personale), against every holder of it, and not merely against some Particular Person. But the question now arises as to whether this Right must be regarded by every other person as a continuous Right of Property per se, if I have not in any way renounced it, although the Thing is in the possession of another.

A Thing may be lost (res amissa), and thus come into other hands in an honourable bonâ fide way as a supposed 'Find;' or it may come to me by formal transfer on the part of one who is in possession of it, and who professes to be its Owner, although he is not so. Taking the latter case, the question arises, Whether, since I cannot acquire a Thing from one who is not its Owner (a non domino), I am excluded by the fact from all Right in the Thing itself, and have merely a personal Right against a wrongful Possessor? This is manifestly so, if the Acquisition is judged purely according to its inner justifying grounds and viewed according to the State of Nature, and not according to the convenience of a Court of Justice.

For everything alienable must be capable of being acquired by any one. The Rightfulness of Acquisition, however, rests entirely upon the form in accordance with which what is in possession of another, is transferred to me and accepted by me. In other words, rightful Acquisition depends upon the formality of the juridical act of commutation or interchange between the Possessor of the Thing and the Acquirer of it, without its being required to ask how the former came by it; because this would itself be an injury, on the ground that Quilibet præsumitur bonus. Now suppose it turned out that the said Possessor was not the real Owner, I cannot admit that the real Owner is entitled to hold me directly responsible, or so entitled with regard to any one who might be holding the Thing. For I have myself taken nothing away from him, when, for example, I bought his horse according to the Law (titulo empti venditi) when it was offered for sale in the public market. The Title of Acquisition is therefore unimpeachable on my side; and as Buyer I am not bound, nor even have I the Right, to investigate the Title of the Seller; for this process of investigation would have to go on in an ascending series ad infinitum. Hence on such grounds I ought to be regarded, in virtue of a regular and formal purchase, as not merely the putative, but the real Owner of the horse.

But against this position, there immediately start up the following juridical Principles. Any Acquisition derived from one who is not the Owner of the Thing in question, is null and void. I cannot derive from

another anything more than what he himself rightfully has; and although as regards the form of the Acquisition — the modus acquirendi — I may proceed in accordance with all the conditions of Right when I deal in a stolen horse exposed for sale in the market, yet a real Title warranting the Acquisition was awanting; for the horse was not really the property of the Seller in question. However I may be a bonâ fide Possessor of a Thing under such conditions, I am still only a putative Owner, and the real Owner has the Right of Vindication against me (rem suam vindicandi).

Now, it may be again asked, what is right and just in itself regarding the Acquisition of external things among men in their intercourse with one another — viewed in the state of Nature — according to the Principles of Commutative Justice? And it must be admitted in this connection, that whoever has a purpose of acquiring anything, must regard it as absolutely necessary to investigate whether the Thing which he wishes to acquire does not already belong to another person. For although he may carefully observe the formal conditions required for appropriating what may belong to the property of another, as in buying a horse according to the usual terms in a market, yet he can, at the most, acquire only a Personal Right in relation to a Thing (jus ad rem) so long as it is still unknown to him whether another than the Seller may not be the real Owner. Hence, if some other person were to come forward, and prove by documentary evidence a prior Right of property in the Thing, nothing would remain for the putative new Owner but the advantage which he has drawn as a bonâ fide Possessor of it up to that moment. Now it is frequently impossible to discover the absolutely first original Owner of a Thing in the series of putative Owners, who derive their Rights from one another. Hence no mere exchange of external things, however well it may agree with the formal conditions of Commutative Justice, can ever guarantee an absolutely certain Acquisition.

Here, however, the juridically law-giving Reason comes in again with the Principle of Distributive Justice; and it adopts as a criterion of the Rightfulness of Possession, not what it is in itself in reference to the Private Will of each individual in the state of Nature, but only the consideration of how it would be adjudged by a Court of Justice in a Civil state, constituted by the united Will of all. In this connection, fulfilment of the formal conditions of Acquisition that in themselves only establish a Personal Right, is postulated as sufficient; and they stand as an equivalent for the material conditions which properly establish the derivation of Property from a prior putative Owner, to the extent of making what is in itself only a Personal Right, valid before a Court, as a Real Right. Thus the horse which I bought when exposed for sale in the public market under conditions regulated by the Municipal Law, becomes my property if all the conditions of Purchase and Sale have been exactly observed in the transaction; but always under the reservation that the real Owner continues to have the Right of a claim against the Seller, on the ground of his prior unalienated possession. My otherwise Personal Right is thus transmuted into a Real Right, according to which I may take and vindicate the object as mine wherever I may find it, without being responsible for the way in which the Seller had come into possession of it.

It is therefore only in behoof of the requirements of juridical decision in a Court (in favorem justitiæ distributivæ) that the Right in respect of a Thing is regarded, not as Personal, which it is in itself, but as Real, because it can thus be most easily and certainly adjudged; and it is thus accepted and dealt with according to a pure Principle à priori. Upon this Principle various Statutory Laws come to be founded which specially aim at laying down the conditions under which alone a mode of Acquisition shall be legitimate, so that the Judge may be able to assign every one his own as easily and certainly as possible. Thus, in the brocard, ‘Purchase breaks Hire,’ what by the nature of the subject is a Real Right — namely the Hire — is taken to hold as a merely Personal Right; and, conversely, as in the case referred to above, what is in itself merely a Personal Right is held to be valid as a Real Right. And this is done only when the question arises as to the Principles by which a Court of Justice in the Civil state is to be guided, in order to proceed with all possible safety in delivering judgment on the Rights of individuals.

40.: IV. Acquisition of Security by the taking of an Oath.

(Cautio juratoria.)

Only one ground can be assigned on which it could be held that men are bound in the juridical relation, to believe and to confess that there are Gods, or that there is a God. It is that they may be able to swear an Oath; and that thus by the fear of an all-seeing Supreme Power, whose revenge they must solemnly invoke upon themselves in case their utterance should be false, they may be constrained to be truthful in statement and faithful in promising. It is not Morality but merely blind Superstition that is reckoned upon in this process; for it is evident it implies that no certainty is to be expected from a mere solemn declaration in matters of Right before a Court, although the duty of truthfulness must have always appeared self-evident to all, in a matter which concerns the Holiest that can be among men — namely, the Right of Man. Hence recourse has been had to a motive founded on mere myths and fables as imaginary guarantees. Thus among the Rejangs, a heathen people in Sumatra, it is the custom — according to the testimony of Marsden — to swear by the bones of their dead relatives, although they have no belief in a life after death. In like manner the negroes of Guinea swear by their Fetish, a bird's feather, which they imprecate under the belief that it will break their neck. And so in other cases. The belief underlying these oaths is that an invisible Power — whether it has Understanding or not — by its very nature possesses magical power that can be put into action by such invocations. Such a belief — which is commonly called Religion, but which ought to be called Superstition — is, however, indispensable for the administration of Justice; because, without referring to it, a Court of Justice would not have adequate means to ascertain facts otherwise kept secret, and to determine rights. A Law making an Oath obligatory, is therefore only given in behoof of the judicial Authority.

But then the question arises as to what the obligation could be founded upon, that would bind any one in a Court of Justice to accept the Oath of another person, as a right and valid proof of the truth of his statements which are to put an end to all dispute. In other words, What obliges me juridically to believe that another person when taking an Oath has any Religion at all, so that I should subordinate or entrust my Right to his Oath? And, on like grounds, conversely, Can I be bound at all to take an Oath? It is evident that both these questions point to what is in itself morally wrong.

But in relation to a Court of Justice — and generally in the Civil state — if it be assumed there are no other means of getting to the truth in certain cases than by an Oath, it must be adopted. In regard to Religion, under the supposition that every one has it, it may be utilized as a necessary means (in causu necessitatis), in behoof of the legitimate procedure of a Court of Justice. The Court uses this form of spiritual compulsion (tortura spiritualis) as an available means, in conformity with the superstitious propensity of mankind, for the ascertainment of what is concealed; and therefore holds itself justified in so doing. The Legislative Power, however, is fundamentally wrong in assigning this authority to the Judicial Power, because even in the Civil state any compulsion with regard to the taking of Oaths is contrary to the inalienable Freedom of Man.

Official Oaths, which are usually promissory, being taken on entering upon an Office to the effect that the individual has sincere intention to administer his functions dutifully, might well be changed into assertory Oaths, to be taken at the end of a year or more of actual administration, the official swearing to the faithfulness of his discharge of duty during that time. This would bring the Conscience more into action than the Promissory Oath, which always gives room for the internal pretext that, with the best intention, the difficulties that arose during the administration of the official function were not foreseen. And, further, violations of Duty, under the prospect of their being summed up by future Censors, would give rise to more anxiety as to censure than when they are merely represented, one after the other, and forgotten.

As regards an Oath taken concerning a matter of Belief (de credulitate), it is evident that no such Oath can be demanded by a Court. 1. For, first, it contains in itself a Contradiction. Such Belief, as intermediate between Opinion and Knowledge, is a thing on which one might venture to lay a wager but not to swear an Oath. 2. And, second, the Judge who imposes an Oath of Belief, in order to ascertain anything pertinent to his own purpose or even to the Common Good, commits a great offence against the Conscientiousness of the party taking such an oath. This he does in regard both to the levity of mind, which he thereby helps to engender, and to the stings of conscience which a man must feel who to-day regards a subject from a certain point of view, but who will very probably to-morrow find it quite improbable from another point of view. Any one, therefore, who is compelled to take such an Oath, is subjected to an injury.

TRANSITION From the Mine and Thine in the state of Nature to the Mine and Thine in the Juridical state generally.

41.: Public Justice as related to the Natural and the Civil state.

The Juridical state is that relation of men to one another which contains the conditions, under which it is alone possible for every one to obtain the Right that is his due. The formal Principle of the possibility of actually participating in such Right, viewed in accordance with the Idea of a universally legislative Will, is Public Justice. Public Justice may be considered in relation either to the Possibility, or Actuality, or Necessity of the Possession of objects — regarded as the matter of the activity of the Will — according to laws. It may thus be divided into Protective Justice (justitia testatrix), Commutative Justice (justitia commutativa), and Distributive Justice (justitia distributiva). In the first mode of Justice, the Law declares merely what Relation is internally right in respect of Form (lex justi); in the second, it declares what is likewise externally in accord with a Law in respect of the Object, and what Possession is rightful (lex juridica); and in the third, it declares what is right, and what is just, and to what extent, by the Judgment of a Court in any particular case coming under the given Law. In this latter relation, the Public Court is called the Justice of the Country; and the question whether there actually is or is not such an administration of Public Justice, may be regarded as the most important of all juridical interests.

The non-juridical state is that condition of Society in which there is no Distributive Justice. It is commonly called the Natural state (status naturalis), or the state of Nature. It is not the ‘Social State,’ as Achenwall puts it, for this may be in itself an artificial state (status artificialis), that is to be contradistinguished from the ‘Natural’ state. The opposite of the state of Nature is the Civil state (status civilis) as the condition of a Society standing under a Distributive Justice. In the state of Nature there may even be juridical forms of Society — such as Marriage, Parental Authority, the Household, and such like. For none of these, however, does any Law à priori lay it down as an incumbent obligation, ‘Thou shalt enter into this state.’ But it may be said of the Juridical state that ‘all men who may even involuntarily come into Relations of Right with one another, ought to enter into this state.’

The Natural or non-juridical Social state may be viewed as the sphere of Private Right, and the Civil state may be specially regarded as the sphere of Public Right. The latter state contains no more and no other Duties of men towards each other than what may be conceived in connection with the former state; the Matter of Private Right is, in short, the very same in both. The Laws of the Civil state, therefore, only turn upon the juridical Form of the co-existence of men under a common Constitution; and in this respect these Laws must necessarily be regarded and conceived as Public Laws.

The Civil Union (Unio civilis) cannot, in the strict sense, be properly called a Society; for there is no sociality in common between the Ruler (imperans) and the Subject (subditus) under a Civil Constitution. They are not co-ordinated as Associates in a Society with each other, but the one is subordinated to the other. Those who may be co-ordinated with one another must consider themselves as mutually equal, in so far as they stand under common Laws. The Civil Union may therefore be regarded not so much as being, but rather as making a Society.

42.: The Postulate of Public Right.

From the conditions of Private Right in the Natural state, there arises the Postulate of Public Right. It may be thus expressed: ‘In the relation of unavoidable co-existence with others, thou shalt pass from the state of Nature into a juridical Union constituted under the condition of a Distributive Justice.’ The Principle of this Postulate may be unfolded analytically from the conception of Right in the external relation, contradistinguished from mere Might as Violence.

No one is under obligation to abstain from interfering with the Possession of others, unless they give him a reciprocal guarantee for the observance of a similar abstention from interference with his Possession. Nor does he require to wait for proof by experience of the need of this guarantee, in view of the antagonistic disposition of others. He is therefore under no obligation to wait till he acquires practical prudence at his own cost; for he can perceive in himself evidence of the natural Inclination of men to play the master over others, and to disregard the claims of the Right of others, when they feel themselves their superiors by Might or Fraud. And thus it is not necessary to wait for the melancholy experience of actual hostility; the individual is from the first entitled to exercise a rightful compulsion towards those who already threaten him by their very nature. Quilibet præsumitur malus, donec securitatem dederit oppositi.

So long as the intention to live and continue in this state of externally lawless Freedom prevails, men may be said to do no wrong or injustice at all to one another, even when they wage war against each other. For what seems competent as good for the one, is equally valid for the other, as if it were so by mutual agreement. Uti partes de jure suo disponunt, ita jus est. But generally they must be considered as being in the highest state of Wrong, as being and willing to be in a condition which is not juridical; and in which, therefore, no one can be secured against Violence, in the possession of his own.

The distinction between what is only formally and what is also materially wrong and unjust, finds frequent application in the Science of Right. An enemy who, on occupying a besieged fortress, instead of honourably fulfilling the conditions of a Capitulation, maltreats the garrison on marching out, or otherwise violates the agreement, cannot complain of injury or wrong if on another occasion the same treatment is inflicted upon themselves. But, in fact, all such actions fundamentally involve the commission of wrong and injustice, in the highest degree; because they take all validity away from the conception of Right, and give up everything, as it were by law itself, to savage Violence, and thus overthrow the Rights of Men generally.

PART SECOND. PUBLIC RIGHT.

PUBLIC RIGHT. THE SYSTEM OF THOSE LAWS WHICH REQUIRE PUBLIC PROMULGATION.

PUBLIC RIGHT. THE PRINCIPLES OF RIGHT IN CIVIL SOCIETY.

43.: Definition and Division of Public Right.

Public Right embraces the whole of the Laws that require to be universally promulgated in order to produce a juridical state of Society. It is therefore a System of those Laws that are requisite for a People as a multitude of men forming a Nation, or for a number of Nations, in their relations to each other. Men and Nations, on account of their mutual influence on one another, require a juridical Constitution uniting them under one Will, in order that they may participate in what is right. — This relation of the Individuals of a Nation to each other, constitutes the Civil Union in the social state; and, viewed as a whole in relation to its constituent members, it forms the political State (Civitas).

The State, as constituted by the common interest of all to live in a juridical union, is called, in view of its form, the Commonwealth or the Republic in the wider sense of the term (Res publica latius sic dicta). The Principles of Right in this sphere, thus constitute the first department of Public Right as the Right of the State (jus Civitatis) or National Right. — 2. The State, again, viewed in relation to other peoples, is called a Power (potentia), whence arises the idea of Potentates. Viewed in relation to the supposed hereditary unity of the people composing it, the State constitutes a Nation (gens). Under the general conception of Public Right, in addition to the Right of the individual State, there thus arises another department of Right, constituting the Right of Nations (jus gentium) or International Right. — 3. Further, as the surface of the earth is not unlimited in extent, but is circumscribed into a unity, National Right and International Right necessarily culminate in the idea of a Universal Right of Mankind, which may be called ‘Cosmopolitical Right’ (jus cosmopoliticum). And National, International, and Cosmopolitical Right are so interconnected, that if any one of these three possible forms of the juridical Relation fails to embody the essential Principles that ought to regulate external freedom by law, the structure of Legislation reared by the others will also be undermined, and the whole System would at last fall to pieces.

PUBLIC RIGHT.

I.: Right of The State and Constitutional Law.

(Jus Civitatis.)

44.: Origin of the Civil Union and Public Right.

It is not from any Experience prior to the appearance of an external authoritative Legislation, that we learn of the maxim of natural violence among men, and their evil tendency to engage in war with each other. Nor is it assumed here that it is merely some particular historical condition or fact, that makes public legislative constraint necessary; for however well-disposed or favourable to Right men may be considered to be of themselves, the rational Idea of a state of Society not yet regulated by Right, must be taken as our starting-point. This Idea implies that before a legal state of Society can be publicly established, individual Men, Nations and States can never be safe against violence from each other; and this is evident from the consideration that every one of his own Will naturally does what seems good and right in his own eyes, entirely independent of the opinion of others. Hence, unless the institution of Right is to be renounced, the first thing incumbent on men is to accept the Principle that it is necessary to leave the state of Nature, in which every one follows his own inclinations, and to form a union of all those who cannot avoid coming into reciprocal communication, and thus subject themselves in common to the external restraint of public compulsory Laws. Men thus enter into a Civil Union, in which every one has it determined by Law what shall be recognised as his; and this is secured to him by a competent external Power distinct from his own individuality. Such is the primary Obligation, on the part of all men, to enter into the relations of a Civil State of Society.

The natural condition of mankind need not, on this ground, be represented as a state of absolute Injustice, as if there could have been no other relation originally among men but what was merely determined by force. But this natural condition must be regarded, if it ever existed, as a state of society that was void of regulation by Right (status justitiæ vacuus), so that if a matter of Right came to be in dispute (jus controversum), no competent judge was found to give an authorized legal decision upon it. It is therefore reasonable that any one should constrain another by force, to pass from such a non-juridical state of life and enter within the jurisdiction of a civil state of Society. For, although on the basis of the ideas of Right held by individuals as such, external things may be acquired by Occupancy or Contract, yet such acquisition is only provisory so long as it has not yet obtained the sanction of a Public Law. Till this sanction is reached, the condition of possession is not determined by any public Distributive Justice, nor is it secured by any Power exercising Public Right.

If men were not disposed to recognise any Acquisition at all as rightful — even in a provisional way — prior to entering into the Civil state, this state of Society would itself be impossible. For the Laws regarding the Mine and Thine in the state of Nature, contain formally the very same thing as they prescribe in the Civil state, when it is viewed merely according to rational conceptions: only that in the forms of the Civil state the conditions are laid down under which the formal prescriptions of the state of Nature attain realization conformable to Distributive Justice. — Were there, then, not even provisionally, an external Meum and Tuum in the state of Nature, neither would there be any juridical Duties in relation to them; and, consequently, there would be no obligation to pass out of that state into another.

45.: The Form of the State and its Three Powers.

A State (Civitas) is the union of a number of men under juridical Laws. These Laws, as such, are to be

regarded as necessary à priori, — that is, as following of themselves from the conceptions of external Right generally, — and not as merely established by Statute. The Form of the State is thus involved in the Idea of the State, viewed as it ought to be according to pure principles of Right; and this ideal Form furnishes the normal criterion of every real union that constitutes a Commonwealth.

Every State contains in itself three Powers, the universal united Will of the People being thus personified in a political triad. These are the Legislative Power, the Executive Power, and the Judiciary Power. — 1. The Legislative Power of the Sovereignty in the State, is embodied in the person of the Lawgiver; 2. the Executive Power is embodied in the person of the Ruler who administers the Law; and 3. the Judiciary Power, embodied in the person of the Judge, is the function of assigning every one what is his own, according to the Law (Potestas legislatoria, rectoria et judiciaria). These three Powers may be compared to the three propositions in a practical Syllogism: — the Major as the sumption laying down the universal Law of a Will, the Minor presenting the command applicable to an action according to the Law as the principle of the subsumption, and the Conclusion containing the Sentence or judgment of Right in the particular case under consideration.

46.: The Legislative Power and the Members of the State.

The Legislative Power, viewed in its rational Principle, can only belong to the united Will of the People. For, as all Right ought to proceed from this Power, it is necessary that its Laws should be unable to do wrong to any one whatever. Now, if any one individual determines anything in the State in contradistinction to another, it is always possible that he may perpetrate a wrong on that other; but this is never possible when all determine and decree what is to be Law to themselves. ‘Volenti non fit injuria.’ Hence it is only the united and consenting Will of all the People — in so far as Each of them determines the same thing about all, and All determine the same thing about each — that ought to have the power of enacting Law in the State.

The Members of a Civil Society thus united for the purpose of Legislation, and thereby constituting a State, are called its Citizens; and there are three juridical attributes that inseparably belong to them by Right. These are — 1. Constitutional Freedom, as the Right of every Citizen to have to obey no other Law than that to which he has given his consent or approval; 2. Civil Equality, as the Right of the Citizen to recognise no one as a Superior among the people in relation to himself, except in so far as such a one is as subject to his moral power to impose obligations, as that other has power to impose obligations upon him; and 3. Political Independence, as the Right to owe his existence and continuance in Society not to the arbitrary Will of another, but to his own Rights and Powers as a Member of the Commonwealth; and, consequently, the possession of a Civil Personality, which cannot be represented by any other than himself.

The capability of Voting by possession of the Suffrage, properly constitutes the political qualification of a Citizen as a Member of the State. But this, again, presupposes the Independence or Self-sufficiency of the individual Citizen among the people, as one who is not a mere incidental part of the Commonwealth, but a Member of it acting of his own Will in community with others. The last of the three qualities involved, necessarily constitutes the distinction between active and passive Citizenship; although the latter conception appears to stand in contradiction to the definition of a Citizen as such. The following examples may serve to remove this difficulty. The Apprentice of a Merchant or Tradesman, a Servant who is not in the employ of the State, a Minor (naturaliter vel civiliter), all Women, and, generally, every one who is compelled to maintain himself not according to his own industry, but as it is arranged by others (the State excepted), are without Civil Personality, and their existence is only, as it were, incidentally included in the State. The Woodcutter whom I employ on my estate; the Smith in India who carries his hammer, anvil, and bellows into the houses where he is engaged to work in iron, as distinguished from the

European Carpenter or Smith, who can offer the independent products of his labour as wares for public sale; the resident Tutor as distinguished from the Schoolmaster; the Ploughman as distinguished from the Farmer and such like, illustrate the distinction in question. In all these cases, the former members of the contrast are distinguished from the latter by being mere subsidiaries of the Commonwealth and not active independent Members of it, because they are of necessity commanded and protected by others, and consequently possess no political Self-sufficiency in themselves. Such Dependence on the Will of others and the consequent Inequality are, however, not inconsistent with the Freedom and Equality of the individuals as Men helping to constitute the people. Much rather is it the case that it is only under such conditions, that a People can become a State and enter into a Civil Constitution. But all are not equally qualified to exercise the Right of the Suffrage under the Constitution, and to be full Citizens of the State, and not mere passive Subjects under its protection. For, although they are entitled to demand to be treated by all the other Citizens according to laws of natural Freedom and Equality, as passive parts of the State, it does not follow that they ought themselves to have the Right to deal with the State as active Members of it, to reorganize it, or to take action by way of introducing certain laws. All they have a right in their circumstances to claim, may be no more than that whatever be the mode in which the positive laws are enacted, these laws must not be contrary to the natural Laws that demand the Freedom of all the people and the Equality that is conformable thereto; and it must therefore be made possible for them to raise themselves from this passive condition in the State, to the condition of active Citizenship.

47.: Dignities in the State and the Original Contract.

All these three Powers in the State are Dignities; and as necessarily arising out of the Idea of the State and essential generally to the foundation of its Constitution, they are to be regarded as political Dignities. They imply the relation between a universal Sovereign as Head of the State — which according to the laws of freedom can be none other than the People itself united into a Nation — and the mass of the individuals of the Nation as Subjects. The former member of the relation is the ruling Power, whose function is to govern (imperans); the latter is the ruled Constituents of the State, whose function is to obey (subditi).

The act by which a People is represented as constituting itself into a State, is termed the original Contract. This is properly only an outward mode of representing the idea by which the rightfulness of the process of organizing the Constitution, may be made conceivable. According to this representation, all and each of the people give up their external Freedom in order to receive it immediately again as Members of a Commonwealth. The Commonwealth is the people viewed as united altogether into a State. And thus it is not to be said that the individual in the State has sacrificed a part of his inborn external Freedom for a particular purpose; but he has abandoned his wild lawless Freedom wholly, in order to find all his proper Freedom again entire and undiminished, but in the form of a regulated order of dependence, that is, in a Civil state regulated by laws of Right. This relation of Dependence thus arises out of his own regulative law-giving Will.

48.: Mutual Relations and Characteristics of the Three Powers.

The three Powers in the State, as regards their relations to each other, are, therefore — (1) co-ordinate with one another as so many Moral Persons, and the one is thus the Complement of the other in the way of completing the Constitution of the State; (2) they are likewise subordinate to one another, so that the one cannot at the same time usurp the function of the other by whose side it moves, each having its own Principle, and maintaining its authority in a particular person, but under the condition of the Will of a Superior; and, further, (3) by the union of both these relations, they assign distributively to every subject

in the State his own Rights.

Considered as to their respective Dignity, the three Powers may be thus described. The Will of the Sovereign Legislator, in respect of what constitutes the external Mine and Thine, is to be regarded as irreprehensible; the executive Function of the supreme Ruler is to be regarded as irresistible; and the judicial Sentence of the Supreme Judge is to be regarded as irreversible, being beyond appeal.

49.: Distinct Functions of the Three Powers. Autonomy of the State.

The Executive Power belongs to the Governor or Regent of the State, whether it assumes the form of a Moral or Individual Person, as the King or Prince (rex, princeps). This Executive Authority, as the Supreme Agent of the State, appoints the Magistrates, and prescribes the Rules to the people, in accordance with which individuals may acquire anything or maintain what is their own conformably to the Law, each case being brought under its application. Regarded as a Moral Person, this Executive Authority constitutes the Government. The Orders issued by the Government to the People and the Magistrates as well as to the higher Ministerial Administrators of the State (gubernatio), are Rescripts or Decrees, and not Laws; for they terminate in the decision of particular cases, and are given forth as unchangeable. A Government acting as an Executive, and at the same time laying down the Law as the Legislative Power, would be a Despotic Government, and would have to be contradistinguished from a patriotic Government. A patriotic Government, again, is to be distinguished from a paternal Government (regimen paternale) which is the most despotic Government of all, the Citizens being dealt with by it as mere children. A patriotic Government, however, is one in which the State, while dealing with the Subjects as if they were Members of a Family, still treats them likewise as Citizens, and according to Laws that recognise their independence, each individual possessing himself and not being dependent on the absolute Will of another beside him or above him.

The Legislative Authority ought not at the same time to be the Executive or Governor; for the Governor, as Administrator, should stand under the authority of the Law, and is bound by it under the supreme control of the Legislator. The Legislative Authority may therefore deprive the Governor of his power, depose him, or reform his administration, but not punish him. This is the proper and only meaning of the common saying in England, ‘The King — as the Supreme Executive Power — can do no wrong.’ For any such application of Punishment would necessarily be an act of that very Executive Power to which the supreme Right to compel according to Law pertains, and which would itself be thus subjected to coercion; which is self-contradictory.

Further, neither the Legislative Power nor the Executive Power ought to exercise the judicial Function, but only appoint Judges as Magistrates. It is the People who ought to judge themselves, through those of the Citizens who are elected by free Choice as their Representatives for this purpose, and even specially for every process or cause. For the judicial Sentence is a special act of public Distributive Justice performed by a Judge or Court as a constitutional Administrator of the Law, to a Subject as one of the People. Such an act is not invested inherently with the power to determine and assign to any one what is his. Every individual among the people being merely passive in this relation to the Supreme Power, either the Executive or the Legislative Authority might do him wrong in their determinations in cases of dispute regarding the property of individuals. It would not be the people themselves who thus determined, or who pronounced the judgments of ‘guilty’ or ‘not guilty’ regarding their fellow-citizens. For it is to the determination of this issue in a cause, that the Court has to apply the Law; and it is by means of the Executive Authority, that the Judge holds power to assign to every one his own. Hence it is only the People that properly can judge in a cause — although indirectly — by Representatives elected and deputed by themselves, as in a Jury. — It would even be beneath the dignity of the Sovereign Head of the

State to play the Judge; for this would be to put himself into a position in which it would be possible to do Wrong, and thus to subject himself to the demand for an appeal to a still higher Power (a rege male informato ad regem melius informandum).

It is by the co-operation of these three Powers — the Legislative, the Executive, and the Judicial — that the State realizes its Autonomy. This Autonomy consists in its organizing, forming, and maintaining itself in accordance with the Laws of Freedom. In their union the Welfare of the State is realized. Salus reipublicæ suprema lex. By this is not to be understood merely the individual well-being and happiness of the Citizens of the State; for — as Rousseau asserts — this End may perhaps be more agreeably and more desirably attained in the state of Nature, or even under a despotic Government. But the Welfare of the State as its own Highest Good, signifies that condition in which the greatest harmony is attained between its Constitution and the Principles of Right, — a condition of the State which Reason by a Categorical Imperative makes it obligatory upon us to strive after.

Constitutional and Juridical Consequences arising from the Nature of the Civil Union.

A.: Right of the Supreme Power, Treason; Dethronement; Revolution; Reform.

The Origin of the Supreme Power is practically inscrutable by the People who are placed under its authority. In other words, the Subject need not reason too curiously in regard to its origin in the practical relation, as if the Right of the obedience due to it were to be doubted (jus controversum). For as the People, in order to be able to adjudicate with a title of Right regarding the Supreme Power in the State, must be regarded as already united under one common legislative Will, it cannot judge otherwise than as the present Supreme Head of the State (summus imperans) wills. The question has been raised as to whether an actual Contract of Subjection (pactum subjectionis civilis) originally preceded the Civil Government as a fact; or whether the Power arose first, and the Law only followed afterwards, or may have followed in this order. But such questions, as regards the People already actually living under the Civil Law, are either entirely aimless, or even fraught with subtle danger to the State. For, should the Subject, after having dug down to the ultimate origin of the State, rise in opposition to the present ruling Authority, he would expose himself as a Citizen, according to the Law and with full Right, to be punished, destroyed, or outlawed. A Law which is so holy and inviolable that it is practically a crime even to cast doubt upon it, or to suspend its operation for a moment, is represented of itself as necessarily derived from some Supreme, unblameable Lawgiver. And this is the meaning of the maxim, 'All Authority is from God;' which proposition does not express the historical foundation of the Civil Constitution, but an ideal Principle of the Practical Reason. It may be otherwise rendered thus, 'It is a Duty to obey the Law of the existing Legislative Power, be its origin what it may.'

Hence it follows, that the Supreme Power in the State has only Rights, and no (compulsory) Duties towards the Subject. — Further, if the Ruler or Regent, as the organ of the Supreme Power, proceeds in violation of the Laws, as in imposing taxes, recruiting soldiers, and so on, contrary to the Law of Equality in the distribution of the political burdens, the Subject may oppose complaints and objections (gravamina) to this injustice, but not active resistance.

There cannot even be an Article contained in the political Constitution that would make it possible for a Power in the State, in case of the transgression of the Constitutional Laws by the Supreme Authority, to resist or even to restrict it in so doing. For, whoever would restrict the Supreme Power of the State must have more, or at least equal power as compared with the Power that is so restricted; and if competent to command the subjects to resist, such a one would also have to be able to protect them, and if he is to be

considered capable of judging what is right in every case, he may also publicly order Resistance. But such a one, and not the actual Authority, would then be the Supreme Power; which is contradictory. The Supreme Sovereign Power, then, in proceeding by a Minister who is at the same time the Ruler of the State, consequently becomes despotic; and the expedient of giving the People to imagine — when they have properly only Legislative influence — that they act by their Deputies by way of limiting the Sovereign Authority, cannot so mask and disguise the actual Despotism of such a Government that it will not appear in the measures and means adopted by the Minister to carry out his function. The People, while represented by their Deputies in Parliament, under such conditions, may have in these warrantors of their Freedom and Rights, persons who are keenly interested on their own account and their families, and who look to such a Minister for the benefit of his influence in the Army, Navy, and Public Offices. And hence, instead of offering resistance to the undue pretensions of the Government — whose public declarations ought to carry a prior accord on the part of the people, which, however, cannot be allowed in peace, — they are rather always ready to play into the hands of the Government. Hence the so-called limited political Constitution, as a Constitution of the internal Rights of the State, is an unreality; and instead of being consistent with Right, it is only a Principle of Expediency. And its aim is not so much to throw all possible obstacles in the way of a powerful violator of popular Rights by his arbitrary influence upon the Government, as rather to cloak it over under the illusion of a Right of opposition conceded to the People.

Resistance on the part of the People to the Supreme Legislative Power of the State, is in no case legitimate; for it is only by submission to the universal Legislative Will, that a condition of law and order is possible. Hence there is no Right of Sedition, and still less of Rebellion, belonging to the People. And least of all, when the Supreme Power is embodied in an individual Monarch, is there any justification, under the pretext of his abuse of power, for seizing his Person or taking away his Life (monarchomachismus sub specie tyrannicidii). The slightest attempt of this kind is High Treason (proditio eminens); and a Traitor of this sort who aims at the overthrow of his country may be punished, as a political parricide, even with Death. It is the duty of the People to bear any abuse of the Supreme Power, even then though it should be considered to be unbearable. And the reason is, that any Resistance of the highest Legislative Authority can never but be contrary to the Law, and must even be regarded as tending to destroy the whole legal Constitution. In order to be entitled to offer such Resistance, a Public Law would be required to permit it. But the Supreme Legislation would by such a Law cease to be supreme, and the People as Subjects would be made sovereign over that to which they are subject; which is a contradiction. And the contradiction becomes more apparent when the question is put: Who is to be the Judge in a controversy between the People and the Sovereign? For the People and the Sovereign are to be constitutionally or juridically regarded as two different Moral Persons; but the question shows that the People would then have to be the Judge in their own cause. — See Supplementary Explanations, IX.

The Dethronement of a Monarch may be also conceived as a voluntary abdication of the Crown, and a resignation of his power into the hands of the People; or it might be a deliberate surrender of these without any assault on the royal person, in order that the Monarch may be relegated into private life. But, however it happen, forcible compulsion of it, on the part of the People, cannot be justified under the pretext of a ‘Right of Necessity’ (casus necessitatis); and least of all can the slightest Right be shown for punishing the Sovereign on the ground of previous maladministration. For all that has been already done in the quality of a Sovereign, must be regarded as done outwardly by Right; and, considered as the source of the Laws, the Sovereign himself can do no wrong. Of all the abominations in the overthrow of a State by Revolution, even the murder or assassination of the Monarch is not the worst. For that may be done by the People out of fear, lest if he is allowed to live, he may again acquire power and inflict punishment upon them; and so it may be done, not as an act of punitive Justice, but merely from regard to self-preservation. It is the formal Execution of a Monarch that horrifies a soul filled with ideas of human right; and this feeling occurs again and again as often as the mind realizes the scenes that terminated the fate of

Charles I. or Louis XVI. Now how is this Feeling to be explained? It is not a mere æsthetic feeling, arising from the working of the Imagination, nor from Sympathy, produced by fancying ourselves in the place of the sufferer. On the contrary, it is a moral feeling arising from the entire subversion of all our notions of Right. Regicide, in short, is regarded as a Crime which always remains such, and can never be expiated (crimen immortale, inexpiabile); and it appears to resemble that Sin which the Theologians declare can neither be forgiven in this world nor in the next. The explanation of this phenomenon in the human mind appears to be furnished by the following reflections upon it; and they even shed some light upon the Principles of Political Right.

Every Transgression of a Law only can and must be explained as arising from a Maxim of the transgressor making such wrong-doing his rule of action; for were it not committed by him as a free Being, it could not be imputed to him. But it is absolutely impossible to explain how any rational individual forms such a Maxim against the clear prohibition of the lawgiving Reason; for it is only events which happen according to the mechanical laws of Nature that are capable of explanation. Now a transgressor or criminal may commit his wrong-doing either according to the Maxim of a Rule supposed to be valid objectively and universally, or only as an Exception from the Rule by dispensing with its obligation for the occasion. In the latter case, he only diverges from the Law, although intentionally. He may, at the same time, abhor his own transgression, and without formally renouncing his obedience to the Law only wish to avoid it. In the former case, however, he rejects the authority of the Law itself, the validity of which, however, he cannot repudiate before his own Reason, even while he makes it his Rule to act against it. His Maxim is therefore not merely defective as being negatively contrary to the Law, but it is even positively illegal, as being diametrically contrary and in hostile opposition to it. So far as we can see into and understand the relation, it would appear as if it were impossible for men to commit wrongs and crimes of a wholly useless form of wickedness, and yet the idea of such extreme perversity cannot be overlooked in a System of Moral Philosophy.

There is thus a feeling of horror at the thought of the formal Execution of a Monarch by his People. And the reason of it is, that whereas an act of Assassination must be considered as only an exception from the Rule which has been constituted a Maxim, such an Execution must be regarded as a complete perversion of the Principles that should regulate the relation between a Sovereign and his People. For it makes the People, who owe their constitutional existence to the Legislation that issued from the Sovereign, to be the Ruler over him. Hence mere violence is thus elevated with bold brow, and as it were by principle, above the holiest Right; and, appearing like an abyss to swallow up everything without recall, it seems like suicide committed by the State upon itself, and a crime that is capable of no atonement. There is therefore reason to assume that the consent that is accorded to such executions is not really based upon a supposed Principle of Right, but only springs from fear of the vengeance that would be taken upon the People were the same Power to revive again in the State. And hence it may be held that the formalities accompanying them, have only been put forward in order to give these deeds a look of Punishment from the accompaniment of a judicial process, such as could not go along with a mere Murder or Assassination. But such a cloaking of the deed entirely fails of its purpose, because this pretension on the part of the People is even worse than Murder itself, as it implies a principle which would necessarily make the restoration of a State, when once overthrown, an impossibility.

An alteration of the still defective Constitution of the State may sometimes be quite necessary. But all such changes ought only to proceed from the Sovereign Power in the way of Reform, and are not to be brought about by the people in the way of Revolution; and when they take place, they should only affect the Executive, and not the Legislative Power. A political Constitution which is so modified that the People by their Representatives in Parliament can legally resist the Executive Power and its representative Minister, is called a Limited Constitution. Yet even under such a Constitution there is no Right of active Resistance, as by an arbitrary combination of the People to coerce the Government into a

certain active procedure; for this would be to assume to perform an act of the Executive itself. All that can rightly be allowed, is only a negative Resistance, amounting to an act of Refusal on the part of the People to concede all the demands which the Executive may deem it necessary to make in behoof of the political Administration. And if this Right were never exercised, it would be a sure sign that the People were corrupted, their Representatives venal, the Supreme Head of the Government despotic, and his Ministers practically betrayers of the People.

Further, when on the success of a Revolution a new Constitution has been founded, the unlawfulness of its beginning and of its institution cannot release the Subjects from the obligation of adapting themselves, as good Citizens, to the new order of things; and they are not entitled to refuse honourably to obey the authority that has thus attained the power in the State. A dethroned Monarch, who has survived such a Revolution, is not to be called to account on the ground of his former administration; and still less may he be punished for it, when withdrawing into the private life of a citizen he prefers his own quiet and the peace of the State to the uncertainty of exile, with the intention of maintaining his claims for restoration at all hazards, and pushing these either by secret counter-revolution or by the assistance of other Powers. However, if he prefers to follow the latter course, his Rights remain, because the Rebellion that drove him from his position was inherently unjust. But the question then emerges as to whether other Powers have the Right to form themselves into an alliance in behalf of such a dethroned Monarch merely in order not to leave the crime committed by the People unavenged, or to do away with it as a scandal to all the States; and whether they are therefore justified and called upon to restore by force to another State a formerly existing Constitution that has been removed by a Revolution. The discussion of this question, however, does not belong to this department of Public Right, but to the following section, concerning the Right of Nations.

B.: Land Rights. Secular and Church Lands. Rights of Taxation; Finance; Police; Inspection.

Is the Sovereign, viewed as embodying the Legislative Power, to be regarded as the Supreme Proprietor of the Soil, or only as the Highest Ruler of the People by the laws? As the Soil is the supreme condition under which it is alone possible to have external things as one’s own, its possible possession and use constitute the first acquirable basis of external Right. Hence it is that all such Rights must be derived from the Sovereign as Over-lord and Paramount Superior of the Soil, or, as it may be better put, as the Supreme Proprietor of the Land (Dominus territorii). The People, as forming the mass of the Subjects, belong to the Sovereign as a People; not in the sense of his being their Proprietor in the way of Real Right, but as their Supreme Commander or Chief in the way of Personal Right. This Supreme Proprietorship, however, is only an Idea of the Civil Constitution, objectified to represent, in accordance with juridical conceptions, the necessary union of the private property of all the people under a public universal Possessor. The relation is so represented in order that it may form a basis for the determination of particular Rights in property. It does not proceed, therefore, upon the Principle of mere Aggregation, which advances empirically from the parts to the Whole, but from the necessary formal principle of a Division of the Soil according to conceptions of Right. In accordance with this Principle, the Supreme Universal Proprietor cannot have any private property in any part of the Soil; for otherwise he would make himself a private Person. Private property in the Soil belongs only to the People, taken distributively and not collectively; — from which condition, however, a nomadic people must be excepted as having no private property at all in the Soil. The Supreme Proprietor accordingly ought not to hold private Estates, either for private use or for the support of the Court. For, as it would depend upon his own pleasure how far these should extend, the State would be in danger of seeing all property in the Land taken into the hands of the Government, and all the Subjects treated as bondsmen of the Soil (glebæ adscripti). As possessors only of what was the private property of another, they might thus be deprived of all freedom and regarded as

Serfs or Slaves. Of the Supreme Proprietor of the Land, it may be said that he possesses nothing as his own, except himself; for if he possessed things in the State alongside of others, dispute and litigation would be possible with these others regarding those things, and there would be no independent Judge to settle the cause. But it may be also said that he possesses everything; for he has the Supreme Right of Sovereignty over the whole People, to whom all external things severally (divisim) belong; and as such he assigns distributively to every one what is to be his.

Hence there cannot be any Corporation in the State, nor any Class or Order, that as Proprietors can transmit the Land for a sole exclusive use to the following generations for all time (ad infinitum), according to certain fixed Statutes. The State may annul and abrogate all such Statutes at any time, only under the condition of indemnifying survivors for their interests. The Order of Knights, constituting the nobility regarded as a mere rank or class of specially titled individuals, as well as the Order of the Clergy, called the Church, are both subject to this relation. They can never be entitled by any hereditary privileges with which they may be favoured, to acquire an absolute property in the soil transmissible to their successors. They can only acquire the use of such property for the time being. If Public Opinion has ceased, on account of other arrangements, to impel the State to protect itself from negligence in the national defence by appeal to the military honour of the knightly order, the Estates granted on that condition may be recalled. And, in like manner, the Church Lands or Spiritualities may be reclaimed by the State without scruple, if Public Opinion has ceased to impel the members of the State to maintain Masses for the Souls of the Dead, Prayers for the Living, and a multitude of Clergy, as means to protect themselves from eternal fire. But in both cases, the condition of indemnifying existing interests must be observed. Those who in this connection fall under the movement of Reform, are not entitled to complain that their property is taken from them; for the foundation of their previous possession lay only in the Opinion of the People, and it can be valid only so long as this opinion lasts. As soon as this Public Opinion in favour of such institutions dies out, or is even extinguished in the judgment of those who have the greatest claim by their acknowledged merit to lead and represent it, the putative proprietorship in question must cease, as if by a public appeal made regarding it to the State (a rege male informato ad regem melius informandum).

On this primarily acquired Supreme Proprietorship in the Land, rests the Right of the Sovereign, as universal Proprietor of the country, to assess the private proprietors of the Soil, and to demand Taxes, Excise, and Dues, or the performance of Service to the State such as may be required in War. But this is to be done so that it is actually the People that assess themselves, this being the only mode of proceeding according to Laws of Right. This may be effected through the medium of the Body of Deputies who represent the People. It is also permissible, in circumstances in which the State is in imminent danger, to proceed by a forced Loan, as a Right vested in the Sovereign, although this may be a divergence from the existing Law.

Upon this Principle is also founded the Right of administering the National Economy, including the Finance and the Police. The Police has specially to care for the Public Safety, Convenience, and Decency. As regards the last of these, — the feeling or negative taste for public Propriety, — it is important that it be not deadened by such influences as Begging, disorderly Noises, offensive Smells, public Prostitution (Venus vulgivaga), or other offences against the Moral Sense, as it greatly facilitates the Government in the task of regulating the life of the People by law.

For the preservation of the State there further belongs to it a Right of Inspection (jus inspectionis), which entitles the public Authority to see that no secret Society, political or religious, exists among the people that can exert a prejudicial influence upon the public Weal. Accordingly, when it is required by the Police, no such secret Society may refuse to lay open its constitution. But the visitation and search of private houses by the Police, can only be justified in a case of Necessity; and in every particular

instance, it must be authorized by a higher Authority.

C.: Relief of the Poor. Foundling Hospitals. The Church.

The Sovereign, as undertaker of the duty of the People, has the Right to tax them for purposes essentially connected with their own preservation. Such are, in particular, the Relief of the Poor, Foundling Asylums, and Ecclesiastical Establishments, otherwise designated charitable or pious Foundations.

The People have in fact united themselves by their common Will into a Society, which has to be perpetually maintained; and for this purpose they have subjected themselves to the internal Power of the State, in order to preserve the members of this Society even when they are not able to support themselves. By the fundamental principle of the State, the Government is justified and entitled to compel those who are able, to furnish the means necessary to preserve those who are not themselves capable of providing for the most necessary wants of Nature. For the existence of persons with property in the State, implies their submission under it for protection and the provision by the State of what is necessary for their existence; and accordingly the State founds a Right upon an obligation on their part to contribute of their means for the preservation of their fellow-citizens. This may be carried out by taxing the Property or the commercial industry of the Citizens, or by establishing Funds and drawing interest from them, not for the wants of the State as such, which is rich, but for those of the People. And this is not to be done merely by voluntary contributions, but by compulsory exactions as State-burdens, for we are here considering only the Right of the State in relation to the People. Among the voluntary modes of raising such contributions Lotteries ought not to be allowed, because they increase the number of those who are poor, and involve danger to the public property. — It may be asked whether the Relief of the Poor ought to be administered out of current contributions, so that every age should maintain its own Poor; or whether this were better done by means of permanent funds and charitable institutions, such as Widows' Homes, Hospitals, etc.? And if the former method is the better, it may also be considered whether the means necessary are to be raised by a legal Assessment rather than by Begging, which is generally nigh akin to robbing. The former method must in reality be regarded as the only one that is conformable to the Right of the State, which cannot withdraw its connection from any one who has to live. For a legal current provision does not make the profession of poverty a means of gain for the indolent, as is to be feared is the case with pious Foundations when they grow with the number of the poor; nor can it be charged with being an unjust or unrighteous burden imposed by the Government on the people.

The State has also a Right to impose upon the People the duty of preserving Children exposed from want or shame, and who would otherwise perish; for it cannot knowingly allow this increase of its power to be destroyed, however unwelcome in some respects it may be. But it is a difficult question to determine how this may most justly be carried out. It might be considered whether it would not be right to exact contributions for this purpose from the unmarried persons of both sexes who are possessed of means, as being in part responsible for the evil; and further, whether the end in view would be best carried out by Foundling Hospitals, or in what other way consistent with Right. But this is a problem of which no solution has yet been offered that does not in some measure offend against Right or Morality.

The Church is here regarded as an Ecclesiastical Establishment merely, and as such it must be carefully distinguished from Religion, which as an internal mode of feeling lies wholly beyond the sphere of the action of the Civil Power. Viewed as an Institution for public Worship founded for the people, — to whose opinion or conviction it owes its origin, — the Church Establishment responds to a real want in the State. This is the need felt by the people to regard themselves as also Subjects of a Supreme Invisible Power to which they must pay homage, and which may often be brought into a very undesirable collision with the Civil Power. The State has therefore a Right in this relation; but it is not to be regarded as the Right of Constitutional Legislation in the Church, so as to organize it as may seem most advantageous for

itself, or to prescribe and command its faith and ritual forms of worship (ritus); for all this must be left entirely to the teachers and rulers which the Church has chosen for itself. The function of the State in this connection, only includes the negative Right of regulating the influence of these public teachers upon the visible political Commonwealth, that it may not be prejudicial to the public peace and tranquillity. Consequently the State has to take measures, on occasion of any internal conflict in the Church, or on occasion of any collision of the several Churches with each other, that Civil concord is not endangered; and this Right falls within the province of the Police. It is beneath the dignity of the Supreme Power to interpose in determining what particular faith the Church shall profess, or to decree that a certain faith shall be unalterably held, and that the Church may not reform itself. For in doing so, the Supreme Power would be mixing itself up in a scholastic wrangle, on a footing of equality with its subjects; the Monarch would be making himself a priest; and the Churchmen might even reproach the Supreme Power with understanding nothing about matters of faith. Especially would this hold in respect of any prohibition of internal Reform in the Church; for what the People as a whole cannot determine upon for themselves, cannot be determined for the People by the Legislator. But no People can ever rationally determine that they will never advance farther in their insight into matters of faith, or resolve that they will never reform the institutions of the Church; because this would be opposed to the humanity in their own persons, and to their highest Rights. And therefore the Supreme Power cannot of itself resolve and decree in these matters for the People. — As regards the cost of maintaining the Ecclesiastical Establishment, for similar reasons this must be derived not from the public funds of the State, but from the section of the People who profess the particular faith of the Church; and thus only ought it to fall as a burden on the Community. — See Supplementary Explanations, VIII.

D.: The Right of assigning Offices and Dignities in the State.

The Right of the Supreme Authority in the State also includes:

The Distribution of Offices, as public and paid employments;

The Conferring of Dignities, as unpaid distinctions of Rank, founded merely on honour, but establishing a gradation of higher and lower orders in the political scale; the latter, although free in themselves, being under obligation determined by the public law to obey the former so far as they are also entitled to command;

Besides these relatively beneficent Rights, the Supreme Power in the State is also invested with the Right of administering Punishment.

As regards Civil Offices, the question arises as to whether the Sovereign has the Right, after bestowing an office on an individual, to take it again away at his mere pleasure, without any crime having been committed by the holder of the office. I say, No. For what the united Will of the People would never resolve regarding their Civil Officers, cannot (constitutionally) be determined by the Sovereign regarding them. The People have to bear the cost incurred by the appointment of an Official, and undoubtedly it must be their Will that any one in Office should be completely competent for its duties. But such competency can only be acquired by a long preparation and training, and this process would necessarily occupy the time that would be required for acquiring the means of support by a different occupation. Arbitrary and frequent changes would therefore, as a rule, have the effect of filling Offices with functionaries who have not acquired the skill required for their duties, and whose judgments had not attained maturity by practice. All this is contrary to the purpose of the State. And besides it is requisite in the interest of the People, that it should be possible for every individual to rise from a lower office to the higher offices, as these latter would otherwise fall into incompetent hands, and that competent officials generally should have some guarantee of life-long provision.

Civil Dignities include not only such as are connected with a public Office, but also those which make the possessors of them without any accompanying services to the State, members of a higher class or rank. The latter constitute the Nobility, whose members are distinguished from the common citizens who form the mass of the People. The rank of the Nobility is inherited by male descendants; and these again communicate it to wives who are not nobly born. Female descendants of noble families, however, do not communicate their rank to husbands who are not of noble birth, but they descend themselves into the common civil status of the People. This being so, the question then emerges as to whether the Sovereign has the Right to found a hereditary rank and class, intermediate between himself and the other Citizens? The import of this question does not turn on whether it is conformable to the prudence of the Sovereign, from regard to his own and the People's interests, to have such an institution; but whether it is in accordance with the Right of the People that they should have a class of Persons above them, who, while being Subjects like themselves, are yet born as their Commanders, or at least as privileged Superiors? The answer to this question, as in previous instances, is to be derived from the Principle that 'what the People as constituting the whole mass of the Subjects could not determine regarding themselves and their associated citizens, cannot be constitutionally determined by the Sovereign regarding the People.' Now a hereditary Nobility is a Rank which takes precedence of Merit and is hoped for without any good reason, — a thing of the imagination without genuine reality. For if an Ancestor had merit, he could not transmit it to his posterity, but they must always acquire it for themselves. Nature has in fact not so arranged that the Talent and Will which give rise to merit in the State, are hereditary. And because it cannot be supposed of any individual that he will throw away his Freedom, it is impossible that the common Will of all the People should agree to such a groundless Prerogative, and hence the Sovereign cannot make it valid. — It may happen, however, that such an anomaly as that of Subjects who would be more than Citizens, in the manner of born Officials or hereditary Professors, has slipped into the mechanism of the Government in olden times, as in the case of the Feudal System, which was almost entirely organized with reference to War. Under such circumstances, the State cannot deal otherwise with this error of a wrongly instituted Rank in its midst, than by the remedy of a gradual extinction through hereditary positions being left unfilled as they fall vacant. The State has therefore the Right provisorily to let a Dignity in Title continue, until the Public Opinion matures on the subject. And this will thus pass from the threefold division into Sovereign, Nobles, and People, to the twofold and only natural division into Sovereign and People.

No individual in the State can indeed be entirely without Dignity; for he has at least that of being a Citizen, except when he has lost his Civil Status by a Crime. As a Criminal he is still maintained in life, but he is made the mere instrument of the Will of another, whether it be the State or a particular Citizen. In the latter position, in which he could only be placed by a juridical judgment, he would practically become a Slave, and would belong as property (dominium) to another, who would be not merely his Master (herus) but his Owner (dominus). Such an Owner would be entitled to exchange or alienate him as a thing, to use him at will except for shameful purposes, and to dispose of his Powers, but not of his Life and Members. No one can bind himself to such a condition of dependence, as he would thereby cease to be a Person, and it is only as a Person that he can make a Contract. It may, however, appear that one man may bind himself to another by a Contract of Hire, to discharge a certain service that is permissible in its kind, but is left entirely undetermined as regards its measure or amount; and that as receiving wages or board or protection in return, he thus becomes only a Servant subject to the Will of a Master (subditus) and not a Slave (servus). But this is an illusion. For if Masters are entitled to use the powers of such subjects at will, they may exhaust these powers, — as has been done in the case of Negroes in the Sugar Islands, — and they may thus reduce their servants to despair and death. But this would imply that they had actually given themselves away to their Masters as property; which, in the case of persons is impossible. A Person can therefore only contract to perform work that is defined both in quality and quantity, either as a Day-

labourer or as a domiciled Subject. In the latter case he may enter into a Contract of Lease for the use of the land of a Superior, giving a definite rent or annual return for its utilization by himself, or he may contract for his service as a Labourer upon the land. But he does not thereby make himself a slave, or a bondsman, or a serf attached to the soil (glebæ adscriptus), as he would thus divest himself of his personality; he can only enter into a temporary or at most a heritable Lease. And even if by committing a Crime he has personally become subjected to another, this subject-condition does not become hereditary; for he has only brought it upon himself by his own wrong-doing. Neither can one who has been begotten by a slave be claimed as property on the ground of the cost of his rearing, because such rearing is an absolute duty naturally incumbent upon parents; and in case the parents be slaves, it devolves upon their masters or owners, who, in undertaking the possession of such subjects, have also made themselves responsible for the performance of their duties.

E.: The Right of Punishing and of Pardoning.

I.: The Right of Punishing.

The Right of administering Punishment, is the Right of the Sovereign as the Supreme Power to inflict pain upon a Subject on account of a Crime committed by him. The Head of the State cannot therefore be punished; but his supremacy may be withdrawn from him. Any Transgression of the public law which makes him who commits it incapable of being a Citizen, constitutes a Crime, either simply as a private Crime (crimen), or also as a public Crime (crimen publicum). Private crimes are dealt with by a Civil Court; Public Crimes by a Criminal Court. — Embezzlement or peculation of money or goods entrusted in trade, Fraud in purchase or sale, if done before the eyes of the party who suffers, are Private Crimes. On the other hand, Coining false money or forging Bills of Exchange, Theft, Robbery, etc., are Public Crimes, because the Commonwealth, and not merely some particular individual, is endangered thereby. Such Crimes may be divided into those of a base character (indolis abjectæ) and those of a violent character (indolis violentiæ).

Judicial or Juridical Punishment (pæna forensis) is to be distinguished from Natural Punishment (pæna naturalis), in which Crime as Vice punishes itself, and does not as such come within the cognizance of the Legislator. Juridical Punishment can never be administered merely as a means for promoting another Good either with regard to the Criminal himself or to Civil Society, but must in all cases be imposed only because the individual on whom it is inflicted has committed a Crime. For one man ought never to be dealt with merely as a means subservient to the purpose of another, nor be mixed up with the subjects of Real Right. Against such treatment his Inborn Personality has a Right to protect him, even although he may be condemned to lose his Civil Personality. He must first be found guilty and punishable, before there can be any thought of drawing from his Punishment any benefit for himself or his fellow-citizens. The Penal Law is a Categorical Imperative; and woe to him who creeps through the serpent-windings of Utilitarianism to discover some advantage that may discharge him from the Justice of Punishment, or even from the due measure of it, according to the Pharisaic maxim: ‘It is better that one man should die than that the whole people should perish.’ For if Justice and Righteousness perish, human life would no longer have any value in the world. — What, then, is to be said of such a proposal as to keep a Criminal alive who has been condemned to death, on his being given to understand that if he agreed to certain dangerous experiments being performed upon him, he would be allowed to survive if he came happily through them? It is argued that Physicians might thus obtain new information that would be of value to the Commonweal. But a Court of Justice would repudiate with scorn any proposal of this kind if made to it by the Medical Faculty; for Justice would cease to be Justice, if it were bartered away for any consideration whatever.

But what is the mode and measure of Punishment which Public Justice takes as its Principle and Standard? It is just the Principle of Equality, by which the pointer of the Scale of Justice is made to incline no more to the one side than the other. It may be rendered by saying that the undeserved evil which any one commits on another, is to be regarded as perpetrated on himself. Hence it may be said: ‘If you slander another, you slander yourself; if you steal from another, you steal from yourself; if you strike another, you strike yourself; if you kill another, you kill yourself.’ This is the Right of Retaliation (jus talionis); and properly understood, it is the only Principle which in regulating a Public Court, as distinguished from mere private judgment, can definitely assign both the quality and the quantity of a just penalty. All other standards are wavering and uncertain; and on account of other considerations involved in them, they contain no principle conformable to the sentence of pure and strict Justice. It may appear, however, that difference of social status would not admit the application of the Principle of Retaliation, which is that of ‘Like with Like.’ But although the application may not in all cases be possible according to the letter, yet as regards the effect it may always be attained in practice, by due regard being given to the disposition and sentiment of the parties in the higher social sphere. Thus a pecuniary penalty on account of a verbal injury, may have no direct proportion to the injustice of slander; for one who is wealthy may be able to indulge himself in this offence for his own gratification. Yet the attack committed on the honour of the party aggrieved may have its equivalent in the pain inflicted upon the pride of the aggressor, especially if he is condemned by the judgment of the Court, not only to retract and apologize, but to submit to some meaner ordeal, as kissing the hand of the injured person. In like manner, if a man of the highest rank has violently assaulted an innocent citizen of the lower orders, he may be condemned not only to apologize but to undergo a solitary and painful imprisonment, whereby, in addition to the discomfort endured, the vanity of the offender would be painfully affected, and the very shame of his position would constitute an adequate Retaliation after the principle of ‘Like with Like.’ But how then would we render the statement: ‘If you steal from another, you steal from yourself’? In this way, that whoever steals anything makes the property of all insecure; he therefore robs himself of all security in property, according to the Right of Retaliation. Such a one has nothing, and can acquire nothing, but he has the Will to live; and this is only possible by others supporting him. But as the State should not do this gratuitously, he must for this purpose yield his powers to the State to be used in penal labour; and thus he falls for a time, or it may be for life, into a condition of slavery. — But whoever has committed Murder, must die. There is, in this case, no juridical substitute or surrogate, that can be given or taken for the satisfaction of Justice. There is no Likeness or proportion between Life, however painful, and Death; and therefore there is no Equality between the crime of Murder and the retaliation of it but what is judicially accomplished by the execution of the Criminal. His death, however, must be kept free from all maltreatment that would make the humanity suffering in his Person loathsome or abominable. Even if a Civil Society resolved to dissolve itself with the consent of all its members — as might be supposed in the case of a People inhabiting an island resolving to separate and scatter themselves throughout the whole world — the last Murderer lying in the prison ought to be executed before the resolution was carried out. This ought to be done in order that every one may realize the desert of his deeds, and that bloodguiltiness may not remain upon the people; for otherwise they might all be regarded as participators in the murder as a public violation of Justice.

The Equalization of Punishment with Crime, is therefore only possible by the cognition of the Judge extending even to the penalty of Death, according to the Right of Retaliation. This is manifest from the fact that it is only thus that a Sentence can be pronounced over all criminals proportionate to their internal wickedness; as may be seen by considering the case when the punishment of Death has to be inflicted, not on account of a murder, but on account of a political crime that can only be punished capitally. A hypothetical case, founded on history, will illustrate this. In the last Scottish Rebellion there were various participators in it — such as Balmerino and others — who believed that in taking part in the Rebellion

they were only discharging their duty to the House of Stuart; but there were also others who were animated only by private motives and interests. Now, suppose that the Judgment of the Supreme Court regarding them had been this: that every one should have liberty to choose between the punishment of Death or Penal Servitude for life. In view of such an alternative, I say that the Man of Honour would choose Death, and the Knave would choose servitude. This would be the effect of their human nature as it is; for the honourable man values his Honour more highly than even Life itself, whereas a Knave regards a Life, although covered with shame, as better in his eyes than not to be. The former is, without gainsaying, less guilty than the other; and they can only be proportionately punished by death being inflicted equally upon them both; yet to the one it is a mild punishment when his nobler temperament is taken into account, whereas it is a hard punishment to the other in view of his baser temperament. But, on the other hand, were they all equally condemned to Penal Servitude for life, the honourable man would be too severely punished, while the other, on account of his baseness of nature, would be too mildly punished. In the judgment to be pronounced over a number of criminals united in such a conspiracy, the best Equalizer of Punishment and Crime in the form of public Justice is Death. And besides all this, it has never been heard of, that a Criminal condemned to death on account of a murder has complained that the Sentence inflicted on him more than was right and just; and any one would treat him with scorn if he expressed himself to this effect against it. Otherwise it would be necessary to admit that although wrong and injustice are not done to the Criminal by the Law, yet the Legislative Power is not entitled to administer this mode of Punishment; and if it did so, it would be in contradiction with itself.

However many they may be who have committed a murder, or have even commanded it, or acted as art and part in it, they ought all to suffer death; for so Justice wills it, in accordance with the Idea of the juridical Power as founded on the universal Laws of Reason. But the number of the Accomplices (correi) in such a deed might happen to be so great that the State, in resolving to be without such criminals, would be in danger of soon also being deprived of subjects. But it will not thus dissolve itself, neither must it return to the much worse condition of Nature, in which there would be no external Justice. Nor, above all, should it deaden the sensibilities of the People by the spectacle of Justice being exhibited in the mere carnage of a slaughtering bench. In such circumstances the Sovereign must always be allowed to have it in his power to take the part of the Judge upon himself as a case of Necessity, — and to deliver a Judgment which, instead of the penalty of death, shall assign some other punishment to the Criminals, and thereby preserve a multitude of the People. The penalty of Deportation is relevant in this connection. Such a form of Judgment cannot be carried out according to a public law, but only by an authoritative act of the royal Prerogative, and it may only be applied as an act of grace in individual cases.

Against these doctrines, the Marquis Beccaria has given forth a different view. Moved by the compassionate sentimentality of a humane feeling, he has asserted that all Capital Punishment is wrong in itself and unjust. He has put forward this view on the ground that the penalty of death could not be contained in the original Civil Contract; for, in that case, every one of the People would have had to consent to lose his life if he murdered any of his fellow-citizens. But, it is argued, such a consent is impossible, because no one can thus dispose of his own life. — All this is mere sophistry and perversion of Right. No one undergoes Punishment because he has willed to be punished, but because he has willed a punishable Action; for it is in fact no Punishment when any one experiences what he wills, and it is impossible for any one to will to be punished. To say, 'I will to be punished, if I murder any one,' can mean nothing more than, 'I submit myself along with all the other citizens to the Laws;' and if there are any Criminals among the People, these Laws will include Penal Laws. The individual who, as a Co-legislator, enacts Penal Law, cannot possibly be the same Person who, as a Subject, is punished according to the Law; for, quâ Criminal, he cannot possibly be regarded as having a voice in the Legislation, the Legislator being rationally viewed as just and holy. If any one, then, enact a Penal Law against himself as a Criminal, it must be the pure juridically law-giving Reason (homo noumenon), which subjects him as

one capable of crime, and consequently as another Person (homo phenomenon), along with all the others in the Civil Union, to this Penal Law. In other words, it is not the People taken distributively, but the Tribunal of public Justice, as distinct from the Criminal, that prescribes Capital Punishment; and it is not to be viewed as if the Social Contract contained the Promise of all the individuals to allow themselves to be punished, thus disposing of themselves and their lives. For if the Right to punish must be grounded upon a promise of the wrongdoer, whereby he is to be regarded as being willing to be punished, it ought also to be left to him to find himself deserving of the Punishment; and the Criminal would thus be his own Judge. The chief error (πρωˆτον ψενˆδος) of this sophistry consists in regarding the judgment of the Criminal himself, necessarily determined by his Reason, that he is under obligation to undergo the loss of his life, as a judgment that must be grounded on a resolution of his Will to take it away himself; and thus the execution of the Right in question is represented as united in one and the same person with the adjudication of the Right.

There are, however, two crimes worthy of death, in respect of which it still remains doubtful whether the Legislature have the Right to deal with them capitally. It is the sentiment of Honour that induces their perpetration. The one originates in a regard for womanly Honour, the other in a regard for military Honour; and in both cases there is a genuine feeling of honour incumbent on the individuals as a Duty. The former is the Crime of Maternal Infanticide (infanticidium maternale); the latter is the Crime of Killing a fellow-soldier in a Duel (Commilitonicidium). Now Legislation cannot take away the shame of an illegitimate birth, nor wipe off the stain attaching from a suspicion of cowardice, to an officer who does not resist an act that would bring him into contempt, by an effort of his own that is superior to the fear of death. Hence it appears that in such circumstances, the individuals concerned are remitted to the State of Nature; and their acts in both cases must be called Homicide, and not Murder, which involves evil intent (homicidium dolosum). In all instances the acts are undoubtedly punishable; but they cannot be punished by the Supreme Power with death. An illegitimate child comes into the world outside of the Law which properly regulates Marriage, and it is thus born beyond the pale or constitutional protection of the Law. Such a child is introduced, as it were, like prohibited goods, into the Commonwealth, and as it has no legal right to existence in this way, its destruction might also be ignored; nor can the shame of the mother when her unmarried confinement is known, be removed by any legal ordinance. A subordinate Officer, again, on whom an insult is inflicted, sees himself compelled by the public opinion of his associates to obtain satisfaction; and, as in the state of Nature, the punishment of the offender can only be effected by a Duel, in which his own life is exposed to danger, and not by means of the Law in a Court of Justice. The Duel is therefore adopted as the means of demonstrating his courage as that characteristic upon which the Honour of his profession essentially rests; and this is done even if it should issue in the killing of his adversary. But as such a result takes place publicly and under consent of both parties, although it may be done unwillingly, it cannot properly be called Murder (homicidium dolosum). — What then is the Right in both cases as relating to Criminal Justice? Penal Justice is here in fact brought into great straits, having apparently either to declare the notion of Honour, which is certainly no mere fancy here, to be nothing in the eye of the Law, or to exempt the crime from its due punishment; and thus it would become either remiss or cruel. The knot thus tied is to be resolved in the following way. The Categorical Imperative of Penal Justice, that the killing of any person contrary to the Law must be punished with death, remains in force; but the Legislation itself and the Civil Constitution generally, so long as they are still barbarous and incomplete, are at fault. And this is the reason why the subjective motive-principles of Honour among the People, do not coincide with the standards which are objectively conformable to another purpose; so that the public Justice issuing from the State becomes Injustice relatively to that which is upheld among the People themselves. [See Supplementary Explanations, V.]

II.: The Right of Pardoning.

The Right of Pardoning (Jus aggratiandi), viewed in relation to the Criminal, is the Right of mitigating or entirely remitting his Punishment. On the side of the Sovereign this is the most delicate of all Rights, as it may be exercised so as to set forth the splendour of his dignity, and yet so as to do a great wrong by it. It ought not to be exercised in application to the crimes of the subjects against each other; for exemption from Punishment (impunitas criminis) would be the greatest wrong that could be done to them. It is only on occasion of some form of Treason (crimen læsæ majestatis), as a lesion against himself, that the Sovereign should make use of this Right. And it should not be exercised even in this connection, if the safety of the People would be endangered by remitting such Punishment. This Right is the only one which properly deserves the name of a 'Right of Majesty.'

50.: Juridical Relations of the Citizen to his Country and to other Countries. Emigration; Immigration; Banishment; Exile.

The Land or Territory whose inhabitants — in virtue of its political Constitution and without the necessary intervention of a special juridical act — are, by birth, fellow-citizens of one and the same Commonwealth, is called their Country or Fatherland. A Foreign Country is one in which they would not possess this condition, but would be living abroad. If a Country abroad form part of the territory under the same Government as at home, it constitutes a Province, according to the Roman usage of the term. It does not constitute an incorporated portion of the Empire (imperii) so as to be the abode of equal fellow-citizens, but is only a possession of the Government, like a lower House; and it must therefore honour the domain of the ruling State as the 'Mother Country' (regio domina).

A Subject, even regarded as a Citizen, has the Right of Emigration; for the State cannot retain him as if he were its property. But he may only carry away with him his Moveables as distinguished from his fixed possessions. However, he is entitled to sell his immovable property, and take the value of it in money with him.

The Supreme Power as Master of the Country, has the Right to favour Immigration, and the settlement of Strangers and Colonists. This will hold even although the natives of the Country may be unfavourably disposed to it, if their private property in the soil is not diminished or interfered with.

In the case of a Subject who has committed a Crime that renders all society of his fellow-citizens with him prejudicial to the State, the Supreme Power has also the Right of inflicting Banishment to a Country abroad. By such Deportation, he does not acquire any share in the Rights of the Citizens of the territory to which he is banished.

The Supreme Power has also the Right of imposing Exile generally (Jus exilii), by which a Citizen is sent abroad into the wide world as the 'Out-land.' And because the Supreme Authority thus withdraws all legal protection from the Citizen, this amounts to making him an 'outlaw' within the territory of his own country.

51.: The Three Forms of the State. Autocracy; Aristocracy; Democracy.

The three Powers in the State, involved in the conception of a Public Government generally (res publica latius dicta), are only so many Relations of the united Will of the People which emanates from the à priori Reason; and viewed as such it is the objective practical realization of the pure Idea of a Supreme Head of the State. This Supreme Head is the Sovereign; but conceived only as a Representation of the whole People, the Idea still requires physical embodiment in a Person, who may exhibit the Supreme Power of the State, and bring the idea actively to bear upon the popular Will. The relation of the Supreme Power to the People, is conceivable in three different forms: Either One in the State rules over all; or Some, united

in a relation of Equality with each other, rule over all the others; or All together rule over each and all individually, including themselves. The Form of the State is therefore either autocratic, or aristocratic, or democratic. — The expression 'monarchic' is not so suitable as 'autocratic' for the conception here intended; for a 'Monarch' is one who has the highest power, an 'Autocrat' is one who has all power, so that this latter is the Sovereign, whereas the former merely represents the Sovereignty.

It is evident that an Autocracy is the simplest form of Government in the State, being constituted by the relation of One, as King, to the People, so that there is one only who is the Lawgiver. An Aristocracy, as a form of Government, is, however, compounded of the union of two relations: that of the Nobles in relation to one another as the Lawgivers, thereby constituting the Sovereignty, and that of this Sovereign Power to the People. A Democracy, again, is the most complex of all the forms of the State, for it has to begin by uniting the will of all so as to form a People; and then it has to appoint a Sovereign over this common Union, which Sovereign is no other than the United Will itself. — The consideration of the ways in which these Forms are adulterated by the intrusion of violent and illegitimate usurpers of power, as in Oligarchy and Ochlocracy, as well as the discussion of the so-called mixed Constitutions, may be passed over here as not essential, and as leading into too much detail.

As regards the Administration of Right in the State, it may be said that the simplest mode is also the best; but as regards its bearing on Right itself, it is also the most dangerous for the People, in view of the Despotism to which simplicity of Administration so naturally gives rise. It is undoubtedly a rational maxim to aim at simplification in the machinery which is to unite the People under compulsory Laws, and this would be secured were all the People to be passive and to obey only one person over them; but the method would not give Subjects who were also Citizens of the State. It is sometimes said that the People should be satisfied with the reflection that Monarchy, regarded as an Autocracy, is the best political Constitution, if the Monarch is good, that is, if he has the judgment as well as the Will to do right. But this is a mere evasion, and belongs to the common class of wise tautological phrases. It only amounts to saying that 'the best Constitution is that by which the supreme administrator of the State is made the best Ruler;' that is, that the best Constitution is the best!

52.: Historical Origin and Changes. A Pure Republic. Representative Government.

It is vain to inquire into the historical Origin of the political Mechanism; for it is no longer possible to discover historically the point of time at which Civil Society took its beginning. Savages do not draw up a documentary Record of their having submitted themselves to Law; and it may be inferred from the nature of uncivilised men that they must have set out from a state of violence. To prosecute such an inquiry in the intention of finding a pretext for altering the existing Constitution by violence, is no less than penal. For such a mode of alteration would amount to a Revolution, that could only be carried out by an Insurrection of the People, and not by constitutional modes of Legislation. But Insurrection against an already existing Constitution, is an overthrow of all civil and juridical relations, and of Right generally; and hence it is not a mere alteration of the Civil Constitution, but a dissolution of it. It would thus form a mode of transition to a better Constitution by Palingenesis and not by mere Metamorphosis; and it would require a new Social Contract, upon which the former Original Contract, as then annulled, would have no influence.

It must, however, be possible for the Sovereign to change the existing Constitution, if it is not actually consistent with the Idea of the Original Contract. In doing so it is essential to give existence to that form of Government which will properly constitute the People into a State. Such a change cannot be made by the State deliberately altering its Constitution from one of the three Forms to one of the other two. — For example, political changes should not be carried out by the Aristocrats combining to subject themselves to an Autocracy, or resolving to fuse all into a Democracy, or conversely; as if it depended on the arbitrary

choice and liking of the Sovereign what Constitution he may impose on the People. For, even if as Sovereign he resolved to alter the Constitution into a Democracy, he might be doing Wrong to the People, because they might hold such a Constitution in abhorrence, and regard either of the other two as more suitable to them in the circumstances.

The Forms of the State are only the letter (littera) of the original Constitution in the Civil Union; and they may therefore remain so long as they are considered, from ancient and long habit (and therefore only subjectively), to be necessary to the machinery of the political Constitution. But the spirit of that original Contract (anima pacti originarii) contains and imposes the obligation on the constituting Power to make the mode of the Government conformable to its Idea; and, if this cannot be effected at once, to change it gradually and continuously till it harmonize in its working with the only rightful Constitution, which is that of a Pure Republic. Thus the old empirical and statutory Forms, which serve only to effect the political subjection of the People, will be resolved into the original and rational Forms which alone take Freedom as their principle, and even as the condition of all compulsion and constraint. Compulsion is in fact requisite for the realization of a juridical Constitution, according to the proper idea of the State; and it will lead at last to the realization of that Idea, even according to the letter. This is the only enduring political Constitution, as in it the Law is itself Sovereign, and is no longer attached to a particular person. This is the ultimate End of all Public Right, and the state in which every citizen can have what is his own peremptorily assigned to him. But so long as the Form of the State has to be represented, according to the Letter, by many different Moral Persons invested with the Supreme Power, there can only be a provisory internal Right, and not an absolutely juridical state of Civil Society.

Every true Republic is and can only be constituted by a Representative System of the People. Such a Representative System is instituted in name of the People, and is constituted by all the Citizens being united together, in order, by means of their Deputies, to protect and secure their Rights. But as soon as a Supreme Head of the State in person — be it as King, or Nobility, or the whole body of the People in a democratic Union — becomes also representative, the United People then does not merely represent the Sovereignty, but they are themselves sovereign. It is in the People that the Supreme Power originally resides, and it is accordingly from this Power that all the Rights of individual Citizens as mere Subjects, and especially as Officials of the State, must be derived. When the Sovereignty of the People themselves is thus realized, the Republic is established; and it is no longer necessary to give up the reins of Government into the hands of those by whom they have been hitherto held, especially as they might again destroy all the new Institutions by their arbitrary and absolute Will.

It was therefore a great error in judgment on the part of a powerful Ruler in our time, when he tried to extricate himself from the embarrassment arising from great public debts, by transferring this burden to the People, and leaving them to undertake and distribute them among themselves as they might best think fit. It thus became natural that the Legislative Power, not only in respect of the Taxation of the Subjects, but in respect of the Government, should come into the hands of the People. It was requisite that they should be able to prevent the incurring of new Debts by extravagance or war; and in consequence, the Supreme Power of the Monarch entirely disappeared, not by being merely suspended, but by passing over in fact to the People, to whose legislative Will the property of every Subject thus became subjected. Nor can it be said that a tacit and yet obligatory promise must be assumed as having, under such circumstances, been given by the National Assembly, not to constitute themselves into a Sovereignty, but only to administer the affairs of the Sovereign for the time, and after this was done to deliver the reins of the Government again into the Monarch’s hands. Such a supposed contract would be null and void. The Right of the Supreme Legislation in the Commonwealth is not an alienable Right, but is the most personal of all Rights. Whoever possesses it, can only dispose by the collective Will of the People, in respect of the People; he cannot dispose in respect of the Collective Will itself, which is the ultimate foundation of all public

Contracts. A Contract, by which the People would be bound to give back their authority again, would not be consistent with their position as a Legislative Power, and yet it would be made binding upon the People; which, on the principle that ‘No one can serve two Masters,’ is a contradiction.

PUBLIC RIGHT.

II.: The Right of Nations and International Law.

(Jus Gentium.)

53.: Nature and Division of the Right of Nations.

The individuals, who make up a People, may be regarded as Natives of the Country sprung by natural descent from a Common Ancestry (congeniti), although this may not hold entirely true in detail. Again, they may be viewed according to the intellectual and juridical relation, as born of a common political Mother, the Republic, so that they constitute, as it were, a public Family or Nation (gens, natio) whose Members are all related to each other as Citizens of the State. As members of a State, they do not mix with those who live beside them in the state of Nature, considering such to be ignoble. Yet these savages, on account of the lawless freedom they have chosen, regard themselves as superior to civilised peoples; and they constitute tribes and even races, but not States. — The public Right of States (jus publicum Civitatum) in their relations to one another, is what we have to consider under the designation of the 'Right of Nations.' Wherever a State, viewed as a Moral Person, acts in relation to another existing in the condition of natural freedom, and consequently in a state of continual war, such Right takes it rise.

The Right of Nations in relation to the State of War may be divided into: 1. The Right of going to War; 2. Right during War; and 3. Right after War, the object of which is to constrain the nations mutually to pass from this state of war, and to found a common Constitution establishing Perpetual Peace. The difference between the Right of individual men or families as related to each other in the state of Nature, and the Right of the Nations among themselves, consists in this, that in the Right of Nations we have to consider not merely a relation of one State to another as a whole, but also the relation of the individual persons in one State to the individuals of another State, as well as to that State as a whole. This difference, however, between the Right of Nations and the Right of Individuals in the mere State of Nature, requires to be determined by elements which can easily be deduced from the conception of the latter.

54.: Elements of the Right of Nations.

The elements of the Right of Nations are as follow: —

States, viewed as Nations, in their external relations to one another — like lawless savages — are naturally in a non-juridical condition;

This natural condition is a State of War in which the Right of the stronger prevails; and although it may not in fact be always found as a state of actual war and incessant hostility, and although no real wrong is done to any one therein, yet the condition is wrong in itself in the highest degree, and the Nations which form States contiguous to each other are bound mutually to pass out of it;

An Alliance of Nations, in accordance with the idea of an original Social Contract, is necessary to protect each other against external aggression and attack, but not involving interference with their several internal difficulties and disputes;

This mutual connection by Alliance must dispense with a distinct Sovereign Power, such as is set up in the Civil Constitution; it can only take the form of a Federation, which as such may be revoked on any occasion, and must consequently be renewed from time to time.

This is therefore a Right which comes in as an accessory (in subsidium) of another original Right, in order to prevent the Nations from falling from Right, and lapsing into the state of actual war with each other. It thus issues in the idea of a Fædus Amphictyonum.

55.: Right of Going to War as related to the Subjects of the State.

We have then to consider, in the first place, the original Right of free States to go to War with each other as being still in a state of Nature, but as exercising this Right in order to establish some condition of society approaching the juridical state. And, first of all, the question arises as to what Right the State has in relation to its own Subjects, to use them in order to make war against other States, to employ their property and even their lives for this purpose, or at least to expose them to hazard and danger; and all this in such a way that it does not depend upon their own personal judgment whether they will march into the field of war or not, but the Supreme Command of the Sovereign claims to settle and dispose of them thus.

This Right appears capable of being easily established. It may be grounded upon the Right which every one has to do with what is his own as he will. Whatever one has made substantially for himself, he holds as his incontestable property. The following, then, is such a deduction as a mere Jurist would put forward.

There are various natural Products in a country which, as regards the number and quantity in which they exist, must be considered as specially produced (artefacta) by the work of the State; for the country would not yield them to such extent were it not under the Constitution of the State and its regular administrative Government, or if the inhabitants were still living in the State of Nature. Sheep, cattle, domestic fowl, — the most useful of their kind, — swine, and such like, would either be used up as necessary food or destroyed by beasts of prey in the district in which I live, so that they would entirely disappear, or be found in very scant supplies, were it not for the Government securing to the inhabitants their acquisitions and property. This holds likewise of the population itself, as we see in the case of the American deserts; and even were the greatest industry applied in those regions — which is not yet done — there might be but a scanty population. The inhabitants of any country would be but sparsely sown here and there were it not for the protection of Government; because without it they could not spread themselves with their households upon a territory which was always in danger of being devastated by enemies or by wild beasts of prey; and further, so great a multitude of men as now live in any one country could not otherwise obtain sufficient means of support. Hence, as it can be said of vegetable growths, such as potatoes, as well as of domesticated animals, that because the abundance in which they are found is a product of human labour, they may be used, destroyed, and consumed by man; so it seems that it may be said of the Sovereign as the Supreme Power in the State, that he has the Right to lead his Subjects, as being for the most part productions of his own, to war, as if it were to the chase, and even to march them to the field of battle, as if it were on a pleasure excursion.

This principle of Right may be supposed to float dimly before the mind of the Monarch, and it certainly holds true at least of the lower animals which may become the property of man. But such a principle will not at all apply to men, especially when viewed as citizens who must be regarded as members of the State, with a share in the legislation, and not merely as means for others but as Ends in themselves. As such they must give their free consent, through their representatives, not only to the carrying on of war generally, but to every separate declaration of war; and it is only under this limiting condition that the State has a Right to demand their services in undertakings so full of danger.

We would therefore deduce this Right rather from the duty of the Sovereign to the people than conversely. Under this relation the people must be regarded as having given their sanction; and, having the Right of voting, they may be considered, although thus passive in reference to themselves individually, to be active in so far as they represent the Sovereignty itself.

56.: Right of Going to War in relation to Hostile States.

Viewed as in the state of Nature, the Right of Nations to go to War and to carry on hostilities is the legitimate way by which they prosecute their Rights by their own power when they regard themselves as

injured; and this is done because in that state the method of a juridical Process, although the only one proper to settle such disputes, cannot be adopted.

The threatening of War is to be distinguished from the active injury of a first Aggression, which again is distinguished from the general outbreak of Hostilities. A threat or menace may be given by the active preparation of Armaments, upon which a Right of Prevention (jus præventionis) is founded on the other side, or merely by the formidable increase of the power of another State (potestas tremenda) by acquisition of Territory. Lesion of a less powerful country may be involved merely in the condition of a more powerful neighbour prior to any action at all; and in the State of Nature an attack under such circumstances would be warrantable. This international relation is the foundation of the Right of Equilibrium, or of the 'balance of Power,' among all the States that are in active contiguity to each other.

The Right to go to War is constituted by any overt act of Injury. This includes any arbitrary Retaliation or act of Reprisal (retorsio) as a satisfaction taken by one people for an offence committed by another, without any attempt being made to obtain reparation in a peaceful way. Such an act of retaliation would be similar in kind to an outbreak of hostilities without a previous Declaration of War. For if there is to be any Right at all during the state of war, something analogous to a Contract must be assumed, involving acceptance on the one side of the declaration on the other, and amounting to the fact that they both will to seek their Right in this way.

57.: Right during War.

The determination of what constitutes Right in War, is the most difficult problem of the Right of Nations and International Law. It is very difficult even to form a conception of such a Right, or to think of any Law in this lawless state without falling into a contradiction. Inter arma silent leges. It must then be just the right to carry on War according to such principles as render it always still possible to pass out of that natural condition of the states in their external relations to each other, and to enter into a condition of Right.

No war of independent States against each other, can rightly be a war of Punishment (bellum punitivum). For punishment is only in place under the relation of a Superior (imperantis) to a Subject (subditum); and this is not the relation of the States to one another. Neither can an international war be 'a war of Extermination' (bellum internicinum), nor even 'a war of Subjugation' (bellum subjugatorium); for this would issue in the moral extinction of a State by its people being either fused into one mass with the conquering State, or being reduced to slavery. Not that this necessary means of attaining to a condition of peace is itself contradictory to the right of a State; but because the idea of the Right of Nations includes merely the conception of an antagonism that is in accordance with principles of external freedom, in order that the State may maintain what is properly its own, but not that it may acquire a condition which, from the aggrandizement of its power, might become threatening to other States.

Defensive measures and means of all kinds are allowable to a State that is forced to war, except such as by their use would make the Subjects using them unfit to be citizens; for the State would thus make itself unfit to be regarded as a person capable of participating in equal rights in the international relations according to the Right of Nations. Among these forbidden means are to be reckoned the appointment of Subjects to act as spies, or engaging Subjects or even strangers to act as assassins, or poisoners (in which class might well be included the so-called sharpshooters who lurk in ambush for individuals), or even employing agents to spread false news. In a word, it is forbidden to use any such malignant and perfidious means as would destroy the confidence which would be requisite to establish a lasting peace thereafter.

It is permissible in war to impose exactions and contributions upon a conquered enemy; but it is not legitimate to plunder the people in the way of forcibly depriving individuals of their property. For this would be robbery, seeing it was not the conquered people but the State under whose government they

were placed that carried on the war by means of them. All exactions should be raised by regular Requisition, and Receipts ought to be given for them, in order that when peace is restored the burden imposed on the country or the province may be proportionately borne.

58.: Right after War.

The Right that follows after War, begins at the moment of the Treaty of Peace and refers to the consequences of the war. The conqueror lays down the conditions under which he will agree with the conquered power to form the conclusion of Peace. Treaties are drawn up; not indeed according to any Right that it pertains to him to protect, on account of an alleged lesion by his opponent, but as taking this question upon himself, he bases the right to decide it upon his own power. Hence the conqueror may not demand restitution of the cost of the war; because he would then have to declare the war of his opponent to be unjust. And even although he should adopt such an argument, he is not entitled to apply it; because he would have to declare the war to be punitive, and he would thus in turn inflict an injury. To this right belongs also the Exchange of Prisoners, which is to be carried out without ransom and without regard to equality of numbers.

Neither the conquered State nor its Subjects, lose their political liberty by conquest of the country, so as that the former should be degraded to a colony, or the latter to slaves; for otherwise it would have been a penal war, which is contradictory in itself. A colony or a province is constituted by a people which has its own constitution, legislation, and territory, where persons belonging to another State are merely strangers, but which is nevertheless subject to the supreme executive power of another State. This other State is called the 'mother-country.' It is ruled as a daughter, but has at the same time its own form of government, as in a separate Parliament under the presidency of a Viceroy (civitas hybrida). Such was Athens in relation to different islands; and such is at present the relation of Great Britain to Ireland.

Still less can Slavery be deduced as a rightful institution, from the conquest of a people in war; for this would assume that the war was of a punitive nature. And least of all can a basis be found in war for a hereditary Slavery, which is absurd in itself, since guilt cannot be inherited from the criminality of another.

Further, that an Amnesty is involved in the conclusion of a Treaty of Peace, is already implied in the very idea of a Peace.

59.: The Rights of Peace.

The Rights of Peace are: —

The Right to be in Peace when War is in the neighbourhood, or the Right of Neutrality.

The Right to have Peace secured so that it may continue when it has been concluded, that is, the Right of Guarantee.

The Right of the several States to enter into a mutual Alliance, so as to defend themselves in common against all external or even internal attacks. This Right of Federation, however, does not extend to the formation of any League for external aggression or internal aggrandizement.

60.: Right as against an Unjust Enemy.

The Right of a State against an unjust Enemy has no limits, at least in respect of quality as distinguished from quantity or degree. In other words, the injured State may use — not, indeed, any means, but yet — all those means that are permissible and in reasonable measure in so far as they are in its power, in order to assert its Right to what is its own. But what then is an unjust enemy according to the conceptions of the Right of Nations, when, as holds generally of the state of Nature, every State is judge in its own cause? It

is one whose publicly expressed Will, whether in word or deed, betrays a maxim which, if it were taken as a universal rule, would make a state of Peace among the nations impossible, and would necessarily perpetuate the state of Nature. Such is the violation of public Treaties, with regard to which it may be assumed that any such violation concerns all nations by threatening their freedom, and that they are thus summoned to unite against such a wrong, and to take away the power of committing it. But this does not include the Right to partition and appropriate the country, so as to make a State as it were disappear from the earth; for this would be an injustice to the people of that State, who cannot lose their original Right to unite into a Commonwealth, and to adopt such a new Constitution as by its nature would be unfavourable to the inclination for war.

Further, it may be said that the expression ‘an unjust enemy in the state of Nature’ is pleonastic; for the state of Nature is itself a state of injustice. A just Enemy would be one to whom I would do wrong in offering resistance; but such a one would really not be my Enemy.

61.: Perpetual Peace and a Permanent Congress of Nations.

The natural state of Nations as well as of individual men is a state which it is a duty to pass out of, in order to enter into a legal state. Hence, before this transition occurs, all the Right of Nations and all the external property of States acquirable or maintainable by war, are merely provisory; and they can only become peremptory in a universal Union of States analogous to that by which a Nation becomes a State. It is thus only that a real state of Peace could be established. But with the too great extension of such a Union of States over vast regions any government of it, and consequently the protection of its individual members, must at last become impossible; and thus a multitude of such corporations would again bring round a state of war. Hence the Perpetual Peace, which is the ultimate end of all the Right of Nations, becomes in fact an impracticable idea. The political principles, however, which aim at such an end, and which enjoin the formation of such unions among the States as may promote a continuous approximation to a Perpetual Peace, are not impracticable; they are as practicable as this approximation itself, which is a practical problem involving a duty, and founded upon the Right of individual men and States.

Such a Union of States, in order to maintain Peace, may be called a Permanent Congress of Nations; and it is free to every neighbouring State to join in it. A union of this kind, so far at least as regards the formalities of the Right of Nations in respect of the preservation of peace, was presented in the first half of this century, in the Assembly of the States-General at the Hague. In this Assembly most of the European Courts, and even the smallest Republics, brought forward their complaints about the hostilities which were carried on by the one against the other. Thus the whole of Europe appeared like a single Federated State, accepted as Umpire by the several nations in their public differences. But in place of this agreement, the Right of Nations afterwards survived only in books; it disappeared from the cabinets, or, after force had been already used, it was relegated in the form of theoretical deductions to the obscurity of Archives.

By such a Congress is here meant only a voluntary combination of different States that would be dissoluble at any time, and not such a union as is embodied in the United States of America, founded upon a political constitution, and therefore indissoluble. It is only by a Congress of this kind that the idea of a Public Right of Nations can be established, and that the settlement of their differences by the mode of a civil process, and not by the barbarous means of war, can be realized.

PUBLIC RIGHT.

III.: The Universal Right of Mankind.

(Jus cosmopoliticum.)

62.: Nature and Conditions of Cosmopolitical Right.

The rational idea of a universal, peaceful, if not yet friendly, Union of all the Nations upon the earth that may come into active relations with each other, is a juridical Principle, as distinguished from philanthropic or ethical principles. Nature has enclosed them altogether within definite boundaries, in virtue of the spherical form of their abode as a globus terraqueus; and the possession of the soil upon which an inhabitant of the earth may live, can only be regarded as possession of a part of a limited whole, and consequently as a part to which every one has originally a Right. Hence all nations originally hold a community of the soil, but not a juridical community of possession (communio), nor consequently of the use or proprietorship of the soil, but only of a possible physical intercourse (commercium) by means of it. In other words, they are placed in such thoroughgoing relations of each to all the rest, that they may claim to enter into intercourse with one another, and they have a right to make an attempt in this direction, while a foreign nation would not be entitled to treat them on this account as enemies. This Right, in so far as it relates to a possible Union of all Nations, in respect of certain laws universally regulating their intercourse with each other, may be called 'Cosmopolitical Right' (jus cosmopoliticum).

It may appear that seas put nations out of all communion with each other. But this is not so; for by means of commerce, seas form the happiest natural provision for their intercourse. And the more there are of neighbouring coast-lands, as in the case of the Mediterranean Sea, this intercourse becomes the more animated. And hence communications with such lands, especially where there are settlements upon them connected with the mother countries giving occasion for such communications, bring it about that evil and violence committed in one place of our globe are felt in all. Such possible abuse cannot, however, annul the Right of man as a citizen of the world to attempt to enter into communion with all others, and for this purpose to visit all the regions of the earth, although this does not constitute a right of settlement upon the territory of another people (jus incolatus), for which a special contract is required.

But the question is raised as to whether, in the case of newly discovered countries, a people may claim the right to settle (accolatus), and to occupy possessions in the neighbourhood of another people that has already settled in that region; and to do this without their consent.

Such a Right is indubitable, if the new settlement takes place at such a distance from the seat of the former, that neither would restrict or injure the other in the use of their territory. But in the case of nomadic peoples, or tribes of shepherds and hunters (such as the Hottentots, the Tungusi, and most of the American Indians), whose support is derived from wide desert tracts, such occupation should never take place by force, but only by contract; and any such contract ought never to take advantage of the ignorance of the original dwellers in regard to the cession of their lands. Yet it is commonly alleged that such acts of violent appropriation may be justified as subserving the general good of the world. It appears as if sufficiently justifying grounds were furnished for them, partly by reference to the civilisation of barbarous peoples (as by a pretext of this kind even Busching tries to excuse the bloody introduction of the Christian religion into Germany), and partly by founding upon the necessity of purging one's own country from depraved criminals, and the hope of their improvement or that of their posterity, in another continent like New Holland. But all these alleged good purposes cannot wash out the stain of injustice in the means employed to attain them. It may be objected that had such scrupulousness about making a beginning in founding a legal State with force been always maintained, the whole earth would still have been in a state of lawlessness. But such an objection would as little annul the conditions of Right in question as the

pretext of the political revolutionaries, that when a constitution has become degenerate, it belongs to the people to transform it by force. This would amount generally to being unjust once and for all, in order thereafter to found justice the more surely, and to make it flourish.

CONCLUSION.

If one cannot prove that a thing is, he may try to prove that it is not. And if he succeeds in doing neither (as often occurs), he may still ask whether it is in his interest to accept one or other of the alternatives hypothetically, from the theoretical or the practical point of view. In other words, a hypothesis may be accepted either in order to explain a certain Phenomenon (as in Astronomy to account for the retrogression and stationariness of the planets), or in order to attain a certain end, which again may be either pragmatic as belonging merely to the sphere of Art, or moral as involving a purpose which it is a duty to adopt as a maxim of action. Now it is evident that the assumption (suppositio) of the practicability of such an End, though presented merely as a theoretical and problematical judgment, may be regarded as constituting a duty; and hence it is so regarded in this case. For although there may be no positive obligation to believe in such an End, yet even if there were not the least theoretical probability of action being carried out in accordance with it, so long as its impossibility cannot be demonstrated, there still remains a duty incumbent upon us with regard to it.

Now, as a matter of fact, the morally practical Reason utters within us its irrevocable Veto: ‘There shall be no War.’ So there ought to be no war, neither between me and you in the condition of Nature, nor between us as members of States which, although internally in a condition of law, are still externally in their relation to each other in a condition of lawlessness; for this is not the way by which any one should prosecute his Right. Hence the question no longer is as to whether Perpetual Peace is a real thing or not a real thing, or as to whether we may not be deceiving ourselves when we adopt the former alternative, but we must act on the supposition of its being real. We must work for what may perhaps not be realized, and establish that Constitution which yet seems best adapted to bring it about (mayhap Republicanism in all States, together and separately). And thus we may put an end to the evil of wars, which have been the chief interest of the internal arrangements of all the States without exception. And although the realization of this purpose may always remain but a pious wish, yet we do certainly not deceive ourselves in adopting the maxim of action that will guide us in working incessantly for it; for it is a duty to do this. To suppose that the moral Law within us is itself deceptive, would be sufficient to excite the horrible wish rather to be deprived of all Reason than to live under such deception, and even to see oneself, according to such principles, degraded like the lower animals to the level of the mechanical play of Nature.

It may be said that the universal and lasting establishment of Peace constitutes not merely a part, but the whole final purpose and End of the Science of Right as viewed within the limits of Reason. The state of Peace is the only condition of the Mine and Thine that is secured and guaranteed by Laws in the relationship of men living in numbers contiguous to each other, and who are thus combined in a Constitution whose rule is derived not from the mere experience of those who have found it the best as a normal guide for others, but which must be taken by the Reason à priori from the ideal of a juridical Union of men under public laws generally. For all particular examples or instances, being able only to furnish illustration but not proof, are deceptive, and at all events require a Metaphysic to establish them by its necessary principles. And this is conceded indirectly even by those who turn Metaphysics into ridicule, when they say, as they often do, ‘The best Constitution is that in which not Men but Laws exercise the power.’ For what can be more metaphysically sublime in its own way than this very Idea of theirs, which according to their own assertion has, notwithstanding, the most objective reality? This may be easily shown by reference to actual instances. And it is this very Idea which alone can be carried out

practically, if it is not forced on in a revolutionary and sudden way by violent overthrow of the existing defective Constitution; for this would produce for the time the momentary annihilation of the whole juridical state of Society. But if the idea is carried forward by gradual Reform, and in accordance with fixed Principles, it may lead by a continuous approximation to the highest political Good, and to Perpetual Peace.

SUPPLEMENTARY EXPLANATIONS of the PRINCIPLES OF RIGHT.

[Written by Kant in 1797, and added to the Second Edition in 1798.]

The Occasion for these Explanations was furnished mainly by a Review of this work that appeared in the Göttingen Journal, No. 28, of 18th February 1797. The Review displays insight, and with sympathetic appreciation it expresses 'the hope that this Exposition of Principles will prove a permanent gain for juridical Science.' It is here taken as a guide in the arrangement of some critical Remarks, and at the same time as suggesting some expansion of the system in certain points of detail.

Objection as to the Faculty of Desire.

In the very first words of the General Introduction the acute Reviewer stumbles on a Definition. He asks what is meant by 'the Faculty of Desire.' In the said Introduction it is defined as 'the Power which Man has, through his mental representations, of becoming the cause of objects corresponding to these representations.' To this Definition the objection is taken, 'that it amounts to nothing as soon as we abstract from the external conditions of the effect or consequence of the act of Desire.''But the Faculty of Desire,' it is added, 'is something even to the Idealist, although there is no external world according to his view.' — Answer: Is there not likewise a violent and yet consciously ineffective form of Desire as a mere mental longing, which is expressed by such words as 'Would to God such a one were still alive!' Yet although this Desire is actless in the sense of not issuing in overt action, it is not effectless in the sense of having no consequence at all; in short, if it does not produce a change on external things, it at least works powerfully upon the internal condition of the Subject, and even may superinduce a morbid condition of disease. A Desire, viewed as an active Striving (nisus) to be a cause by means of one's own mental representations, even although the individual may perceive his incapacity to attain the desired effect, is still a mode of causality within his own internal experience. — There is therefore a misunderstanding involved in the objection, that because the consciousness of one's Power in a case of Desire may be at the same time accompanied with a consciousness of the Want of Power in respect of the external world, the definition is therefore not applicable to the Idealist. But as the question only turns generally upon the relation of a Cause (the Representation) to an Effect (the Feeling), the Causality of the Representation in respect of its object — whether it be external or internal — must inevitably be included by thought in the conception of the Faculty of Desire.

I.: Logical Preparation for the Preceding Conception of Right.

If philosophical Jurists would rise to the Metaphysical Principles of the Science of Right, without which all their juridical Science will be merely statutory, they must not be indifferent to securing completeness in the Division of their juridical conceptions. Apart from such internal completeness their science would not be a rational System, but only an Aggregate of accidental details. The topical arrangement of Principles as determined by the form of the System, must therefore be made complete; that is to say, there must be a proper place assigned to each conception (locus communis) as determined by the synthetic form of the Division. And it would have to be afterwards made apparent that when any other conception were put in the place of the one thus assigned, it would be contradictory to itself and out of its own place.

Now Jurists have hitherto received only two formal commonplaces in their Systems, namely, the conceptions of Real Right and of Personal Right. But since there are other two conceptions possible even

à priori by a mere formal combination of these two as members of a rational Division, giving the conception of a Personal Right of a Real Kind, and that of a Real Right of a Personal Kind, — it is natural to ask whether these further conceptions, although viewed as only problematical in themselves, should not likewise be incorporated in the scheme of a complete Division of the juridical System? This in fact does not admit of doubt. The merely logical Division, indeed, as abstracting from the object of Knowledge, is always in the form of a Dichotomy; so that every Right is either a Real or a not-Real Right. But the metaphysical Division, here under consideration, may also be in the fourfold form of a Tetrachotomy; for in addition to the two simple members of the Division, there are also two relations between them, as conditions of mutual limitation arising from the one Right entering into combination with the other; and the possibility of this requires a special investigation. — But the conception of a Real Right of a Personal Kind falls out at once; for the Right of a Thing as against a Person is inconceivable. It remains, therefore, only to consider, whether the converse of this relation is likewise inconceivable; or whether the conception of a Personal Right of a Real Kind is not only free from internal contradiction, but is even contained à priori in Reason and belongs as a necessary constituent to the conception of the external Mine and Thine in its completeness, in order that Persons may be viewed so far in the same way as Things; not indeed to the extent of treating them in all respects alike, but by regard to the possession of them, and to proceeding with Persons in certain relations as if they were Things.

II.: Justification of the Conception of a Personal Right of a Real Kind.

The Definition of a Personal Right of a Real Kind may be put shortly and appropriately thus: ‘it is the Right which a man has to have another Person than himself as his.’ I say intentionally a ‘Person;’ for one might have another man who had lost his civil personality and become enslaved as his; but such a Real Right is not under consideration here.

Now we have to examine the question whether this conception — described as ‘a new phenomenon in the juristic sky’ — is a stella mirabilis in the sense of growing into a star of the first magnitude, unseen before but gradually vanishing again, yet perhaps destined to return, or whether it is to be regarded as merely a shooting and falling star!

III.: Examples of Real-Personal Right.

To have anything external as one’s own, means to possess it rightfully; and Possession is the condition of the possibility of using a thing. If this condition is regarded merely as physical, the possession is called detention or holding. But legal detention alone does not suffice to make an object mine, or to entitle me so to regard it. If, however, I am entitled, on any ground whatever, to press for the possession of an object which has escaped from my power or been taken from me, this conception of right is a sign in effect that I hold myself entitled to conduct myself towards it as being mine and in my rational possession, and so to use it as my object.

The ‘Mine’ in this connection does not mean that it is constituted by ownership of the Person of another; for a man cannot even be the owner of himself, and much less of another person. It means only the right of Usufruct (jus utendi fruendi) in immediate reference to this person, as if he were a thing, but without infringing on the right of his personality, even while using him is a means for my own ends.

These ends, however, as conditioning the rightfulness of such use, must necessarily be moral. A man may neither desire a wife in order to enjoy her as if she were a thing by the immediate pleasure in mere physical intercourse, nor may the wife surrender herself for this purpose; for otherwise the rights of personality would be given up on both sides. In other words, it is only under the condition of a marriage having been previously concluded that there can be such a reciprocal surrender of the two persons into the

possession of each other that they will not dehumanize themselves by making a corporeal use of each other.

When this condition is not respected, the carnal enjoyment referred to, is in principle, although not always in effect, on the level of cannibalism. There is merely a difference in the manner of the enjoyment between the exhaustion which may thus be produced and the consumption of bodies by the teeth and maw of the savage; and in such reciprocal use of the sexes the one is really made a res fungibilis to the other. Hence a contract that would bind any one for such mere use would be an illegal contract (pactum turpe).

In like manner, a husband and wife cannot produce a child as their mutual offspring (res artificialis) without both coming under the obligation towards it and towards each other to maintain it as their child. This relation accordingly involves the acquisition of a human being as if it were a thing, but it holds only in form according to the idea of a merely Personal Right of a real kind. The parents have a Right against any possessor of the child who may have taken it out of their power (jus in re), and they have likewise a Right to compel the child to perform and obey all their commands in so far as they are not opposed to any law of freedom (jus ad rem); and hence they have also a Personal Right over the child.

Finally, if, on attaining the age of majority, the duty of the parents in regard to the maintenance of their children ceases, they have still the Right to use them as members of the house subjected to their authority, in order to maintain the household until they are released from parental control. This Right of the parents follows from the natural limitation of the former Right. Until the children attain maturity, they belong as members of the household to the family; but thereafter they may belong to the domestics (famulatus) as servants of the household, and they can enter into this relation only by a contract whereby they are bound to the master of the house as his domestics. In like manner, a relation of master and servant may be formed outside of the family, in accordance with a personal right of a real kind on the part of the master; and the domestics are acquired to the household by contract (famulatus domesticus). Such a contract is not a mere letting and hiring of work (locatio conductio operæ); but it further includes the giving of the person of the domestic into the possession of the master, as a letting and hiring of the person (locatio conductio personæ). The latter relation is distinguished from the former in that the domestic enters the contract on the understanding that he will be available for everything that is allowable in respect of the well-being of the household, and is not merely engaged for a certain assigned and specified piece of work. On the other hand, an artisan or a day-labourer who is hired for a specific piece of work, does not give himself into the possession of another, nor is he therefore a member of his household. As the latter is not in the legal possession of his employer, who has bound him only to perform certain things, the employer, even though he should have him dwelling in his house (inquilinus), is not entitled to seize him as a thing (via facti), but must press for the performance of his engagement on the ground of personal right, by the legal means that are at his command (via juris).

So much, then, for the explanation and vindication of this new Title of Right in the Science of Natural Law, which may at first appear strange, but which has nevertheless been always tacitly in use.

IV.: Confusion of Real and Personal Right.

The proposition ‘Purchase breaks Hire’ (§ 31,) has further been objected to as a heterodoxy in the doctrine of Natural Private Right. It certainly appears at first sight to be contrary to all the Rights of contract, that any one should intimate the termination of the lease of a house to the present Lessee before the expiry of the period of occupation agreed upon; and that the former can thus, as it appears, break his promise to the latter, if he only gives him the usual warning determined by the customary and legal practice. But let it be supposed that it can be proved that the Lessee when he entered upon his contract of hire knew, or must have known, that the promise given to him by the Lessor or proprietor was naturally (without needing to be expressly stated in the contract, and therefore tacitly) connected with the condition

‘in so far as he should not sell his house within this time, or might have to renounce it on the occasion of an action on the part of his creditors.’ On this supposition the Lessor does not break his promise, which is already conditioned in itself according to reason, and the Lessee does not suffer any infringement of his Right by such an intimation being made to him before the period of lease has expired. For the Right of the latter arising from the contract of hire, is a Personal Right to what a certain person has to perform for another (jus ad rem); it is not a Real Right (jus in re) that holds against every possessor of the thing.

The Lessee might indeed secure himself in his lease and acquire a Real Right in the house; but he could do this only by having it engrossed by a reference to the house of the Lessor as attached to the soil. In this way he would provide against being dispossessed before the expiry of the time agreed upon, either by the intimation of the proprietor or by his natural death, or even by his civil death as a bankrupt. If he did not do this, because he would rather be free to conclude another lease on better conditions, or because the proprietor would not have such a burden (onus) upon his house, it is to be inferred that, in respect of the period of intimation, both parties were conscious of having made a tacit contract to dissolve their relation at any time, according to their convenience, — subject, however, to the conditions determined by the municipal law. The confirmation of the Right to break hire by purchase, may be further shown by certain juridical consequences that follow from such a naked contract of hire as is here under consideration. Thus the Heirs of the Lessee when he dies should not have the obligation imposed upon them to continue the hire, because it is only an obligation as against a certain person and should cease with his death, although here again the legal period of intimation must be always kept in view. The right of the Lessee as such can thus only pass to his heirs by a special contract. Nor, for the same reason, is he entitled even during the life of both parties, to sublet to others what he has hired for himself, without express agreement to that effect.

V.: Addition to the Explanation of the Conceptions of Penal Right.

The mere idea of a political Constitution among men involves the conception of a punitive Justice as belonging to the supreme Power. The only question, then, is to consider whether the legislator may be indifferent to the modes of punishment, if they are only available as means for the removal of crime, regarded as a violation of the Security of property in the State; or whether he must also have regard to respect for the Humanity in the person of the criminal, as related to the species; and if this latter alternative holds, whether he is to be guided by pure principles of Right, taking the jus talionis as in form the only à priori idea and determining principle of Penal Right, rather than any generalization from experience as to the remedial measures most effective for his purpose. But if this is so, it will then be asked how he would proceed in the case of crimes which do not admit of the application of this Principle of Retaliation, as being either impossible in itself, or as in the circumstances involving the perpetration of a penal offence against Humanity generally. Such, in particular, are the relations of rape, pæderasty, and bestiality. The former two would have to be punished by castration (after the manner of the white or black eunuchs in a seraglio), and the last by expulsion for ever from civil society, because the individual has made himself unworthy of human relations. Per quod quis peccat per idem punitur et idem. These crimes are called unnatural, because they are committed against all that is essential to Humanity. To punish them by arbitrary penalties, is literally opposed to the conception of a penal Justice. But even then the criminal cannot complain that wrong is done to him, since his own evil deed draws the punishment upon himself; and he only experiences what is in accordance with the spirit, if not the letter, of the penal Law which he has broken in his relation to others.

Every punishment implies something that is rightly degrading to the feeling of honour of the party condemned. For it contains a mere one-sided compulsion. Thus his dignity as a citizen is suspended, at least in a particular instance, by his being subjected to an external obligation of duty, to which he may not

oppose resistance on his side. Men of rank and wealth, when mulcted in a fine, feel the humiliation of being compelled to bend under the will of an inferior in position, more than the loss of the money. Punitive Justice (justitia punitiva), in which the ground of the penalty is moral (quia peccatum est), must be distinguished from punitive Expediency, the foundation of which is merely pragmatic (ne peccetur) as being grounded upon the experience of what operates most effectively to prevent crime. It has consequently an entirely distinct place (locus justi) in the topical arrangement of the juridical conceptions. It is neither the conception of what is conducible to a certain effect (conducibilis), nor even that of the pure Honestum, which must be properly placed in Ethics.

VI.: On the Right of Usucapion.

Referring to § 33, , it is said that 'the Right of Usucapion ought to be founded on natural right; for if it were not assumed that an ideal acquisition, as it is here called, is established by bona fide possession, no acquisition would be ever peremptorily secured.' — But I assume a merely provisory acquisition in the state of nature; and, for this reason, insist upon the juridical necessity of the civil constitution. — Further, it is said, 'I assert myself as bona fide possessor only against any one who cannot prove that he was bona fide possessor of the same thing before me, and who has not ceased by his own will to be such.' But the question here under consideration is not as to whether I can assert myself as owner of a thing although another should put in a claim as an earlier real owner of it, the cognizance of his existence as possessor and of his possessorship as owner having been absolutely impossible; which case occurs when such a one has given no publicly valid indication of his uninterrupted possession, — whether owing to his own fault or not, — as by Registration in public Records, or uncontested voting as owner of the property in civil Assemblies.

The question really under consideration is this: Who is the party that ought to prove his rightful Acquisition? This obligation as an onus probandi cannot be imposed upon the actual Possessor, for he is in possession of the thing so far back as his authenticated history reaches. The former alleged owner of it is, however, entirely separated, according to juridical principles, from the series of successive possessors by an interval of time within which he gave no publicly valid indications of his ownership. This intromission or discontinuance of all public possessory activity reduces him to an untitled claimant. But here, as in theology, the maxim holds that conservatio est continua creatio. And although a claimant, hitherto unmanifested but now provided with discovered documentary evidence, should afterwards arise, the doubt again would come up with regard to him as to whether a still older claimant might not yet appear and found a claim upon even earlier possession. — Mere length of time in possession effects nothing here in the way of finally acquiring a thing (acquirere per usucapionem). For it is absurd to suppose that what is wrong, by being long continued, would at last become right. The use of the thing, be it ever so long, thus presupposes a Right in it; whereas the latter cannot be founded upon the former. Hence Usucapion, viewed as acquisition of a thing merely by long use of it, is a contradictory conception. The prescription of claims, as a mode of securing possession (conservatio possessionis meæ per præscriptionem), is not less contradictory, although it is a different conception as regards the basis of appropriation. It is in fact a negative Principle; and it takes the complete disuse of a Right, even such as is necessary to manifest possessorship, as equivalent to a renunciation of the thing (derelictio). But such renunciation is a juridical act, and it implies the use of the Right against another, in order to exclude him by any claim (per perscriptionem) from acquiring the object; which involves a contradiction.

I acquire therefore without probation, and without any juridical act; I do not require to prove, but I acquire by the law (lege). What then do I acquire? The public release from all further claims; that is, the legal security of my possession in virtue of the fact that I do not require to bring forward the proof of it, and may now found upon uninterrupted possession. And the fact that all Acquisition in the state of Nature

is merely provisory, has no influence upon the question of Security in the Possession of what has been acquired, this consideration necessarily taking precedence before the former.

VII.: On Inheritance and Succession.

As regards the ‘Right of Inheritance,’ the acuteness of the Reviewer has here failed him, and he has not reached the nerve of the proof of my position. I do not say (§ 34,) that ‘every man necessarily accepts every thing that is offered to him, when by such acceptance he can only gain and can lose nothing;’ for there are no things of such a kind. But what I say is, that every one always in fact accepts the Right of the offer of the thing, at the moment in which it is offered, inevitably and tacitly, but yet validly; that is, when the circumstances are such that revocation of the offer is impossible, as at the moment of the Testator’s death. For the Promiser cannot then recall the offer; and the nominated Beneficiary, without the intervention of any juridical act, becomes at the moment the acceptor, not of the promised inheritance, but of the Right to accept it or decline it. At that moment he sees himself, on the opening of the Testament and before any acceptance of the inheritance, become possessed of more than he was before; for he has acquired exclusively the Right to accept, which constitutes an element of property. A Civil state is no doubt here presupposed, in order to make the thing in question the property of another person when its former owner is no more; but this transmission of the possession from the hand of the dead (mort-main) does not alter the possibility of Acquisition according to the universal Principles of Natural Right, although a Civil Constitution must be assumed in order to apply them to cases of actual experience. A thing which it is in my free choice to accept or to refuse unconditionally, is called a res jacens. If the owner of a thing offers me gratuitously a thing of this kind, — as, for instance, the furniture of a house out of which I am about to remove, — or promises it shall be mine, so long as he does not recall his offer or promise, which is impossible if he dies when it is still valid, then I have exclusively a Right to the acceptance of the thing offered (jus in re jacente); in other words, I alone can accept or refuse it, as I please. And this Right, exclusively to have the choosing of the thing, I do not obtain by means of a special juridical act, as by a declaration that ‘I will that this Right shall belong to me;’ but I obtain it without any special act on my part, and merely by the law (lege). I can therefore declare myself to this effect: ‘I will that the thing shall not belong to me’ (for the acceptance of it might bring me into trouble with others). But I cannot will to have exclusively the choice as to whether it shall or shall not belong to me; for this Right of accepting or of refusing it, I have immediately by virtue of the Offer itself, apart from any declaration of acceptance on my part. If I could refuse even to have the choice, I might choose not to choose; which is a contradiction. Now this right to choose passes at the moment of the death of the Testator to me; but although instituted heir by his Will (institutio hæredis), I do not yet, in fact, acquire any of the property of the Testator, but merely the juridical or rational possession of that property or part of it, and I can renounce it for the benefit of others. Hence this possession is not interrupted for a moment, but the Succession, as in a continuous series, passes by acceptance from the dying Testator to the heir appointed by him; and thus the proposition testamenta sunt juris naturæ is established beyond all dispute.

VIII.: The Right of the State in relation to Perpetual Foundations for the Benefit of the Subjects.

A Foundation (Sanctio testamentaria beneficii perpetui) is a voluntary beneficent institution, confirmed by the State and applied for the benefit of certain of its members, so that it is established for all the period of their existence. It is called perpetual when the ordinance establishing it is connected with the Constitution of the State; for the State must be regarded as instituted for all time. The beneficence of such a foundation applies either to the people generally, or to a class as a part of the people united by certain particular principles, or to a certain family and their descendants for ever. Hospitals present an example of the first

kind of foundations; Churches of the second; the Orders in the State (spiritual and secular) of the third; Primogeniture and Entail of the fourth.

Of these corporate institutions and their Rights of succession, it is said that they cannot be abolished; because the Right has been made the property of the appointed heirs in virtue of a legacy, and to abrogate such a constitution (corpus mysticum) would amount to taking from some one what was his.

A.: Hospitals.

Such benevolent institutions as Hospitals and other Foundations for the poor, for invalids, and for the sick, when they have been founded by the property of the State, are certainly to be regarded as indissoluble. But if the spirit, rather than the mere letter, of the will of a private Testator is to form the ground of determination, it may be that circumstances will arise in the course of time such as would make the abolition of such foundations advisable, at least in respect of their form. Thus it has been found that the poor and the sick may be better and more cheaply provided for by giving them the assistance of a certain sum of money proportionate to the wants of the time, and allowing them to board with relatives or friends, than by maintaining them in magnificent and costly institutions like Greenwich Hospital, or other similar institutions which are maintained at great expense and yet impose much restriction on personal liberty. Lunatic asylums, however, must be regarded as exceptions. In abolishing any such institutions in favour of other arrangements, the State cannot be said to be taking from the people the enjoyment of a benefit to which they have a right as their own; rather does it promote their interest by choosing wiser means for the maintenance of their rights and the advancement of their well-being.

B.: Churches.

A spiritual order, like that of the Roman Catholic Church, which does not propagate itself in direct descendants, may, under the favour of the State, possess lands with subjects attached to them, and may constitute a spiritual corporation called the Church. To this corporation the laity may, for the salvation of their souls, bequeath or give lands which are to be the property of the Church. The Roman Clergy have thus in fact acquired possessions which have been legally transmitted from one age to another, and which have been formally confirmed by Papal Bulls. Now, can it be admitted that this relation of the clergy to the laity may be annulled by the supreme power of the secular State; and would not this amount to taking violently from them what was their own, as has been attempted, for example, by the unbelievers of the French Republic?

The question really to be determined here is whether the Church can belong to the State or the State to the Church, in the relation of property; for two supreme powers cannot be subordinated to one another without contradiction. It is clear that only the former constitution (politico-hierarchica), according to which the property of the Church belongs to the State, can have proper existence; for every Civil Constitution is of this world, because it is an earthly human power that can be incorporated with all its consequences and effects in experience. On the other hand, the believers whose Kingdom is in Heaven as the other world, in so far as a hierarchico-political constitution relating to this world is conceded to them, must submit themselves to the sufferings of the time, under the supreme power of the men who act in the world. Hence the former Constitution is only in place.

Religion, as manifested in the form of belief in the dogmas of the Church and the power of the Priests who form the aristocracy of such a constitution, even when it is monarchical and papal, ought not to be forced upon the people, nor taken from them by any political power. Neither should the citizen — as is at present the case in Great Britain with the Irish Nation — be excluded from the political services of the

State, and the advantages thence arising, on account of a religion that may be different from that of the Court.

Now, it may be that certain devout and believing souls, in order to become participators of the grace which the Church promises to procure for believers even after their death, establish an institution for all time, in accordance with which, after their death, certain lands of theirs shall become the property of the Church. Further, the State may make itself to a certain extent, or entirely, the vassal of the Church, in order to obtain by the prayers, indulgences, and expiations administered by the clergy as the servants of the Church, participation in the boon promised in the other world. But such a Foundation, although presumably made for all time, is not really established as a perpetuity; for the State may throw off any burden thus imposed upon it by the Church at will. For the Church itself is an institution established on faith, and if this faith be an illusion engendered by mere opinion, and if it disappear with the enlightenment of the people, the terrible power of the Clergy founded upon it also falls. The State will then, with full right, seize upon the presumed property of the Church, consisting of the land bestowed upon it by legacies. However, the feudatories of the hitherto existing institution, may of their own right demand to be indemnified for their life interests.

In like manner, Foundations established for all time, in behoof of the poor as well as educational Institutions even supposing them to have a certain definite character impressed by the idea of their founder, cannot be held as founded for all time, so as to be a burden upon the land. The State must have the liberty to reconstitute them, in accordance with the wants of the time. No one may be surprised that it proves always more and more difficult to carry out such ideas, as for instance a provision that poor foundationers must make up for the inadequacy of the funds of their benevolent institution by singing as mendicants; for it is only natural that one who has founded a beneficent institution should feel a certain desire of glory in connection with it, and that he should be unwilling to have another altering his ideas, when he may have intended to immortalize himself by it. But this does not change the conditions of the thing itself, nor the right, and even the duty of the State, to modify any foundation when it becomes inconsistent with its own preservation and progress; and hence no such institution can be regarded as unalterably founded for all time.

C.: The Orders in the State.

The nobility of a country which is not under an aristocratic but a monarchical Constitution, may well form an institution that is not only allowable for a certain time, but even necessary from circumstances. But it cannot be maintained that such a class may be established for all time, and that the Head of the State should not have the right entirely to abolish the privileges of such a class; nor, if this be done, can it be held that thereby what belonged to the Nobility as Subjects, by way of a hereditary possession, has been taken from them. The Nobility, in fact, constitute a temporary corporation or guild, authorized by the State; and it must adapt itself to the circumstances of the time, nor may it do violence to the universal right of man, however long that may have been suspended. For the rank of the nobleman in the State is not only dependent upon the Constitution itself, but is only an accident, with a merely contingent inherence in the Constitution. A nobleman can be regarded as having a place only in the Civil Constitution, but not as having his position grounded on the state of Nature. Hence, if the State alters its constitution, no one who thereby loses his title and rank would be justified in saying that what was his own had been taken from him; because he could only call it his own under the condition of the continued duration of the previous form of the State. But the State has the right to alter its form, and even to change it into a pure Republic. The Orders in the State, and the privilege of wearing certain insignia distinctive of them, do not therefore establish any right of perpetual possession.

D.: Primogeniture and Entail.

By the Foundation of Primogeniture and Entail is meant that arrangement by which a proprietor institutes a succession of inheritance, so that the next proprietor in the series shall always be the eldest born heir of the family, after the analogy of a hereditary monarchy in the State. But such a Foundation must be regarded as always capable of being annulled with the consent of all the Agnates; and it may not be held to be instituted as for all time, like a hereditary Right attaching to the Soil. Nor, consequently, can it be said that the abrogation of it is a violation of the Foundation and Will of the first ancestral Founder. On the contrary, the State has here a Right and even a duty, in connection with gradually emerging necessity for its own Reform, if it has been once extinguished, not to allow the resuscitation of such a federative system of its subjects, as if they were viceroys or sub-kings, after the analogy of the ancient Satraps and Heads of Dynasties.

IX.: Concluding Remarks on Public Right and Absolute Submission to the Sovereign Authority.

With regard to the ideas presented under the Heading of Public Right, the Reviewer says that 'the want of room does not permit him to express himself in detail.' But he makes the following remarks on one point: 'So far as we know, no other philosopher has recognised this most paradoxical of all paradoxes, that the mere idea of a Sovereign Power should compel me to obey as my master any one who gives himself out to be my master, without asking who has given him the Right to command me? That a Sovereign Power and a Sovereign are to be recognised, and that the one or the other whose existence is not given in any way à priori is also to be regarded à priori as a master, are represented so as to be one and the same thing.' Now, while this view is admitted to be paradoxical, I hope when it is more closely considered, it will not at least be convicted of heterodoxy. Rather, indeed, may it be hoped that this penetrating, thoughtful, and modestly censuring Critic may not grudge to make a second examination of this point, nor regret to have taken the whole discussion under his protection against the pretentious and shallow utterances of others. And this all the more, in view of his statement that he 'regards these Metaphysical Principles of the Science of Right as a real gain for the Science.'

Now, it is asserted that obedience must be given to whoever is in possession of the supreme authoritative and legislative power over a people; and this must be done so unconditionally by right, that it would even be penal to inquire publicly into the title of a power thus held, with the view of calling it in doubt, or opposing it in consequence of its being found defective. Accordingly it is maintained, that 'Obey the authority which has power over you' (in everything which is not opposed to morality), is a Categorical Imperative. This is the objectionable proposition which is called in question; and it is not merely this principle which founds a right upon the fact of occupation as its condition, but it is even the very idea of a sovereignty over a people obliging me as belonging to it, to obey the presumptive right of its power, without previous inquiry (§ 44), that appears to arouse the reason of the Reviewer.

Now every fact is an object which presents itself to the senses, whereas what can only be realized by pure Reason must be regarded as an idea for which no adequately corresponding object can be found in experience. Thus a perfect juridical Constitution among men is an ideal Thing in itself.

If then a people be united by laws under a sovereign power, it is conformable to the idea of its unity as such under a supreme authoritative will, when it is in fact so presented as an object of experience. But this holds only of its phenomenal manifestation. In other words, a juridical constitution so far exists in the general sense of the term; and although it may be vitiated by great defects and coarse errors, and may be in need of important improvements, it is nevertheless absolutely unallowable and punishable to resist it. For if the people regarded themselves as entitled to oppose force to the Constitution, however defective it may be, and to resist the supreme authority, they would also suppose they had a right to substitute force for

the supreme Legislation that establishes all rights. But this would result in a supreme will that would destroy itself.

The idea of a political Constitution in general, involves at the same time an absolute command of a practical Reason that judges according to conceptions of right, and is valid for every people; and as such it is holy and irresistible. And although the organization of a State were defective in itself, yet no subordinate power in the State is entitled to oppose active resistance to its legislative Head. Any defects attaching to it ought to be gradually removed by reforms carried out on itself; for otherwise, according to the opposite maxim, that the subject may proceed according to his own private will, a good Constitution can only be realized by blind accident. The precept, 'Obey the authority that has power over you,' forbids investigating into how this power has been attained, at least with any view to undermining it. For the Power which already exists, and under which any one may be living, is already in possession of the power of Legislation; and one may, indeed, rationalize about it, but not set himself up as an opposing lawgiver.

The will of the people is naturally un-unified, and consequently it is lawless; and its unconditional subjection under a sovereign Will, uniting all particular wills by one law, is a fact which can only originate in the institution of a supreme power, and thus is public Right founded. Hence to allow a Right of resistance to this sovereignty, and to limit its supreme power, is a contradiction; for in that case it would not be the supreme legal power, if it might be resisted, nor could it primarily determine what shall be publicly right or not. This principle is involved à priori in the idea of a political Constitution generally as a conception of the practical Reason. And although no example adequately corresponding to this principle can be found in experience, yet neither can any Constitution be in complete contradiction to it when it is taken as a standard or rule.

APOLOGIA. KANT'S VINDICATION OF HIS PHILOSOPHICAL STYLE.

[IN THE PREFACE TO THE FIRST EDITION, 1796-97.]

The reproach of obscurity, and even of a studied indefiniteness affecting the appearance of profound insight, has been frequently raised against my philosophical style of exposition. I do not know how I could better meet or remove this objection than by readily accepting the condition which Garve, a philosopher in the genuine sense of the term, has laid down as a duty incumbent upon every writer, and especially on philosophical authors. And for my part, I would only restrict his injunction by the condition, that it is to be followed only so far as the nature of the science which is to be improved or enlarged will allow.

Garve wisely and rightly demands, that every philosophical doctrine must be capable of being presented in a popular form, if the expounder of it is to escape the suspicion of obscurity in his ideas; that is, it must be capable of being conveyed in expressions that are universally intelligible. I readily admit this, with the exception only of the systematic Critique of the Faculty of Reason, and all that can only be determined and unfolded by it; for all this relates to the distinction of the sensible in our knowledge from the supersensible, which is attainable by Reason. This can never be made popular, nor can any formal Metaphysic as such be popular; although their results may be made quite intelligible to the common reason, which is metaphysical without its being known to be so. In this sphere, popularity in expression is not to be thought of. We are here forced to use scholastic accuracy, even if it should have to bear the reproach of troublesomeness; because it is only by such technical language that the precipitancy of reason can be arrested, and brought to understand itself in face of its dogmatic assertions.

But if pedants presume to address the public in technical phraseology from pulpits or in popular books, and in expressions that are only fitted for the Schools, the fault of this must not be laid as a burden upon the critical philosophers, any more than the folly of the mere wordmonger (logodædalus) is to be imputed to the grammarian. The laugh should here only turn against the man and not against the science.

It may sound arrogant, egotistical, and, to those who have not yet renounced their old system, even derogatory, to assert 'that before the rise of the Critical Philosophy, there was not yet a philosophy at all.' Now, in order to be able to pronounce upon this seeming presumption, it is necessary to resolve the question as to whether there can really be more than one philosophy. There have, in fact, not only been various modes of philosophizing and of going back to the first principles of Reason in order to found a system upon them, with more or less success; but there must be many attempts of this kind of which every one has its own merit at least for the present. However, as objectively considered there can only be one human Reason, so there cannot be many Philosophies; in other words, there is only one true System of Philosophy founded upon principles, however variously and however contradictorily men may have philosophized over one and the same proposition. Thus the Moralist rightly says, there is only one virtue, and only one doctrine regarding it; that is, one single system connects all the duties of virtue by one principle. The Chemist, in like manner, says there is only one chemistry, that which is expounded by Lavoisier. The Physician, in like manner, says there is only one principle, according to Brown, in the system of classifying Diseases. But because it is held that the new systems exclude all the others, it is not thereby meant to detract from the merit of the older Moralists, Chemists, and Physicians; for without their discoveries, and even their failures, we would not have attained to the unity of the true principle of a complete philosophy in a system. Accordingly, when any one announces a system of philosophy as a production of his own, this is equivalent to saying that 'before this Philosophy there was properly no

philosophy.’ For should he admit that there had been another and a true philosophy, it would follow that there may be two true systems of philosophy regarding its proper objects; which is a contradiction. If, therefore, the Critical Philosophy gives itself forth as that System before which there had been properly no true philosophy at all, it does no more than has been done, will be done, and even must be done, by all who construct a Philosophy on a plan of their own.

Another objection has been made to my System which is of less general significance, and yet is not entirely without importance. It has been alleged that one of the essentially distinguishing elements of this Critical Philosophy is not a growth of its own, but has been borrowed from some other philosophy, or even from an exposition of Mathematics. Such is the supposed discovery, which a Tübingen Reviewer thinks he has made, in regard to the Definition of Philosophy which the author of the Critique of the Pure Reason gives out as his own, and as a not insignificant product of his system, but which it is alleged had been given many years before by another writer, and almost in the same words. I leave it to any one to judge whether the words: ‘intellectualis quædam constructio,’ could have originated the thought of the presentation of a given conception in an intuitive perception à priori, by which Philosophy is at once entirely and definitely distinguished from Mathematics. I am certain that Hausen himself would have refused to recognise this as an explanation of his expression; for the possibility of an intuitive perception à priori, and the recognition of Space as such an intuition and not the mere outward coexistence of the manifold objects of empirical perception (as Wolf defines it), would have at once repelled him, on the ground that he would have felt himself thus entangled in wide philosophical investigations. The presentation, constructed, as it were, by the Understanding, referred to by the acute Mathematician, meant nothing more than the (empirical) representation of a Line corresponding to a conception, in making which representation attention is to be given merely to the Rule, and abstraction is to be made from the deviations from it that inevitably occur in actual execution, as may be easily perceived in the geometrical construction of Equalities.

And least of all is there any importance to be laid upon the objection made regarding the spirit of this Philosophy, on the ground of the improper use of some of its terms by those who merely ape the system in words. The technical expressions employed in the Critique of the Pure Reason cannot well be replaced by others in current use, but it is another thing to employ them outside of the sphere of Philosophy in the public interchange of ideas. Such a usage of them deserves to be well castigated, as Nicolai has shown; but he even shrinks from adopting the view that such technical terms are entirely dispensable in their own sphere, as if they were adopted merely to disguise a poverty of thought. However, the laugh may be much more easily turned upon the unpopular pedant than upon the uncritical ignoramus; for in truth the Metaphysician who sticks rigidly to his system without any concern about Criticism, may be reckoned as belonging to the latter class, although his ignorance is voluntary, because he will only not accept what does not belong to his own older school. But if, according to Shaftesbury’s saying, it is no contemptible test of the truth of a predominantly practical doctrine, that it can endure Ridicule, then the Critical Philosophy must, in the course of time, also have its turn; and it may yet laugh best when it will be able to laugh last. This will be when the mere paper systems of those who for a long time have had the lead in words, crumble to pieces one after the other; and it sees all their adherents scattering away, — a fate which inevitably awaits them.

OF THE INJUSTICE OF COUNTERFEITING BOOKS

Anonymous translation, 1798

CONTENTS

Of The Injustice of Counterfeiting Books
I. Deduction of the Editor’s Right against the Counterfeiter
II. Refutation of the Counterfeiter’s pretended Right against the Editor.

Of The Injustice of Counterfeiting Books

Those who consider the publication of a book to be equivalent to the use of an author’s property in the form of a copy (whether the possessor came by it as a manuscript from the author or as a transcript of it from an actual editor), and then, however, via the reservation of certain rights, whether of the author’s or of the editor’s, who is appointed by the author, want to limit the use of the book only to this, that is, want to impose the rule that it is not permitted to counterfeit the book, cannot, based upon the rationale of this aforementioned consideration, attain this anti-counterfeiting objective. For the author’s property in his thoughts or sentiments (even if it were not granted that the concept of such thought or sentiment property has legal merit according to external laws) would remain to him regardless of whether or not that property was used or represented in the form of a counterfeit; and, since an express legal consent given by the purchaser of a book to such a limitation of their property would not likely be granted,* how much less would a merely presumed consent suffice to determine the purchaser’s obligation?

[*Footnote: Would an editor attempt to bind everybody who purchased his work to the condition, to be accused of embezzling the property of another entrusted to him, if, either intentionally, or by the purchaser’s lack of oversight, the copy which the purchaser purchased were used for the purpose of counterfeiting? Scarcely anyone would consent to this: because he would thereby expose himself to every sort of trouble about the inquiry and the defense. The work would therefore remain exclusively in the editor’s hands.]

I believe, however, that I am justified to consider the publication of a book to be not the trading of a good [in the form of a book] in the trader’s own name, but as the transacting of business in the name of another, namely, the author. [By considering the act of publication to be such a transaction], I am able to represent easily and distinctly the wrongfulness of counterfeiting books. My argument, which also proves the editor’s right, is contained in a ratiocination; after which follows a second, wherein the counterfeiter’s pretension shall be refuted.

I. Deduction of the Editor’s Right against the Counterfeiter

Whoever transacts another’s business in his name and yet against his will is obliged to give up to him, or to his attorney, all the profits that may arise therefrom, and to repair all the loss which is thereby occasioned to either the one or the other.

Now the counterfeiter is he who transacts another’s business (the author’s) against the other’s will. Therefore the counterfeiter is obliged to give up to the author or to his attorney (or the editor) [any profits from the transaction].

Proof of the Major

As the agent, who intrudes himself, acts in the name of another in a manner not permitted, he has no claim to the profit which arises from this business; but the author or editor in whose name he carries on the business, or another authorized controller of the work to whose charge the former has committed the work, possesses the right to appropriate this profit to himself, as the fruit of his property. Besides, as this agent injures the possessor’s right by intermeddling, “nullo jure,” in another’s business, he must of necessity compensate for all damages sustained. This lies without a doubt in the elementary conceptions of natural right.

Proof of the Minor

The first point of the minor is: that the editor transacts the business of the author by the publication. Here, everything depends on the conception of a book, or of a writing in general, as a labour of the author’s, and on the conception of the editor in general (be he an attorney or not). Whether a book be a commodity which the author, either through the author’s own efforts or by means of another, can traffic with the public, and can therefore transfer the ownership rights of the book, either with or without reservation of certain rights; or whether the book is instead a mere use of his works, which the author can indeed concede to others, but never transfer the ownership rights of; Again: whether the editor transacts his business in his own name, or transacts another’s business in the name of another?

In a book, as a writing, the author speaks to his reader; and he who printed it speaks by his copies not for himself, but entirely in the name of the author. The editor exhibits the author as speaking publicly, and mediates only the delivery of this speech to the public. Let the copy of this speech, whether it be in handwriting or in print, belong to whom it will; yet to use this for one’s self, or to traffic with it, is a business which every owner of it may conduct in his own name and at pleasure. But to let any one speak publicly, to publish his speech as such, means to speak in his name, and, in a way, to say to the public:

“A writer lets you know, or teaches you, this or that, etc., through me. I answer for nothing, not even for the liberty, which the writer takes, to speak publicly through me; I am but the mediator of the writer’s thoughts coming to you.”

That is no doubt a business which one can execute only in the name of another, and never in one’s own (as editor). The editor furnishes in his own name the mute instrument of the delivering of a speech of the author’s to the public;* * the editor can publish the said speech by printing, which consequently shows himself as the person through whom the author addresses the public, but he can do so only in the name of the author.

[* *Footnote: A book is the instrument of the delivering of a speech to the public, not merely of the thoughts, as pictures of a symbolical representation of an idea or of an event. What is here the most essential about it is that it is not a thing, which is thereby delivered, but is rather an opera, namely a speech, and certainly literal. In naming it a mute instrument, I distinguish it from what delivers the speech by a sound, such as a trumpet in music, or the mouths of others.]

The second point of the minor is: that the counterfeiter undertakes the author’s business, not only

without any permission from the owner, but even contrary to the owner's will. Given that he is a counterfeiter because he invades the province of another, who is authorized by the author himself to publish the work: the question is, whether the author can confer the same permission on yet another, and consent thereto. It is, however, clear that, as then each of them — the first editor and the person afterwards usurping the publication of the work (the counterfeiter) — would manage the author's business with one and the same public, the labour of the one must render that of the other useless and be ruinous to both; therefore a contract between the author and an editor that contains the corollary, to allow yet another besides the editor to venture the publication of the author's work, is impossible; consequently the author was not entitled to give the permission to any other, [including by implication a] counterfeiter), and the counterfeiter should not have even presumed this; by consequence the counterfeiting of books is a business totally contrary to the will of the proprietor, and yet undertaken in the proprietor's name.

From this ground it follows that not the author, but the editor authorized by him, suffers damages. For as the author has entirely, without reservation, given up to the editor his right to the managing of his business with the public, or to dispose of it otherwise, so the editor is the only proprietor of the transaction of this business, and the counterfeiter encroaches on the editor, but not on the author.

But as this right of transacting a business, which may be done just as well by another, is not inalienable (jus personalissimum), assuming that no corollary exists otherwise in the author's contractual agreement with the editor, so the editor, as he has been authorized to have power over the work, also has the right to transfer his right of publication to another; and as the author must consent to this, he who undertakes the business from the second hand is not a counterfeiter, but a rightfully authorized editor, i.e. one to whom the editor, who was appointed by the author, has transferred his power over the work.

II. Refutation of the Counterfeiter’s pretended Right against the Editor.

The question remains still to be answered: since the editor projects to the public the ownership over the work of the author, does not the consent of the editor (and by implication also the author, who gave the editor legal control over it) to every use of the work, including reprinting it, result automatically from ownership of a copy of the work, such that such consent is automatically furnished to whoever purchases a copy of the work, however disagreeable such consent to permit counterfeiting may be to the editor? For the prospect of profit has perhaps enticed the editor to undertake, with the risk of having the published work counterfeited, the business of editor, where this risk is more likely since the purchaser has not been excluded from counterfeiting via an express contract, because it would hurt the editor’s business if the editor tried to obligate all potential purchasers of the work to agree to a contract forbidding counterfeiting, because potential purchases would generally not consent to such an agreement and therefore would be less likely to purchase a copy of the work. My answer to this question is that the ownership of the copy does not furnish the right of counterfeiting. I prove this by the following ratiocination:

A personal positive right against another can never be derived from the ownership of a thing only.

But the right of publishing a work is a personal positive right.

Therefore, the right of publishing never can be derived from the ownership of a thing (the copy) only.

Proof of the Major

With the ownership of a thing is indeed accompanied the negative right to resist any one who would hinder me from the use of it at pleasure; but a positive right against a person, to demand of him to perform something or to be obliged to serve me in anything, cannot arise from the mere ownership of a thing. It is true this positive right might by a particular agreement be added to the purchase contract whereby I acquire a property from anybody; e.g. that, when I purchase a commodity, the seller shall also send it to a certain place free from expenses. But then the right against the person, to do something for me, does not proceed from the mere ownership of my purchased thing, but from a particular contract.

Proof of the Minor

If someone can dispose of something at pleasure in his own name, then that someone has a right to that thing. But if someone can perform only in the name of another, he transacts this business such that the other is thereby bound, as if the business were transacted by himself. (Quod quis facit per alium, ipse fecisse putandus set). Therefore my right to the transacting of a business in the name of another is a personal positive right, to necessitate the author of the business to guarantee something, namely, to answer for everything which he has done through me, or to which he obliges himself through me. The publishing of the work is now a speech to the public (by printing) in the name of the author, and is consequently a business in the name of another. Therefore the right to it is a right of the editor’s against a person: not merely to defend himself in the use of his property at pleasure against him; but to necessitate him to acknowledge and to answer for as his own a certain business, which the editor transacts in his name; consequently this is a personal positive right.

The copy, according to which the editor prints, is a work of the author’s and belongs totally to the editor after he has purchased it, either in the manuscript form or the printed form, to do with it everything the editor pleases, where said doings can be done in the editor’s own name; for that is a requisite of the complete right in a thing, i.e. ownership. But the use, which the editor cannot make of it except only in the name of another (namely the author’s), is a business (opera) that this other transacts through the owner of the copy, where in addition to the ownership of the copy, a particular contract is still requisite for other

rights to be provided to the owner of the copy.

Now, the publication of a book is a business which can only be transacted in the name of another (namely the author, whom the editor presents as speaking to the public through him); therefore the rights of transacting the business of publishing the book is separate from the rights that are associated with the ownership of a copy of the book. The right to publish the book can legally be acquired only by a particular contract with the author. Who publishes without such a contract with the author (or, if the author has already granted this right to another, i.e. to an authorized editor, without a contract with that authorized editor) is the counterfeiter, who then damages the authorized editor, and must make amends to him for all damages.

Universal Observation

That the editor transacts his business of editor not merely in his own name, but in the name of another* * * (namely the author), and without whose consent cannot transact this business at all, is confirmed from certain obligations which fix themselves according to universal acknowledgement.

[* * *Footnote: If the editor is at the same time also the author, then, however, both businesses (writing versus publishing) are different; the editor publishes as a tradesman, whereas what he published he originally wrote as a scholar or man of letter. But we may set aside such an unusual example of two different roles being held simultaneously by the same person, and restrict our exposition only to that where the editor is not at the same time the author: it will afterwards be easy to extend the consequence to the first case likewise.]

Were the author to die after he had delivered his manuscript to the editor to be printed, and the editor had previously bound himself as the authorized publisher: then the editor would not have the liberty to suppress the manuscript’s publication on the grounds that it is his property; but the public has a right, if the author left no heirs, either to force the editor to publish the book or to give up the manuscript to another who offers to publish it. For the publishing of his manuscript is a business which the author, prior to dying, had the intention to transact with the public through the editor, and for which the editor succeeds the author by becoming the agent. The public does not even need to know whether or not the author had this intention, or to agree with the author’s intention; the public acquires this right against the editor (to perform something) by the law only. For he possesses the manuscript only on the condition to use it for the purpose of a business of the author’s with the public; but this obligation towards the public remains, though that towards the author has ceased by his death. Here the argument is not built upon a right of the public to the manuscript, but upon a business with the author. Should the editor give out the author’s work, after his death, mutilated or falsified, or let the necessary number of copies for the demand be wanting; the public would thus be entitled to force him to more justness or to augment the publication, but otherwise to provide for this elsewhere. All of which would not be legally justifiable, were the editor’s right not deduced from the legal concept that the editor is transacting a business between the author and the public in the name of the author.

However, to this obligation of the editor’s, which will probably be granted, a corresponding right exists, namely, the right to all that, without which the editor’s obligation could not be fulfilled. This is: that he exercises the right of publication exclusively, because the rivalry of others in his business would render the transaction of it practically impossible for him.

Works of art, as things, may, on the other hand, be imitated or otherwise modeled, at will, from a copy of them which was rightfully acquired, and those imitations may be publicly sold, without requiring the consent of the author of the original or of the master who supervised the artist in developing the artist’s ideas. A drawing, which anyone has drawn, or had engraved by another, or executed in stone, metal, or stucco, may be copied, and the copies publicly sold; as everything, that one can perform with his thing in his own name, does not require the consent of another. Lippert’s “Dactyliotec” may be imitated by every possessor of it who understands it, and exposed to sale, and the inventor of it has no right to complain of

encroachment on his business. For it is a work (an opus, not an opera; these terms are mutually exclusive) which everybody who possesses it may, without even mentioning the name of the inventor, assume title over it, and also imitate it and use it in public trade, in his own name, as his own.

But the writing of another is the speech of a person (opera); and whoever publishes it can speak to the public only in the name of this other, and say nothing more of himself than that the author makes the following speech to the public through him (Impensis Bibliopola). For it is a contradiction, to make in his own name a speech which he knows, and conformably to the demand of the public, must be the speech of another.

The reason why all works of art of others may be imitated for public sale, but books, to which an editor is designated, dare not be counterfeited, lies in this: that artworks are works (opera), but books are acts (operae); artworks may be as things existing for themselves, but books can have their existence only in a person. Consequently, books belong to the person of the author exclusively;* * * * and the author has an inalienable right (jus personalissimum) always to speak himself through every other, that is, nobody dares make the same speech to the public except in the author's name.

[* * * *Footnote: The author, and the owner of the copy, may both say of it with equal right: "It is my book!" However, each would say this in a different sense. The author takes the book as a writing or a speech; the owner interprets the book as being the mute instrument merely of the delivering of the speech to him or to the public, that is, as a copy. The author does not have ownership rights over the thing, namely, the copy of the book (for the owner may burn that copy before the author's face); instead, the author has an innate right, in the author's own person, to wit, to hinder another from reading the copy to the public without the author's consent, which consent can by no means be presumed, because the author may have already given it exclusively to another editor.]

But while altering (abridging, augmenting or retouching) the book of another, such as to re-work the book into what is substantially a new book, such that it would be wrong to publish the new book in the name of the author of the original book, the retouching of a book, in the proper name of the publisher, is no counterfeit, and therefore is not prohibited. For here, another author transacts, via his editor, another business transaction that is different from the initial business transaction transacted by the initial author, and consequently does not intrude upon the initial author's initial business transaction with the public; he represents not that author, as speaking through him, but another. Similarly, [I believe that the unauthorized] translation of an author's work into another language cannot be considered to be a counterfeit; for the translated book is not the same speech of the author, though the thoughts may be exactly the same.

If the idea of a copyright, or of the publication of books in general, that were demonstrated in this essay, were well-understood, and precisely elaborated (which, flattering myself, I think is possible), with a formality that was at the level of Roman juridical learning, a complaint against a counterfeiter might be brought before a court, without first needing to ask for a new law to structure the due process proceedings that would govern such a lawsuit against a counterfeiter.

ON EDUCATION

Translated by Annette Churton

CHAPTER VI: PRACTICAL EDUCATION

INTRODUCTION

Nearly a century after its original publication in Germany Immanuel Kant über Pädagogik is now for the first time presented to English readers in the translation made by Miss Annette Churton. The little work, as is well known, was not compiled for publication by the master himself. In the last years of his long life he handed over to his younger friend and former pupil, Theodor Rink, the notes he had written for his professorial courses on Physical Geography and on Pædagogics, and commissioned the latter to select and compile from the loose leaflets as much as he thought might prove serviceable to the reading public. Rink set to work and brought out the notes on education in 1803, the year before Kant's death. The lectures, it seems, were not intended, nor à fortiori the notes, to give an exhaustive theory of education, nor do they present any well-formulated body of philosophical doctrine based on either metaphysical or psychological or sociological data. Kant's chair at Königsberg University was that of logic and metaphysic, but his lecturing work — both as professor and, before that, as Privat-docent — included a number of subsidiary subjects. During the last quarter of the eighteenth century pædagogics was included as a subject of instruction in the university, certain professors taking it in turn to deliver a course of lectures thereon. When the course fell to Kant he conformed, as was his wont, to the not unusual custom of taking a standard text-book on his theme — in this connection it was that of his colleague, Prof. Bock, Ueber die Erziehungskunst (Königsberg, 1780) — as a nominal guide to procedure. But he did not allow the exposition of the book to hamper him in the original and constructive treatment of his subject. There is, indeed, no very apparent trace of Bock in these notes. The text-book, being in his hand and accessible to his hearers, probably required no memoranda for exposition and criticism of it. Whether he expounded and criticised or not, the legacy transmitted through his pupil to posterity consists simply of a number of independent reflections, of criticisms not relating to Bock, of series of apophthegms, suggestive points, aperçus, with here and there digression and repetition. Above all we feel that, according to his usual method, the master is addressing the average youth among his listeners. The toughest things of the Critiques are not drawn upon, nor is there any terminological paraphernalia to deter the listener. The Kantian ethic is there, right enough, but the teacher is feeling out after a theory of education. He is deeply interested in his theme, but his attitude towards it is inductive and experimental. He realised its importance and the magnitude of its issues, but also the imperfect and provisional nature of existing conclusions on the subject. There was his nine years' experience as a private tutor to correct any rash theorising — he used to say he had never been able to apply his own precepts in any specific case among his pupils! And his long academic career must have afforded him very varied insight into the nature of youthful development.

But it was above all the time and the man that left the thoughtful minds of the last quarter of the eighteenth century no option but to be intensely concerned with the problem of education. The doctrine of the rights of man, the conviction of the worth of the individual as such, was taking flesh to dwell among us. The child too, quâ child, had rights to be let live his child-life and enjoy his youth. Laissez mûrir l'enfance dans les enfants! pleaded the book which was the charter of the rights of the child — I allude, of course, to the Émile — they have their own ways of seeing, thinking, feeling. Be not for ever seeking the man in the child, heedless of what the child is in and for himself. He is not simply 'undeveloped man, but diverse.' His plane of being is one of transition, no doubt, yet in a way it is independent, positive, integral, a microcosm. If he die young, look on him not merely as a failure, a bud nipped off, but as one who for a while and in his own way has tasted sweet life. And see to it that life to such has been made sweet! Let the child, echoed Kant, be trained as a child and not as a Bürger. He had, of course, to be trained up in the duties he owed to a social macrocosm, but this entity was not so much a definitely

conceived state — that ideal was of the past and not yet re-born — as a vaguely comprehensive humanity of independent individuals. The child was to graduate as a Weltbürger. Nor was the community of children, nor were their claims on each other, very definitely taken into account. That also was to come. The individualism of the time saw only the Child and the Man, the nature of him overlaid by a crust of privilege, convention, and corrupt tradition. This was to be broken away; and the common nature that lay stifled beneath elicited and developed by a wholesome culture that should be all-powerful to redeem and reform. So would the moral sense innate in him sprout and burgeon, till the dignity of Man in the blossom of the Youth should stand confessed and vindicated.

Such and much more was in the air when these lecture-notes were written. And its Conjunktur had brought forth the man. Comenius and Locke, over and under a century earlier, had been fashioning him. And now Voltaire had gone to Locke comme l'enfant prodigue qui retourne chez son père, and had brought that father home to the adopted land of Rousseau. Émile saw the light in 1762, and the effect of its absorbing fascination on Kant when he opened the book is an old story. The next two decades witnessed the ideas therein put forth taking root and germinating in Kant's native land. Educational innovations were tried; educational reformers were maturing. The Philanthropist schools were founded in Germany in and after 1774, Kant taking a lively interest in the parent Philanthropin at Dessau. Bahrdt, Basedow, Campe, were avowed Rousseauists. Pestalozzi was preparing his aphorisms. Oberlin, Herder, Lessing, were in their prime; Olivier yet a youth. Herbart was in the nursery; Fichte and Froebel in the cradle.

If these slight suggestions be worked out, the reader of these Thoughts on Education will get a more lifelike background to them than if he held in his hand the defunct text-book on which Kant embroidered his lectures. Rousseau far more than Bock — the pioneer and not the pedant — is the real inspirer, I do not say of Kant's underlying principles, but of so much in these notes as indicates an inductive search for a fresh theory of education. This is patent throughout. Bock, as I have said, is never quoted. Apparently his colleague's views did not get woven up into the tissue of Kant's theorising. Rousseau, on the other hand, appears throughout, explicit and implicit, though the tender insight of the father is replaced by the relatively rigid and crude standpoints of one who had never gone in and out among infants of his own. It is Rousseau's Baby who sits enthroned in the Chair of Logic and Metaphysics of the elderly bachelor philosopher, and hears curious things said respecting his temperature, a Spartan treatment prescribed for his many tears, an impossible reasonableness in expressing his wants required of him, but a glorious freedom in dress and limb declared essential to his happiness. It is Rousseau's Child for whom Kant claims that he be brought up independent of the stunting assistance of tools and apparatus generally; that his nature, devoid of original perversity, but depending for its moral growth on right nurture, be drawn out, not repressed — be allowed the play of regulated freedom and not moulded into an automaton of habits, nor be worried by arguments appealing to faculties yet undeveloped. We do not catch distinctly in Kant's teaching the real Leitmotif of Émile, viz. education not by precepts but by 'things' — in other words by the laws of Nature. What, again, we find in Kant and not in the Émile I will outline presently. But through both works, while the ideals of liberty and equality are held up as supremely worthy, both the Stoic Prussian and the sympathetic Genevan submerge that of fraternity in the concept of the free Weltbürger, jealous of his own liberty so it encroach not on that of others, jealous for the dignity of humanity in himself and others. To the ideal of liberty Kant attained by a road peculiar to his own philosophy. As to that of equality, by his own admission it was Rousseau — l'ami de l'égalité — who had dragged him from his exclusive and aristocratic standpoint, and had made him sensible of the claims of all men on him in virtue of the common humanity in all. At times, offended by Rousseau's extreme and paradoxical conclusions couched in a style of great charm, Kant accused him, just as Rousseau himself had accused many old and newer philosophers, of attempting to trick out well-worn doctrines in new forms. Yet the profound impression made by Rousseau remained, and so too does Kant's confession remain, that never before were sagacity of mind, loftiness of genius, and sensitiveness of soul so

combined as in this man.

Thus it was during the dawn of a new era of social philosophy, during the re-birth of the art of education, that Kant compiled his lectures on pædagogics. They bear the impress of these conditions. Both dogmatic and inductive, like his critical philosophy, they show also a standpoint which is characteristic of an age that was passing, and yet affords glimpses into the future. There is the optimistic construction of man's destiny; the antithesis between man and beast, reason and instinct; there is the familiar analogy between family and state; values are not an evolutional growth, but are essential and intrinsic; nurture is all-important; nature as handicapped by heredity is not yet a problem. 'Man is nothing but what education makes of him.' There is no account taken of the wear and tear of the career, of the strain and stress of competition. That the boy's education is to be compressed or expanded from such considerations as the overcrowding of professions, the struggle for life, the race for wealth, the commercial status of his fatherland, is undreamt of in these quiet, hazy horizons.

I say 'the boy's education' — for we do not find nor should we expect to find, the problem of the education of the girl faced and discussed, even though (and indeed just because) Rousseau had supplemented Émile by Sophie. Sophie was not an individual, an integer, a potential equal among equals; she was an adjunct. In a Königsberg Chair especially she was a negligible quantity. It is true that the question of intellectual development for her, in so far as it was raised by Rousseau, made its impression upon Kant. And possibly his tutorial experience may have given him glimpses of the needs and capacities of girls for more adequate cultivation. Nevertheless the indefinite sex of his child becomes solely masculine when its more advanced training is discussed. In the second appendix to Vogt's edition of these lectures we find the problem cautiously raised — and put aside, for the same reason as Kant put aside the problem of teaching theology inductively, viz. the practical exigencies of current tradition. So the Woman bode her time.

Thus far for peruke and powder. But Kant is too great to be merely historically interesting. There is much in these lecture-notes worthy to be considered by educators for many a generation to come. Now and again the hand of the writer is on the pulse of the future. Always he is earnest, wise, and sane.

Broadly divided, education for Kant is either physical or moral, is either cultivation or moralisation of the individual. In the former what the child is capable of knowing and performing is elicited and practised. His φύσις — bodily, intellectual, emotional — is developed by nurture, discipline, and training. The pupil is 'passive' (that is, receptive) and not self-determined. In the latter the Character is formed; the reason becomes established as 'practical or pragmatic;' that is, as moral and self-determining. This can only be effected through those 'maxims' or subjective laws which are implicate in the reason, but are not evolved till the reason attains to self-expression; that is, to the concepts of duty and law. Till then the child is unmoral. Then he does good because it is good, and not from specific motives. This is the coming of age of the moralisation of the individual. And as compared with the amount of 'physical' education bestowed, Kant held we were very far from realising the need for that other kind of culture. For to 'moralise' a child, recourse must not be had to the usual incentives of discipline — habits, imitation, rewards, punishments. Moral conduct entails a fresh fiat of the practical reason every time the individual is confronted by the need of moral choice. If the child infringe the moral law, the teacher must resent it as an offence against one or more individuals as moral. For Kant, then, the problem of education resolved itself into that of Indeterminism — how to constrain the child without enslaving his moral freedom; how to compel the will, while fitting it to use its liberty. For Rousseau, mindful of an external cosmos of Nature, it resolved itself into an equation between faculties and desires in man's task of 'measuring himself avec tout ce qui l'environne.'

That the ultimate ideal of education is nothing less than the perfection of human nature was set by Kant in the forefront of his course. And it is not a goal to be attained by a few elect individuals. Academic aristocracy is waved aside by his all-embracing faith: 'Not particular human beings but the human race is

to attain it.’ He does not in these notes attempt any philosophical definition or criterion of perfection. We of to-day, as he here says, are not by any means clear on that point. But it is impressive to find the old man not only demanding much of human character, but believing to the last in his dictum: Du kannst denn du sollst.

It is worth while noticing that both Kant and Rousseau, at least implicitly, teach that the proximate ideal best conducing towards that ultimate end is not citizenship, nor fraternity, but fatherhood. For Kant the boy’s training culminates and ceases when he is old enough to have children of his own. And there is nothing wanting in the emphasis laid on the mission of the father in the Émile. What, truly, would be left of most of our painful social problems were all parents always at their best and wisest in intercourse with their children? And who shall say whether we may not come to see progress in concentrating the goal of boyhood in proportion as we expand that of girlhood?

Finally, as to those who should educate the fathers of the coming generation, Kant has left a word pregnant with the future far more than he himself was aware, and going far beyond the educational range of the time. ‘The whole race’ — not a group of cities here and there, or an epoch now and then— ‘the whole race must educate the individual.’ Though, as he has said, it be chiefly through the agency of ‘those who know,’ it is all humanity, past and present, that must minister to the development of the child, by whom in his or her turn, when rightly trained, the whole race, both present and future and past, is served.

Our modern pædagogics will in no wise suffer from keeping in view Kant’s wide and high prospect. And for the general English reader, in whose eyes Kant still counts, most inaccurately, as a mainly speculative thinker, it should prove a benefit to come to know, through Miss Churton’s translation, some of the less known workings of a mind whose influence on modern philosophic and scientific thought has scarcely been surpassed.

C. A. Foley Rhys Davids.

TRANSLATOR'S PREFACE

The text adopted in this translation of Kant's 'Pädagogik' is that of Dr. Theodor Vogt (Langensalza, second edition, 1883). I have, however, compared this throughout with the original edition of Friedrich Theodor Rink (Königsberg, 1803) and with that of Rosenkranz and Schubert (Kant's Werke, 1838), and wherever Vogt differs materially from the older editions the different reading has been quoted in a footnote. In a few places where Vogt's text was obviously corrupt it has been supplemented by the reading of the original edition.

I should like to take this opportunity of expressing my thanks to Dr. Winternitz of Oxford for his kindness in revising the MS., and to Mrs. Rhys Davids for many valuable suggestions.

CHAPTER I: INTRODUCTION

Education includes nurture, discipline, instruction, and moral training

1. Man is the only being who needs education. For by education we must understand nurture (the tending and feeding of the child), discipline (Zucht), and teaching, together with culture. According to this, man is in succession infant (requiring nursing), child (requiring discipline), and scholar (requiring teaching).

Man needs nurture: animals do not

2. Animals use their powers, as soon as they are possessed of them, according to a regular plan — that is, in a way not harmful to themselves.

It is indeed wonderful, for instance, that young swallows, when newly hatched and still blind, are careful not to defile their nests.

Animals therefore need no nurture, but at the most, food, warmth, and guidance, or a kind of protection. It is true, most animals need feeding, but they do not require nurture. For by nurture we mean the tender care and attention which parents must bestow upon their children, so as to prevent them from using their powers in a way which would be harmful to themselves. For instance, should an animal cry when it comes into the world, as children do, it would surely become a prey to wolves and other wild animals, which would gather round, attracted by its cry.

Man needs discipline: animals have instinct to guide them

3. Discipline changes animal nature into human nature. Animals are by their instinct all that they ever can be; some other reason has provided everything for them at the outset. But man needs a reason of his own. Having no instinct, he has to work out a plan of conduct for himself. Since, however, he is not able to do this all at once, but comes into the world undeveloped, others have to do it for him.

Discipline is merely negative

4. All the natural endowments of mankind must be developed little by little out of man himself, through his own effort.

One generation educates the next. The first beginnings of this process of educating may be looked for either in a rude and unformed, or in a fully developed condition of man. If we assume the latter to have come first, man must at all events afterwards have degenerated and lapsed into barbarism.

It is discipline, which prevents man from being turned aside by his animal impulses from humanity, his appointed end. Discipline, for instance, must restrain him from venturing wildly and rashly into danger. Discipline, thus, is merely negative, its action being to counteract man's natural unruliness. The positive part of education is instruction.

Unruliness consists in independence of law. By discipline men are placed in subjection to the laws of mankind, and brought to feel their constraint. This, however, must be accomplished early. Children, for instance, are first sent to school, not so much with the object of their learning something, but rather that they may become used to sitting still and doing exactly as they are told. And this to the end that in later life they should not wish to put actually and instantly into practice anything that strikes them.

The necessity of discipline in early life

5. The love of freedom is naturally so strong in man, that when once he has grown accustomed to freedom, he will sacrifice everything for its sake. For this very reason discipline must be brought into play very early; for when this has not been done, it is difficult to alter character later in life. Undisciplined men are apt to follow every caprice.

We see this also among savage nations, who, though they may discharge functions for some time like Europeans, yet can never become accustomed to European manners. With them, however, it is not the

noble love of freedom which Rousseau and others imagine, but a kind of barbarism — the animal, so to speak, not having yet developed its human nature. Men should therefore accustom themselves early to yield to the commands of reason, for if a man be allowed to follow his own will in his youth, without opposition, a certain lawlessness will cling to him throughout his life. And it is no advantage to such a man that in his youth he has been spared through an over-abundance of motherly tenderness, for later on all the more will he have to face opposition from all sides, and constantly receive rebuffs, as soon as he enters into the business of the world.

It is a common mistake made in the education of those of high rank, that because they are hereafter to become rulers they must on that account receive no opposition in their youth. Owing to his natural love of freedom it is necessary that man should have his natural roughness smoothed down; with animals, their instinct renders this unnecessary.

Man needs instruction: animals, as a rule, do not

6. Man needs nurture and culture. Culture includes discipline and instruction. These, as far as we know, no animal needs, for none of them learn anything from their elders, except birds, who are taught by them to sing; and it is a touching sight to watch the mother bird singing with all her might to her young ones, who, like children at school, stand round and try to produce the same tones out of their tiny throats. In order to convince ourselves that birds do not sing by instinct, but that they are actually taught to sing, it is worth while to make an experiment. Suppose we take away half the eggs from a canary, and put sparrow’s eggs in their place, or exchange young sparrows for young canaries; if the young birds are then brought into a room where they cannot hear the sparrows outside, they will learn the canary’s song, and we thus get singing sparrows. It is, indeed, very wonderful that each species of bird has its own peculiar song, which is preserved unchanged through all its generations; and the tradition of the song is probably the most faithful in the world.

It is only through education that the perfecting of man’s nature can be accomplished

7. Man can only become man by education. He is merely what education makes of him. It is noticeable that man is only educated by man — that is, by men who have themselves been educated. Hence with some people it is want of discipline and instruction on their own part, which makes them in turn unfit educators of their pupils. Were some being of higher nature than man to undertake our education, we should then be able to see what man might become. It is, however, difficult for us accurately to estimate man’s natural capabilities, since some things are imparted to man by education, while other things are only developed by education. Were it possible, by the help of those in high rank, and through the united forces of many people, to make an experiment on this question, we might even by this means be able to gain some information as to the degree of eminence which it is possible for man to attain. But it is as important to the speculative mind, as it is sad to one who loves his fellow-men, to see how those in high rank generally care only for their own concerns, and take no part in the important experiments of education, which bring our nature one step nearer to perfection.

There is no one who, having been neglected in his youth, can come to years of discretion without knowing whether the defect lies in discipline or culture (for so we may call instruction). The uncultivated man is crude, the undisciplined is unruly. Neglect of discipline is a greater evil than neglect of culture, for this last can be remedied later in life, but unruliness cannot be done away with, and a mistake in discipline can never be repaired. It may be that education will be constantly improved, and that each succeeding generation will advance one step towards the perfecting of mankind; for with education is involved the great secret of the perfection of human nature. It is only now that something may be done in this direction, since for the first time people have begun to judge rightly, and understand clearly, what actually belongs to a good education. It is delightful to realise that through education human nature will be continually improved, and brought to such a condition as is worthy of the nature of man. This opens out to us the prospect of a happier human race in the future.

The theory of education is a glorious ideal; none the less worthy of our aim because it has not yet been realised

8. The prospect of a theory of education is a glorious ideal, and it matters little if we are not able to realise it at once. Only we must not look upon the idea as chimerical, nor decry it as a beautiful dream, notwithstanding the difficulties that stand in the way of its realisation.

An idea is nothing else than the conception of a perfection which has not yet been experienced. For instance, the idea of a perfect republic governed by principles of justice — is such an idea impossible, because it has not yet been experienced?

Our idea must in the first place be correct, and then, notwithstanding all the hindrances that still stand in the way of its realisation, it is not at all impossible. Suppose, for instance, lying to become universal, would truth-speaking on that account become nothing but a whim? And the idea of an education which will develop all man's natural gifts is certainly a true one.

This plan of an adequate education may be gradually realised

9. Under the present educational system man does not fully attain to the object of his being; for in what various ways men live! Uniformity can only result when all men act according to the same principles, which principles would have to become with them a second nature. What we can do is to work out a scheme of education better suited to further its objects, and hand down to posterity directions as to how this scheme may be carried into practice, so that they might be able to realise it gradually. Take the auricula as an example. When raised from a root this plant bears flowers of one colour only; when raised from seed, the flowers are of the most varied colours. Nature has placed these manifold germs in the plant, and their development is only a question of proper sowing and planting. Thus it is with man.

True education should have for its aim the development of natural gifts, and the fulfilment of man's destiny

10. There are many germs lying undeveloped in man. It is for us to make these germs grow, by developing his natural gifts in their due proportion, and to see that he fulfils his destiny. Animals accomplish this for themselves unconsciously. Man must strive to attain it, but this he cannot do if he has not even a conception as to the object of his existence. For the individual it is absolutely impossible to attain this object. Let us suppose the first parents to have been fully developed, and see how they educate their children. These first parents set their children an example, which the children imitate and in this way develop some of their own natural gifts. All their gifts cannot, however, be developed in this way, for it all depends on occasional circumstances what examples children see. In times past men had no conception of the perfection to which human nature might attain — even now we have not a very clear idea of the matter. This much, however, is certain: that no individual man, no matter what degree of culture may be reached by his pupils, can insure their attaining their destiny. To succeed in this, not the work of a few individuals only is necessary, but that of the whole human race.

Since such development can only be brought about gradually in the course of generations, education is an art

11. Education is an art which can only become perfect through the practice of many generations. Each generation, provided with the knowledge of the foregoing one, is able more and more to bring about an education which shall develop man's natural gifts in their due proportion and in relation to their end, and thus advance the whole human race towards its destiny. Providence has willed, that man shall bring forth for himself the good that lies hidden in his nature, and has spoken, as it were, thus to man. 'Go forth into the world! I have equipped thee with every tendency towards the good. Thy part let it be to develop those tendencies. Thy happiness and unhappiness depend upon thyself alone.'

This development must be a development towards the good: a great and most difficult problem

12. Man must develop his tendency towards the good. Providence has not placed goodness ready formed in him, but merely as a tendency and without the distinction of moral law. Man's duty is to

improve himself; to cultivate his mind; and, when he finds himself going astray, to bring the moral law to bear upon himself. Upon reflection we shall find this very difficult. Hence the greatest and most difficult problem to which man can devote himself is the problem of education. For insight depends on education, and education in its turn depends on insight. It follows therefore that education can only advance by slow degrees, and a true conception of the method of education can only arise when one generation transmits to the next its stores of experience and knowledge, each generation adding something of its own before transmitting them to the following. What vast culture and experience does not this conception presuppose? It could only be arrived at at a late stage, and we ourselves have not fully realised this conception. The question arises, Should we in the education of the individual imitate the course followed by the education of the human race through its successive generations?

There are two human inventions which may be considered more difficult than any others — the art of government, and the art of education; and people still contend as to their very meaning.

The development is more conceivable in an already civilised state of society

13. But in developing human talents where are we to take our stand? Shall we begin with a rude, or with an already developed state of society?

It is difficult to conceive a development from a state of rudeness (hence it is so difficult to understand what the first man was like), and we see that in a development out of such a condition man has invariably fallen back again into that condition, and has raised himself out of it. In the earliest records of even very civilised nations we still find a distinct taint of barbarism, and yet how much culture is presupposed for mere writing to be possible! So much so that, with regard to civilised people, the beginning of the art of writing might be called the beginning of the world.

The origin and the carrying out of the art of education must not be merely mechanical; they must involve the exercise of judgment

14. Since the development of man's natural gifts does not take place of itself, all education is an art. Nature has placed no instinct in him for that purpose. The origin as well as the carrying out of this art is either mechanical and without plan, ruled by given circumstances, or it involves the exercise of judgment. The art of education is only then mechanical, when on chance occasions we learn by experience whether anything is useful or harmful to man. All education which is merely mechanical must carry with it many mistakes and deficiencies, because it has no sure principle to work upon. If education is to develop human nature so that it may attain the object of its being, it must involve the exercise of judgment. Educated parents are examples which children use for their guidance. If, however, the children are to progress beyond their parents, education must become a study, otherwise we can hope for nothing from it, and one man whose education has been spoilt will only repeat his own mistakes in trying to educate others. The mechanism of education must be changed into a science, and one generation may have to pull down what another had built up.

15. One principle of education which those men especially who form educational schemes should keep before their eyes is this — children ought to be educated, not for the present, but for a possibly improved condition of man in the future; that is, in a manner which is adapted to the idea of humanity and the whole destiny of man. This principle is of great importance. Parents usually educate their children merely in such a manner that, however bad the world may be, they may adapt themselves to its present conditions. But they ought to give them an education so much better than this, that a better condition of things may thereby be brought about in the future.This principle is overlooked by parents when they look merely to worldly position, and by princes when they look merely to the usefulness of individuals for the state

16. Here, however, we are met by two difficulties — (a) parents usually only care that their children make their way in the world, and (b) Sovereigns look upon their subjects merely as tools for their own purposes.

Parents care for the home, rulers for the state. Neither have as their aim the universal good and the

perfection to which man is destined, and for which he has also a natural disposition. But the basis of a scheme of education must be cosmopolitan. And is, then, the idea of the universal good harmful to us as individuals?The basis of education should be cosmopolitan Never! for though it may appear that something must be sacrificed by this idea, an advance is also made towards what is the best even for the individual under his present conditions. And then what glorious consequences follow! It is through good education that all the good in the world arises. For this the germs which lie hidden in man need only to be more and more developed; for the rudiments of evil are not to be found in the natural disposition of man. Evil is only the result of nature not being brought under control. In man there are only germs of good.

We must approach this goal chiefly through the efforts of private individuals

17. But by whom is the better condition of the world to be brought about? By rulers or by their subjects? Is it by the latter, who shall so improve themselves that they meet half-way the measures for their good which the government might establish? Were it to depend upon rulers, their own education will first have to be improved, for this has for a long time suffered, owing to the great mistake that they have been allowed to meet with no opposition in their youth.

A tree which stands in a field alone grows crooked and spreads wide its branches; while a tree which stands in the middle of a forest, with the pressure of other trees around, grows tall and straight, seeking air and sunshine from above. It is the same with rulers. In any case it is always better that they should be educated by some one among their subjects, rather than by one of themselves. We can therefore only expect progress to be brought about by rulers if their education has been of a higher kind than that of their subjects.

It depends, then, mainly upon private effort, and not so much on the help of rulers, as Basedow and others supposed; for we find by experience that they have not the universal good so much in view, as the well-being of the state, whereby they may attain their own ends. If, however, they provide funds for this object, the drawing up of the scheme must be deferred to them. So it is with everything which concerns the perfection of man’s intellect and the widening of his knowledge. Influence and money alone cannot do it; they can only lighten the task. They might do it, if only the financial authorities of the state were not so anxious to calculate beforehand the interests which any sums spent for this purpose might bear for the treasury. Even academic bodies hitherto have not undertaken the task, and the likelihood that they will do so in the future is now as small as ever.

The management of schools ought, then, to depend entirely upon the judgment of the most enlightened experts. All culture begins with the individual, one man gradually influencing others. It is only through the efforts of people of broader views, who take an interest in the universal good, and who are capable of entertaining the idea of a better condition of things in the future, that the gradual progress of human nature towards its goal is possible. Do we not still meet, now and then, with a ruler who looks upon his people merely as forming part of the animal kingdom, and whose aim it is merely to propagate the human species? If he considers the subject of training the intellect at all, it is merely in order that his people may be of more use to him in working out his own ends. It is, of course, necessary for private individuals to keep this natural end in view, but they must also bear in mind more particularly the development of mankind, and see to it that men become not only clever, but good; and, what is most difficult, they must seek to bring posterity nearer to a state of perfection than they have themselves attained.

Education includes (1) Discipline (2) Culture (3) Discretion (4) Moral training

18. Through education, then, man must be made —

First, subject to discipline; by which we must understand that influence which is always restraining our animal nature from getting the better of our manhood, either in the individual as such, or in man as a member of society. Discipline, then, is merely restraining unruliness.

Secondly, education must also supply men with culture. This includes information and instruction. It is culture which brings out ability. Ability is the possession of a faculty which is capable of being adapted

to various ends. Ability, therefore, does not determine any ends, but leaves that to circumstances as they arise afterwards.

Some accomplishments are essentially good for everybody — reading and writing, for instance; others, merely in the pursuit of certain objects, such as music, which we pursue in order to make ourselves liked. Indeed, the various purposes to which ability may be put are almost endless.

Thirdly, education must also supply a person with discretion (Klugheit), so that he may be able to conduct himself in society, that he may be liked, and that he may gain influence. For this a kind of culture is necessary which we call refinement (Civilisierung). The latter requires manners, courtesy, and a kind of discretion which will enable him to use all men for his own ends. This refinement changes according to the ever-changing tastes of different ages. Thus some twenty or thirty years ago ceremonies in social intercourse were still the fashion.

Fourthly, moral training must form a part of education. It is not enough that a man shall be fitted for any end, but his disposition must be so trained that he shall choose none but good ends — good ends being those which are necessarily approved by everyone, and which may at the same time be the aim of everyone.

Moral training is still too much neglected

19. Man may be either broken in, trained, and mechanically taught, or he may be really enlightened. Horses and dogs are broken in; and man, too, may be broken in.

It is, however, not enough that children should be merely broken in; for it is of greater importance that they shall learn to think. By learning to think, man comes to act according to fixed principles and not at random. Thus we see that a real education implies a great deal. But as a rule, in our private education the fourth and most important point is still too much neglected, children being for the most part educated in such a way that moral training is left to the Church. And yet how important it is that children should learn from their youth up to detest vice; — not merely on the ground that God has forbidden it, but because vice is detestable in itself. If children do not learn this early, they are very likely to think that, if only God had not forbidden it, there would be no harm in practising wickedness, and that it would otherwise be allowed, and that therefore He would probably make an exception now and then. But God is the most holy being, and wills only what is good, and desires that we may love virtue for its own sake, and not merely because He requires it.

We live in an age of discipline, culture, and refinement, but we are still a long way off from the age of moral training. According to the present conditions of mankind, one might say that the prosperity of the state grows side by side with the misery of the people. Indeed, it is still a question whether we should not be happier in an uncivilised condition, where all the culture of the present time would find no place, than we are in the present state of society; for how can man be made happy, unless he is first made wise and good? And until this is made our first aim the amount of evil will not be lessened.

The need of experimental schools

20. Experimental schools must first be established before we can establish normal schools. Education and instruction must not be merely mechanical; they must be founded upon fixed principles; although at the same time education must not merely proceed by way of reasoning, but must be, in a certain sense, mechanical.

In Austria the greater number of schools used to be normal schools, and these were founded and carried on after a fixed plan, against which much has been said, not without reason. The chief complaint against them was this, that the teaching in them was merely mechanical. But all other schools were obliged to form themselves after the pattern of these normal schools, because government even refused to promote persons who had not been educated in these schools. This is an example of how government might interfere in the education of subjects, and how much evil might arise from compulsion.

People imagine, indeed, that experiments in education are unnecessary, and that we can judge from our

reason whether anything is good or not. This is a great mistake, and experience teaches us that the results of an experiment are often entirely different from what we expected.

Thus we see that, since we must be guided by experiments, no one generation can set forth a complete scheme of education. The only experimental school which had in a measure made a beginning to clear the way was the Dessau Institute. This must be said in its praise, in spite of the many mistakes with which we might reproach it — mistakes which attend all conclusions made from experiments — namely, that still more experiments are required.

This school was in a certain way the only one in which the teachers were free to work out their own methods and plans, and in which the teachers were in communication with each other and with all the learned men of Germany.

For educators we may say education consists of (1) Maintenance (the work of parents), (2) Instruction (the work of school-teachers), and (3) Guidance (the work of private tutors)

21. Education includes the nurture of the child and, as it grows, its culture. The latter is firstly negative, consisting of discipline; that is, merely the correcting of faults. Secondly, culture is positive, consisting of instruction and guidance (and thus forming part of education). Guidance means directing the pupil in putting into practice what he has been taught. Hence the difference between a private teacher who merely instructs, and a tutor or governor who guides and directs his pupil. The one trains for school only, the other for life.

Education is either private or public

22. Education is either private or public. The latter is concerned only with instruction, and this can always remain public. The carrying out of what is taught is left to private education. A complete public education is one which unites instruction and moral culture. Its aim is to promote a good private education. A school which does this is called an educational institute. There cannot be many such institutions, and the number of children in them can be but small, since the fees must of necessity be high, for the institutions require elaborate management, which entails a good deal of expense. It is the same as with almshouses and hospitals. The buildings required for them, and the salaries of directors, overseers, and servants, take away at once half of the funds, so that there can be no doubt that the poor would be better provided for, if all that money were sent direct to their houses. For this reason it is also difficult to provide that any but the children of rich people should share in these institutions.

The aim of public education is the perfecting of home education

23. The object of such public institutions as these is the improvement of home education. If only parents, or those who are their fellowhelpers in the work of education, were well educated themselves, the expense of public institutions might be avoided. The purpose of these institutions is to make experiments, and to educate individuals, so that in time a good private education may arise out of these public institutions.

Home education and its chief difficulty

24. Home education is carried on either by the parents themselves, or, should the parents not have the time, aptitude, or inclination for it, by others who are paid to assist them in it. But in education which is carried on by these assistants one very great difficulty arises — namely, the division of authority between parent and teacher. The child is called upon to obey the teacher's rule, and at the same time to follow his parents' whims. The only way out of this difficulty is for the parents to surrender the whole of their authority to the tutor.

Public education is, on the whole, the best

25. How far, then, has home education an advantage over public education, or vice versâ? Regarded not only from the point of view of developing ability, but also as a preparation for the duties of a citizen, it must, I am inclined to think, be allowed that, on the whole, public education is the best. Home education frequently not only fosters family failings, but tends to continue these failings in the new

generation.

Education should continue till about the sixteenth year

26. How long, then, should education last? Till the youth has reached that period of his life when nature has ordained that he shall be capable of guiding his own conduct; when the instinct of sex has developed in him, and he can become a father himself, and have to educate his own children. This period is generally reached about the sixteenth year. After this we may still make use of some means of culture, and secretly exercise some discipline; but of education in the ordinary sense of the word we shall have no further need.

The first period of a child's training is one of mechanical, the second one of moral constraint

27. In the first period of childhood the child must learn submission and positive obedience. In the next stage he should be allowed to think for himself, and to enjoy a certain amount of freedom, although still obliged to follow certain rules. In the first period there is a mechanical, in the second a moral constraint.

Submission is either positive or negative

28. The child's submission is either positive or negative. Positive in that he is obliged to do what he is told, because he cannot judge for himself, and the faculty of imitation is still strong in him; or negative, in that he is obliged to do what others wish him to do, if he wishes others to do him a good turn. In the former case, the consequence of not obeying is punishment; in the latter, the fact that people do not comply with his wishes. He is in this case, though capable of thinking for himself, dependent on others with regard to his own pleasure.

In the development of moral constraint it is necessary to unite submission with the exercise of freewill by the child

29. One of the greatest problems of education is how to unite submission to the necessary restraint with the child's capability of exercising his freewill — for restraint is necessary. How am I to develop the sense of freedom in spite of the restraint? I am to accustom my pupil to endure a restraint of his freedom, and at the same time I am to guide him to use his freedom aright. Without this all education is merely mechanical, and the child, when his education is over, will never be able to make a proper use of his freedom. He should be made to feel early the inevitable opposition of society, that he may learn how difficult it is to support himself, to endure privation, and to acquire those things which are necessary to make him independent.

The child should be allowed perfect liberty, while at the same time he must be taught to respect the liberty of others, and submit himself to a restraint which will lead to a right use of future liberty

30. Here we must observe the following: —

First, we must allow the child from his earliest childhood perfect liberty in every respect (except on those occasions when he might hurt himself — as, for instance, when he clutches at a knife), provided that in acting so he does not interfere with the liberty of others. For instance, as soon as he screams or is too boisterously happy, he annoys others.

Secondly, he must be shown that he can only attain his own ends by allowing others to attain theirs. For instance, should he be disobedient, or refuse to learn his lessons, he ought to be refused any treat he may have been looking forward to.

Thirdly, we must prove to him that restraint is only laid upon him that he may learn in time to use his liberty aright, and that his mind is being cultivated so that one day he may be free; that is, independent of the help of others. This is the last thing a child will come to understand. It is much later in life that children realise such facts as that they will afterwards have to support themselves; for they imagine that they can always go on as they are in their parents' house, and that food and drink will always be provided for them without any trouble on their part. Indeed, unless children, and especially the children of rich parents and princes, are made to realise this, they are like the inhabitants of Otaheiti, who remain children all their lives.

The wholesome competition of school life

Again, we see the advantage of public education in that under such a system, we learn to measure our powers with those of others, and to know the limits imposed upon us by the rights of others. Thus we can have no preference shown us, because we meet with opposition everywhere, and we can only make our mark and obtain an advantage over others by real merit. Public education is the best school for future citizens.

There is yet another difficulty to be mentioned here — that is, the difficulty of anticipating the knowledge of sexual matters in such a manner as to prevent vice at the very outset of manhood. This, however, will be discussed later on.

Education may be divided into physical and ‘practical’

31. Education is either physical or ‘practical.’ One part of physical education is that which man has in common with animals, namely, feeding and tending. ‘Practical’ or moral training is that which teaches a man how to live as a free being. (We call anything ‘practical’ which has reference to freedom.) This is the education of a personal character, of a free being, who is able to maintain himself, and to take his proper place in society, keeping at the same time a proper sense of his own individuality.

(1) Instruction makes man valuable as an individual (for himself) (2) Practical education makes him valuable as a citizen (for the state and society) (3) Moral training makes him valuable as a human being (for mankind)

32. This ‘practical’ education consists, then, of three parts: —

(a) The ordinary curriculum of the school, where the child’s general ability is developed — the work of the schoolmaster.

(b) Instruction in the practical matters of life — to act with wisdom and discretion — the work of the private tutor or governess.

(c) The training of moral character.

Men need the training of school-teaching or instruction to develop the ability necessary to success in the various vocations of life. School-teaching bestows upon each member an individual value of his own.

Next, by learning the lesson of discretion in the practical matters of life, he is educated as a citizen, and becomes of value to his fellow-citizens, learning both how to accommodate himself to their society and also how to profit by it.

Lastly, moral training imparts to man a value with regard to the whole human race.

School-teaching is the earliest, moral training the last, in order of time

33. Of these three divisions of education school-teaching comes first in order of time; for a child’s abilities must first be developed and trained, otherwise he is incapable of gaining knowledge in the practical matters of life. Discretion is the faculty of using our abilities aright.

Moral training, in as far as it is based upon fundamental principles which a man must himself comprehend, comes last in order of time. In so far, however, as it is based on common sense merely, it must be taken into account from the beginning, at the same time with physical training; for if moral training be omitted, many faults will take root in the child, against which all influences of education at a later stage will be powerless. As to ability and the general knowledge of life, everything must depend entirely upon the age of the pupil. Let a child be clever after the manner of children; let him be shrewd and good-natured in a childish way, but not cunning (listig) like a man. The latter is as unsuitable for a child as a childish mind is for a grown-up person.

CHAPTER II: PHYSICAL EDUCATION

The private tutor, as the confidant of the parents, should know something of the physical training of children

34. Although those who undertake the home education of children do not have them entrusted to their care so early as to have charge of their physical education, at the same time it is useful for them to know all that is necessary to carry out this part of a child's education from first to last. Though the tutor may only have to do with older children, it may happen that others may be born in the house, and if he conducts himself wisely he will always have a claim to become the confidant of the parents, and to be consulted about the physical training of the little ones; the more so as often the tutor is the only well-educated person in the house. He should therefore have previously made himself acquainted with the subject of the physical education of children.

35. Physical training, properly speaking, consists merely in the tending and feeding of the child, usually the work of parents or nurses.

The mother's milk is the best nourishment for infants

The nourishment which Nature has provided for the infant is the mother's milk, and it is better for both when the mother is able to nurse her child. That the child's disposition is affected in this way, however, is mere prejudice, though one often hears it said of some trait of character: 'You have imbibed that with your mother's milk.'

We must, however, make an exception in extreme cases, such as when the mother's condition is unhealthy. It was formerly believed that the first milk given by the mother after the birth of the infant, which resembles whey, is unwholesome, and must first be removed before the child is nursed.

Rousseau, however, called the attention of physicians to this point, to ascertain whether this first milk might not be useful to the child, since Nature has made nothing in vain, and it was actually found that the refuse which is always met with in a new-born child, which is known among doctors as meconium, is best removed by this milk, which is therefore useful and not harmful to the child.

Animal's milk is a poor substitute

36. The question has been asked whether an infant might not be as well brought up on the milk of animals; but human milk is very different in substance from the milk of animals. The milk of all those animals which live on grass and vegetables very soon curdles, if anything sour is added to it — tartaric acid, for instance, citric acid, or especially the acid of rennet. Human milk, on the other hand, does not curdle. But should the mother or nurse take a vegetable diet for a few days, her milk will curdle in the same way as cows' milk, &c.; though when she has returned to a meat diet for a little while, her milk will again become as good as ever. From this it has been concluded that it is best and most healthy for the mother or nurse to eat meat during the nursing period. When children throw up the milk, it is found to be curdled. The acid in the child's stomach must therefore accelerate the curdling of the milk more than any other kind of acid, since human milk cannot be brought to curdle in the ordinary way. How much worse would it be if milk were given to the child which curdled of itself! We see, however, from the customs of other nations with regard to the bringing up of their infants, that everything does not depend on this.

There is a certain tribe of Russians in Asia who eat scarcely anything but meat, and are a strong and healthy people. They are not, however, very long lived, and are of such a slight build that a full-grown youth, whom one would hardly expect to be so light, can be carried as easily as a child. On the other hand Swedes, and more particularly Indian nations, eat scarcely any meat, and yet their men are tall and well-formed. It seems, then, from these cases that all depends on the good health of the nurse, and that the best diet for mother or nurse is that which best agrees with her.

After milk meal may be given, but no wine, spices, or salt

37. The question here arises as to how the child is to be fed if the mother's milk should cease. For some time past all sorts of farinaceous foods have been tried, but such food is not good for the child from the beginning.

We must especially bear in mind that nothing stimulating be given to the child, such as wine, spices, salt, &c. It is a singular fact, however, that children have such a strong craving for things of this sort; this is because they act as a stimulant, and arouse their as yet undeveloped appetites in a manner pleasant to them. In Russia, it is true, children are given brandy to drink by their parents, who are great brandy-drinkers themselves, and it has been noticed that the Russians are a strong and healthy people. Certainly the fact of their being able to stand such a habit proves that they must have a good constitution: nevertheless, it is a fact that many who otherwise might have lived die in consequence of it. For such early stimulus to the nerves is the cause of many disorders. Children should be carefully kept even from too warm foods and drinks, as they are very apt to weaken the constitution.

Children ought not to be kept very warm, neither should their hunger be artificially excited

38. Further we should notice that children need not be very warmly clad, for their blood is already naturally warmer than that of the full-grown. The heat of a child's blood reaches 110° Fahr., while the blood of a grown man or woman reaches only 96°. A child would be stifled in the same degree of warmth which his elders would enjoy. It is not good even for grown-up people to dress too warmly, to cover themselves up, and to accustom themselves to too warm drinks, for cool habits above all make people strong. Therefore it is good for a child to have a cool and hard bed. Cold baths also are good. No stimulant must be allowed in order to excite the child's hunger, for hunger must only be the consequence of activity and occupation. However, the child must not be allowed so to accustom himself to anything as to feel the loss of it. It is better not to encourage artificially the formation of habits either good or bad.

The custom of swathing children is useless and even harmful

39. Among savage nations the custom of swathing infants is never observed. Savage nations in America, for instance, make holes in the earth, and strew them with dust from rotting trees, which serves to keep the children to a certain extent clean and dry. In these holes the children lie, covered with leaves, having except for this covering, the free use of their limbs.

It is simply for the sake of our own convenience that we swathe our children like mummies, so that we may not have the trouble of watching them in order to prevent their limbs from getting broken or bent. And yet it often happens that they do get bent, just by swathing them. Also it makes the children themselves uneasy, and they are almost driven to despair on account of their never being able to use their limbs. And then people imagine that by calling to the child they stop its crying. But suppose a grown man were to be subjected to the same treatment, and we shall soon see whether he, too, would not cry and fall into uneasiness and despair.

In general we must bear in mind that early education is only negative — that is, we have not to add anything to the provision of Nature, but merely to see that such provision is duly carried out. If any addition to this is necessary on our part, it must be the process of hardening the child. For this reason, also, we must give up the habit of swathing our children. If, however, we want to use some kind of caution, the most suitable arrangement would be a kind of box covered with leather straps, such as the Italians use and call arcuccio. The child is never taken out of this box, even when nursed by its mother. This protects the child from the chance of being smothered when sleeping with its mother at night, while with us many children lose their lives in this way. This arrangement is better than swathing the child, since it allows greater freedom for the limbs, while at the same time it serves as a protection against anything that might hurt or bend its body.

Rocking, also, is objectionable

40. Another custom belonging to early education is the rocking of babies. The easiest way of doing this

is the way some peasants do it. The cradle is hung by a cord to the rafter, and, when the cord is pulled, the cradle rocks of itself from side to side. Rocking, however, is altogether objectionable, for the swinging backwards and forwards is bad for the child. We see this among grown people, in whom swinging often produces a feeling of sickness and giddiness. By swinging, nurses want to stun the child, so that he should not cry. But crying is a wholesome thing for a child, for when a child is born and draws its first breath the course of the blood in its veins is altered, which causes a painful sensation; the child immediately cries, and the energy expended in crying develops and strengthens the various organs of its body. To run at once to a child's help when he cries — to sing to him, as the way of nurses is — is very bad for the child, and is often the beginning of spoiling him, for when he sees he gets things by crying for them he will cry all the more.

Leading-strings and gocarts are superfluous, and the former, at any rate, hurtful

41. Children are usually taught to walk by means of leading-strings and go-carts; but, when one comes to think of it, it seems a surprising thing that people should insist upon teaching children how to walk, as if ever a human being had been found to be unable to walk for want of instruction. Besides, leading-strings are especially bad for the child. A writer once remarked that he had no doubt that the asthma from which he suffered was due to the use of leading-strings when he was a child, which he thought had narrowed his chest. For since a child takes hold of everything or picks up everything from the floor, his chest is confined by the leading-strings; and since the chest is still undeveloped, any pressure tends to flatten it, and the form it then takes is retained in after-life. Besides this, children do not learn to walk so surely as when they walk by themselves. The best plan is to let children crawl, until by degrees they learn of themselves to walk. To prevent them from hurting themselves with splinters from the floor, a woollen rug might be laid down, which would serve at the same time to break their fall.

It is commonly said that children fall very heavily; they do not, however; and it does them no harm to fall sometimes. They learn all the sooner to find their balance, and to fall without hurting themselves.

It is customary to protect the child's head with a kind of wide-brimmed bonnet, which is supposed to prevent it from falling on its face. But it is a merely negative education which consists in employing artificial instruments, instead of teaching the child to use those with which Nature has already provided him. Here the natural instruments are the child's hands, which he will manage to use to steady himself. The more artificial instruments we use, the more do we become dependent on instruments.

Instruments should, as far as possible, be dispensed with

42. Generally speaking, it would be better if fewer instruments were used, and children were allowed to learn more things by themselves. They would then learn them more thoroughly.

For example, it is quite possible that a child might learn to write by itself; for some one must at one time have discovered this for himself, and the discovery is not such a very difficult one. For instance, if a child asked one for bread, one might ask him to draw a picture of what he wanted — he might then, perhaps, draw a rough oval; on being asked to describe his wants a little more accurately — for an oval might as well be a stone as a loaf — he might then be led on to express the letter B in some way, and so on. The child might invent his own alphabet in this way, which he would afterwards only have to exchange for other signs.

Stays, which are sometimes used to remedy defects in the figure, generally increase the mischief

43. There are some children who come into the world with certain defects. Are there no means of remedying these defects? It has been decided, according to the opinion of many learned writers, that stays are of no use in such cases, but rather tend to aggravate the mischief by hindering the circulation of the blood and humours, and the healthy expansion of both the outer and inner parts of the body. If the child is left free he will exercise his body, and a man who has worn stays is weaker on leaving them off than a man who has never put them on. Perhaps some good might be done for those who are born crooked by more weight being put upon the side where the muscles are stronger. This, however, is a dangerous

practice, too, for who is to decide what is the right balance?

It seems best that the child should learn to use his limbs, and remedy this defect by keeping his body in a certain position, even though he may find it troublesome, for no instruments are of any use in such cases.

An enervating influence is as much to be avoided as an over-hardenin process

44. All these artificial contrivances are the more hurtful in that they run counter to the aim of Nature in making organised and reasonable beings; for Nature requires them to keep their freedom, in order that they may learn how to use their powers. All that education can do in this matter is to prevent children from becoming effeminate. This might be done by accustoming them to habits of hardiness, which is the opposite of effeminacy. It is venturing too much to want to accustom children to everything. Russians have made the mistake of going too far in this direction, and consequently an enormous number of their children die young, from the over-hardening process. Habit is the result of the constant repetition of any one enjoyment or action, until such enjoyment or action becomes a necessity of our nature. There is nothing to which children become more easily accustomed, and which should be more carefully kept from them, than such highly stimulating things as tobacco, brandy, and warm drinks. Once acquired, it is very difficult to give up these things; and giving them up causes physical disturbances at first, since the repeated use of anything effects a change in the functions of the different organs of our body. The more habits a man allows himself to form, the less free and independent he becomes; for it is the same with man as with all other animals; whatever he has been accustomed to early in life always retains a certain attraction for him in after life. Children, therefore, must be prevented from forming any habits, nor should habits be fostered in them.

Regular times should be observed for eating and drinking

45. Many parents want to get their children used to anything and everything. But this is no good. For human nature in general, as well as the nature of certain individuals in particular, will not allow of such training, and consequently many children remain apprentices all their lives. Some parents, for instance, would have their children go to sleep, get up, and have their meals whenever they please; but in order that they may do this with impunity, they must follow a special diet, a diet which will strengthen the body, and repair the evil which this irregularity causes. We find, indeed, many instances of periodicity in Nature also. Animals have their appointed time to sleep, and man should accustom himself to a certain time, that the functions of the body be not disturbed. As to the other matter, that children ought to eat at any hour, we cannot well adduce here the case of the animal as an example; as, for instance, all grass-eating animals get but little nourishment each time they eat, therefore grazing is necessarily a constant occupation with them. It is, however, very important for man always to eat at regular hours. Many parents try to accustom their children to endure great cold, bad smells, and noises; this, however, is quite unnecessary, the only thing needful being to prevent them from forming habits. And for this it is best that they shall not always be subject to the same conditions.

A severe education is helpful to the body

46. A hard bed is much more healthy than a soft one; and, generally speaking, a severe education is very helpful in strengthening the body. By a severe education we must understand merely that which tends to prevent one from taking one’s ease. Remarkable examples in confirmation of this assertion are not lacking, only they are not observed, or, to speak more correctly, people will not observe them.

Discipline must be strict without being slavish

47. With regard to the training of character — which we may indeed call also, in a certain sense, physical culture — we must chiefly bear in mind that discipline should not be slavish. For a child ought always to be conscious of his freedom, but always in such a way as not to interfere with the liberty of others — in which case he must be met with opposition. Many parents refuse their children everything they ask, in order that they may exercise their patience, but in doing so they require from their children more patience than they have themselves. This is cruel. One ought rather to give a child as much as will

agree with him, and then tell him ‘that is enough’; but this decision must be absolutely final. No attention should ever be given to a child when he cries for anything, and children’s wishes should never be complied with if they try to extort something by crying; but if they ask properly, it should be given them, provided it is for their good. By this the child will also become accustomed to being open-minded; and since he does not annoy anyone by his crying, everybody will be friendly towards him.

Providence seems indeed to have given children happy, winning ways, in order that they may gain people’s hearts. Nothing does children more harm than to exercise a vexatious and slavish discipline over them with a view to breaking their self-will.

From the time the child begins to cry from some conscious reason, caution is the more necessary to prevent his being spoilt

48. During the first eight months of a child’s life its sense of sight is not fully developed. It experiences, it is true, the sensation of light, but cannot as yet distinguish one object from another. To convince ourselves of this, we have only to hold up a glittering object before the child’s eyes and then remove it; we may at once notice that he does not follow it with his eyes.

At the same time as the sense of sight, the power of laughing and crying is developed. When the child has once reached that stage, there is always some reasoning, however vague it may be, connected with his crying. He cries with the idea that some harm has been done him. Rousseau says that if you merely tap a child of six months on the hand, it will scream as if a bit of burning wood had touched it. Here the child has actually a sense of grievance besides the mere bodily hurt. Parents talk a great deal about breaking the will of their children, but there is no need to break their will unless they have already been spoilt. The spoiling begins when a child has but to cry to get his own way. It is very difficult to repair this evil later on; indeed, it can scarcely be done. We may keep the child from crying or otherwise worrying us, but he swallows his vexation, and is inwardly nursing anger all the more.How children are made dissemblers In this way the child becomes accustomed to dissembling and agitation of mind. It is, for instance, very strange that parents should expect their children to turn and kiss their hand (vide) after they have just beaten them. That is the way to teach them dissembling and falsehood. For the child surely does not look on the rod with any special favour, so that he should feel any gratitude for its chastisement, and one can easily imagine with what feelings the child kisses the hand which has punished him.

Terms of abuse should never be used to children, for they lead merely to timidity and concealment

49. We often say to a child: ‘Fie, for shame! you shouldn’t do that,’ &c. But such expressions are futile in this early stage of education; for the child has, as yet, no sense of shame or of seemliness. He has nothing to be ashamed of, and ought not to be ashamed. These expressions therefore will simply make him timid. He will become embarrassed before others, and inclined to keep away from their company — and from this arises reserve and harmful concealment. He is afraid to ask for anything, when he ought to ask for all he wants. He conceals his true character, and always appears to be other than he is, when he ought to be able to speak frankly and freely. Instead of being always near his parents he shuns them, preferring to make friends with the servants of the house.

To be constantly playing with and caressing children makes them self-willed and deceitful

50. No better than this vexatious system of bringing up children is that of perpetually playing with and caressing the child; this makes him self-willed and deceitful, and by betraying to him their weakness, parents lose the necessary respect in the eyes of the child. If, on the other hand, he is so trained that he gets nothing by crying for it, he will be frank without being bold, and modest without being timid. Boldness, or, what is almost the same thing, insolence, is insufferable. There are many men whose constant insolence has given them such an expression that their very look leads one to expect rudeness from them, while you have only to look at others to see at once that they are incapable of being rude to anyone. Now we can always be frank in our demeanour, provided our frankness be united with a certain kindness. People often speak of men of rank having a royal air, but this is nothing but a certain self-

sufficient manner in consequence of having met with no opposition all their life.

Working-class parents are specially wont to spoil their children in this way, causing them to become head-strong and unruly

51. It may be said with truth that the children of the working classes are more spoilt than the children of those of higher rank, for the working classes play with their children like monkeys, singing to them, caressing, kissing, and dancing with them. They think indeed they are doing a kindness to their child in always running to him when he cries, and playing with him, &c.; but he only cries the oftener. If, on the other hand, no notice is taken of the child's crying, he will leave off at last — for no one cares to continue a fruitless task. Once a child has become accustomed to having all his whims gratified, it is afterwards too late to begin to cross his will. On the other hand, if you do not mind the child's crying, he will soon get tired of it. But should his fancies always be gratified, both his character and his manners will be spoilt.

The child has as yet, indeed, no idea of manners, but it goes far towards spoiling his natural disposition, so that afterwards sharp measures are necessary to undo the evil caused by early indulgence. When attempts are made later on to break off the habit of giving way to all the child's wishes, his crying is then accompanied by a rage as fierce as any of which grown-up people are capable, only that he has not the physical strength to exercise it. This is but what we must expect, for children who have been for so long accustomed merely to cry to get what they want, become veritable despots, and are naturally aggrieved when their rule comes suddenly to an end; for even grown-up people who have been for some time in a high position find it very difficult if they are suddenly called upon to abdicate.

The training of the sense of pleasure and pain must be of a negative kind

52. Here we have also to discuss the training of the sense of pleasure or pain. In this our work must be negative; we must see that the child's sensibility be not spoilt by over-indulgence. Love of ease does more harm than all the ills of life.We must guard against over-indulgence, dislike of work, and daintiness Therefore it is of the utmost importance that children should be taught early to work. If they have not been over-indulged, children are naturally fond of amusements which are attended with fatigue, and occupations which require exercise of strength. With regard to pleasures, it is best not to let them be dainty, nor to allow them to pick and choose. As a rule, mothers spoil their children in this way and indulge them altogether too much. In spite of this we very often notice that children, and especially boys, are fonder of their father than of their mother. This is probably because mothers are timid, and do not allow them to use their limbs as freely as they would wish, for fear of the children hurting themselves. While fathers, on the other hand, although they are stern to them, and perhaps punish them severely when they are naughty, yet take them out sometimes into the fields and do not try to hinder their boyish games.

The patience of children should not be unnecessarily put to the proof

53. Some people believe that in making children wait a long time for what they want they teach them patience. This is, however, hardly necessary, though doubtless in times of illness, &c., patience is needed. Patience is two-fold, consisting either in giving up all hope or in gaining new courage to go on. The first is not necessary, provided what we hope to gain is possible; the second we should always desire, as long as what we strive for is right. In cases of illness, however, hopelessness spoils what has been made good by cheerfulness. But he who is still capable of taking courage with regard to his physical or moral condition is not likely to give up all hope.

The will of children should be bent, not broken — though at first their obedience is necessarily blind

54. The will of children, as has been already remarked, must not be broken, but merely bent in such a way that it may yield to natural obstacles. At the beginning, it is true, the child must obey blindly. It is unnatural that a child should command by his crying, and that the strong should obey the weak. Children should never, even in their earliest childhood, be humoured because they cry, nor allowed to extort anything by crying. Parents often make a mistake in this, and then, wishing to undo the result of their over-

indulgence, they deny their children in later life whatever they ask for. It is, however, very wrong to refuse them without cause what they may naturally expect from the kindness of their parents, merely for the sake of opposing them, and that they, being the weaker, should be made to feel the superior power of their parents.

We should not yield to a child's every wish; nor, on the other hand, should we unnecessarily thwart him

55. To grant children their wishes is to spoil them; to thwart them purposely is an utterly wrong way of bringing them up. The former generally happens as long as they are the playthings of their parents, and especially during the time when they are beginning to talk. By spoiling a child, however, very great harm is done, affecting its whole life. Those who thwart the wishes of children prevent them (and must necessarily prevent them) at the same time from showing their anger; but their inward rage will be all the stronger, for children have not yet learned to control themselves.

The following rules should accordingly be observed with children from their earliest days: — When they cry, and we have reason to believe they are hurt, we should go to their help. On the other hand, when they cry simply from temper, they should be left alone. And this way of dealing with them should be continued as they grow older. In this case the opposition the child meets with is quite natural, and, properly speaking, merely negative, consisting simply in his not being indulged. Many children, on the other hand, get all they want from their parents by persistent asking. If children are allowed to get whatever they want by crying, they become ill-tempered; while if they are allowed to get whatever they want by asking, their characters are weakened. Should there, then, be no important reason to the contrary, a child's request should be granted; should there be a reason to the contrary, it should not be granted, no matter how often the request is repeated. A refusal should always be final. This will shortly have the effect of making its repetition unnecessary.

Obstinacy should be met by natural opposition

56. Supposing — what is of extremely rare occurrence — that a child should be naturally inclined to be stubborn, it is best to deal with him in this way: — If he refuses to do anything to please us, we must refuse to do anything to please him.

Breaking a child's will makes him a slave, while natural opposition makes him docile.

Many fears are due to false impressions

57. All this we may consider as negative training, for many weaknesses of mankind proceed not so much from lack of teaching as from false impressions. For instance, fear of spiders and toads, &c., is suggested to children by their nurses. A child would probably pick up a spider as readily as anything else, were it not that the nurse's horror at the sight of spiders has affected the child by a sort of sympathy. Many children retain this fear all their lives, and in this matter always remain childish; for spiders, though dangerous to flies, for whom their bite is poisonous, are harmless to men. In the same way the toad is as harmless as the beautiful green frog or any other animal.

CHAPTER III: INSTRUCTION (CULTURE)

In physical training artificial aids should, as far as possible, be dispensed with

58. The positive part of physical education is culture. It is this which distinguishes man from the animals. Culture consists chiefly in the exercise of the mental faculties. Parents, then, should give their children opportunities for such exercise. The first and most important rule is that all artificial aids should, as far as possible, be dispensed with. Thus in early childhood leading-strings and go-carts should be discarded, and the child allowed to crawl about on the ground till he learns to go by himself — he will then walk more steadily. For the use of tools is the ruin of natural quickness. Thus we want a cord to measure a certain distance, though we might as well measure it by the eye; or a clock to tell the time, when we might do this by the position of the sun; or a compass to find our way in a forest, when we might instead be guided by the position of the sun by day, of the stars by night. Indeed, we might even say that instead of needing a boat we might swim across the water. The celebrated Franklin wondered why everyone didn’t learn to swim, since swimming is so pleasant and so useful. He also suggested an easy way by which to teach oneself to swim: — Standing in a brook with the water up to your neck, you drop an egg into the water, and then try to reach it. In bending forward to do this you will be carried off your feet, and, in order to prevent the water getting into your mouth, you will throw your head back. You are now in the proper position for swimming, and have only to strike out with the arms to find yourself actually swimming.

What has to be done is to see that natural ability is cultivated. Sometimes instruction is necessary; sometimes the child’s mind is inventive enough, or he invents tools for himself.

Physical exercises should be such as will develop strength and skill, quickness and self-confidence

59. What should be observed in physical education, with respect to the training of the body, relates either to the use of voluntary movements or to the organs of sense. As to the first of these, what is wanted is that the child should always help himself. For this, both strength and skill, quickness and self-confidence, are necessary, so as to be able, for instance, to go along narrow paths, or to climb steep places with an abyss before one’s eye, or to cross a slender plank. If a man cannot do this, he is not entirely what he might be.

Since the Philanthropinon of Dessau set the example, many attempts of this kind have been made with children in other institutions. It is wonderful to read how the Swiss accustom themselves from early childhood to climb mountains, how readily they venture along the narrowest paths with perfect confidence, and leap over chasms, having first measured the distance with the eye, lest it should prove to be beyond their powers.

Most people, however, fear some imaginary danger of falling, and this fear actually paralyses their limbs, so that for them such a proceeding would be really fraught with danger. This fear generally grows with age, and is chiefly found in those men who work much with their heads. For children to make such attempts is not really very dangerous; they are much lighter in proportion to their strength than grown-up people, and for this reason do not fall so heavily. Besides this, their bones are not so inflexible and brittle as they become with age. Children often put their strength to the proof of their own accord. We often see them climbing, for instance, for no particular reason. Running is a healthy exercise and strengthens the body. Jumping, lifting weights, carrying, slinging, throwing towards a mark, wrestling, running races, and all such exercises are good. Dancing, so far as it is of an elaborate kind, is not so well suited to actual childhood.

To exercise the senses certain games should be encouraged which will further this object

60. Exercises in throwing, whether it be throwing a distance or hitting a mark, have the additional

advantage of exercising the senses, especially the eyesight. Games with balls are among the best for children, as they necessitate healthy running.

Generally speaking, those games are the best which unite the development of skill with the exercise of the senses — for example, those that exercise the eyesight in correctly judging distance, size and proportion, in finding the position of places in different regions by means of the sun, &c. All these are good training. Of great advantage also is local imagination, by which we mean the capability of recalling the exact position of places where we have seen certain things — as, for example, when we are able to find our way out of a forest by having noticed the trees we have passed. In the same way the memoria localis, by which we recall, not only in what book we have read a certain thing, but in what part of the book. Thus the musician has the keys before his mind's eye, and does not need to have the actual instrument before him while he composes. It is very useful also to cultivate the ear of children, so that they may know whether a sound comes from far or near, from this side or that.

Different games and their uses

61. The children's game of 'blindman's buff' was already known among the Greeks, who called it μυῖνδα. Generally speaking, children's games are the same everywhere; those which are found in Germany being also found in France and England, and so on. They have their principle in a certain instinct common to all children. In 'blindman's buff,' for instance, there is the desire to know how they would help themselves were they deprived of one of their senses.

Spinning tops is a singular game. Such games as these furnish matter for further reflection to grown-up men, and occasionally lead even to important discoveries. Thus Segner has written a treatise on the top; and the top has furnished an English sea-captain with material for inventing a mirror, by means of which the height of the stars may be measured from a ship.

Children are fond of noisy instruments, such as trumpets, drums, and the like; but these are objectionable, since they become a nuisance to others. It would be less objectionable, however, were children to learn how to cut a reed so as to play on it.

Swinging is also a healthy exercise, as well for grown-up people as for children. Children, however, should be watched, lest they swing too fast.

Kite-flying is also an unobjectionable game. It calls forth skill, the flight of the kite depending on its being in a certain position relatively to the wind.

By games the child learns endurance, maintains his natural cheerfulness, and gains in candour

62. For the sake of these games the boy will deny himself in his other wants, and thus train himself unconsciously for other and greater privations. Further, he will accustom himself to constant occupation; nevertheless for that very reason these games must not be mere games, but games having some end and object. For the more a child's body is strengthened and hardened in this way, the more surely will he be saved from the ruinous consequences of over-indulgence. Gymnastics also are intended merely to direct Nature; hence we must not aim at artificial grace.

On social training

Discipline must precede instruction. Here, however, in training the bodies of children we must also take care to fit them for society. Rousseau says: 'You will never get an able man, unless you have a street urchin first.' A lively boy will sooner become a good man than a conceited and priggish lad.

A child must learn to be neither troublesome nor insinuating in company. He must be confident at the invitation of others without being obtrusive, and frank without being impertinent. As a means to this end all we have to do is not to spoil the child's nature, either by giving him such ideas of good behaviour as will only serve to make him timid and shy, or, on the other hand, by suggesting to him a wish to assert himself. Nothing is more ridiculous than precocious good behaviour and priggish self-conceit in a child. In this last instance we must let the child see his weakness all the more, but at the same time we must not overpower him with a sense of our own superiority and power; so that, though the child may develop his

own individuality, he should do so only as a member of society — in a world which must, it is true, be large enough for him, but also for others. Toby in 'Tristram Shandy' says to a fly which has been annoying him for some time, and which he at last puts out of the window, 'Go away, tiresome creature; the world is large enough for us both.' We may each of us take these words for our motto. We need not be troublesome to one another; the world is large enough for all of us.

CHAPTER IV: CULTIVATION OF THE MIND

Mental culture may also in a certain sense be called physical, so far as it is distinguished from ‘practical’

63. We come now to the cultivation of the mind, which also we may call, in a certain sense, physical. We must, however, distinguish between nature and freedom. To give laws to freedom is quite another thing to cultivating nature. The nature of the body and the nature of the mind agree in this, that culture goes to prevent the spoiling of either, and that art adds something to both. We may, therefore, call the cultivation of the mind physical, in a certain sense, just as well as the cultivation of the body.

This physical cultivation of the mind, however, must be distinguished from moral training, in that it aims only at nature, while moral training aims at freedom. A man may be highly cultivated physically, he may have a well-cultivated mind; but if he lacks moral culture, he will be a wicked man.

Physical culture must, however, be distinguished from ‘practical’ culture, which last is pragmatic or moral. In this last case morality is the aim rather than culture.

‘Free’ and ‘scholastic’ culture

64. The physical cultivation of the mind may be divided into (i) free and (ii) scholastic culture. Free culture is, as it were, but a pastime, while scholastic culture constitutes a business. Free culture is that which must always be observed with the child. In scholastic culture, on the other hand, the child is looked upon as under restraint. We may be occupied in games, which we call being occupied in our leisure time, and we may be occupied by compulsion, which we call work. Scholastic culture constitutes work for the child, free culture constitutes play.

Work and play are both necessary, but they should not be confused by trying to make play of work

65. Various plans of education have been drawn up by different people, in order to discover the best methods — a most praiseworthy undertaking. One among others suggests that children should be allowed to learn everything as it were in play. In an article in the ‘Göttingen Magazine’ Lichtenberg ridicules the folly of trying to make everything like play for boys, while they ought to be accustomed to serious business at an early period, since they must some time enter a business life. This is an utterly preposterous notion. A child must play, must have his hours of recreation; but he must also learn to work. It is a good thing, doubtless, to exercise skill, as it is to cultivate the mind, but these two kinds of culture should have their separate hours. Moreover, it is a great misfortune for man that he is by nature so inclined to inaction. The longer a man gives way to this inclination, the more difficult will he find it to make up his mind to work.

Work is to be distinguished from play by having some ulterior end in view

66. In work the occupation is not pleasant in itself, but it is undertaken for the sake of the end in view. In games, on the other hand, the occupation is pleasant in itself without having any other end in view. When we go for a walk, we do so for the sake of the walk, and therefore the further we go the pleasanter it is; while when we go to a certain place, our object is the company which we shall find there, or something else, and therefore we shall naturally choose the shortest way. The same thing happens in card games. It is really extraordinary how reasonable men can sit by the hour and shuffle cards. It is not, it seems, so easy for men to leave off being children. For how is this a better game than the children’s game of ball? It is true that grown men do not care to ride hobby-horses, but they ride other hobbies.

Man needs occupation and restraint; therefore schoollife, with its compulsory occupation and restraint, is a good training for the child

67. It is of the greatest importance that children should learn to work. Man is the only animal who is obliged to work. He must go through a long apprenticeship before he can enjoy anything for his own sustenance. The question whether Heaven would not have shown us greater kindness by supplying all our

wants without the necessity of work on our part must certainly be answered in the negative, for man needs occupation, even occupation that involves a certain amount of restraint. Just as false a notion is it that if Adam and Eve had only remained in Paradise they would have done nothing there but sit together singing pastoral songs and admiring the beauty of Nature. Were this so, they would have been tormented with ennui, just as much as other people in the same position.

Men ought to be occupied in such a way that, filled with the idea of the end which they have before their eyes, they are not conscious of themselves, and the best rest for them is the rest which follows work. In the same way a child must become accustomed to work, and where can the inclination to work be cultivated so well as at school? School is a place of compulsory culture. It is very bad for a child to learn to look upon everything as play. He must, it is true, have his time for recreation, but he must also have his time for work. Even though the child does not at once understand the use of this restraint, later in life he will recognise its value. It would be merely training the child to bad habits of inquisitiveness were one always to answer his questions: 'What is the use of this?' or, 'What is the use of that?' Education must be compulsory, but it need not therefore be slavish.

The mental faculties ought not to be cultivated separately, but each one in relation to others — the inferior with a view to the superior

68. With regard to the 'free' cultivation of the mental faculties, we must remember that this cultivation is going on constantly. It really deals with the superior faculties. The inferior faculties must be cultivated along with them, but only with a view to the superior; for instance, the intelligence with a view to the understanding — the principal rule that we should follow being that no mental faculty is to be cultivated by itself, but always in relation to others; for instance, the imagination to the advantage of the understanding.

The inferior faculties have no value in themselves; for instance, a man who has a good memory, but no judgment. Such a man is merely a walking dictionary. These beasts of burden of Parnassus are of some use, however, for if they cannot do anything useful themselves they at least furnish material out of which others may produce something good. Intelligence divorced from judgment produces nothing but foolishness. Understanding is the knowledge of the general. Judgment is the application of the general to the particular. Reason is the power of understanding the connection between the general and the particular. This free culture runs its course from childhood onwards till the time that the young man is released from all education. When a young man, for instance, quotes a general rule, we may make him quote examples drawn from history or fable in which this rule is disguised, passages from the poets where it is expressed, and thus encourage him to exercise both his intelligence and his memory, &c.

The memory should be carefully trained to retain such things as are important

69. The maxim Tantum scimus, quantum memoria tenemus is quite true — hence it is very necessary to cultivate the memory. Things are so constituted that the understanding first follows the mental impression, and the memory must preserve this impression. So it is, for instance, in languages. We learn them either by the formal method of committing them to memory or by conversation — this last being the best method for modern languages. The learning of words is really necessary, but the best plan is for the youth to learn words as he comes across them in the author he is reading. The youth should have a certain set task. In the same way geography is best learnt mechanically. What is learnt in a mechanical way is best retained by the memory, and in a great many cases this way is indeed very useful. The proper mechanism for the study of history has yet to be found. An attempt has been made in this direction consisting of a system of tables, but the result has not been very satisfactory. History, however, is an excellent means of exercising the understanding in judging rightly. Learning by heart is very necessary, but doing it merely for the sake of exercising the memory is of no use educationally — for instance, the learning of a speech by heart. At all events, it only serves to encourage forwardness. Besides this, declamation is only proper for grown-up men. The same may be said of all those things which we learn merely for some future examination or with

a view to futuram oblivionem. The memory should only be occupied with such things as are important to be retained, and which will be of service to us in real life.Novel-reading is bad for children Novel-reading is the worst thing for children, since they can make no further use of it, and it merely affords them entertainment for the moment. Novel-reading weakens the memory. For it would be ridiculous to remember novels in order to relate them to others. Therefore all novels should be taken away from children. Whilst reading them they weave, as it were, an inner romance of their own, rearranging the circumstances for themselves; their fancy is thus imprisoned, but there is no exercise of thought.

Distractions must never be allowed, least of all in school, for the result will be a certain propensity in that direction which might soon grow into a habit. Even the finest talents may be wasted when once a man is subject to distraction. Although children are inattentive at their games, they soon recall their attention. We may notice, however, that they are most distracted when they are thinking of some mischief, for then they are contriving either how to hide it, or else how to repair the evil done. They then only half hear anything, give wrong answers, and know nothing about what they are reading, &c.

The memory should be cultivated by learning names, by reading and writing, and by learning languages

70. The memory must be cultivated early, but we must be careful to cultivate the understanding at the same time.

The memory is cultivated (i) by learning the names which are met with in tales, (ii) by reading and writing. But as to reading, children should practise it with the head, without depending on the spelling. (iii) By languages, which children should first learn by hearing, before they read anything.

Then a well-constructed so-called orbis pictus will prove very useful. We might begin with botany, mineralogy, and natural history in general. In order to make sketches of these objects, drawing and modelling will have to be learned, and for this some knowledge of mathematics is necessary. The first lessons in science will most advantageously be directed to the study of geography, mathematical as well as physical. Tales of travel, illustrated by pictures and maps, will lead on to political geography. From the present condition of the earth's surface we go back to its earlier condition, and this leads us to ancient geography, ancient history, and so on.

Knowing and doing should be combined

But in teaching children we must seek insensibly to unite knowledge with the carrying out of that knowledge into practice. Of all the sciences, mathematics seems to be the one that best fulfils this. Further, knowledge and speech (ease in speaking, fluency, eloquence) must be united. The child, however, must learn also to distinguish clearly between knowledge and mere opinion and belief. Thus we prepare the way for a right understanding, and a right — not a refined or delicate — taste. This taste must at first be that of the senses, especially the eyes, but ultimately of ideas.

The understanding should be cultivated by rules which should be studied side by side with their application

71. It is necessary to have rules for everything which is intended to cultivate the understanding. It is very useful mentally to separate the rules, that the understanding may proceed not merely mechanically, but with the consciousness of following a rule.

It is also very useful to bring these rules into a set form, and thus commit them to memory. If we keep the rule in our memory, though we forget its application, we shall soon find our way again.

Here the question arises whether the rules shall first be studied in abstracto, and whether they ought to be studied after they have been applied, or whether the rule and its application should be studied side by side. This last is the only advisable course; otherwise the application of the rule is very uncertain till the rule itself is learned.

But from time to time the rules must also be arranged in classes, for it is difficult to keep them in memory when they are not associated together. Consequently in learning languages the study of grammar must always, to a certain extent, come first.

The general cultivation of the mental faculties is in part physical — consisting of discipline and exercise; and in part moral — consisting of 'maxims'

72. We must now give a systematic idea of the whole aim of education, and the means of obtaining it.

I. The general cultivation of the mental faculties, as distinguished from the cultivation of particular mental faculties. — This aims at skill and perfection, and has not for its object the imparting of any particular knowledge, but the general strengthening of the mental faculties.

This culture is either (a) physical — here everything depends upon exercise and discipline, without the child needing to learn any 'maxims'; it is passive for the pupil, who has only to follow the guidance of others — or (b) it is moral. This depends not upon discipline, but upon 'maxims.' All will be spoilt if moral training rests upon examples, threats, punishments, and so on. It would then be merely discipline. We must see that the child does right on account of his own 'maxims,' and not merely from habit; and not only that he does right, but that he does it because it is right. For the whole moral value of actions consists in 'maxims' concerning the good.

Physical education, then, is distinguished from moral in the former being passive, while the latter is active, for the child. He should always understand the principle of an action, and its relation to the idea of duty.

The cultivation of particular mental faculties includes, first, the inferior faculties: such as cognition, the senses, imagination, memory, and power of concentration

73. II. The cultivation of particular mental faculties. — This includes the cultivation of the faculty of cognition, of the senses, the imagination, memory, power of attention, and intelligence — in a word, the inferior powers of the understanding.

Of the cultivation of the senses — eyesight, for instance — we have already spoken. As to the cultivation of the imagination, the following is to be noticed: — Children generally have a very lively imagination, which does not need to be expanded or made more intense by the reading of fairy tales. It needs rather to be curbed and brought under rule, but at the same time should not be left quite unoccupied. There is something in maps which attracts everybody, even the smallest children. When they are tired of everything else, they will still learn something by means of maps. And this is a good amusement for children, for here their imagination is not allowed to rove, since it must, as it were, confine itself to certain figures. We might really begin with geography in teaching children. Figures of animals, plants, and so on, might be added at the same time; these will make the study of geography more lively. History, however, would probably have to come later on.

With regard to the power of attention, we may remark that this faculty needs general strengthening. The power of rigidly fixing our thoughts upon one object is not so much a talent as a weakness of our mind, which in this case is inflexible, and does not allow itself to be applied at pleasure. But distraction is the enemy of all education. Memory depends upon our attention.

Secondly, the cultivation of the superior mental faculties: understanding, judgment, and reason

74. As regards the cultivation of the superior mental faculties, this includes the cultivation of the understanding, judgment, and reason. The understanding may at first be cultivated, in a certain way, passively also, either by quoting examples which prove the rules, or, on the contrary, by discovering rules for particular cases. The judgment shows us what use to make of the understanding. Understanding is necessary in order that we may understand what we learn or say, and that we may not repeat anything without understanding it. How many people hear and read things which they do not understand, though they believe them! Of that kind are both images and real things.

It is through reason that we get an insight into principles. But we must remember that we are speaking here of a reason which still needs guidance. Hence the child should not be encouraged to be always reasoning, nor should we indulge in reasoning in the presence of children, about things which surpass their conception.

We are not dealing here with speculative reason, but only with reflection upon actual occurrences, according to their causes and effects. It is in its arrangement and working a practical reason.

The best way to understand is to do

75. The best way of cultivating the mental faculties is to do ourselves all that we wish to accomplish; for instance, by carrying out into practice the grammatical rule which we have learnt. We understand a map best when we are able to draw it out for ourselves. The best way to understand is to do. That which we learn most thoroughly, and remember the best, is what we have in a way taught ourselves. There are but few men, however, who are capable of doing this. They are called self-taught (αὐτοδίδακτοι).

In the culture of reason the Socratic method is the best

76. In the culture of reason we must proceed according to the Socratic method. Socrates, who called himself the midwife of his hearers' knowledge, gives examples in his dialogues, which Plato has in a manner preserved for us, of the way in which, even in the case of grown-up people, ideas may be drawn forth from their own individual reason. In many respects children need not exercise their reason. They must not be allowed to argue about everything. It is not necessary for them to know the principles of everything connected with their education; but when the question of duty arises, they should be made to understand those principles. But on the whole we should try to draw out their own ideas, founded on reason, rather than to introduce such ideas into their minds. The Socratic method should form, then, the rule for the catechetical method. True it is somewhat slow, and it is difficult to manage so that in drawing ideas out of one child the others shall also learn something. The mechanical method of catechising is also useful in some sciences; for instance, in the explanation of revealed religion. In universal religion, on the other hand, we must employ the Socratic method. As to what has to be learnt historically, the mechanical method of catechising is much to be commended.

CHAPTER V: MORAL CULTURE

By moral culture the child is taught to think, so that he may act in accordance with 'maxims' — a difficult task since what is right or wrong is easily confounded with what gains reward, and what does not.

77. Moral culture must be based upon 'maxims,' not upon discipline; the one prevents evil habits, the other trains the mind to think. We must see, then, that the child should accustom himself to act in accordance with 'maxims,' and not from certain ever-changing springs of action. Through discipline we form certain habits, moreover, the force of which becomes lessened in the course of years. The child should learn to act according to 'maxims,' the reasonableness of which he is able to see for himself. One can easily see that there is some difficulty in carrying out this principle with young children, and that moral culture demands a great deal of insight on the part of parents and teachers.

Supposing a child tells a lie, for instance, he ought not to be punished, but treated with contempt, and told that he will not be believed in the future, and the like. If you punish a child for being naughty, and reward him for being good, he will do right merely for the sake of the reward; and when he goes out into the world and finds that goodness is not always rewarded, nor wickedness always punished, he will grow into a man who only thinks about how he may get on in the world, and does right or wrong according as he finds either of advantage to himself.

In the culture of 'maxims' children should be taught early to distinguish between right and wrong The school 'maxims' of childhood are followed by 'maxims' of mankind

78. 'Maxims' ought to originate in the human being as such. In moral training we should seek early to infuse into children ideas as to what is right and wrong. If we wish to establish morality, we must abolish punishment. Morality is something so sacred and sublime that we must not degrade it by placing it in the same rank as discipline. The first endeavour in moral education is the formation of character. Character consists in readiness to act in accordance with 'maxims.' At first they are school 'maxims,' and later 'maxims' of mankind. At first the child obeys rules. 'Maxims' are also rules, but subjective rules. They proceed from the understanding of man. No infringement of school discipline must be allowed to go unpunished, although the punishment must always fit the offence.

Method and strict adherence to rules are of great importance in the formation of character

79. If we wish to form the characters of children, it is of the greatest importance to point out to them a certain plan, and certain rules, in everything; and these must be strictly adhered to. For instance, they must have set times for sleep, for work, and for pleasure; and these times must be neither shortened nor lengthened. With indifferent matters children might be allowed to choose for themselves, but having once made a rule they must always follow it. We must, however, form in children the character of a child, and not the character of a citizen.

Unmethodical men are not to be relied on; it is difficult to understand them, and to know how far we are to trust them. It is true we often blame people who always act by rule — for instance, the man who does everything by the clock, having a fixed hour for every one of his actions — but we blame them often unreasonably, for this exactness, though it looks like pedantry, goes far towards helping the formation of character.

Obedience is twofold: absolute and voluntary; both kinds being essential to the character of a child

80. Above all things, obedience is an essential feature in the character of a child, especially of a school boy or girl. This obedience is twofold, including absolute obedience to his master's commands, and obedience to what he feels to be a good and reasonable will. Obedience may be the result of compulsion; it is then absolute: or it may arise out of confidence; it is then obedience of the second kind. This voluntary obedience is very important, but the former is also very necessary, for it prepares the child

for the fulfilment of laws that he will have to obey later, as a citizen, even though he may not like them.

School laws must be general, and put into force without partiality

81. Children, then, must be subject to a certain law of necessity. This law, however, must be a general one — a rule which has to be kept constantly in view, especially in schools. The master must not show any predilection or preference for one child above others; for thus the law would cease to be general. As soon as a child sees that the other children are not all placed under the same rules as himself, he will at once become refractory.

The idea of duty, apart from inclination, must be imparted early in life

82. One often hears it said that we should put everything before children in such a way that they shall do it from inclination. In some cases, it is true, this is all very well, but there is much besides which we must place before them as duty. And this will be of great use to them throughout their life. For in the paying of rates and taxes, in the work of the office, and in many other cases, we must be led, not by inclination, but by duty. Even though a child should not be able to see the reason of a duty, it is nevertheless better that certain things should be prescribed to him in this way; for, after all, a child will always be able to see that he has certain duties as a child, while it will be more difficult for him to see that he has certain duties as a human being. Were he able to understand this also — which, however, will only be possible in the course of years — his obedience would be still more perfect.

Disobedience is always followed by punishment — either physical or moral

83. Every transgression of a command in a child is a want of obedience, and this brings punishment with it. Also, should a command be disobeyed through inattention, punishment is still necessary. This punishment is either physical or moral. It is moral when we do something derogatory to the child's longing to be honoured and loved (a longing which is an aid to moral training); for instance, when we humiliate the child by treating him coldly and distantly. This longing of children should, however, be cultivated as much as possible. Hence this kind of punishment is the best, since it is an aid to moral training — for instance, if a child tells a lie, a look of contempt is punishment enough, and punishment of a most appropriate kind.

Physical punishment consists either in refusing a child's requests or in the infliction of pain. The first is akin to moral punishment, and is of a negative kind. The second form must be used with caution, lest an indoles servilis should be the result. It is of no use to give children rewards; this makes them selfish, and gives rise to an indoles mercenaria.

Punishments may also be divided into natural and artificial punishments

84. Further, obedience is either that of the child or that of the youth. Disobedience is always followed by punishment. This is either a really natural punishment, which a man brings upon himself by his own behaviour — for instance, when a child gets ill from over-eating — and this kind of punishment is the best, since a man is subject to it throughout his life, and not merely during his childhood; or, on the other hand, the punishment is artificial. By taking into consideration the child's desire to be loved and respected, such punishments may be chosen as will have a lasting effect upon its character. Physical punishments must merely supplement the insufficiency of moral punishment. If moral punishment have no effect at all, and we have at last to resort to physical punishment, we shall find after all that no good character is formed in this way. At the beginning, however, physical restraint may serve to take the place of reflection.

Punishments should be inflicted with great caution, never in anger, and always with a view to their object — namely, the improvement of the child

85. Punishments inflicted with signs of anger are useless. Children then look upon the punishment simply as the result of anger, and upon themselves merely as the victims of that anger; and as a general rule punishment must be inflicted on children with great caution, that they may understand that its one aim is their improvement. It is foolish to cause children, when they are punished, to return thanks for the

punishment by kissing hands, and only turns the child into a slave. If physical punishment is often repeated, it makes a child stubborn; and if parents punish their children for obstinacy, they often become all the more obstinate. Besides, it is not always the worst men who are obstinate, and they will often yield easily to kind remonstrance.

By duty a child understands submission to rules. A child's obedience, therefore must be distinguished from the obedience of a youth, who understands by duty obedience to reason

86. The obedience of the growing youth must be distinguished from the obedience of the child. The former consists in submission to rules of duty. To do something for the sake of duty means obeying reason. It is in vain to speak to children of duty. They look upon it in the end as something which if not fulfilled will be followed by the rod. A child may be guided by mere instinct. As he grows up, however, the idea of duty must come in. Also the idea of shame should not be made use of with children, but only with those who have left childhood for youth. For it cannot exist with them till the idea of honour has first taken root.

The foundation and essence of character is truthfulness

87. The second principal feature in the formation of a child's character is truthfulness. This is the foundation and very essence of character. A man who tells lies has no character, and if he has any good in him it is merely the result of a certain kind of temperament. Some children have an inclination towards lying, and this frequently for no other reason than that they have a lively imagination. It is the father's business to see that they are broken of this habit, for mothers generally look upon it as a matter of little or no importance, even finding in it a flattering proof of the cleverness and ability of their children. This is the time to make use of the sense of shame, for the child in this case will understand it well. The blush of shame betrays us when we lie, but it is not always a proof of it, for we often blush at the shamelessness of others who accuse us of guilt. On no condition must we punish children to force the truth from them, unless their telling a lie immediately results in some mischief; then they may be punished for that mischief. The withdrawal of respect is the only fit punishment for lying.

Punishments may be divided into negative and positive punishments. The first may be applied to laziness or viciousness; for instance, lying, disobedience. Positive punishment may be applied to acts of spitefulness. But above all things we must take care never to bear children a grudge.

Children should be encouraged to form friendships, to be cheerful and light-hearted. School hours should be followed by hours of recreation

88. A third feature in the child's character is sociableness. He must form friendships with other children, and not be always by himself. Some teachers, it is true, are opposed to these friendships in schools, but this is a great mistake. Children ought to prepare themselves for the sweetest enjoyment of life.

If a teacher allows himself to prefer one child to another, it must be on account of its character, and not for the sake of any talents the child may possess; otherwise jealousy will arise, which is opposed to friendship.

Children ought to be open-hearted and cheerful in their looks as the sun. A joyful heart alone is able to find its happiness in the good. A religion which makes people gloomy is a false religion; for we should serve God with a joyful heart, and not of constraint.

Children should sometimes be released from the narrow constraint of school, otherwise their natural joyousness will soon be quenched. When the child is set free he soon recovers his natural elasticity. Those games in which children, enjoying perfect freedom, are ever trying to outdo one another, will serve this purpose best, and they will soon make their minds bright and cheerful again.

The most troublesome period of life is the period of youth

89. Many people imagine that the years of their youth are the pleasantest and best of their lives; but it is not really so. They are the most troublesome; for we are then under strict discipline, can seldom choose our own friends, and still more seldom can we have our freedom. As Horace says: Multa tulit, fecitque

puer, sudavit et alsit.

Children should be taught only what is suitable to their age. Precocity and vanity must be guarded against

90. Children should only be taught those things which are suited to their age. Many parents are pleased with the precocity of their offspring; but as a rule, nothing will come of such children. A child should be clever, but only as a child. He should not ape the manners of his elders. For a child to provide himself with moral sentences proper to manhood is to go quite beyond his province and to become merely an imitator. He ought to have merely the understanding of a child, and not seek to display it too early. A precocious child will never become a man of insight and clear understanding. It is just as much out of place for a child to follow all the fashions of the time, to curl his hair, wear ruffles, and even carry a snuff-box. He will thus acquire affected manners not becoming to a child. Polite society is a burden to him, and he entirely lacks a man's heart. For that very reason we must set ourselves early to fight against all signs of vanity in a child; or, rather, we must give him no occasion to become vain. This easily happens by people prattling before children, telling them how beautiful they are, and how well this or that dress becomes them, and promising them some finery or other as a reward. Finery is not suitable for children. They must accept their neat and simple clothes as necessaries merely.

At the same time the parents must not set great store by their own clothes, nor admire themselves; for here, as everywhere, example is all-powerful, and either strengthens or destroys good precepts.

CHAPTER VI: PRACTICAL EDUCATION

91. Practical education includes (1) skill, (2) discretion, and (3) morality.

Skill must be thorough

With regard to skill, we must see that it is thorough, and not superficial. We must not pretend to know things which we afterwards cannot accomplish. Skill must be characterised by thoroughness, and this thoroughness should gradually become a habit. Thoroughness is an essential element in the formation of a man's character, while skill is necessary for talent.

Discretion consists in using others for our own ends; this necessitates reserve and self-control

92. As regards discretion, it consists in the art of turning our skill to account; that is, of using our fellow-men for our own ends. For this several things are necessary. Properly speaking, it is the last quality attained by man, but it ranks second in importance.

In order that a child may acquire prudence, he must learn to disguise his feelings and to be reserved, while at the same time he learns to read the character of others. It is chiefly with regard to his own character that he must cultivate reserve. Decorum is the art of outward behaviour, and this is an art that we must possess. It is difficult to read the characters of others, but we must learn to do this without losing our own reserve. For this end a kind of dissembling is necessary; that is to say, we have to hide our faults and keep up that outward appearance. This is not necessarily deceit, and is sometimes allowable, although it does border closely on insincerity.

Dissimulation, however, is but a desperate expedient. To be prudent it is necessary that we should not lose our temper; on the other hand, we should not be too apathetic. A man should be brave without being violent — two qualities which are quite distinct. A brave man is one who is desirous of exercising his will. This desire necessitates control of the passions. Discretion is a matter of temperament.

Self-control is the first step towards the formation of a good character

93. Morality is a matter of character. Sustine et abstine, such is the preparation for a wise moderation. The first step towards the formation of a good character is to put our passions on one side. We must take care that our desires and inclinations do not become passions, by learning to go without those things that are denied to us. Sustine implies endure and accustom thyself to endure. Courage and a certain bent of mind towards it are necessary for renunciation. We ought to accustom ourselves to opposition, the refusal of our requests, and so on.

Pity as a motive should take the place of emotional sympathy

'Sympathy' is a matter of temperament. Children, however, ought to be prevented from contracting the habit of a sentimental maudlin sympathy. 'Sympathy' is really sensitiveness, and belongs only to characters of delicate feeling. It is distinct from compassion, and it is an evil, consisting as it does merely in lamenting over a thing. It is a good thing to give children some pocket-money of their own, that they may help the needy; and in this way we should see if they are really compassionate or not. But if they are only charitable with their parents' money, we have no such test.

It is better to know a few things thoroughly than many things superficially

The saying Festina lente expresses constant activity, by which we must hasten to learn a great deal — that is, festina. But we must also learn thoroughly, and this needs time; that is, lente. The question here arises whether it is better to know a great many things in a superficial way or a few things thoroughly. It is better to know but little, and that little thoroughly, than to know a great deal and that superficially; for one becomes aware of the shallowness of superficial knowledge later on. But the child does not know as yet in what condition he may be with regard to requiring this or that branch of knowledge: it is best, therefore, that he should know something thoroughly of all, otherwise he will but deceive and dazzle others by his

superficially acquired knowledge.

Character, the formation of, which is the ultimate aim of education consists of fixity of purpose, and the carrying out of that purpose

94. Our ultimate aim is the formation of character. Character consists in the firm purpose to accomplish something, and then also in the actual accomplishing of it. Vir propositi tenax, said Horace, and this is a good character. For instance, if a man makes a promise, he must keep it, however inconvenient it may be to himself; for a man who makes a resolution and fails to keep it will have no more confidence in himself. Suppose, for example, that a man resolves to rise early every morning that he may study, or do something or other, or take a walk — and excuses himself in spring because the mornings are still too cold, and rising early might injure his health, and in summer because it is well to allow himself to sleep, and sleep is pleasant — thus he puts off his resolution from day to day, until he ends in having no confidence in himself.

Those things which are contrary to morality must be excluded from such resolutions. The character of a wicked man is evil; but then, in this case, we do not call it 'character' any longer, but obstinacy; and yet there is still a certain satisfaction to find such a man holding fast to his resolutions and carrying them out, though it would be much better if he showed the same persistency in good things.

Those who delay to fulfil their resolutions will do but little in life. We cannot expect much good to come of so-called future conversion. The sudden conversion of a man who has led a vicious life cannot possibly be enduring, in that it would be nothing short of a miracle to expect a man who has lived in such a way suddenly to assume the well-conducted life of a man who has always had good and upright thoughts. For the same reason we can expect no good to come from pilgrimages, mortifications, and fastings; for it is difficult to see how such customs can, all at once, make a virtuous man out of a vicious one. How can it make a man more upright, or improve him in any way, to fast by day and to feast at night; to impose a penance upon his body, which can in no way help towards improving his mind?

In laying the foundation of the child's moral character, his duties should be placed before him by means of examples and rules. (1) His duty towards himself — to maintain the dignity of man in his own person; and (2) his duty towards others — to reverence and respect their rights

95. To form the foundation of moral character in children, we must observe the following: —

We must place before them the duties they have to perform, as far as possible, by examples and rules. The duties which a child has to fulfil are only the common duties towards himself and towards others. These duties must be the natural outcome of the kind of question involved. We have thus to consider more closely: —

(1) The child's duties towards himself. — These do not consist in putting on fine clothes, in having sumptuous dinners, and so on, although his food should be good and his clothing neat. They do not consist in seeking to satisfy his cravings and inclinations; for, on the contrary, he ought to be very temperate and abstemious. But they consist in his being conscious that man possesses a certain dignity, which ennobles him above all other creatures, and that it is his duty so to act as not to violate in his own person this dignity of mankind. We are acting contrary to the dignity of man, for instance, when we give way to drink, or commit unnatural sins, or practise all kinds of irregularities, and so on, all of which place man far below the animals. Further, to be cringing in one's behaviour to others; to be always paying compliments, in order by such undignified conduct to ingratiate ourselves, as we assume — all this is against the dignity of man.

We can easily find opportunities for making children conscious of the dignity of man, even in their own persons. For instance, in the case of uncleanliness, which is at least unbecoming to mankind. But it is really through lying that a child degrades himself below the dignity of man, since lying presupposes the power of thinking and of communicating one's thoughts to others. Lying makes a man the object of common contempt, and is a means of robbing him of the respect for and trust in himself that every man

should have.

(2) The child's duties towards others. — A child should learn early to reverence and respect the rights of others, and we must be careful to see that this reverence is realised in his actions. For instance, were a child to meet another poorer child and to push him rudely away, or to hit him, and so on, we must not say to the aggressor, 'Don't do that, you will hurt him; you should have pity, he is a poor child,' and so on. But we must treat him in the same haughty manner, because his conduct is against the rights of man. Children have as yet no idea, properly speaking, of generosity. We may, for instance, notice that when a child is told by his parents to share his slice of bread-and-butter with another, without being promised a second slice, the child either refuses to obey, or obeys unwillingly. It is, besides, useless to talk to a child of generosity, as it is not yet in his power to be generous.

The first duty of the child towards himself, which is often overlooked, is of great importance, especially during the period when childhood is left for youth

96. Many writers — Crugott, for instance — have either quite omitted, or explained falsely, that chapter of morality which teaches our duties towards ourselves. Our duties towards ourselves consist, as has been already said, in guarding, each in our own person, the dignity of mankind. A man will only reproach himself if he has the idea of mankind before his eyes. In this idea he finds an original, with which he compares himself. But when years increase, then is the critical period in which the idea of the dignity of man alone will suffice to keep the young man in bounds. But the youth must have some timely hints which will help him to know what he is to approve and what to mistrust.

In teaching children their duty towards others a catechism of right conduct would be of great use

97. Almost all our schools are lacking in something which would nevertheless greatly tend to the formation of uprightness in children — namely, a catechism of right conduct. This should contain, in a popular form, everyday questions of right and wrong. For instance, a man has a certain debt to pay to-day, but he sees another man in sore need, and, moved with pity, gives him the money which belongs of right to his creditor. Is this right or wrong?

It is wrong, for we must be free from obligation before we can be generous. When we give alms, we do a meritorious act; but in paying our debts, we do what we are bound to do.

Again, can a lie ever be justified by necessity? No, there is no single instance in which a lie can be justified. If this rule were not strictly adhered to, children especially would take the smallest excuse for a necessity, and would very often allow themselves to tell lies. If there were a book of this kind, an hour might very profitably be spent daily in studying it, so that children might learn and take to heart lessons on right conduct — that apple of God's eye upon earth.

With regard to the obligation of benevolence, we should arouse children to the duty of helping others, rather than to the sentiment of feeling for them

98. As to the obligation of benevolence, it is not an absolute obligation. We must arouse the sympathies of children, not so much to feel for the sorrows of others as to a sense of their duty to help them. Children ought not to be full of feeling, but they should be full of the idea of duty. Many people, indeed, become hardhearted, where once they were pitiful, because they have so often been deceived. It is in vain to point out to children the meritorious side of actions. Religious teachers often make the mistake of representing acts of benevolence as meritorious, without seeing that all we can do for God is just to do what we are bound to do; and in doing good to the poor, we are only doing our duty. For the inequality of man arises only from accidental circumstances — if I possess wealth, to what do I owe it but to the laying hold of circumstances favourable to me or to my predecessors? — while our consideration of the whole remains ever the same.

Children should not be encouraged to compare themselves with others, but with an ideal standard of what is right and fitting

99. We only excite envy in a child by telling him to compare his own worth with the worth of others.

He ought rather to compare himself with a concept of his reason. For humility is really nothing else than the comparing of our own worth with the standard of moral perfection. Thus, for instance, the Christian religion makes people humble, not by preaching humility, but by teaching them to compare themselves with the highest pattern of perfection. It is very absurd to see humility in depreciating ourselves. 'See how such and such a child behaves himself!' An exclamation of this kind produces only a very ignoble mode of thinking; for if a man estimates his own worth by the worth of others, he either tries to elevate himself above others or to detract from another's worth. But this last is envy. We then only seek to impute faults to others, in order that we may compare favourably with them. Thus the spirit of emulation, wrongly applied, only arouses envy. Emulation may occasionally be used to good purpose, as when we tell a child, in order to convince him of the possibility of performing a certain task, that others could easily do it. We must on no account allow one child to humiliate another. We must seek to avoid every form of pride which is founded upon superiority of fortune. At the same time we must seek to cultivate frankness in the child. This is an unassuming confidence in himself, the possession of which places him in a position to exhibit his talents in a becoming manner. This self-confidence is to be distinguished from insolence, which is really indifference to the judgment of others.

Classification of cravings and vices

100. All the cravings of men are either formal (relating to freedom and power), or material (set upon a certain object) — that is to say, either cravings of imagination or enjoyment — or, finally, cravings for the continuation of these two things as elements of happiness. Cravings of the first kind are the lust of honour (ambition), the lust of power, and the lust of possession. Those of the second kind are sexual indulgence (voluptuousness), enjoyment of good things (good living), or the enjoyment of social intercourse (love of amusement).

Cravings of the third kind, finally, are love of life, love of health, and love of ease (freedom from care as regards the future).

Vices are either those of malice, baseness, or narrow-mindedness.

To the first belong envy, ingratitude, and joy at the misfortune of others. To the second kind belong injustice, unfaithfulness (deceitfulness), dissoluteness — and this in the squandering of wealth as well as of health (intemperance) and of honour.

Vices of the third kind are those of unkindness, niggardliness, and idleness (effeminacy).

Classification of virtues

101. Virtues are either virtues of merit or merely of obligation or of innocence.

To the first belong magnanimity (shown in self-conquest in times of anger or when tempted to ease and the lust of possession), benevolence, and self-command.

To the second belong honesty, propriety, peaceableness; and to the third, finally, belong honourableness, modesty, and content.

Man is by nature neither good nor bad. He becomes both, however — his inclinations urging him one way, while his reason would drive him in another

102. But is man by nature morally good or bad? He is neither, for he is not by nature a moral being. He only becomes a moral being when his reason has developed ideas of duty and law. One may say, however, that he has a natural inclination to every vice, for he has inclinations and instincts which would urge him one way, while his reason would drive him in another. He can only become morally good by means of virtue — that is to say, by self-restraint — though he may be innocent as long as his vicious inclinations lie dormant.

Vices, for the most part, arise in this way, that civilisation does violence to Nature; and yet our destiny as human beings is to emerge from our natural state as animals. Perfect art becomes second nature.

All depends on leading children to understand and accept correct principles

103. Everything in education depends upon establishing correct principles, and leading children to

understand and accept them. They must learn to substitute abhorrence for what is revolting and absurd, for hatred; the fear of their own conscience, for the fear of man and divine punishment; self-respect and inward dignity, for the opinions of men; the inner value of actions, for words and mere impulses; understanding, for feeling; and joyousness and piety with good humour, for a morose, timid, and gloomy devotion.

But above all things we must keep children from esteeming the merita fortunæ too highly.

The method of teaching children religion

104. In looking at the education of children with regard to religion, the first question which arises is whether it is practicable to impart religious ideas to children early in life. On this point much has been written in educational works. Religious ideas always imply a theology; and how can young people be taught theology when they do not yet know themselves, much less the world? Is the youth who as yet knows nothing of duty in the condition to comprehend an immediate duty towards God? This much is certain — that, could it be brought about that children should never witness a single act of veneration to God, never even hear the name of God spoken, it might then be the right order of things to teach them first about ends and aims, and of what concerns mankind; to sharpen their judgment; to instruct them in the order and beauty of the works of Nature; then add a wider knowledge of the structure of the universe; and then only might be revealed to them for the first time the idea of a Supreme Being — a Law-giver. But since this mode of proceeding is impossible, according to the present condition of society, and we cannot prevent children from hearing the name of God and seeing tokens of man's devotion to Him; if we were to teach them something about God only when they are grown up, the result would be either indifference or false ideas — for instance, terror of God's power. Since, then, it is to be feared that such ideas might find a dwelling-place in the child's imagination, to avoid it we should seek early to impart religious ideas to the child. But this instruction must not be merely the work of memory and imitation; the way chosen must be always in accordance with Nature. Children will understand — without abstract ideas of duty, of obligations, of good and bad conduct — that there is a law of duty which is not the same as ease, utility, or other considerations of the kind, but something universal, which is not governed by the caprice of men. The teacher himself, however, must form this idea.

At first we must ascribe everything to Nature, and afterwards Nature herself to God; showing at first, for instance, how everything is disposed for the preservation of the species and their equilibrium, but at the same time with consideration in the long run for man, that he may attain happiness.

The idea of God might first be taught by analogy with that of a father under whose care we are placed, and in this way we may with advantage point out to the child the unity of men as represented by one family.

Religion is morality applied to the knowledge of God. In teaching children we must begin with the law which is in us. Morality must come first, and theology follow

105. What, then, is religion? Religion is the law in us, in so far as it derives emphasis from a Law-giver and a Judge above us. It is morality applied to the knowledge of God. If religion is not united to morality, it becomes merely an endeavour to win favour. Hymnsinging, prayers, and church-going should only give men fresh strength, fresh courage to advance; or they should be the utterance of a heart inspired with the idea of duty. They are but preparations for good works, and not the works themselves; and the only real way in which we may please God is by our becoming better men.

In teaching a child we must first begin with the law which is in him. A vicious man is contemptible to himself, and this contempt is inborn, and does not arise in the first instance because God has forbidden vice; for it does not necessarily follow that the law-giver is the author of the law. A prince, for instance, may forbid stealing in his country without being called the original prohibitor of theft. From this, man learns to understand that it is a good life alone which makes him worthy of happiness. The divine law must at the same time be recognised as Nature's law, for it is not arbitrary. Hence religion belongs to all

morality.

We must not, however, begin with theology. The religion which is founded merely on theology can never contain anything of morality. Hence we derive no other feelings from it but fear on the one hand, and hope of reward on the other, and this produces merely a superstitious cult. Morality, then, must come first and theology follow; and that is religion.

Conscience is the representative of God

106. The law that is within us we call conscience. Conscience, properly speaking, is the application of our actions to this law. The reproaches of conscience would be without effect, if we did not regard it as the representative of God, who, while He has raised up a tribunal over us, has also established a judgment-seat within us. If religion is not added to moral conscientiousness, it is of no effect. Religion without moral conscientiousness is a service of superstition. People will serve God by praising Him and reverencing His power and wisdom, without thinking how to fulfil the divine law; nay, even without knowing and searching out His power, wisdom, and so on. These hymnsingings are an opiate for the conscience of such people, and a pillow upon which it may quietly slumber.

Children should be taught reverence and obedience to the divine will

107. Children cannot comprehend all religious ideas, notwithstanding there are some which we ought to teach them; these, however, must be more negative than positive. It is of no use whatever to let children recite formulæ; it only produces a misconception of piety. The true way of honouring God consists in acting in accordance with His will, and this is what we must teach children to do. We must see to it that the name of God is not so often taken in vain, and this by ourselves as well as by children. If we use it in congratulating our friends — even with pious intent — this also is a misuse of the holy name. The idea of God ought to fill people with reverence every time they hear His name spoken. And it should be pronounced but seldom and never lightly. The child must learn to feel reverence towards God, as the Lord of life and of the whole world; further, as one who cares for men, and lastly as their Judge. We are told of Newton that he never pronounced the name of God without pausing for a while and meditating upon it.

By uniting the idea of God and duty the child will learn to be kind to animals. He should be taught also to discover good in evil

108. Through an explanation which unites the ideas of God and of duty the child learns the better to respect the divine care for creatures, and will thus be kept from an inclination towards destruction and cruelty, which we so often see in the torture of small animals. At the same time we should teach the child to discover good in evil. For instance, beasts of prey and insects are patterns of cleanliness and diligence; so, too, evil men are a warning to follow the law; and birds, by waylaying worms, protect the garden; and so on.

Religious ideas should be taught to children early, though they should be few in number and merely negative

109. We must, then, give children some idea of the Supreme Being, in order that when they see others praying, and so on, they may know to whom they are praying, and why. But these ideas must be few in number, and, as has been said, merely negative. We must begin to impart them from early youth, being careful at the same time that they do not esteem men according to their religious observances, for, in spite of the diversity of religions, religion is everywhere the same.

At the time when the instinct of sex develops in the youth, he should be spoken to clearly and definitely on the subject

110. Here, in conclusion, we shall add a few remarks which should especially be observed by the youth as he approaches the years of early manhood. At this time the youth begins to make certain distinctions which he did not make formerly. In the first place, the distinction of sex. Nature has spread a certain veil of secrecy over this subject, as if it were something unseemly for man, and merely an animal need in him. She has, however, sought to unite it, as far as possible, with every kind of morality. Even

savage nations behave with a kind of shame and reserve in this matter. Children now and then ask curious questions; for instance, 'Where do children come from?' &c. They are, however, easily satisfied either at receiving an unreasonable answer which means nothing, or by being told that these are childish questions.

These inclinations develop mechanically in the youth, and, as is the way with all instincts, even without the knowledge of a particular object. Thus it is impossible to keep the youth in ignorance and the innocence which belongs to ignorance. By silence the evil is but increased. We see this in the education of our forefathers. In the education of the present day it is rightly assumed that we must speak openly, clearly, and definitely with the youth. We must allow that it is a delicate point, for we cannot look upon it as a subject for open conversation; but if we enter with sympathy into his new impulses all will go well.

The thirteenth or fourteenth year is usually the time in which the feeling of sex develops itself in the youth. (When it happens earlier it is because children have been led astray and corrupted through bad examples.) Their judgment also is then already formed, and at about this time Nature has prepared them for our discussing this matter with them.

Evil impulses may be escaped from by constant occupation. The youth should learn to respect women

111. Nothing weakens the mind as well as the body so much as the kind of lust which is directed towards themselves, and it is entirely at variance with the nature of man. But this also must not be concealed from the youth. We must place it before him in all its horribleness, telling him that in this way he will become useless for the propagation of the race, that his bodily strength will be ruined by this vice more than by anything else, that he will bring on himself premature old age, and that his intellect will be very much weakened, and so on.

We may escape from these impulses by constant occupation, and by devoting no more time to bed and sleep than is necessary. Through this constant occupation we may banish all such thoughts from our mind, for even if the object only remains in our imagination it eats away our vital strength. If we direct our inclination towards the other sex, there are at any rate certain obstacles in the way; if, however, they are directed towards ourselves, we may satisfy them at any time. The physical effects are extremely hurtful, but the consequences with regard to morality are even worse. The bounds of Nature are here overstepped and the inclination rages ceaselessly, since no real satisfaction can take place. The teachers of grown-up youths have propounded the question whether it is allowable for a youth to enter into relations with the other sex? If we must choose one of the two things, this is certainly better than the other. In the former he acts against Nature; in the latter he does not. Nature has called upon him to be a man so soon as he becomes of age, and to propagate his kind; the exigences, however, which exist for man in a civilised community render it sometimes impossible for him to marry and educate his children at that period. Herein he would be transgressing the social order. It is the best way — indeed, it is the duty of the young man — to wait till he is in a condition to marry. He acts then not only as a good man, but as a good citizen.

The youth should learn early to entertain a proper respect for the other sex; to win their esteem by an activity free from vice; and thus to strive after the high prize of a happy marriage.

With regard to distinctions of rank, the youth should be made conscious of the equality of men, as well as of their civil inequality

112. A second distinction which the youth begins to make about the time of his entrance into society consists in the knowledge of the distinction of rank and the inequality of men. As a child he must not be allowed to notice this. He must not even be allowed to give orders to the servants. If the child sees his parents giving orders to the servants, they may at any rate say to him: 'We give them their bread, and therefore they obey us — you do not, and therefore they need not obey you.' In fact, children would of themselves know nothing of this distinction, if only their parents did not give them this false notion. The young man should be shown that the inequality of man is an institution that has arisen on account of one man striving to get an advantage over another. The consciousness of the equality of men, together with

their civil inequality, may be taught him little by little.

In what way the moral character may best be maintained throughout life

113. We must accustom the youth to esteem himself absolutely and not relatively to others. The high esteem of others for what does not constitute the true value of men at all is vanity. Further, we must teach him to be conscientious in everything, and not merely to appear so, but to strive to be so. We must also make him heedful that in no matter about which he has well weighed a resolution shall it remain an empty resolution. Rather than this it is better to conceive of no resolution at all, and let the matter remain in doubt. He must be taught contentedness as regards outward circumstances, and patience in work — Sustine et abstine — moderation in pleasure. If we are not always thinking of pleasure, but will be patient in our work, we shall become useful members of the community and be kept from ennui.

Again, we must encourage the youth —

(1) To be cheerful and good-humoured. Cheerfulness arises from the fact of having nothing to reproach oneself with.

(2) To be even-tempered. By means of self-discipline one can train oneself to become a cheerful companion in society.

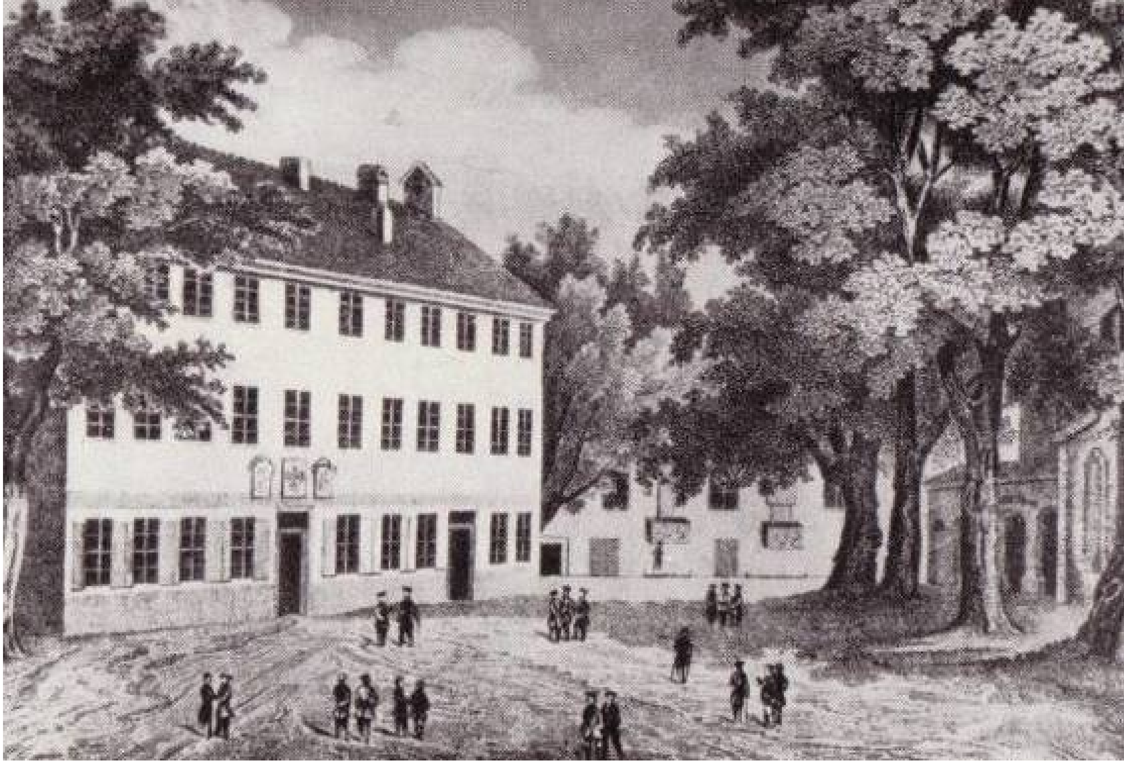
(3) To regard many things invariably as matters of duty. We must hold an action to be worthy, not because it falls in with our inclinations, but because in performing it we fulfil our duty.

(4) In love towards others, as well as to feelings of cosmopolitanism. There exists something in our minds which causes us to take an interest (a) in ourselves, (b) in those with whom we have been brought up, and (c) there should also be an interest in the progress of the world. Children should be made acquainted with this interest, so that it may give warmth to their hearts. They should learn to rejoice at the world’s progress, although it may not be to their own advantage or to that of their country.

(5) To set little store by the enjoyment of the good things of life. The childish fear of death will then disappear — we must point out to the youth that the anticipations of pleasure are not realised in its fulfilment.

Lastly, by pointing out the necessity of daily ‘settling accounts’ with himself, so that at the end of life he may be able to make an estimate with regard to its value.

The Criticism



In 1740, aged 16, Kant enrolled at the University of Königsberg, where he spent his whole career. He studied the philosophy of Gottfried Leibniz and Christian Wolff under Martin Knutzen (Associate Professor of Logic and Metaphysics from 1734 until his death in 1756), a rationalist who was also familiar with developments in British philosophy and science and introduced Kant to the new mathematical physics of Isaac Newton.

PREFACE

The *Critique of Pure Reason* is more obscure and difficult than even a metaphysical treatise has any right to be. The difficulties are not merely due to defects of exposition; they multiply rather than diminish upon detailed study; and, as I shall endeavour to show in this *Commentary*, are traceable to two main causes, the composite nature of the text, written at various dates throughout the period 1772-1780, and the conflicting tendencies of Kant's own thinking.

The *Commentary* is both expository and critical; and in exposition no less than in criticism I have sought to subordinate the treatment of textual questions and of minor issues to the systematic discussion of the central problems. Full use is made of the various selections from Kant's private papers that have appeared, at intervals, since the publication of his *Lectures on Metaphysics* in 1821. Their significance has not hitherto been generally recognised in English books upon Kant. They seem to me to be of capital importance for the right understanding of the *Critique*.

Some apology is perhaps required for publishing a work of this character at the present moment. It was completed, and arrangements made for its publication, shortly before the outbreak of war. The printers have, I understand, found in it a useful stop-gap to occupy them in the intervals of more pressing work; and now that the type must be released, I trust that in spite of, or even because of, the overwhelming preoccupations of the war, there may be some few readers to whom the volume may be not unwelcome. That even amidst the distractions of actual campaigning metaphysical speculation can serve as a refuge and a solace is shown by the {viii}memorable example of General Smuts. He has himself told us that on his raid into Cape Colony in the South African War he carried with him for evening reading the *Critique of Pure Reason*. Is it surprising that our British generals, pitted against so unconventional an opponent, should have been worsted in the battle of wits?

The *Critique of Pure Reason* is a philosophical classic that marks a turning-point in the history of philosophy, and no interpretation, even though now attempted after the lapse of a hundred years, can hope to be adequate or final. Some things are clearer to us than they were to Kant's contemporaries; in other essential ways our point of view has receded from his, and the historical record, that should determine our judgments, is far from complete. But there is a further difficulty of an even more serious character. The *Critique* deals with issues that are still controversial, and their interpretation is possible only from a definite standpoint. The limitations of this standpoint and of the philosophical *milieu* in which it has been acquired unavoidably intervene to distort or obscure our apprehension of the text. Arbitrary and merely personal judgments I have, however, endeavoured to avoid. My sole aim has been to reach, as far as may prove feasible, an unbiassed understanding of Kant's great work.

Among German commentators I owe most to Vaihinger, Adickes, B. Erdmann, Cohen, and Riehl, especially to the first named. The chief English writers upon Kant are Green, Caird, and Adamson. In so far as Green and Caird treat the Critical philosophy as a half-way stage to the Hegelian standpoint I find myself frequently in disagreement with them; but my indebtedness to their writings is much greater than my occasional criticisms of their views may seem to imply. With Robert Adamson I enjoyed the privilege of personal discussions at a time when his earlier view of Kant's teaching was undergoing revision in a more radical manner than is apparent even in his posthumously published University lectures. To the stimulus of his suggestions the writing of this *Commentary* is largely due.

My first study of the *Critique* was under the genial and inspiring guidance of Sir Henry Jones. With characteristic kindliness he has read through my manuscript and has{ix} disclosed to me many defects of exposition and argument. The same service has been rendered me by Professor G. Dawes Hicks, whose criticisms have been very valuable, particularly since they come from a student of Kant who on many

fundamental points takes an opposite view from my own.

I have also to thank my colleague, Professor Oswald Veblen, for much helpful discussion of Kant's doctrines of space and time, and of mathematical reasoning.

Mr. H. H. Joachim has read the entire proofs, and I have made frequent modifications to meet his very searching criticisms. I have also gratefully adopted his revisions of my translations from the *Critique*. Similar acknowledgments are due to my colleague, Professor A. A. Bowman, and to my friend Dr. C. W. Hendel.

I have in preparation a translation of the *Critique of Pure Reason*, and am responsible for the translations of all passages given in the present work. In quoting from Kant's other writings, I have made use of the renderings of Abbott, Bernard, and Mahaffy; but have occasionally allowed myself the liberty of introducing alterations.

Should readers who are already well acquainted with the *Critique* desire to use my *Commentary* for its systematic discussions of Kant's teaching, rather than as an accompaniment to their study of the text, I may refer them to those sections which receive italicised headings in the table of contents.

NORMAN KEMP SMITH.

London, *January 1918*.{xi}

NOTE

In all references to the *Kritik der Reinen Vernunft* I have given the original pagings of both the first and second editions. References to Kant's other works are, whenever possible, to the volumes thus far issued in the new Berlin edition. As the *Reflexionen Kants zur Kritik der reinen Vernunft* had not been published in this edition at the time when the *Commentary* was completed, the numbering given is that of B. Erdmann's edition of 1884.

ABBREVIATIONS

Berlin edition of Kant's works
W

Pagings in the first edition of the *Kritik der reinen Vernunft*
A

Pagings in the second edition
B

Adickes' edition of the *Kritik der reinen Vernunft* (1889)

INTRODUCTION

I. TEXTUAL

KANT'S METHOD OF COMPOSING THE 'CRITIQUE OF PURE REASON'

SELDOM, in the history of literature, has a work been more conscientiously and deliberately thought out, or more hastily thrown together, than the *Critique of Pure Reason*. The following is the account which Kant in a letter to Moses Mendelssohn (August 16, 1783) has given of its composition:

"[Though the *Critique* is] the outcome of reflection which had occupied me for a period of at least twelve years, I brought it to completion in the greatest haste within some four to five months, giving the closest attention to the content, but with little thought of the exposition or of rendering it easy of comprehension by the reader — a decision which I have never regretted, since otherwise, had I any longer delayed, and sought to give it a more popular form, the work would probably never have been completed at all. This defect can, however, be gradually removed, now that the work exists in a rough form."

These statements must be allowed the greater weight as Kant, in another letter (to Garve, August 7, 1783), has given them in almost the same words:

"I freely admit that I have not expected that my book should meet with an immediate favourable reception. The exposition of the materials which for more than twelve successive years I had been carefully maturing, was not composed in a sufficiently suitable manner for general comprehension. For the perfecting of its exposition several years would have been required, whereas I brought it to completion in some four to five months, in the fear that, on longer delay, so prolonged a labour might finally become burdensome, and that my increasing years (I am already in my sixtieth year) would perhaps incapacitate me, while I am still the sole possessor of my complete system."

{xx}

The twelve years here referred to are 1769-1780; the phrase "at least twelve years" indicates Kant's appreciation of the continuity of his mental development. Hume's first influence upon Kant is probably to be dated prior to 1760. The choice, however, of the year 1769 is not arbitrary; it is the year of Kant's adoption of the semi-Critical position recorded in the *Inaugural Dissertation* (1770). The "four to five months" may be dated in the latter half of 1780. The printing of the *Critique* was probably commenced in December or January 1780-1781.

But the *Critique* is not merely defective in clearness or popularity of exposition. That is a common failing of metaphysical treatises, especially when they are in the German language, and might pass without special remark. What is much more serious, is that Kant flatly contradicts himself in almost every chapter; and that there is hardly a technical term which is not employed by him in a variety of different and conflicting senses. As a writer, he is the least exact of all the great thinkers.

So obvious are these inconsistencies that every commentator has felt constrained to offer some explanation of their occurrence. Thus Caird has asserted that Kant opens his exposition from the non-Critical standpoint of ordinary consciousness, and that he discloses the final position, towards which he has all along been working, only through repeated modifications of his preliminary statements. Such a view, however, cannot account either for the specific manner of occurrence or for the actual character of the contradictions of which the *Critique* affords so many examples. These are by no means limited to the opening sections of its main divisions; and careful examination of the text shows that they have no such

merely expository origin. The publication of Kant's *Reflexionen* and *Lose Blätter*, and the devoted labours of Benno Erdmann, Vaihinger, Adickes, Reicke and others, have, indeed, placed the issue upon an entirely new plane. It can now be proved that the *Critique* is not a unitary work, and that in the five months in which, as Kant tells us, it was "brought to completion" (*zu Stande gebracht*), it was not actually written, but was pieced together by the combining of manuscripts written at various dates throughout the period 1772-1780.

Kant's correspondence in these years contains the repeated assertion that he expected to be able to complete the work within some three or six months. This implies that it was already, at least as early as 1777, in great part committed{xxi} to writing. In 1780 Kant must therefore have had a large body of manuscript at his disposal. The recently published *Lose Blätter* are, indeed, part of it. And as we shall have constant occasion to observe, the *Critique* affords ample evidence of having been more or less mechanically constructed through the piecing together of older manuscript, supplemented, no doubt, by the insertion of connecting links, and modified by occasional alterations to suit the new context. Kant, it would almost seem, objected to nothing so much as the sacrifice of an argument once consecrated by committal to paper. If it could be inserted, no matter at what cost of repetition, or even confusion, he insisted upon its insertion. Thus the *Subjective* and *Objective Deductions* of the first edition can, as we shall find, be broken up into at least four distinct layers, which, like geological strata, remain to the bewilderment of the reader who naturally expects a unified system, but to the enlightenment of the student, once the clues that serve to identify and to date them have been detected. To cite another example: in the *Second Analogy*, as given in the first edition, the main thesis is demonstrated in no less than five distinct proofs, some of which are repetitions; and when Kant restated the argument in the second edition, he allowed the five proofs to remain, but superimposed still another upon them. Kant does, indeed, in the second edition omit some few passages from various parts of the *Critique*; but this is in the main owing to his desire to protect himself against serious misunderstanding to which, as he found, he had very unguardedly laid himself open. The alterations of the second edition are chiefly of the nature of additions.

Adickes' theory that Kant in the "four to five months" composed a brief outline of his entire argument, and that it was upon the framework of this outline that the *Critique* was elaborated out of the older manuscript, may possibly be correct. It has certainly enabled Adickes to cast much light upon many textual problems. But his own supplementary hypothesis in regard to the section on the *Antinomies*, namely, that it formed an older and separate treatise, may very profitably be further extended. Surely it is unlikely that with the expectation, continued over many years, of completion within a few months, Kant did not possess, at least for the *Aesthetic*, *Dialectic*, and *Methodology*, a general outline, that dated further back than 1780. And doubtless this outline was itself altered, patched, and recast, in proportion as insight into the problems of the *Analytic*, the problems, that is to say,{xxii} which caused publication to be so long deferred, deepened and took final form.

The composite character of the *Critique* is largely concealed by the highly elaborate, and extremely artificial, arrangement of its parts. To the general plan, based upon professedly logical principles, Kant has himself given the title, architectonic; and he carries it out with a thoroughness to which all other considerations, and even at times those of sound reasoning, are made to give way. Indeed, he clings to it with the unreasoning affection which not infrequently attaches to a favourite hobby. He lovingly elaborates even its minor detail, and is rewarded by a framework so extremely complicated that the most heterogeneous contents can be tidily arranged, side by side, in its many compartments. By its uniformity and rigour it gives the appearance of systematic order even when such order is wholly absent.

But we have still to consider the chief reason for the contradictory character of the contents of the *Critique*. It is inseparably bound up with what may perhaps be regarded as Kant's supreme merit as a philosophical thinker, especially as shown in the first *Critique*, — namely, his open-minded recognition of the complexity of his problems, and of the many difficulties which lie in the way of any solution which

he is himself able to propound. Kant's method of working seems to have consisted in alternating between the various possible solutions, developing each in turn, in the hope that some midway position, which would share in the merits of all, might finally disclose itself. When, as frequently happened, such a midway solution could not be found, he developed his thought along the parallel lines of the alternative views.

"You know that I do not approach reasonable objections with the intention merely of refuting them, but that in thinking them over I always weave them into my judgments, and afford them the opportunity of overturning all my most cherished beliefs. I entertain the hope that by thus viewing my judgments impartially from the standpoint of others some third view that will improve upon my previous insight may be obtainable.... Long experience has taught me that insight into a subject which I am seeking to master is not to be forced, or even hastened, by sheer effort, but demands a fairly prolonged period during which I return again and again to the same concepts, viewing them in all their aspects and in their widest possible connections, while in the intervals the sceptical spirit awakens, and makes trial whether my conclusions can withstand a {xxiii}searching criticism." "In mental labour of so delicate a character nothing is more harmful than preoccupation with extraneous matters. The mind, though not constantly on the stretch, must still, alike in its idle and in its favourable moments, lie uninterruptedly open to any chance suggestion which may present itself. Relaxations and diversions must maintain its powers in freedom and mobility, so that it may be enabled to view the object afresh from every side, and so to enlarge its point of view from a microscopic to a universal outlook that it adopts in turn every conceivable standpoint, verifying the observations of each by means of all the others." "I am not of the opinion of the well-meaning writer who has recommended us never to allow doubts in regard to a matter upon which we have once made up our minds. In pure philosophy that is not feasible. Indeed the understanding has in itself a natural objection to any such procedure. We must consider propositions in all their various applications; even when they may not seem to require a special proof, we must make trial of their opposites, and in this way fight for delay, until the truth becomes in all respects evident."

That these are no mere pious expressions of good intention, but represent Kant's actual method of working, is amply proved by the contents of the *Critique*. We find Kant constantly alternating between opposed standpoints, to no one of which he quite definitely commits himself, and constantly restating his principles in the effort to remove the objections to which, as he recognises, they continue to lie open. The *Critique*, as already stated, is not the exposition of a single unified system, but is the record of Kant's manifold attempts to formulate and to solve his many-sided problems. Even those portions of the *Critique* which embody his latest views show that Kant is still unwilling to sacrifice insight to consistency. When he is guilty of special pleading — for he cannot be altogether absolved even from that charge — it is in the interests of his logical architectonic, for which, as I have said, he cherishes a quite unreasoning affection, and not of his central principles. So far from concealing difficulties, or unduly dwelling upon the favouring considerations, Kant himself emphasises the outstanding objections to which his conclusions remain subject. If his teaching is on certain points very definite, it is in other hardly less important respects largely tentative.

The value of Kant's *Critique* as an introduction to modern philosophy is greatly enhanced by this method of procedure. The student who has steeped himself in the atmosphere of the *Critique*, however dissatisfied he may perhaps be with many of its doctrines, has become familiar with the main requirements{xxiv} which a really adequate metaphysics must fulfil, or at least will have acquired a due sense of the complexity of the problems with which it deals.

Recognition of the composite nature of the text will safeguard us in two ways. In the first place, citation of single passages is quite inconclusive. Not only must all the relevant passages be collated; they must be interpreted in the light of an historical understanding of the various stages in Kant's development. We must also be prepared to find that on certain main questions Kant hesitates between opposed positions, and that

he nowhere definitively commits himself to any quite final expression of view.

Secondly, we cannot proceed on the assumption that Kant's maturest teaching comes where, had the *Critique* been a unitary work, composed upon a definite and previously thought out plan, we should naturally expect to find it, namely, in its concluding portions. The teaching of much of the *Dialectic*, especially in its account of the nature of the phenomenal world and of its relation to the knowing mind, is only semi-Critical. This is also true of Kant's *Introduction* to the *Critique*. Introductions are usually written last; and probably Kant's *Introduction* was written after the completion of the *Aesthetic*, of the *Dialectic*, and of the *Analytic* in its earlier forms. But it bears all the signs of having been composed prior to the working out of several of his most characteristic doctrines in the central parts of the *Analytic*.

Thus both Kant's introductory statements of the aims and purposes of the *Critique*, and his application of his results in the solution of metaphysical problems, fail to represent in any adequate fashion the new and revolutionary principles to which he very gradually but successfully worked his way. The key to the *Critique* is given in the central portions of the *Analytic*, especially in the *Deduction of the Categories*. The other parts of the *Critique* reveal the Critical doctrines only as gradually emerging from the entangling influence of pre-Critical assumptions. Their teaching has to be radically remodelled before they can be made to harmonise with what, in view both of their intrinsic character and of the corresponding alterations in the second edition, must be regarded as Kant's maturest utterances.

This was a task which Kant never himself attempted. For no sooner had he attained to comparative clearness in regard to his new Critical principles and briefly expounded them in the *Analytic* of the first edition, than he hastened to apply them in the spheres of morality, aesthetics, and teleology. When the *Critique* appeared in 1781 he was fifty-{xxv}seven years of age; and he seems to have feared that if he allowed these purely theoretical problems, which had already occupied his main attention for "at least twelve years," to detain him longer, he would be debarred from developing and placing on permanent record the new metaphysics of ethics which, as the references in the first *Critique* show, had already begun to shape itself in his mind. To have expended further energy upon the perfecting of his theoretical philosophy would have endangered its own best fruits. Even the opportunity in 1787 of a second edition of the *Critique* he used very sparingly, altering or adding only where occasional current criticism — his puzzled contemporaries having still for the most part maintained a discreet silence — had clearly shown that his modes of exposition were incomplete or misleading.

II. HISTORICAL

KANT'S RELATION TO HUME AND TO LEIBNIZ

Kant's manner of formulating his fundamental problem — How are synthetic *a priori* judgments possible? — may well seem to the modern reader to imply an unduly scholastic and extremely rationalistic method of approach. Kant's reasons for adopting it have, unfortunately, been largely obscured, owing to the mistaken interpretation which has usually been given to certain of his personal utterances. They have been supposed to prove that the immediate occasion of the above formula was Hume's discussion of the problem of causality in the *Enquiry into the Human Understanding*. Kant, it is argued, could not have been acquainted with Hume's earlier and more elaborate *Treatise on Human Nature*, of which there was then no translation; and his references to Hume must therefore concern only the later work.

Vaihinger has done valuable service in disputing this reading of Kant's autobiographical statements. Kant does not himself make direct mention of the *Enquiry*, and the passages in the *Critique* and in the *Prolegomena* in which Hume's teaching is under consideration seem rather to point to the wider argument

of the *Treatise*. This is a matter of no small importance; for if Vaihinger's view can be established, it will{xxvi} enable us to appreciate, in a manner otherwise impossible, how Kant should have come to regard the problem of *a priori synthesis* as being the most pressing question in the entire field of speculative philosophy.

The essential difference between the *Treatise* and the *Enquiry*, from the standpoint of their bearing upon Critical issues, lies in the wider scope and more radical character of the earlier work. The *Enquiry* discusses the problem of causality only in the form in which it emerges in *particular* causal judgments, *i.e.* as to our grounds for asserting that this or that effect is due to this or that cause. In the *Treatise*, Hume raises the broader question as to our right to postulate that events must always be causally determined. In other words, he there questions the validity of the *universal* causal principle, that whatever begins to exist must have a cause of existence; and he does so on the explicit ground that it demands as necessary the connecting of two concepts, that of an event and that of an antecedent cause, between which *no connection of any kind* can be detected by the mind. The principle, that is to say, is not self-evident; it is synthetic. The concept of an event and the concept of a cause are quite separate and distinct ideas. Events can be conceived without our requiring to think antecedent events upon which they are dependent. Nor is the principle capable of demonstration. For if it be objected that in questioning its validity we are committing ourselves to the impossible assertion that events arise out of nothing, such argument is only applicable if the principle be previously granted. If events do not require a cause, it is as little necessary to seek their source in a generation out of nothing as in anything positive. Similarly, when it is argued that as all the parts of time and space are uniform, there must be a cause determining an event to happen at one moment and in one place rather than at some other time or place, the principle is again assumed. There is no greater difficulty in supposing the time and place to be fixed without a cause than in supposing the existence to be so determined. The principle, Hume concludes, is non-rational in character. It is an instrument useful for the organisation of experience; and for that reason nature has determined us to its formation and acceptance. Properly viewed, it expresses a merely instinctive belief, and is explicable only in the naturalistic manner of our other propensities, as necessary to the fulfilling of some practical need. "Nature has determined us to judge as well as to breathe and feel."

From this naturalistic position Hume makes a no less vigorous attack upon the empirical philosophies which profess{xxvii} to establish general principles by inductive inference from the facts of experience. If the principles which lie at the basis of our experience are non-rational in character, the same must be true of our empirical judgments. They may correctly describe the uniformities that have hitherto occurred in the sequences of our sensations, and may express the natural expectations to which they spontaneously give rise; but they must never be regarded as capable of serving as a basis for inference. In eliminating *a priori* principles, and appealing exclusively to sense-experience, the empiricist removes all grounds of distinction between inductive inference and custom-bred expectation. And since from this standpoint the possibility of universal or abstract concepts — so Hume argues — must also be denied, deductive inference must likewise be eliminated from among the possible instruments at the disposal of the mind. So-called inference is never the source of our beliefs; it is our fundamental natural beliefs, as determined by the constitution of our nature in its reaction upon external influences, that generate those expectations which, however they may masquerade in logical costume, have as purely natural a source as our sensations and feelings. Such, briefly and dogmatically stated, is the sum and substance of Hume's teaching.

Now it was these considerations that, as it would seem, awakened Kant to the problem of *a priori synthesis*. He was, and to the very last remained, in entire agreement with Hume's contention that the principle of causality is neither self-evident nor capable of logical demonstration, and he at once realised that what is true of this principle must also hold of all the other principles fundamental to science and philosophy. Kant further agreed that inductive inference from the data of experience is only possible upon

the prior acceptance of rational principles independently established; and that we may not, therefore, look to experience for proof of their validity. Thus with the rejection of self-evidence as a feature of the *a priori*, and with the consequent admission of its synthetic character, Kant is compelled to acquiesce in the inevitableness of the dilemma which Hume propounds. Either Hume's sceptical conclusions must be accepted, or we must be able to point to some criterion which is not subject to the defects of the rationalist and empirical methods of proof, and which is adequate to determine the validity or invalidity of general principles. Is there any such alternative? Such is Kant's problem as{xxviii} expressed in the formula: How are synthetic *a priori* judgments possible?

It is a very remarkable historical fact that notwithstanding the clearness and cogency of Hume's argument, and the appearance of such competent thinkers as Thomas Reid in Scotland, Lambert and Crusius in Germany, no less than thirty years should have elapsed before Hume found a single reader capable of appreciating the teaching of the *Treatise* at its true value. Even Kant himself was not able from his reading of the *Enquiry* in 1756-1762 to realise the importance and bearing of the main problem. Though in the *Enquiry* the wider issue regarding the general principle of causality is not raised, the bearing of Hume's discussion, when interpreted in the light of Kant's own teaching, is sufficiently clear; and accordingly we cannot be absolutely certain that it was not a re-reading of the *Enquiry* or a recalling of its argument that suggested to Kant the central problem of his Critical philosophy. The probability, however, is rather that this awakening took place only indirectly through his becoming acquainted with the wider argument of the *Treatise* as revealed in James Beattie's extremely crude and unsympathetic criticism of Hume's philosophy. Beattie had great natural ability, and considerable literary power. His prose writings have a lucidity, a crispness, and a felicity of illustration which go far to explain their widespread popularity in the latter half of the eighteenth century. Their literary quality is, however, more than counterbalanced by the absence of any genuine appreciation{xxix} of the deeper, speculative implications and consequences of the problems discussed. And this being so, he is naturally at his worst in criticising Hume. In insisting, as he does, upon the absurd practical results that would follow from the adoption of Hume's sceptical conclusions, he is merely exploiting popular prejudice in the philosophical arena. That, however, may be forgiven him, if, as would seem to be the case, the quotations which he gives verbatim from Hume's *Treatise* really first revealed to Kant the scope and innermost meaning of Hume's analysis of the causal problem.

The evidence in support of this contention is entirely circumstantial. The German translation of Beattie's *Essay on the Nature and Immutability of Truth* was published at Easter 1772, *i.e.* in the year in which Kant, in the process of his own independent development, came, as is shown by his famous letter to Herz, to realise the mysterious, problematic character of *a priori* knowledge *of the independently real*. He was then, however, still entirely unconscious of the deeper problem which at once emerges upon recognition that *a priori* principles, quite apart from all question of their objective validity, are synthetic in form. We know that Kant was acquainted with Beattie's work; for he twice refers to Beattie's criticism of Hume. What more probable than that he read the translation in the year of its publication, or at least at some time not very long subsequent to the date of the letter to Herz? The passages which Beattie quotes from the *Treatise* are exactly those that were necessary to reveal the full scope of Hume's revolutionary teaching in respect to the general principle of causality. There seems, indeed, little doubt that this must have been the channel through which Hume's influence chiefly acted. Thus at last, by a circuitous path, through the quotations of an adversary, Hume awakened philosophy from its dogmatic slumber, and won for his argument that appreciation which despite its cogency it had for thirty years so vainly demanded.{xxx}

Let us now turn our attention to the rationalist philosophy in which Kant was educated. Hume's contention that experience cannot by itself justify any inductive inference, forms the natural bridge over which we can best pass to the contrasting standpoint of Leibniz. Hume and Leibniz find common ground in

denouncing empiricism. Both agree in regarding it as the mongrel offspring of conflicting principles. If rationalism cannot hold its own, the alternative is not the finding of firm foothold in concrete experience, but only such consolation as a sceptical philosophy may afford. The overthrow of rationalism means the destruction of metaphysics in every form. Even mathematics and the natural sciences will have to be viewed as fulfilling a practical end, not as satisfying a theoretical need. But though Leibniz's criticism of empiricism is, in its main contention, identical with that of Hume, it is profoundly different both in its orientation and in the conclusions to which it leads. While Hume maintains that induction must be regarded as a non-rational process of merely instinctive anticipation, Leibniz argues to the self-legislative character of pure thought. Sense-experience reveals reality only in proportion as it embodies principles derived from the inherent character of thought itself. Experience conforms to *a priori* principles, and so can afford an adequate basis for scientific induction.

There is a passage in Hume's *Enquiry* which may be employed to illustrate the boldly speculative character of Leibniz's interpretation of the nature and function of human thought. "Nothing ... [seems] more unbounded than the thought of man, which not only escapes all human power and authority, but is not even restrained within the limits of nature and reality.... While the body is confined to one planet, along which it creeps with pain and difficulty, the thought can in an instant transport us into the most distant regions of the universe.... What never was seen, or heard of, may yet be conceived; nor is anything beyond the power of thought, except what implies an absolute contradiction." This passage in which Hume means to depict a false belief, already sufficiently condemned by the absurdity of its claims, expresses for Leibniz the wonderful but literal truth. Thought is the revealer of an eternal unchanging reality, and its validity{xxxi} is in no way dependent upon its verification through sense. When Voltaire in his *Ignorant Philosopher* remarks that "it would be very singular that all nature, all the planets, should obey eternal laws, and that there should be a little animal, five feet high, who, in contempt of these laws, could act as he pleased, solely according to his caprice," he is forgetting that this same animal of five feet can contain the stellar universe in thought within himself, and has therefore a dignity which is not expressible in any such terms as his size may seem, for vulgar estimation, to imply. Man, though dependent upon the body and confined to one planet, has the sun and stars as the playthings of his mind. Though finite in his mortal conditions, he is divinely infinite in his powers.

Leibniz thus boldly challenges the sceptical view of the function of reason. Instead of limiting thought to the translating of sense-data into conceptual forms, he claims for it a creative power which enables it out of its own resources to discover for itself, not only the actual constitution of the material world, but also the immensely wider realm of possible entities. The real, he maintains, is only one of the many kingdoms which thought discovers for itself in the universe of truth. It is the most comprehensive and the most perfect, but still only one out of innumerable others which unfold themselves to the mind in pure thought. Truth is not the abstracting of the universal aspects in things, not a copy of reality, dependent upon it for meaning and significance. Truth is wider than reality, is logically prior to it, and instead of being dependent upon the actual, legislates for it. Leibniz thus starts from the possible, as discovered by pure thought, to determine in an *a priori* manner the nature of the real.

This Leibnizian view of thought may seem, at first sight, to be merely the re-emergence of the romantic, rationalistic ideal of Descartes and Malebranche. So to regard it would, however, be a serious injustice. It was held with full consciousness of its grounds and implications, and reality was metaphysically reinterpreted so as to afford it a genuine basis. There was nothing merely mystical and nothing undefined in its main tenets. Leibniz differs from Malebranche in being himself a profound mathematician, the co-discoverer with Newton of the differential calculus. He also differs from Descartes in possessing an absorbing interest in the purely logical aspects of the problem of method; and was therefore equipped in a supreme degree for determining{xxxii} in genuinely scientific fashion the philosophical significance and value of the mathematical disciplines.

Hume and Leibniz are thus the two protagonists that dwarf all others. They realised as neither Malebranche, Locke, nor Berkeley, neither Reid, Lambert, Crusius, nor Mendelssohn ever did, the really crucial issues which must ultimately decide between the competing possibilities. Each maintained, in the manner prescribed by his general philosophy, one of what then appeared to be the only two possible views of the function of thought. The alternatives were these: (*a*) Thought is merely a practical instrument for the convenient interpretation of our human experience; it has no objective or metaphysical validity of any kind; (*b*) Thought legislates universally; it reveals the wider universe of the eternally possible; and prior to all experience can determine the fundamental conditions to which that experience must conform. Or to interpret this opposition in logical terms: (*a*) The fundamental principles of experience are synthetic judgments in which no relation is discoverable between subject and predicate, and which for that reason can be justified neither *a priori* nor by experience; (*b*) all principles are analytic, and can therefore be justified by pure thought.

The problem of Kant's *Critique*, broadly stated, consists in the examination and critical estimate of these two opposed views. There is no problem, scientific, moral, or religious, which is not vitally affected by the decision which of these alternatives we are to adopt, or what reconciliation of their conflicting claims we hope to achieve. Since Kant's day, largely owing to the establishment of the evolution theory, this problem has become only the more pressing. The naturalistic, instrumental view of thought seems to be immensely reinforced by biological authority. Thought would seem to be reduced to the level of sense-affection, and to be an instrument developed through natural processes for the practical purposes of adaptation. Yet the counter-view has been no less powerfully strengthened by the victorious march of the mathematical sciences. They have advanced beyond the limits of Euclidean space, defining possibilities such as no experience reveals to us. The Leibnizian view has also been reinforced by the successes of physical science in determining what would seem to be the actual, objective character of the independently real. Kant was a rationalist by education, temperament, and conviction. Consequently his problem was to reconcile Leibniz's view of the function of thought with Hume's proof of the synthetic character of the causal{xxxiii} principle. He strives to determine how much of Leibniz's belief in the legislative power of pure reason can be retained after full justice has been done to Hume's damaging criticisms. The fundamental principles upon which all experience and all knowledge ultimately rest are *synthetic* in nature: how is it possible that they should also be *a priori*? Such is the problem that was Kant's troublous inheritance from his philosophical progenitors, Hume and Leibniz.

III. GENERAL

In indicating some of the main features of Kant's general teaching, I shall limit myself to those points which seem most helpful in preliminary orientation, or which are necessary for guarding against the misunderstandings likely to result from the very radical changes in terminology and in outlook that have occurred in the hundred and thirty years since the publication of the *Critique*. Statements which thus attempt to present in outline, and in modern terms, the more general features of Kant's philosophical teaching will doubtless seem to many of my readers dogmatic in form and highly questionable in content. They must stand or fall by the results obtained through detailed examination of Kant's *ipsissima verba*. Such justification as I can give for them will be found in the body of the *Commentary*.

I. THE NATURE OF THE *A PRIORI*

The fundamental presupposition upon which Kant's argument rests — a presupposition never itself investigated but always assumed — is that universality and necessity cannot be reached by any process that is empirical in character. By way of this initial assumption Kant arrives at the conclusion that the *a*

priori, the distinguishing characteristics of which are universality and necessity, is not given in sense but is imposed by the mind; or in other less ambiguous terms, is not part of the matter of experience but constitutes its form. The matter of experience is here taken as equivalent to sensation; while sensation, in turn, is regarded as being the non-relational.

The explanation of Kant's failure either to investigate or to prove this assumption has already been indicated. Leibniz{xxxiv} proceeds upon the assumption of its truth no less confidently than Hume, and as Kant's main task consisted in reconciling what he regarded as being the elements of truth in their opposed philosophies, he very naturally felt secure in rearing his system upon the one fundamental presupposition on which they were able to agree. It lay outside the field of controversy, and possessed for Kant, as it had possessed for Hume and for Leibniz, that authoritative and axiomatic character which an unchallenged preconception tends always to acquire.

The general thesis, that the universal and necessary elements in experience constitute its form, Kant specifies in the following determinate manner. The form is fixed for all experience, that is to say, it is one and the same in each and every experience, however simple or however complex. It is to be detected in consciousness of duration no less than in consciousness of objects or in consciousness of self. For, as Kant argues, consciousness of duration involves the capacity to distinguish between subjective and objective succession, and likewise involves recognition with its necessary component self-consciousness. Or to state the same point of view in another way, human experience is a temporal process and yet is always a consciousness of meaning. As temporal, its states are ordered successively, that is, externally to one another; but the consciousness which they constitute is at each and every moment the awareness of some single unitary meaning by reference to which the contents of the successive experiences are organised. The problem of knowledge may therefore be described as being the analysis of the consciousness of duration, of objectivity, and of self-consciousness, or alternatively as the analysis of our awareness of meaning. Kant arrives at the conclusion that the conditions of all four are one and the same.

Kant thus teaches that experience in all its embodiments and in each of its momentary states can be analysed into an endlessly variable material and a fixed set of relational elements. And as no one of the relational factors can be absent without at once nullifying all the others, they together constitute what must be regarded as the determining form and{xxxv} structure of every mental process that is cognitive in character. Awareness, that is to say, is identical with the act of judgment, and therefore involves everything that a judgment, in its distinction from any mere association of ideas, demands for its possibility.

Kant's position, when thus stated, differs from that of Leibniz only in its clearer grasp of the issues and difficulties involved, and consequently in the more subtle, pertinacious, and thoroughgoing character of the argument by which it is established. Its revolutionary character first appears when Kant further argues, in extension of the teaching of Hume, that the formal, relational elements are of a *synthetic* nature. The significance and scope of this conclusion can hardly be exaggerated. No other Kantian tenet is of more fundamental importance. With it the main consequences of Kant's Critical teaching are indissolubly bound up. *As the principles which lie at the basis of our knowledge are synthetic, they have no intrinsic necessity, and cannot possess the absolute authority ascribed to them by the rationalists.* They are prescribed to human reason, but cannot be shown to be inherently rational in any usual sense of that highly ambiguous term. They can be established only as brute conditions, verifiable in fact though not demonstrable in pure theory (if there be any such thing), of our actual experience. They are conditions of *sense*-experience, and that means of our knowledge of appearances, never legitimately applicable in the deciphering of ultimate reality. They are valid within the realm of experience, useless for the construction of a metaphysical theory of things in themselves. This conclusion is reinforced when we recognise that human experience, even in its fundamental features (*e.g.* the temporal and the spatial), might conceivably be altogether different from what it actually is, and that its presuppositions are always, therefore, of the

same contingent character. Even the universality and necessity which Kant claims to have established for his *a priori* principles are of this nature. Their necessity is always for us extrinsic; they can be postulated only if, and so long as, we are assuming the occurrence of human sense-experience.

Thus Kant is a rationalist of a new and unique type. He believes in, and emphasises the importance of, the *a priori*. With it alone, he contends, is the *Critique* competent to deal. But it is an *a priori* which cannot be shown to be more than {xxxvi}relative. It does, indeed, enable us to conceive the known as relative, and to entertain in thought the possibility of an Absolute; but this it can do without itself possessing independent validity. For though the proof of the *a priori* is not empirical in the sense of being inductive, neither is it logical in the sense of being deduced from necessities of thought. Its "transcendental" proof can be executed only so long as experience is granted as actual; and so long as the fundamental characteristics of this experience are kept in view.

Lastly, the *a priori* factors are purely relational. They have no inherent content from which clues bearing on the supersensible can be obtained. Their sole function is to serve in the interpretation of contents otherwise supplied.

The *a priori*, then, is merely relational, without inherent content; it is synthetic, and therefore incapable of independent or metaphysical proof; it is relative to an experience which is only capable of yielding appearances. The *a priori* is as merely factual as the experience which it conditions.

Even in the field of morality Kant held fast to this conviction. Morality, no less than knowledge, presupposes *a priori* principles. These, however, are never self-evident, and cannot be established by any mere appeal to intuition. They have authority only to the extent to which they can be shown to be the indispensable presuppositions of a moral consciousness that is undeniably actual.

That the *a priori* is of this character must be clearly understood. Otherwise the reader will be pursued by a feeling of the unreality, of the merely historical or antiquarian significance, of the entire discussion. He may, if he pleases, substitute the term formal or relational for *a priori*. And if he bears in mind that by the relational Kant is here intending those elements in knowledge which render possible the relations constitutive of *meaning*, he will recognise that the Critical discussion is by no means antiquated, but still remains one of the most important issues in the entire field of philosophical enquiry.

2. KANT'S CONTRIBUTION TO THE SCIENCE OF LOGIC

The above conclusions have an important bearing upon logical doctrine. Just as modern geometry originates in a sceptical treatment of the axiom of parallels, so modern, idealist logic rests upon Kant's demonstration of the revolutionary {xxxvii}consequences of Hume's sceptical teaching. If principles are never self-evident, and yet are not arrived at by induction from experience, by what alternative method can they be established? In answer to this question, Kant outlines the position which is now usually entitled the *Coherence* theory of truth. That theory, though frequently ascribed to Hegel, has its real sources in the *Critique of Pure Reason*. It expresses that modification in the Leibnizian rationalism which is demanded by Hume's discovery of the synthetic character of the causal axiom. Neither the deductive methods of the Cartesian systems nor the inductive methods of the English philosophies can any longer be regarded as correctly describing the actual processes of scientific proof.

General principles are either presuppositions or postulates. If *a priori*, they are presupposed in all conscious awareness; as above indicated, they have a *de facto* validity within the experience which they thus make possible. If more special in nature, they are the postulates to which we find ourselves committed in the process of solving specific problems; and they are therefore discovered by the method of trial and failure. They are valid in proportion as they enable us to harmonise appearances, and to adjudicate to each a kind of reality consistent with that assigned to every other.

Proof of fact is similar in general character. The term fact is eulogistic, not merely descriptive; it marks

the possession of cognitive significance in regard to some body of knowledge, actual or possible. It can be applied to particular appearances only in so far as we can determine their conditions, and can show that as thus conditioned the mode of their existence is relevant to the enquiry that is being pursued. The convergence of parallel lines is fact from the standpoint of psychological investigation; from the point of view of their physical existence it is merely appearance. Ultimately, of course, everything is real, including what we entitle appearance; but in the articulation of human experience such distinctions are indispensable, and the criteria that define them are prescribed by the context in which they are being employed.

Thus facts cannot be established apart from principles, nor principles apart from facts. The proof of a principle is its adequacy to the interpretation of all those appearances that can be shown to be in any respect relevant to it, while the test of an asserted fact, *i.e.* of our description of a given appearance, is its conformity to the principles that make insight possible.

Though the method employed in the *Critique* is entitled{xxxviii} by Kant the "transcendental method," it is really identical in general character with the hypothetical method of the natural sciences. It proceeds by enquiring what conditions must be postulated in order that the admittedly given may be explained and accounted for. Starting from the given, it also submits its conclusions to confirmation by the given. Considered as a method, there is nothing metaphysical or high-flying about it save the name. None the less, Kant is in some degree justified in adopting the special title. In view of the unique character of the problem to be dealt with, the method calls for very careful statement, and has to be defended against the charge of inapplicability in the philosophical field.

The fundamental thesis of the Coherence theory finds explicit formulation in Kant's doctrine of the judgment: the doctrine, that awareness is identical with the act of judging, and that judgment is always complex, involving both factual and interpretative elements. Synthetic, relational factors are present in *all* knowledge, even in knowledge that may seem, on superficial study, to be purely analytic or to consist merely of sense-impressions. Not contents alone, but contents interpreted in terms of some specific setting, are the sole possible objects of human thought. Even when, by forced abstraction, particulars and universals are held mentally apart, they are still being apprehended through judgments, and therefore through mental processes that involve both. They stand in relations of mutual implication within a *de facto* system; and together they constitute it.

This is the reason why in modern logic, as in Kant's *Critique*, the theory of the judgment receives so much more attention than the theory of reasoning. For once the above view of the judgment has been established, all the main points in the doctrine of reasoning follow of themselves as so many corollaries. Knowledge starts neither from sense-data nor from general principles, but from the complex situation in which the human race finds itself at the dawn of self-consciousness. That situation is organised in terms of our mental equipment; and this already existing, rudimentary system is what has made practicable further advance; to create a system *ab initio* is altogether impossible. The starting-point does not, however, by itself alone determine our conclusions. Owing to the creative activities of the mind, regulative principles are active in all consciousness; and under their guidance the experienced order, largely practical in satisfaction of the instinctive desires, is transformed into a comprehended{xxxix} order, controlled in view of Ideal ends. Logic is the science of the processes whereby this transformation is brought about. An essentially metaphysical discipline, it cannot be isolated from the general body of philosophical teaching; it is not formal, but transcendental; in defining the factors and processes that constitute knowledge, its chief preoccupation is with ultimate issues.

In calling his new logic "transcendental" Kant, it is true, also intends to signify that it is supplementary to, not a substitute for, the older logic, which he professes to accept. Moreover his intuitional theory of mathematical science, his doctrine of the "pure concept," his attributive view of the judgment — all of them survivals from his pre-Critical period — frequently set him at cross-purposes with himself. His

preoccupation, too, with the problem of the *a priori* leads him to underestimate the part played in knowledge by the merely empirical. But despite all inconsistencies, and notwithstanding his perverse preference for outlandish modes of expression, he succeeds in enforcing with sufficient clearness the really fundamental tenets of the Coherence view.

3. THE NATURE OF CONSCIOUSNESS

I shall now approach Kant's central position from another direction, namely, as an answer to the problem of the nature of consciousness. We are justified, I think, in saying that Kant was the first in modern times to raise the problem of the nature of awareness, and of the conditions of its possibility. Though Descartes is constantly speaking of consciousness, he defines it in merely negative terms, through its opposition to matter; and when he propounds the question how material bodies can be known by the immaterial mind, his mode of dealing with it shows that his real interest lies not in the nature of consciousness but in the character of the existences which it reveals. His answer, formulated in terms of the doctrine of representative perception, and based on the supposed teaching of physics and physiology, is that material bodies through their action on the sense-organs and brain generate images or duplicates of themselves. These images, existing not in outer space but only in consciousness, are, he asserts, mental in nature; and being mental they are, he would seem to conclude, immediately and necessarily apprehended by the mind. Thus Descartes gives us, not an analysis{xl} of the knowing process, but only a subjectivist interpretation of the nature of the *objects* upon which it is directed.

Quite apart, then, from the question as to whether Descartes' doctrine of representative perception rests on a correct interpretation of the teaching of the natural sciences — Kant was ultimately led to reject the doctrine — it is obvious that the main epistemological problem, *i.e.* the problem how awareness is possible, and in what it consists, has so far not so much as even been raised. Descartes and his successors virtually assume that consciousness is an ultimate, unanalysable form of awareness, and that all that can reasonably be demanded of the philosopher is that he explain what objects are actually presented to it, and under what conditions their presentation can occur. On Descartes' view they are conditioned by antecedent physical and physiological processes; according to Berkeley they are due to the creative activity of a Divine Being; according to Hume nothing whatsoever can be determined as to their originating causes. But all three fail to recognise that even granting the objects to be of the character asserted, namely, mental, the further problem still remains for consideration, how they come to be consciously apprehended, and in what such awareness consists.

Certain interpretations of the nature of the knowing process are, of course, to be found in the writings of Descartes and his successors. But they are so much a matter of unexamined presupposition that they never receive exact formulation, and alternate with one another in quite a haphazard fashion. We may consider three typical views.

1. There is, Descartes frequently seems to imply — the same assumption is evident throughout Locke's *Essay* — a self that stands behind all mental states, observing and apprehending them. Consciousness is the power which this self has of contemplating both itself and its ideas. Obviously this is a mere ignoring of the issue. If we assume an observer, we *ipso facto* postulate a process of observation, but we have not explained or even defined it.

2. There is also in Descartes a second, very different, view of consciousness, namely, as a diaphanous medium analogous to light. Just as light is popularly conceived as revealing the objects upon which it falls, so consciousness is regarded as revealing to us our inner states. This view of consciousness, for reasons which I shall indicate shortly, is entirely inadequate to the facts for which we have to account. It is no more tenable than the corresponding view of light.

3. In Hume we find this latter theory propounded in what may at first sight seem a more satisfactory

form, but is even{xli} less satisfactory. Sensations, images, feelings, he argues, are *states* of consciousness, one might almost say *pieces* of consciousness, *i.e.* they are conceived as carrying their own consciousness with them. Red, for instance, is spoken of as a sensation, and is consequently viewed both as being a sense-content, *i.e.* something sensed or apprehended, and also at the same time as the sensing or awareness of it. This view is unable to withstand criticism. There is really no more ground for asserting that red colour carries with it consciousness of itself than for saying that a table does. The illegitimacy of the assertion is concealed from us by the fact that tables appear to exist when there is no consciousness present, whereas redness cannot be proved to exist independently of consciousness — it may or may not do so. Many present-day thinkers, continuing the tradition of the English associationists, hold to this pre-Kantian view. Sensations, feelings, etc., are, it is implied, pieces of consciousness, forms of awareness; through their varying combinations they constitute the complex experiences of the animal and human mind.

Kant's teaching is developed in direct opposition to all such views. If we discard his antiquated terminology, and state his position in current terms, we find that it amounts to the assertion that *consciousness is in all cases awareness of meaning*. There is no awareness, however rudimentary or primitive, that does not involve the apprehension of meaning. Meaning and awareness are correlative terms; each must be studied in its relation to the other. And inasmuch as meaning is a highly complex object of apprehension, awareness cannot be regarded as ultimate or as unanalysable. It can be shown to rest upon a complexity of generative conditions and to involve a variety of distinct factors.

There are thus, from the Kantian standpoint, two all-sufficient reasons why the diaphanous view of consciousness, *i.e.* any view which treats consciousness merely as a medium whereby the existent gets itself reported, must be regarded as untenable. In the first place, as already remarked, it is based on the false assumption that consciousness is an ultimate, and that we are therefore dispensed from all further investigation of its nature. Kant claims to have distinguished successfully the many components which go to constitute it; and he also professes to have shown that until such analysis has been made, there can be no sufficient basis for a philosophical treatment either of the problems of sense-perception or of the logical problems of judgment and inference. The diaphanous view, with its mirror-like mode of representation, might allow of the side-by-sideness of{xlii} associated contents; it can never account for the processes whereby the associated contents come to be apprehended.

Secondly, the diaphanous view ignores the fundamental distinction between meaning and existence. Existences rest, so to speak, on their own bottom; they are self-centred even at the very moment of their reaction to external influences. Meaning, on the other hand, always involves the interpretation of what is given in the light of wider considerations that lend it significance. In the awareness of meaning the given, the actually presented, is in some way transcended, and this transcendence is what has chiefly to be reckoned with in any attempt to explain the conscious process. Kant is giving expression to this thesis when he contends that all awareness, no matter how rudimentary or apparently simple, is an act of judgment, and therefore involves the relational categories. *Not passive contemplation but active judgment, not mere conception but inferential interpretation, is the fundamental form, and the only form, in which our consciousness exists.* This, of course, commits Kant to the assertion that there is no mode of cognition that can be described as immediate or unreflective. There is an immediate *element* in all knowledge, but our consciousness of it is always conditioned and accompanied by interpretative processes, and in their absence there can be no awareness of any kind.

By way of this primary distinction between existence and meaning Kant advances to all those other distinctions which characterise our human experience, between appearance and reality, between the real and the Ideal, between that which is judged and the criteria which control and direct the judging process. Just because all awareness is awareness of meaning, our human experience becomes intelligible as a purposive activity that directs itself according to Ideal standards.

The contrast between the Kantian and the Cartesian views of consciousness can be defined in reference to another important issue. The diaphanous view commits its adherents to a very definite interpretation of the nature of relations. Since they regard consciousness as passive and receptive, they have to maintain that relations can be known only in so far as they are apprehended in a manner analogous to the contents themselves. I do not, of course, wish to imply that this view of relational knowledge is in all cases and in all respects illegitimate. Kant, as we shall find, has carried the opposite view to an impossible extreme, assuming without further argument that what has been shown to be true of certain types of relation (for instance, of the causal and{xliii} substance-attribute relations) must be true of all relations, even of those that constitute space and time. It cannot be denied that, as William James and others have very rightly insisted, such relations as the space-relations are *in some degree or manner* presentational. This does not, however, justify James in concluding, as he at times seems inclined to do, that all relations are directly experienced. Such procedure lays him open to the same charge of illegitimate reasoning. But even if we could grant James's thesis in its widest form, the all-important Critical question would still remain: in what does awareness, whether of presented contents or of presented relations, consist, and how is it possible? In answering this question Kant is led to the conclusion that consciousness must be regarded as an activity, and as supplying certain of the conditions of its own possibility. Its contribution is of a uniform and constant nature; it consists, as already noted, of certain relational factors whose presence can be detected in each and every act of awareness.

There is one other respect in which Kant's view of consciousness differs from that of his Cartesian predecessors. Consciousness, he maintains, does not reveal itself, but only its objects. In other words, there is no awareness of awareness. So far as our mental states and processes can be known at all, they are known in the same objective manner in which we apprehend existences in space. Now if that be so, a very important consequence follows. If there is no awareness of awareness, but only of meanings all of which are objective, there can be no consciousness of the generative, synthetic processes that constitute consciousness *on its subjective side*. For consciousness, being an *act* of awareness in which *meaning* is apprehended, has a twofold nature, and must be very differently described according to the aspect which at any one time we may have in view. When we regard it on its *objective* side as awareness of *meaning*, we are chiefly concerned with the various factors that are necessary to meaning and that enter into its constitution. That is to say, our analysis is essentially logical. When, on the other hand, we consider consciousness as an *act* of awareness, our problem is ontological or as it may be entitled (though the term is in this reference somewhat misleading, since the enquiry as defined by Kant is essentially metaphysical) psychological in character. Between these two aspects {xliv}there is this very important difference. The logical factors constitutive of meaning can be exhaustively known; they are elements in the meanings which consciousness reveals; whereas the synthetic processes are postulated solely in view of these constituent factors, and in order to account for them. The processes, that is to say, are known only through that which they condition, and on Kant's teaching we are entirely ruled out from attempting to comprehend even their possibility. They must be thought as occurring, but they cannot be known, *i.e.* their nature cannot be definitely specified. The postulating of them marks a gap in our knowledge, and extends our insight only in the degree that it discloses our ignorance. As consciousness rests upon, and is made possible by, these processes, it can never be explained in terms of the objective world to which our sense-experience, and therefore, as Kant argues, our specific knowledge, is exclusively limited. The mind can unfold its contents in the sunshine of consciousness, only because its roots strike deep into a soil that the light does not penetrate. These processes, thus postulated, Kant regards as the source of the *a priori* elements, and as the agency through which the synthetic connections necessary to all consciousness are brought about.

According to Kant's Critical teaching, therefore, consciousness, though analysable, is not such as can ever be rendered completely comprehensible. When all is said, it remains for us a merely *de facto* form

of existence, and has to be taken just for what it presents itself as being. It is actually such as to make possible the logical processes of judgment and inference. It is actually such as to render possible a satisfactory proof of the scientific validity, within the field of sense-experience, of the principle of causality, and of such other principles as are required in the development of the positive sciences. It is also such as to render comprehensible the controlling influence of Ideal standards. But when we come to the question, how is consciousness of this type and form possible, that is, to the question of its metaphysical significance and of the generative conditions upon which it rests, we find, Kant maintains, that we have no data sufficient to justify any decisive answer.{xlv}

The ontological, creative, or dynamical aspect of consciousness, I may further insist, must be constantly borne in mind if the Critical standpoint is to be properly viewed. The logical analysis is, indeed, for the purposes of the central portions of the *Critique* much the more important, and alone allows of detailed, exhaustive development; but the other is no less essential for an appreciation of Kant's attitude towards the more strictly metaphysical problems of the *Dialectic*.

Hegel and his disciples have been the chief culprits in subordinating, or rather in entirely eliminating, this aspect of Kant's teaching. Many of the inconsistencies of which they accuse Kant exist only if Kant's teaching be first reduced to a part of itself. To eliminate the ontological implications of his theory of consciousness is, by anticipation, to render many of his main conclusions entirely untenable, and in particular to destroy the force of his fundamental distinction between appearance and reality. If consciousness knows itself in its ultimate nature — and such is Hegel's contention — one half of reality is taken out of the obscurity in which, on Kant's reading of the situation, it is condemned to lie hidden. Man is more knowable than nature, and is the key to nature; such is Hegel's position, crudely stated. Contrast therewith the teaching of Kant. We can know nature more completely (though still very incompletely) than we can ever hope to comprehend the conditions that make possible and actual man's spiritual life. The moral consciousness is an autonomously acting source of independent values, and though a standing miracle, must be taken for all that on independent and separate enquiry it is found to be. Hegel, in his endeavour to establish an intellectual monism, does violence to some of the highest interests which he professes to be safeguarding. Kant, while outlining in Idea a Kingdom of Ends, remains satisfied with a pluralistic distinction between the intellectual and the moral categories. The antithesis of the two philosophies is in some degree the ancient opposition between Aristotle and Plato, restated in modern terms.

4. PHENOMENALISM, KANT'S SUBSTITUTE FOR SUBJECTIVISM

The revolutionary character of the above conclusions is shown by the difficulty which Kant himself found in breaking away from many of the presuppositions that underlie the views which he was renouncing; and this is nowhere more evident than in his constant alternation throughout the{xlvi} *Critique* between a *subjectivism* that is thoroughly Cartesian — we might almost, allowing for his rationalism, say Berkeleian — in character, and a radically different position which may be entitled *phenomenalism*. The latter is alone genuinely Critical, and presents Kant's teaching in its maturest form. For though first formulated only in those portions of the *Analytic* that are late in date of writing, and in those passages of the second edition which supplement them, it would seem to be the only logical outcome of Kant's other main doctrines.

I have especially in mind Kant's fundamental distinction between appearance and reality; it has an all-important bearing upon the Cartesian opposition between the mental and the material, and especially upon the question as to what view ought to be taken of our so-called *subjective* experiences. The objective is for the Cartesians the independently real; the subjective is asserted to have an altogether different kind of existence in what is named the field of consciousness. Kant's phenomenalist restatement of this distinction

is too complex and subtle to be made intelligible in the brief space available in this *Introduction* — it is expounded in the body of the *Commentary* — but its general character I may indicate in a few sentences. All subjectivist modes of stating the problem of knowledge, such as we find in Hume and in Leibniz no less than in Descartes, Locke, and Berkeley, are, Kant finally concluded, illegitimate and question-begging. Our so-called subjective states, whether they be sensations, feelings, or desires, are *objective* in the sense that they are *objects* for consciousness. Our mental states do not run parallel with the system of natural existences; nor are they additional to it. They do not constitute our consciousness of nature; they are themselves part of the natural order which consciousness reveals. They compose the empirical self which is an objective existence, integrally connected with the material environment in terms of which alone it can be understood. The subjective is not opposite in nature to the objective, but a sub-species within it. While, however, the psychical is thus to be regarded as a class of known appearances, and as forming together with the physical a single{xlvii} system of nature, this entire order is, in Kant's view, conditioned by an underlying realm of noumenal existence; and when the question of the possibility of the *knowing*, that is, of the *experiencing* of such a comprehensive natural system, is raised, it is to this noumenal sphere that we are referred. Everything experienced, even a sensation or feeling, is an event, but the experiencing of it is an act of awareness, and calls for an explanation of an altogether different kind.

Thus the problem of knowledge, stated in adequate Critical terms, is not how we can advance from the merely subjective to knowledge of the independently real, but how, if everything known forms part of a comprehensive natural system, consciousness and the complex factors which contribute to its possibility are to be interpreted. On this latter question, as already indicated, Kant, though debarring both subjectivism and materialism, otherwise adopts a non-committal attitude. So long as we continue within the purely theoretical domain, there are a number of alternatives between which there are no sufficient data for deciding. To debar subjectivism is not to maintain the illusory or phenomenal character of the individual self; and to rule out materialism is not to assert that the unconscious may not generate and account for the conscious. In other words, they are ruled out not for any ulterior reasons derived from their supposed metaphysical consequences, but solely because they are based on palpable misinterpretations of the cognitive situation that generates those very problems to which they profess to be an answer.

5. THE DISTINCTION BETWEEN HUMAN AND ANIMAL INTELLIGENCE

The inwardness of Kant's Critical standpoint may perhaps be made clearer by a brief consideration of his view of animal intelligence. We are accustomed nowadays to test a psychology of human consciousness by its capacity to render conceivable an evolution from lower forms. How does Kant's teaching emerge from such a test?

It may at once be admitted that Kant has made no special study of animal behaviour, and was by no means competent to speak with authority in regard to its conditions. Indeed it is evident that anything which he may have to say upon this{xlviii} question is entirely of the nature of a deduction from results obtained in the human sphere. But when this has been admitted, and we are therefore prepared to find the problems approached from the point of view of the difference rather than of the kinship between man and the animals, we can recognise that, so far as the independent study of human consciousness is concerned, there is a certain compensating advantage in Kant's pre-Darwinian standpoint. For it leaves him free from that desire which exercises so constant, and frequently so deleterious an influence, upon many workers in the field of psychology, namely, to maintain at all costs, in anticipation of conclusions not yet by any means established, the fundamental identity of animal and human intelligence. This besetting desire all too easily tends to the minimising of differences that may perhaps with fuller insight be found to involve no

breach of continuity, but which in the present state of our knowledge cannot profitably be interpreted save in terms of their differentiating peculiarities.

The current controversy between mechanism and vitalism enforces the point which I desire to make. Biological problems, as many biologists are now urging, can be most profitably discussed in comparative independence of ultimate issues, entirely in view of their own domestic circumstances. For only when the actual constitution of organic compounds has been more completely determined than has hitherto been possible can the broader questions be adequately dealt with. In other words, the differences must be known before the exact nature and degree of the continuity can be defined. They cannot be anticipated by any mere deduction from general principles.

The value of Kant's analysis of human consciousness is thus closely bound up with his frank recognition of its inherent complexity. Not simplification, but specification, down to the bedrock of an irreducible minimum of correlated factors, is the governing motive of his Critical enquiries. His results have therefore the great advantage of being inspired by no considerations save such as are prescribed by the actual subject-matter under investigation. As already noted, Kant maintains that human consciousness is always an awareness of meaning, and that consequently it can find expression only in judgments which involve together with their other factors the element of recognition or self-consciousness.

This decides for Kant the character of the distinction to be drawn between animal and human intelligence. As animals, in his view, cannot be regarded as possessing a capacity of self-consciousness, they must also be denied all awareness of{xlix} meaning. However complicated the associative organisation of their ideas may be, it never rises to the higher level of logical judgment. For the same reason, though their ideas may be schematic in outline, and in their bearing on behaviour may therefore have the same efficiency as general concepts, they cannot become universal in the logical sense. "Animals have apprehensions, but not apperceptions, and cannot, therefore, make their representations universal." In support of this position Kant might have pointed to the significant fact that animals are so teachable up to a certain point, and so unteachable beyond it. They can be carried as far as associative suggestion will allow, but not a step further. To this day it remains true — at least I venture the assertion — that no animal has ever been conclusively shown to be capable of apprehending a sign as a sign. Animals may seem to do so owing to the influence of associated ideas, but are, as it would appear, debarred from crossing the boundary line which so sharply distinguishes associative suggestion from reflective knowledge.

But Kant is committed to a further assertion. If animals are devoid of all awareness of meaning, they must also be denied anything analogous to what we must signify by the term consciousness. Their experience must fall apart into events, that may, perhaps, be described as mental, but cannot be taken as equivalent to an act of awareness. "*Apprehensio bruta* without consciousness," such is Kant's view of the animal mind. Its mental states, like all other natural existences, are events in time, explicable in the same naturalistic fashion as the bodily processes by which they are conditioned; they can not be equated with that human consciousness which enables us to reflect upon them, and to determine the conditions of their temporal happening.

The distinction which Kant desires to draw is ultimately that between events and consciousness of events. Even if events are psychical in character, consisting of sensations and feelings, there will still remain as fundamental the distinction between what is simply a member of the causal series of natural events and the consciousness through which the series is apprehended. Kant's most explicit statements occur in a letter to Herz. He is referring to data of the senses which cannot be self-consciously apprehended:

"I should not be able to know that I have them, and they would therefore be for me, as a cognitive being, absolutely nothing.{l} They might still (if I conceive myself as an animal) exist in me (a being unconscious of my own existence) as representations ..., connected according to an empirical law of association, exercising influence upon feeling and desire, and so always disporting themselves with

regularity, without my thereby acquiring the least cognition of anything, not even of these my own states."

As to whether Kant is justified in maintaining that the distinction between animal and human consciousness coincides with the distinction between associative and logical or reflective thinking, I am not concerned to maintain. This digression has been introduced solely for the purpose of defining more precisely the central tenets of Kant's Critical teaching.

6. THE NATURE AND CONDITIONS OF SELF-CONSCIOUSNESS

We have still to consider what is perhaps the most serious of all the misunderstandings to which Kant has laid himself open, and which is in large part responsible for the widespread belief that his Critical principles, when consistently developed, must finally eventuate in some such metaphysics as that of Fichte and Hegel. I refer to the view that Kant in postulating synthetic processes as conditioning consciousness is postulating a noumenal self as exercising these activities, and is therefore propounding a *metaphysical explanation* of the synthetic, *a priori* factors in human experience.

Kant's language is frequently ambiguous. The Leibnizian spiritualism, to which in his pre-Critical period he had unquestioningly held, continued to influence his terminology, and so to prevent his Critical principles from obtaining consistent expression. This much can be said in support of the above interpretation of Kant's position. But in all other respects such a reading of his philosophy is little better than a parody of his actual teaching. For Kant is very well aware that the problem of knowledge is not to be solved in any such easy and high-handed fashion. In the *Critique* he teaches quite explicitly that to profess to explain the presence of{li} *a priori* factors in human experience by means of a self assumed for that very purpose would be a flagrant violation, not only of Critical principles, but even of the elementary maxims of scientific reasoning. In the first place, explanation by reference to the activities of such a self would be explanation by faculties, by the unknown; it is a cause that will explain anything and everything equally well or badly. Self-consciousness has, indeed, to be admitted as a fact; and from its occurrence Kant draws important conclusions in regard to the conditions which make experience possible. But, in so doing, Kant never intends to maintain that we are justified in postulating as part of those conditions, or as condition of those conditions, a noumenal self. The conditions which make experience possible, whatever they may be, are also the conditions which make self-consciousness possible. Since the self is known only as appearance, it cannot be asserted to be the conditioning ground of appearance.

This first objection is not explicitly stated by Kant, but it is implied in a second argument which finds expression both in the *Deduction of the Categories* and in the chapter on the *Paralogisms*. The only self that we know to exist is the *conscious* self. Now, as Kant claims to have proved, the self can be thus conscious, even of itself, only in so far as it is conscious of objects. Consequently we have no right to assume that the self can precede such consciousness as its generating cause. That would be to regard the self as existing prior to its own conditions, working in darkness to create itself as a source of light.

But there is also a third reason why Kant's Critical solution of the problem of knowledge must not be stated in spiritualist terms. Self-consciousness, as he shows, is itself *relational* in character. It is a fundamental factor in human experience,{lii} not because the self can be shown to be the agency to which relations are due, but solely because, itself a case of recognition, it is at the same time a necessary condition of recognition, and recognition is indispensably presupposed in all consciousness of meaning. Awareness of meaning is the fundamental mystery, and retains its profoundly mysterious character even when self-consciousness has been thus detected as an essential constituent. For self-consciousness does not explain the possibility of meaning; it is itself, as I have just remarked, only one case of recognition, and so is itself only an instance, though indeed the supreme and most important instance, of what we must intend by the term meaning. All awareness, not excepting that of the knowing self, rests upon noumenal

conditions whose specific nature it does not itself reveal. Only on moral grounds, never through any purely theoretical analysis of cognitive experience, can it be proved that the self is an abiding personality, and that in conscious, personal form it belongs to the order of noumenal reality.

7. KANT'S THREEFOLD DISTINCTION BETWEEN SENSIBILITY, UNDERSTANDING, AND REASON

Even so summary a statement of Critical teaching as I am attempting in this *Introduction* would be very incomplete without some reference to Kant's threefold distinction between the forms of sensibility, the categories of the understanding, and the Ideas of Reason.

On investigating space and time Kant discovers that they cannot be classed either with the data of the bodily senses or with the concepts of the understanding. They are sensuous (*i.e.* are not abstract but concrete, not ways of thinking but modes of existence), yet at the same time are *a priori*. They thus stand apart by themselves. Each is unique in its kind, is single, and is an infinite existence. To describe them is to combine predicates seemingly contradictory. In Kant's own phrase, they are monstrosities (*Undinge*), none the less incomprehensible that they are undeniably actual. To them, primarily, are due those problems which have been a standing challenge to philosophy since the time of Zeno the Eleatic, and which Kant has entitled "antinomies of Reason."

In contrast of sensibility Kant sets the intellectual faculties, understanding and Reason. In the understanding originate certain pure concepts, or as he more usually names them,{liii} categories. The chief of these are the categories of "relation" — substance, causality and reciprocity. They combine with the forms of sensibility and the manifold of sense to yield the consciousness of an empirical order, interpretable in accordance with universal laws.

To the faculty of Reason Kant ascribes what he entitles Ideas. The Ideas differ from space, time, and the categories in being not "constitutive" but "regulative." They demand an *unconditionedness* of existence and a *completeness* of explanation which can never be found in actual experience. Their function is threefold. In the first place, they render the mind dissatisfied with the haphazard collocations of ordinary experience, and define the goal for its scientific endeavours. Secondly, they determine for us the criteria that distinguish between truth and falsity. And thirdly, in so doing, they likewise make possible the distinction between appearance and reality, revealing to us an irreconcilable conflict between the ultimate aims of science and the human conditions, especially the spatial and temporal conditions under which these aims are realised. The Ideas of Reason are the second main factor in the "antinomies."

The problem of the *Critique*, the analysis of our awareness of meaning, is a single problem, and each of the above elements involves all the others. Kant, however, for reasons into which I need not here enter, has assigned part of the problem to what he entitles the *Transcendental Aesthetic*, and another part to the *Transcendental Dialectic*. Only what remains is dealt with in what is really the most important of the three divisions, the *Transcendental Analytic*. But as the problem is one and indivisible, the discussions in all three sections are condemned to incompleteness save in so far as Kant, by happy inconsistency, transgresses the limits imposed by his method of treatment. The *Aesthetic* really does no more than prepare the ground for the more adequate analysis of space and time given in the *Analytic* and *Dialectic*, while the problem of the *Analytic* is itself incompletely stated until the more comprehensive argument of the *Dialectic* is taken into account. Thus the statement in the *Aesthetic* that space and time are *given* to the mind by the sensuous faculty of{liv} receptivity is modified in the *Analytic* through recognition of the part which the syntheses and concepts of the understanding must play in the construction of these forms; and in the *Dialectic* their apprehension is further found to involve an Idea of Reason. Similarly, in the concluding chapter of the *Analytic*, in discussing the grounds for distinguishing between appearance and reality, Kant omits all reference to certain important considerations which first emerge into view in the

course of the *Dialectic*. Yet, though no question is more vital to Critical teaching, the reader is left under the impression that the treatment given in the *Analytic* is complete and final.

Partly as a consequence of this, partly owing to Kant's inconsistent retention of earlier modes of thinking, there are traceable throughout the *Critique* two opposed views of the nature of the distinction between appearance and reality. On the one view, this distinction is mediated by the relational categories of the understanding, especially by that of causality; on the other view, it is grounded in the Ideas of Reason. The former sets appearance in opposition to reality; the latter regards the distinction in a more tenable fashion, as being between realities less and more comprehensively conceived.

A similar defect is caused by Kant's isolation of immanent from transcendent metaphysics. The former is dealt with only in the *Analytic*, the latter only in the *Dialectic*. The former, Kant asserts, is made possible by the forms of sensibility and the categories of the understanding; the latter he traces to an illegitimate employment of the Ideas of Reason. Such a mode of statement itself reveals the impossibility of any sharp distinction between the immanent and the transcendent. If science is conditioned by Ideals which arouse the mind to further acquisitions, and at the same time reveal the limitations to which our knowledge is for ever condemned to remain subject; if, in other words, everything known, in being correctly known, must be apprehended as appearance (*i.e.* as a subordinate existence within a more comprehensive reality), the distinction between the immanent and the transcendent falls within and not beyond the domain of our total experience. The meaning which our consciousness discloses in each of its judgments is an essentially metaphysical one. It involves the thought, though not the knowledge, of something more than what the experienced can ever itself be found to be. The metaphysical is immanent in our knowledge; the transcendent is merely a name{lv} for this immanent factor when it is falsely viewed as capable of isolation and of independent treatment. By Kant's own showing, the task of the *Dialectic* is not merely to refute the pretensions of transcendent metaphysics, but to develop the above general thesis, in confirmation of the positive conclusions established in the *Analytic*. The *Critique* will then supply the remedy for certain evils to which the human mind has hitherto been subject.

"*The Critique of Pure Reason* is a preservative against a malady which has its source in our rational nature. This malady is the opposite of the love of home (the home-sickness) which binds us to our fatherland. It is a longing to pass out beyond our immediate confines and to relate ourselves to other worlds."

8. THE PLACE OF THE *CRITIQUE OF PURE REASON* IN KANT'S PHILOSOPHICAL SYSTEM

The positive character of Kant's conclusions cannot be properly appreciated save in the wider perspectives that open to view in the *Critique of Practical Reason* and in the *Critique of Judgment*. Though in the *Critique of Pure Reason* a distinction is drawn between theoretical and moral belief, it is introduced in a somewhat casual manner, and there is no clear indication of the far-reaching consequences that follow in its train. Unfortunately also, even in his later writings, Kant is very unfair to himself in his methods of formulating the distinction. His real intention is to show that scientific knowledge is not coextensive with human insight; but he employs a misleading terminology, contrasting knowledge with faith, scientific demonstration with practical belief.

As already indicated, the term knowledge has, in the Critical philosophy, a much narrower connotation than in current speech. It is limited to *sense*-experience, and to such inferences therefrom as can be obtained by the only methods that Kant is willing to recognise, namely, the mathematico-physical. Aesthetic, moral and religious experience, and even organic phenomena, are excluded from the field of possible knowledge.

In holding to this position, Kant is, of course, the child of his time. The absolute sufficiency of the Newtonian physics is a presupposition of all his utterances on this theme. Newton, he believes, has

determined in a quite final manner the principles, methods and limits of scientific investigation. For though Kant himself imposes upon science a further{lvi} limitation, namely, to appearances, he conceives himself, in so doing, not as weakening Newton's natural philosophy, but as securing it against all possible objections. And to balance the narrow connotation thus assigned to the term knowledge, he has to give a correspondingly wide meaning to the terms faith, moral belief, subjective principles of interpretation. If this be not kept constantly in mind, the reader is certain to misconstrue the character and tendencies of Kant's actual teaching.

But though the advances made by the sciences since Kant's time have rendered this mode of delimiting the field of knowledge altogether untenable, his method of defining the sources of *philosophical insight* has proved very fruitful, and has many adherents at the present day. What Kant does — stated in broad outline — is to distinguish between the problems of *existence* and the problems of *value*, assigning the former to science and the latter to philosophy. Theoretical philosophy, represented in his system by the *Critique of Pure Reason*, takes as its province the logical values, that is, the distinction of truth and falsity, and defining their criteria determines the nature and limits of our theoretical insight. Kant finds that these criteria enable us to distinguish between truth and falsity only on the empirical plane. Beyond making possible a distinction between appearance and reality, they have no applicability in the metaphysical sphere.

The *Critique of Practical Reason* deals with values of a very different character. The faculty of Reason, which, as already noted, renders our consciousness a purposive agency controlled by Ideal standards, is also, Kant maintains, the source of the moral sanctions. But whereas in the theoretical field it subdues our minds to the discipline of experience, and restrains our intellectual ambitions within the limits of the empirical order, it here summons us to sacrifice every natural impulse and every secular advantage to the furtherance of an end that has absolute value. In imposing duties, it raises our life from the "pragmatic" level of a calculating expediency to the higher plane of a categorical imperative.

The categorical imperative at once humbles and exalts; it discloses our limitations, but does so through the greatness of the vocation to which it calls us.

"This principle of morality, just on account of the universality of the legislation which makes it the formal supreme determining principle of our will, without regard to any subjective differences, is{lvii} declared by the Reason to be a law for all rational beings.... It is, therefore, not limited to men only, but applies to all finite beings that possess Reason and Will; nay, it even includes the Infinite Being as the Supreme Intelligence."

Consequently, in employing moral ends in the interpretation of the Universe, we are not picturing the Divine under human limitations, but are discounting these limitations in the light of the one form of value that is known to us as absolute.

"*Duty!* ... What origin is worthy of thee and where is to be found the root of thy noble descent ... a root to be derived from which is the indispensable condition of the only worth that men can give themselves."

In his earlier years Kant had accepted the current, Leibnizian view that human excellence consists in intellectual enlightenment, and that it is therefore reserved for an *élite*, privileged with the leisure and endowed with the special abilities required for its enjoyment. From this arid intellectualism he was delivered through the influence of Rousseau.

"I am by disposition an enquirer. I feel the consuming thirst for knowledge, the eager unrest to advance ever further, and the delights of discovery. There was a time when I believed that this is what confers real dignity upon human life, and I despised the common people who know nothing. Rousseau has set me right. This imagined advantage vanishes. I learn to honour men, and should regard myself as of much less use than the common labourer, if I did not believe that my philosophy will restore to all men the common rights of humanity."

These common rights Kant formulates in a purely individualist manner. For here also, in his lack of

historic sense and in his distrust alike of priests and of statesmen, he is the child of his time. In the education and discipline of the soul he looks to nothing so artificial and humanly limited — Kant so regards them — as religious tradition and social{lviii} institutions. Human rights, he believes, do not vary with time and place; and for their enjoyment man requires no initiation and no equipment beyond what is supplied by Nature herself. It is from this standpoint that Kant adduces, as the twofold and sufficient inspiration to the rigours and sublimities of the spiritual life, the starry heavens above us and the moral law within. They are ever-present influences on the life of man. The naked eye reveals the former; of the latter all men are immediately aware. In their universal appeal they are of the very substance of human existence. Philosophy may avail to counteract certain of the hindrances which prevent them from exercising their native influence; it cannot be a substitute for the inspiration which they alone can yield.

Thus the categorical imperative, in endowing the human soul with an intrinsic value, singles it out from all other natural existences, and strengthens it to face, with equanimity, the cold immensities of the cosmic system. For though the heavens arouse in us a painful feeling of our insignificance as animal existences, they intensify our consciousness of a sublime destiny, as bearers of a rival, and indeed a superior, dignity.

In one fundamental respect Kant broke with the teaching of Rousseau, namely, in questioning his doctrine of the natural goodness and indefinite perfectibility of human nature. Nothing, Kant maintains, is good without qualification except the good will; and even that, perhaps, is never completely attained in any single instance. The exercise of duty demands a perpetual vigilance, under the ever-present consciousness of continuing demerit.

"I am willing to admit out of love of humanity that most of our actions are indeed correct, but if we examine them more closely we everywhere come upon the dear self which is always prominent...." "Nothing but moral fanaticism and exaggerated self-conceit is infused into the mind by exhortation to actions as noble, sublime and magnanimous. Thereby men are led into the delusion that it is not duty, that is, respect for the law, whose yoke ... they must bear, whether they like it or not, that constitutes the determining principle of their actions, and which always humbles them while{lix} they *obey* it. They then fancy that those actions are expected from them, not from duty, but as pure merit.... In this way they engender a vain high-flying fantastic way of thinking, flattering themselves with a spontaneous goodness of heart that needs neither spur nor bridle, nor any command...."

In asserting the goodness and self-sufficiency of our natural impulses Rousseau is the spokesman of a philosophy which has dominated social and political theory since his day, and which is still prevalent. This philosophy, in Kant's view, is disastrous in its consequences. As a reading of human nature and of our moral vocation, it is hardly less false than the Epicurean teaching, which finds in the pursuit of pleasure the motive of all our actions. A naturalistic ethics, in either form, is incapacitated, by the very nature of its controlling assumptions, from appreciating the distinguishing features of the moral consciousness. Neither the successes nor the failures of man's spiritual endeavour can be rightly understood from any such standpoint. The human race, in its endurance and tenacity, in its dauntless courage and in its soaring spirit, reveals the presence of a *prevenient* influence, *non-natural* in character; and only if human nature be taken as including this higher, directive power, can it assume to itself the eulogy which Rousseau so mistakenly passes upon the natural and undisciplined tendencies of the human heart. For as history demonstrates, while *men* are weak, *humanity* is marvellous.

"There is one thing in our soul which, when we take a right view of it, we cannot cease to regard with the highest astonishment, and in regard to which admiration is right and indeed elevating, and that is our original moral capacity in general.... Even the incomprehensibility of this capacity, a capacity which proclaims a Divine origin, must rouse man's spirit to enthusiasm and strengthen it for any sacrifices which respect for his duty may impose on him."

We are not here concerned with the detail of Kant's ethical teaching, or with the manner in which he establishes the freedom of the will, and justifies belief in the existence of God and the immortality of the

soul. In many respects his argument lies open to criticism. There is an unhappy{lx} contrast between the largeness of his fundamental thesis and the formal, doctrinaire manner in which it is developed. Indeed, in the *Critique of Practical Reason* the individualist, deistic, rationalistic modes of thinking of his time are much more in evidence than in any other of his chief writings; and incidentally he also displays a curious insensibility — again characteristic of his period — to all that is specific in the religious attitude. But when due allowances have been made, we can still maintain that in resting his constructive views upon the supreme value of the moral personality Kant has influenced subsequent philosophy in hardly less degree than by his teaching in the *Critique of Pure Reason*.

The two *Critiques*, in method of exposition and argument, in general outcome, and indeed in the total impression they leave upon the mind, are extraordinarily different. In the *Critique of Pure Reason* Kant is meticulously scrupulous in testing the validity of each link in his argument. Constantly he retraces his steps; and in many of his chief problems he halts between competing solutions. Kant's sceptical spirit is awake, and it refuses to cease from its questionings. In the *Critique of Practical Reason*, on the other hand, there is an austere simplicity of argument, which advances, without looking to right or left, from a few simple principles direct to their ultimate consequences. The impressiveness of the first *Critique* consists in its appreciation of the *complexity* of the problems, and in the care with which their various, conflicting aspects are separately dealt with. The second *Critique* derives its force from the fundamental conviction upon which it is based.

Such, then, stated in the most general terms, is the manner in which Kant conceives the *Critique of Pure Reason* as contributing to the establishment of a humanistic philosophy. It clears the ground for the practical Reason, and secures it in the autonomous control of its own domain. While preserving to the intellect and to science certain definitely prescribed rights, Kant places in the forefront of his system the moral values; and he does so under the conviction that in living up to the opportunities, in whatever rank of life, of our common heritage, we obtain a truer and deeper insight into ultimate issues than can be acquired through the abstruse subtleties of metaphysical speculation.

I may again draw attention to the consequences which follow from Kant's habitual method of isolating his problems. Truth is a value of universal jurisdiction, and from its criteria{lxi} the judgments of moral and other values can claim no exemption. Existences and values do not constitute independent orders. They interpenetrate, and neither can be adequately dealt with apart from the considerations appropriate to the other. In failing to co-ordinate his problems, Kant has over-emphasised the negative aspects of his logical enquiries and has formulated his ethical doctrines in a needlessly dogmatic form.

These defects are, however, in some degree remedied in the last of his chief works, the *Critique of Judgment*. In certain respects it is the most interesting of all Kant's writings. The qualities of both the earlier *Critiques* here appear in happy combination, while in addition his concrete interests are more in evidence, to the great enrichment of his abstract argument. Many of the doctrines of the *Critique of Pure Reason*, especially those that bear on the problems of teleology, are restated in a less negative manner, and in their connection with the kindred problems of natural beauty and the fine arts. For though the final decision in all metaphysical questions is still reserved to moral considerations, Kant now takes a more catholic view of the field of philosophy. He allows, though with characteristic reservations, that the *empirical* evidence obtainable through examination of the broader features of our total experience is of genuinely philosophical value, and that it can safely be employed to amplify and confirm the independent convictions of the moral consciousness. The embargo which in the *Critique of Pure Reason*, in matters metaphysical, is placed upon all tentative and probable reasoning is thus tacitly removed; and the term knowledge again acquires the wider meaning very properly ascribed to it in ordinary speech.

A COMMENTARY TO KANT'S "CRITIQUE OF PURE REASON"

TITLE: KRITIK DER REINEN VERNUNFT

THE term critique or criticism, as employed by Kant, is of English origin. It appears in seventeenth and eighteenth century English, chiefly in adjectival form, as a literary and artistic term — for instance, in the works of Pope, who was Kant's favourite English poet. Kant was the first to employ it in German, extending it from the field of aesthetics to that of general philosophy. A reference in Kant's *Logic* to Home's *Elements of Criticism* would seem to indicate that it was Home's use of the term which suggested to him its wider employment. "Critique of pure reason," in its primary meaning, signifies the passing of critical judgments upon pure reason. In this sense Kant speaks of his time as "the age of criticism (*Zeitalter der Kritik*)." Frequently, however, he takes the term more specifically as meaning a critical investigation leading to positive as well as to negative results. Occasionally, especially in the *Dialectic*, it also signifies a discipline applied to pure reason, limiting it within due bounds. The first appearance of the word in Kant's writings is in 1765 in the *Nachricht* of his lectures for the winter term 1765-1766. Kant seldom employs the corresponding adjective, critical (*kritisch*). His usual substitute for it is the term transcendental.

Pure (*rein*) has here a very definite meaning. It is the absolutely *a priori*. Negatively it signifies that which is independent of experience. Positively it signifies that which originates from reason itself, and which is characterised by universality and necessity. By "pure reason" Kant therefore means reason in so far as it supplies out of itself, independently of experience, *a priori* elements that as such are characterised by universality and necessity.

Reason (*Vernunft*) is used in the *Critique* in three different meanings. In the above title it is employed in its widest sense, as the source of all *a priori* elements. It includes what is *a priori* in sensibility as well as in understanding (*Verstand*). In its narrowest sense it is distinct even from understanding, and signifies that faculty which renders the mind dissatisfied with its ordinary and scientific knowledge, and which leads it to demand a completeness and unconditionedness which can never be found in the empirical sphere. Understanding conditions science; reason generates metaphysic. Understanding has categories; reason has its Ideas. Thirdly, Kant frequently employs understanding and reason as synonymous terms, dividing the mind only into the two faculties, sensibility and spontaneity. Thus in A 1-2, understanding and reason are used promiscuously, and in place of *reine Vernunft* we find *reiner Verstand*. As already stated, the term reason, as employed in Kant's title, ought properly to be taken in its widest sense. Sensibility falls within reason in virtue of the *a priori* forms which it contains. Kant does not himself, however, always interpret the title in this strict sense. The triple use of the term is an excellent example of the looseness and carelessness with which he employs even the most important and fundamental of his technical terms. Only the context can reveal the particular meaning to be assigned in each case.

The phrase "*of* pure reason" (*der reinen Vernunft*) has, as Vaihinger points out, a threefold ambiguity. (1) Sometimes it is a genitive objective. The critical enquiry is directed upon pure reason as its object. This corresponds to the view of the *Critique* as merely a treatise on method. (2) Sometimes it is a genitive subjective. The critical enquiry is undertaken by and executed through pure reason. This expresses the view of the *Critique* as itself a system of pure rational knowledge. (3) At other times it has a reflexive meaning. Pure reason is subject and object at once. It is both subject-matter and method or instrument. Through the *Critique* it attains to self-knowledge. The *Critique* is the critical examination of pure reason by itself. The first view would seem to be the original and primary meaning of the title. The second view very early took its place alongside it, and appears in many passages. The third view must be taken as representing Kant's final interpretation of the title; it is on the whole the most adequate to the actual content and scope of the *Critique*. For the *Critique* is not merely a treatise on method; it is also a system of pure rational knowledge. It professes to establish, in an exhaustive and final manner, the *a*

priori principles which determine the possibility, conditions, and limits of pure rational knowledge.

MOTTO

DE nobis ipsis silemus: De re autem, quae agitur, petimus: ut homines eam non opinionem, sed opus esse cogitent; ac pro certo habeant, non sectae nos alicuius, aut placiti, sed utilitatis et amplitudinis humanae fundamenta moliri. Deinde ut suis commodis aequi ... in commune consulant ... et ipsi in partem veniant. Praeterea ut bene sperent, neque instaurationem nostram ut quiddam infinitum et ultra mortale fingant, et animo concipiant; quum revera sit infiniti erroris finis et terminus legitimus.

This motto, which was added in the second edition, is taken from the preface to Bacon's *Instauratio Magna*, of which the *Novum Organum* is the second part. As the first part of the *Instauratio* is represented only by the later, separately published, *De Augmentis Scientiarum*, this preface originally appeared, and is still usually given, as introductory to the *Novum Organum*.

The complete passage (in which I have indicated Kant's omissions) is rendered as follows in the translation of Ellis and Spedding:

"Of myself I say nothing; but in behalf of the business which is in hand I entreat men to believe that it is not an opinion to be held, but a work to be done; and to be well assured that I am labouring to lay the foundation, not of any sect or doctrine, but of human utility and power. Next, I ask them to deal fairly by their own interests [and laying aside all emulations and prejudices in favour of this or that opinion], to join in consultation for the common good; and [being now freed and guarded by the securities and helps which I offer from the errors and impediments of the way] to come forward themselves and take part [in that which remains to be done]. Moreover, to be of good hope, nor to imagine that this Instauration of mine is a thing infinite and beyond the power of man, when it is in fact the true end and termination of infinite error."

The opening sentence of Bacon's preface might also have served as a fitting motto to the *Critique*:

"It seems to me that men do not rightly understand either their store or their strength, but overrate the one and underrate the other."

Or again the following:

"I have not sought nor do I seek either to enforce or to ensnare men's judgments, but I lead them to things themselves and the concordances of things, that they may see for themselves what they have, what they can dispute, what they can add and contribute to the common stock.... And by these means I suppose that I have established for ever a true and lawful marriage between the empirical and the rational faculty, the unkind and ill-starred divorce and separation of which has thrown into confusion all the affairs of the human family."

DEDICATION

TO

FREIHERR VON ZEDLITZ

Karl Abraham, Freiherr von Zedlitz had been entrusted, as Minister (1771-1788) to Frederick the Great, with the oversight and direction of the Prussian system of education. He held Kant in the highest

esteem. In February 1778 we find him writing to thank Kant for the pleasure he had found in perusing notes of his lectures on physical geography, and requesting the favour of a complete copy. A week later he invited Kant to accept a professorship of philosophy in Halle, which was then much the most important university centre in Germany. Upon Kant's refusal he repeated the offer, with added inducements, including the title of Hofrat. Again, in August of the same year, he writes that he is attending, upon Mendelssohn's recommendation (and doubtless also in the hope of receiving from this indirect source further light upon Kant's own teaching in a favourite field), the lectures on anthropology of Kant's disciple and friend, Marcus Herz. The letter concludes with a passage which may perhaps have suggested to Kant the appropriateness of dedicating his *Critique* to so wise and discerning a patron of true philosophy.

"Should your inventive power extend so far, suggest to me the means of holding back the students in the universities from the bread and butter studies, and of making them understand that their modicum of law, even their theology and medicine, will be immensely more easily acquired and safely applied, if they are in possession of more philosophical knowledge. They can be judges, advocates, preachers and physicians only for a few hours each day; but in these and all the remainder of the day they are men, and have need of other sciences. In short, you must instruct me how this is to be brought home to students. Printed injunctions, laws, regulations — these are even worse than bread and butter study itself."

A Minister of Education who thus ranks philosophy above professional studies, and both as more important than all academic machinery, holds his office by divine right.

PREFACE TO THE FIRST EDITION

Detailed discussion of the *Prefaces* is not advisable. The problems which they raise can best be treated in the order in which they come up in the *Critique* itself. I shall dwell only on the minor incidental difficulties of the text, and on those features in Kant's exposition which are peculiar to the *Prefaces*, or which seem helpful in the way of preliminary orientation. I shall first briefly restate the argument of the *Preface* to the first edition, and then add the necessary comment.

Human reason is ineradicably metaphysical. It is haunted by questions which, though springing from its very nature, none the less transcend its powers. Such a principle, for instance, as that of causality, in carrying us to more and more remote conditions, forces us to realise that by such regress our questions can never be answered. However far we recede in time, and however far we proceed in space, we are still no nearer to a final answer to our initial problems, and are therefore compelled to take refuge in postulates of a different kind, such, for instance, as that there must be a first unconditioned cause from which the empirical series of causes and effects starts, or that space is capable of existing as a completed whole. But these assumptions plunge reason in darkness and involve it in contradictions. They are the sources of all the troubles of the warring schools. Error lies somewhere concealed in them — the more thoroughly concealed that they surpass the limits of possible experience. Until such error has been detected and laid bare, metaphysical speculation must remain the idlest of all tasks.

In the latter part of the eighteenth century metaphysics had fallen, as Kant here states, into disrepute. The wonderful success with which the mathematical and natural sciences were being developed served only to emphasise by contrast the ineffectiveness of the metaphysical disciplines. Indifference to philosophy was the inevitable outcome, and was due, not to levity, but to the matured judgment of the age, which refused to be any longer put off with such pretended knowledge. But since the philosophical sciences aim at that knowledge which, if attainable, we should be least willing to dispense with, the failure of philosophy is really a summons to reason to take up anew the most difficult of all its tasks. It must once and for all determine either the possibility or the impossibility of metaphysics. It must establish

"...a tribunal which will assure to reason its lawful claims, and which will also be able to dismiss all

groundless pretensions, not by despotic decrees, but in accordance with its own eternal and unalterable laws. This tribunal is no other than the *Critique of Pure Reason*." "Our age is, in especial degree, the age of criticism (*Kritik*), and to such criticism everything must submit. Religion, through its sanctity, and law-giving, through its majesty, may seek to exempt themselves from it. But they then awaken just suspicion, and cannot claim the sincere respect which reason accords only to that which has been able to sustain the test of free and open examination."

As has already been emphasised in the preceding historical sketch, Kant had learnt to trust the use of reason, and was a rationalist by education, temperament, and conviction. He here classifies philosophies as dogmatic and sceptical; and under the latter rubric he includes all empirical systems. 'Empiricism' and 'scepticism' he interprets as practically synonymous terms. The defect of the dogmatists is that they have not critically examined their methods of procedure, and in the absence of an adequate distinction between appearance and reality have interpreted the latter in terms of the former. The defect of the empiricists and sceptics is that they have misrepresented the nature of the faculty of reason, ignoring its claims and misreading its functions, and accordingly have gone even further astray than their dogmatic opponents. All knowledge worthy of the name is *a priori* knowledge. It possesses universality and necessity, and as such must rest on pure reason. Wherever there is science, there is an element of pure reason. Whether or not pure reason can also extend to the unconditioned is the question which decides the possibility of constructive metaphysics. This is what Kant means when he declares that the *Critique* is a criticism of the power of reason, in respect of all knowledge after which it may strive independently of experience. Pure reason is the subject-matter of the enquiry; it is also the instrument through which the enquiry is made. Nothing empirical or merely hypothetical has any place in it, either as subject-matter or as method of argument.

From this position Kant draws several important consequences. First, since pure reason means that faculty whereby we gain knowledge independently of all experience, it can be isolated and its whole nature exhaustively determined. Indeed pure reason (Kant seeks to prove) is so perfect a unity that if "its principle" should be found insufficient to the solution of a single one of all the questions which are presented to it by its own nature, we should be justified in forthwith rejecting it as also incompetent to answer with complete certainty any one of the other questions. In metaphysics it must be either all or nothing, either final and complete certainty or else absolute failure.

"While I am saying this I can fancy that I detect in the face of the reader an expression of indignation mingled with contempt at pretensions seemingly so arrogant and vainglorious; and yet they are incomparably more moderate than the claims of all those writers who on the lines of the usual programme profess to prove the simple nature of the soul or the necessity of a first beginning of the world."

In so doing they pretend to define realities which lie beyond the limits of possible experience; the *Critique* seeks only to deal with that faculty of reason which manifests itself to us within our own minds. Formal logic shows how completely and systematically the simple acts of reason can be enumerated. Aristotle created this science of logic complete at a stroke. Kant professes to have established an equally final metaphysics; and as logic is not a science proper, but rather a propaedeutic to all science, metaphysics, thus interpreted, is the only one of all the sciences which can immediately attain to such completeness.

"For it is nothing but the inventory of all our possessions through pure reason, systematically arranged. In this field nothing can escape us. What reason produces entirely out of itself cannot lie concealed, but is brought to light by reason itself immediately the common principle has been discovered."

Secondly, the *Critique* also claims certainty. With the removal of everything empirical, and the reduction of its subject-matter to pure reason, all mere opinion or hypothesis is likewise eliminated. Probabilities or hypotheses can have no place in a *Critique of Pure Reason*. Everything must be derived according to *a priori* principles from pure conceptions in which there is no intermixture of experience or

any special intuition.

This *Preface* to the first edition, considered as introductory to the *Critique*, is misleading for two reasons. First, because in it Kant is preoccupied almost exclusively with the problems of metaphysics in the strict ontological sense, that is to say, with the problems of the *Dialectic*. The problems of the *Analytic*, which is the very heart of the *Critique*, are almost entirely ignored. They are, it is true, referred to in A x-xi, but the citation is quite externally intercalated; it receives no support or extension from the other parts of the *Preface*. This results in a second defect, namely, that Kant fails to indicate the more empirical features of his new Critical standpoint. Since ultimate reality is supersensuous, metaphysics, as above conceived, can have no instrument save pure reason. The subjects of its enquiry, God, freedom, and immortality, if they are to be known at all, can be determined only through *a priori* speculation. This fact, fundamental and all-important for Kant, was completely ignored in the popular eclectic philosophies of the time. They professed to derive metaphysical conclusions from empirical evidence. They substituted, as Kant has pointed out, "a physiology of the human understanding" for the Critical investigation of the claims of reason, and anthropology for ethics. They were blind to the dogmatism of which they are thereby guilty. They assumed those very points which most call for proof, namely, that reason is adequate to the solution of metaphysical problems, and that all existence is so fundamentally of one type that we can argue from the sensuous to the supersensuous, from appearance to reality. When they fell into difficulties, they pleaded the insufficiency of human reason, and yet were all the while unquestioningly relying upon it in the drawing of the most tremendous inferences. Such, for instance, are the assumptions which underlie Moses Mendelssohn's contention that since animals as well as men agree in the apprehension of space, it must be believed to be absolutely real. These assumptions also determine Priestley's assertion that though every event has its cause, there is one causeless happening, namely, the creative act to which the existence of the world is due. On such terms, metaphysics is too patently easy to be even plausible. "Indifference, doubt, and, in final issue, severe criticism, are truer signs of a profound habit of thought." The matter of experience affords no data for metaphysical inference. In the *a priori* forms of experience, and there alone, can metaphysics hope to find a basis, if any basis is really discoverable.

This is Kant's reason for so emphatically insisting that the problem of the *Critique* is to determine "how much we can hope to achieve by reason, when all the material and assistance of experience is taken away." But in keeping only this one point in view Kant greatly misrepresents the problems and scope of the *Critique*. Throughout the *Preface* he speaks the language of the *Aufklärung*. Even in the very act of limiting the scope of reason, he overstresses its powers, and omits reference to its empirical conditions. It is well to contrast this teaching with such a passage as the following:

"The position of all genuine idealists from the Eleatics to Berkeley is contained in this formula: 'All cognition through the senses and experience is nothing but mere illusion, and only in the ideas of pure understanding and Reason is there truth.' The fundamental principle ruling all my idealism, on the contrary, is this: 'All cognition of things solely from pure understanding or pure Reason is nothing but mere illusion, and only in experience is there truth.'"

But that passage is equally inadequate as a complete expression of Kant's Critical philosophy. The truth lies midway between it and the teaching of the *Preface* to the first edition. Pure reason is as defective an instrument of knowledge as is factual experience. Though the primary aim of metaphysics is to determine our relation to the absolutely real, and though that can only be done by first determining the nature and possible scope of *a priori* principles, such principles are found on investigation to possess only empirical validity. The central question of the *Critique* thus becomes the problem of the validity of their empirical employment. The interrelation of these two problems, that of the *a priori* and that of experience, and Kant's attitude towards them, cannot be considered till later. The defects of the *Preface* to the first

edition are in part corrected by the extremely valuable *Preface* substituted in the second edition. But some further points in this first *Preface* must be considered.

Prescribed by the very nature of reason itself. — Metaphysics exists as a "natural disposition," and its questions are not therefore merely artificial.

"As natural disposition (*Naturanlage*) ... metaphysics is real. For human reason, without being moved merely by the idle desire for extent and variety of knowledge, proceeds impetuously, driven on by an inward need, to questions such as cannot be answered by any empirical employment of reason, or by principles thence derived. Thus in all men, as soon as their reason has become ripe for speculation, there has always existed and will always continue to exist some kind of metaphysics."

Hence results what Kant entitles *transcendental illusion*.

"The cause of this transcendental illusion is that there are fundamental rules and maxims for the employment of Reason, subjectively regarded as a faculty of human knowledge, and that these rules and maxims have all the appearance of being objective principles. We take the subjective necessity of a connection of our concepts, *i.e*. a connection necessitated for the advantage of the understanding, for an objective necessity in the determination of things in themselves. This is an illusion which can no more be prevented than we can prevent the sea from appearing higher at the horizon than at the shore, since we see it through higher light rays; or to cite a still better example, than the astronomer can prevent the moon from appearing larger at its rising, although he is not deceived by this illusion.... There exists, then, a natural and unavoidable dialectic of pure Reason, not one in which a bungler might entangle himself through lack of knowledge, or one which some sophist has artificially invented to confuse thinking people, but one which is inseparable from human Reason, and which, even after its deceiving power has been exposed, will not cease to play tricks with it and continually to entrap it into momentary aberrations that will ever and again call for correction."

Dogmatism. — According to Kant there are three possible standpoints in philosophy — the dogmatic, the sceptical, and the critical. All preceding thinkers come under the first two heads. A dogmatist is one who assumes that human reason can comprehend ultimate reality, and who proceeds upon this assumption. He does not, before proceeding to construct a metaphysics, enquire whether it is possible. Dogmatism expresses itself (to borrow Vaihinger's convenient mode of definition) through three factors — *rationalism*, *realism*, and *transcendence*. Descartes and Leibniz are typical dogmatists. As rationalists they hold that it is possible to determine from pure *a priori* principles the ultimate nature of God, of the soul, and of the material universe. They are realists in that they assert that by human thought the complete nature of objective reality can be determined. They also adopt the attitude of transcendence. Through pure thought they go out beyond the sensible and determine the supersensuous. Scepticism (Kant, as above stated, regards it as being in effect equivalent to empiricism) may similarly be defined through the three terms, *empiricism*, *subjectivism*, *immanence*. A sceptic can never be a rationalist. He must reduce knowledge to sense-experience. For this reason also his knowledge is infected by subjective conditions; through sensation we cannot hope to determine the nature of the objectively real. This attitude is also that of immanence; knowledge is limited to the sphere of sense-experience. Criticism has similarly its three constitutive factors, *rationalism, subjectivism, immanence*. It agrees with dogmatism in maintaining that only through *a priori* principles can true knowledge be obtained. Such knowledge is, however, subjective in its origin, and for that reason it is also only of immanent application; knowledge is possible only in the sphere of sense-experience. Dogmatism claims that knowledge arises independently of experience and extends beyond it. Empiricism holds that knowledge arises out of sense-experience and is valid only within it. Criticism teaches that knowledge arises independently of particular experience but is valid only for experience.

The following passages in the *Methodology* give Kant's view of the historical and relative values of the two false methods:

"The sceptic is the taskmaster who constrains the dogmatic reasoner to develop a sound critique of the understanding and reason. When the latter has been made to advance thus far, he need fear no further challenge, since he has learned to distinguish his real possessions from that which lies entirely beyond them, and to which he can therefore lay no claim.... Thus the sceptical procedure cannot of itself yield any satisfying answer to the questions of reason, but none the less it prepares the way by awakening its circumspection, and by indicating the radical measures which are adequate to secure it in its legitimate possessions." "The first step in matters of pure reason, marking its infancy, is *dogmatic*. The second step is *sceptical*, and indicates that experience has rendered our judgment wiser and more circumspect. But a third step, such as can be taken only by fully matured judgment, is now necessary.... This is not the censorship but the critique of reason, whereby not its present bounds but its determinate [and necessary] limits, not its ignorance on this or that point, but in regard to all possible questions of a certain kind, are demonstrated from principles, and not merely arrived at by way of conjecture. Scepticism is thus a resting-place for human reason, where it can reflect upon its dogmatic wanderings and make survey of the region in which it finds itself, so that for the future it may be able to choose its path with more certainty. But it is no dwelling-place for permanent settlement. That can be obtained only through perfect certainty in our knowledge, alike of the objects themselves and of the limits within which all our knowledge of objects is enclosed."

Locke. — Cf. A 86 = B 119; A 270 = B 327; B 127.

On the unfavourable contrast between mathematics and metaphysics. — Cf. *Ueber die Deutlichkeit der Grundsätze* (1764), *erste Betrachtung*, and below, p, 563 ff.

The age of criticism. — Kant considered himself as contributing to the further advance of the eighteenth century Enlightenment. In view, however, of the contrast between eighteenth and nineteenth century thought, and of the real affiliations and ultimate consequences of Kant's teaching, it seems truer to regard the Critical philosophy as at once completing and transcending the *Aufklärung*. Kant breaks with many of its most fundamental assumptions.

The Critique of Pure Reason. — Kant here defines the *Critique* as directed upon pure reason. Further, it is a criticism of knowledge which is "independent of all experience," or, as Kant adds "free from all experience." Such phrases, in this context, really mean *transcendent*. The *Critique* is here taken as being a Critical investigation of transcendent metaphysics, of its sources, scope, and limits.

Opinion or hypothesis not permissible. — Cf. below, ff.

I know no enquiries, etc. — The important questions raised by this paragraph are discussed below, ff.

Jean Terrasson (1670-1750). — The quotation is from his work posthumously published (1754), and translated from the French by Frau Gottsched under the title *Philosophie nach ihrem allgemeinen Einflusse auf alle Gegenstände des Geistes und der Sitten* (1762). Terrasson is also referred to by Kant in his *Anthropologie*, §§ 44 and 77. Terrasson would seem to be the author of the *Traité de l'infini créé* which has been falsely ascribed to Malebranche. I have translated this latter treatise in the *Philosophical Review* (July 1905).

Such a system of pure speculative reason. — The relation in which this system would stand to the *Critique* is discussed below, p-2. Speculative does not with Kant mean transcendent, but merely theoretical as opposed to practical. Cf. B 25, A 15 = B 29, A 845 = B 873.

Under the title: Metaphysics of Nature. — No such work, at least under this title, was ever completed by Kant. In the Kantian terminology "nature" signifies "all that is." Cf. below, .

PREFACE TO THE SECOND EDITION

I SHALL again give a brief explanatory paraphrase, before proceeding to detailed comment. The main points of the preface of the first edition are repeated. "Metaphysics soars above all teaching of

experience, and rests on concepts only. In it reason has to be her own pupil." But Kant immediately proceeds to a further point. That logic should have attained the secure method of science is due to its limitation to the mere *a priori* form of knowledge. For metaphysics this is far more difficult, since it "*has to deal not with itself alone, but also with objects*."

The words which I have italicised form a very necessary correction of the first edition preface, according to which the *Critique* would seem to "treat only of reason and its pure thinking." A further difference follows. The second edition preface, in thus emphasising the objective aspect of the problem, is led to characterise in a more complete manner the method to be followed in the Critical enquiry. How can the *Critique*, if it is concerned, as both editions agree in insisting, only with the *a priori* which originates in human reason, solve the specifically metaphysical problem, viz. that of determining the independently real? How can an idea in us refer to, and constitute knowledge of, an object? The larger part of the preface to the second edition is devoted to the Critical solution of this problem. The argument of the *Dialectic* is no longer emphasised at the expense of the *Analytic*.

Kant points out that as a matter of historical fact each of the two rational sciences, mathematics and physics, first entered upon the assured path of knowledge by a sudden revolution, and by the adoption of a method which in its general characteristics is common to both. This method consists, not in being led by nature as in leading-strings, but in interrogating nature in accordance with what reason produces on its own plan. The method of the geometrician does not consist in the study of figures presented to the senses. That would be an empirical (in Kant's view, sceptical) method. Geometrical propositions could not then be regarded as possessing universality and necessity. Nor does the geometrician employ a dogmatic method, that of studying the mere conception of a figure. By that means no new knowledge could ever be attained. The actual method consists in interpreting the sensible figures through conceptions that have been rigorously defined, and in accordance with which the figures have been constructively generated. The first discovery of this method, by Thales or some other Greek, was "far more important than the discovery of the passage round the celebrated Cape of Good Hope."

Some two thousand years elapsed before Galileo formulated a corresponding method for physical science. He relied neither on mere observation nor on his own conceptions. He determined the principles according to which alone concordant phenomena can be admitted as laws of nature, and then by experiment compelled nature to answer the questions which these principles suggest. Here again the method is neither merely empirical nor purely dogmatic. It possesses the advantages of both.

Metaphysics is ripe for a similar advance. It must be promoted to the rank of positive science by the transforming power of an analogous method. The fundamental and distinguishing characteristic of mathematical and physical procedure is the legislative power to which reason lays claim. Such procedure, if generalised and extended, will supply the required method of the new philosophy. Reason must be regarded as self-legislative in all the domains of our possible knowledge. *Objects must be viewed as conforming to human thought, not human thought to the independently real*. This is the "hypothesis" to which Kant has given the somewhat misleading title, "Copernican." The *method of procedure* which it prescribes is, he declares, analogous to that which was followed by Copernicus, and will be found to be as revolutionary in its consequences. In terms of this hypothesis a complete and absolutely certain metaphysics, valid now and for all time, can be created at a stroke. The earliest and oldest enterprise of the human mind will achieve a new beginning. Metaphysics, the mother of all the sciences, will renew her youth, and will equal in assurance, as she surpasses in dignity, the offspring of her womb.

From this new standpoint Kant develops phenomenalism on rationalist lines. He professes to prove that though our knowledge is only of appearances, it is conditioned by *a priori* principles. His "Copernican hypothesis," so far from destroying positive science, is, he claims, merely a philosophical extension of the method which it has long been practising. Since all science worthy of the name involves *a priori*

elements, it can be accounted for only in terms of the new hypothesis. Only if objects are regarded as conforming to our forms of intuition, and to our modes of conception, can they be anticipated by *a priori* reasoning. Science can be *a priori* just because, properly understood, it is not a rival of metaphysics, and does not attempt to define the absolutely real.

But such a statement at once suggests what may at first seem a most fatal objection. Though the new standpoint may account for the *a priori* in experience and science, it can be of no avail in metaphysics. If the *a priori* concepts have a mental origin, they can have no validity for the independently real. If we can know only what we ourselves originate, things in themselves must be unknown, and metaphysics must be impossible. But in this very consequence the new hypothesis first reveals its full advantages. It leads to an interpretation of metaphysics which is as new and as revolutionary as that which it gives to natural science. Transcendent metaphysics is indeed impossible, but in harmony with man's practical and moral vocation, its place is more efficiently taken by an immanent metaphysics on the one hand, and by a metaphysics of ethics on the other. Together these constitute the new and final philosophy which Kant claims to have established by his Critical method. Its chief task is to continue "that noblest enterprise of antiquity," the distinguishing of appearances from things in themselves. The unconditioned is that which alone will satisfy speculative reason; its determination is the ultimate presupposition of metaphysical enquiry. But so long as the empirical world is regarded as true reality, totality or unconditionedness cannot possibly be conceived — is, indeed, inherently self-contradictory. On the new hypothesis there is no such difficulty. By the proof that things in themselves are unknowable, a sphere is left open within which the unconditioned can be sought. For though this sphere is closed to speculative reason, the unconditioned can be determined from data yielded by reason in its practical activity. The hypothesis which at first seems to destroy metaphysics proves on examination to be its necessary presupposition. The "Copernican hypothesis" which conditions science will also account for metaphysics properly conceived.

Upon this important point Kant dwells at some length. Even the negative results of the *Critique* are, he emphasises, truly positive in their ultimate consequences. The dogmatic extension of speculative reason really leads to the narrowing of its employment, for the principles of which it then makes use involve the subjecting of things in themselves to the limiting conditions of sensibility. All attempts to construe the unconditioned in terms that will satisfy reason are by such procedure ruled out from the very start. To demonstrate this is the fundamental purpose and chief aim of the *Critique*. Space and time are merely forms of sensuous intuition; the concepts of understanding can yield knowledge only in their connection with them. Though the concepts in their purity possess a quite general meaning, this is not sufficient to constitute knowledge. The conception of causality, for instance, necessarily involves the notion of time-sequence; apart from time it is the bare, empty, and entirely unspecified conception of a sufficient ground. Similarly, the category of substance signifies the permanent in time and space; as a form of pure reason it has a quite indefinite meaning signifying merely that which is always a subject and never a predicate. In the absence of further specification, it remains entirely problematic in its reference. The fact, however, that the categories of the understanding possess, in independence of sensibility, even this quite general significance is all-important. Originating in pure reason they have a wider scope than the forms of sense, and enable us to conceive, though not to gain knowledge of, things in themselves. Our dual nature, as being at once sensuous and supersensuous, opens out to us the apprehension of both.

Kant illustrates his position by reference to the problem of the freedom of the will. As thought is wider than sense, and reveals to us the existence of a noumenal realm, we are enabled to reconcile belief in the freedom of the will with the mechanism of nature. We can recognise that within the phenomenal sphere everything without exception is causally determined, and yet at the same time maintain that the whole order of nature is grounded in noumenal conditions. We can assert of one and the same being that its will is subject to the necessity of nature and that it is free — mechanically determined in its visible actions, free in its real supersensible existence. We have, indeed, no knowledge of the soul, and therefore cannot

assert on theoretical grounds that it possesses any such freedom. The very possibility of freedom transcends our powers of comprehension. The proof that it can at least be conceived without contradiction is, however, all-important. For otherwise no arguments from the nature of the moral consciousness could be of the least avail; before a palpable contradiction every argument is bound to give way. Now, for the first time, the doctrine of morals and the doctrine of nature can be independently developed, without conflict, each in accordance with its own laws. The same is true in regard to the existence of God and the immortality of the soul. By means of the Critical distinction between the empirical and the supersensible worlds, *these conceptions are now for the first time rendered possible of belief*. "I had to remove *knowledge*, in order to make room for *belief*." "This loss affects only the *monopoly of the schools*, in no respect the *interests of humanity*."

Lastly, Kant emphasises the fact that the method of the *Critique* must be akin to that of dogmatism. It must be rational *a priori*. To adopt any other method of procedure is "to shake off the fetters of *science* altogether, and thus to change work into play, certainty into opinion, philosophy into philodoxy." And Kant repeats the claims of the preface of the first edition as to the completeness and finality of his system. "This system will, as I hope, maintain through the future this same unchangeableness."

Logic. — For Kant's view of the logic of Aristotle as complete and perfect, cf. below, p-5. Kant compares metaphysics to mathematics and physics on the one hand, and to formal logic on the other. The former show the possibility of attaining to the secure path of science by a sudden and single revolution; the latter demonstrates the possibility of creating a science complete and entire at a stroke. Thanks to the new Critical method, metaphysics may be enabled, Kant claims, to parallel both achievements at once.

Theoretical and practical reason. — Such comment as is necessary upon this distinction is given below. Cf. ff.

Hitherto it has been supposed that all knowledge must conform to the objects. — This statement is historically correct. That assumption did actually underlie one and all of the pre-Kantian philosophies. At the same time, it is true that Kant's phenomenalist standpoint is partially anticipated by Hume, by Malebranche and by Leibniz, especially by the first named. Hume argues that to condemn knowledge on the ground that it can never copy or truly reveal any external reality is to misunderstand its true function. Our sense perceptions and our general principles are so determined by nature as to render feasible only a practical organisation of life. When we attempt to derive from them a consistent body of knowledge, failure is the inevitable result. Malebranche, while retaining the absolutist view of conceptual knowledge, propounds a similar theory of sense-perception. Our perceptions are, as he shows, permeated through and through, from end to end, with illusion. Such illusions justify themselves by their practical usefulness, but they likewise prove that theoretical insight is not the purpose of our sense-experience. Kant's Copernican hypothesis consists in great part of an extension of this view to our conceptual, scientific knowledge. But he differs both from Malebranche and from Hume in that he develops his phenomenalism on rationalist lines. He professes to show that though our knowledge is only of the phenomenal, it is conditioned by *a priori* principles. The resulting view of the distinction between appearance and reality has kinship with that of Leibniz. The phenomena of science, though only appearances, are none the less *bene fundata*. Our scientific knowledge, though not equivalent to metaphysical apprehension of the ultimately real, can be progressively developed by scientific methods.

The two "parts" of metaphysics. — Kant is here drawing the important distinction, which is one result of his new standpoint, between *immanent* and *transcendent* metaphysics. It is unfortunate that he does not do so in a more explicit manner, with full recognition of its novelty and of its far-reaching significance. Many ambiguities in his exposition here and elsewhere would then have been obviated.

The unconditioned which Reason postulates in all things by themselves, by necessity and by right. — Points are here raised the discussion of which must be deferred. Cf. below, p-31, 433-4, 558-61.

The Critique is a treatise on method, not a system of the science itself. — Cf. A xv.; B xxxvi.; and

especially A 11 = B 24, below p-2.

The Copernican hypothesis. — Kant’s comparison of his new hypothesis to that of Copernicus has generally been misunderstood. The reader very naturally conceives the Copernican revolution in terms of its main ultimate consequence, the reduction of the earth from its proud position of central pre-eminence. But that does not bear the least analogy to the intended consequences of the Critical philosophy. The direct opposite is indeed true. Kant’s hypothesis is inspired by the avowed purpose of neutralising the naturalistic implications of the Copernican astronomy. His aim is nothing less than the firm establishment of what may perhaps be described as a Ptolemaic, anthropocentric metaphysics. Such naturalistic philosophy as that of Hume may perhaps be described as Copernican, but the Critical philosophy, as humanistic, has genuine kinship with the Greek standpoint.

Even some of Kant’s best commentators have interpreted the analogy in the above manner. It is so interpreted by T. H. Green and by J. Hutchison Stirling. Caird in his *Critical Philosophy of Kant* makes not the least mention of the analogy, probably for the reason that while reading it in the same fashion as Green, he recognised the inappropriateness of the comparison as thus taken. The analogy is stated in typically ambiguous fashion by Lange and by Höffding. S. Alexander, while very forcibly insisting upon the Ptolemaic character of the Kantian philosophy, also endorses this interpretation in the following terms:

“It is very ironical that Kant himself signalised the revolution which he believed himself to be effecting as a Copernican revolution. But there is nothing Copernican in it except that he believed it to be a revolution. If every change is Copernican which reverses the order of the terms with which it deals, which declares A to depend on B when B had before been declared to depend on A, then Kant — who believed that he had reversed the order of dependence of mind and things — was right in saying that he effected a Copernican revolution. But he was not right in any other sense. For his revolution, so far as it was one, was accurately anti-Copernican.”

As the second edition preface is not covered by the published volumes of Vaihinger’s *Commentary*, the point has not been taken up by him.

Now Kant’s own statements are entirely unambiguous and do not justify any such interpretation as that of Green and Alexander. As it seems to me, they have missed the real point of the analogy. The misunderstanding would never have been possible save for our neglect of the scientific classics. Kant must have had first-hand acquaintance with Copernicus’ *De Revolutionibus*, and the comparison which he draws assumes similar knowledge on the part of his readers. Copernicus by his proof of the “hypothesis” (his own term) of the earth’s motion sought only to achieve a more harmonious ordering of the Ptolemaic universe. And as thus merely a simplification of the traditional cosmology, his treatise could fittingly be dedicated to the reigning Pope. The sun upon which our terrestrial life depends was still regarded as uniquely distinct from the fixed stars; and our earth was still located in the central region of a universe that was conceived in the traditional manner as being single and spherical. Giordano Bruno was the first, a generation later, to realise the revolutionary consequences to which the new teaching, consistently developed, must inevitably lead. It was he who first taught what we have now come to regard as an integral part of Copernicus’ revolution, the doctrine of innumerable planetary systems side by side with one another in infinite space.

Copernicus’ argument starts from the Aristotelian principle of relative motion. To quote Copernicus’ exact words:

“All apprehended change of place is due to movement either of the observed object or of the observer, or to differences in movements that are occurring simultaneously in both. For if the observed object and the observer are moving in the same direction with equal velocity, no motion can be detected. Now it is from the earth that we visually apprehend the revolution of the heavens. If, then, any movement is ascribed to the earth, that motion will generate the appearance of itself in all things which are external to it, though

as occurring in the opposite direction, as if everything were passing across the earth. This will be especially true of the daily revolution. For it seems to seize upon the whole world, and indeed upon everything that is around the earth, though not upon the earth itself.... As the heavens, which contain and cover everything, are the common locus of things, it is not at all evident why it should be to the containing rather than to the contained, to the located rather than to the locating, that a motion is to be ascribed."

The apparently objective movements of the fixed stars and of the sun are mere appearances, due to the projection of our own motion into the heavens.

"The first and highest of all the spheres is that of the fixed stars, self-containing and all-containing, and consequently immobile, in short the locus of the universe, by relation to which the motion and position of all the other heavenly bodies have to be reckoned."

Now it is this doctrine, and this doctrine alone, to which Kant is referring in the passages before us, namely, Copernicus' hypothesis of a subjective explanation of apparently objective motions. And further, in thus comparing his Critical procedure to that of Copernicus, he is concerned more with the positive than with the negative consequences of their common hypothesis. For it is chiefly from the point of view of the *constructive* parts of the *Aesthetic*, *Analytic*, and *Dialectic* that the comparison is formulated. By means of the Critical hypothesis Kant professes on the one hand to account for our scientific knowledge, and on the other to safeguard our legitimate metaphysical aspirations. The spectator projects his own motion into the heavens; human reason legislates for the domain of natural science. The sphere of the fixed stars is proved to be motionless; things in themselves are freed from the limitations of space and time. "Copernicus dared, in a manner contradictory of the senses but yet true, to seek the observed movements, not in the heavenly bodies, but in the spectator."

In view of Kant's explicit elimination of all *hypotheses* from the *Critique* the employment of that term would seem to be illegitimate. He accordingly here states that though in the *Preface* his Critical theory is formulated as an hypothesis only, in the *Critique* itself its truth is demonstrated *a priori*.

Distinction between knowing and thinking. — Since according to Critical teaching the limits of sense-experience are the limits of knowledge, the term knowledge has for Kant a very limited denotation, and leaves open a proportionately wide field for what he entitles thought. Though things in themselves are unknowable, their existence may still be recognised in thought.

INTRODUCTION

I SHALL first give a restatement, partly historical and partly explanatory, of Kant's main argument as contained in the enlarged *Introduction* of the second edition.

There were two stages in the process by which Kant came to full realisation of the Critical problem. There is first the problem as formulated in his letter of 1772 to Herz: how the *a priori* can yield knowledge of the independently real. This, as he there states it, is an essentially metaphysical problem. It is the problem of the possibility of transcendent metaphysics. He became aware of it when reflecting upon the function which he had ascribed to intellect in the *Dissertation*. Then, secondly, this problem was immeasurably deepened, and at the same time the proper line for its treatment was discovered, through the renewed influence which Hume at some date subsequent to February 1772 exercised upon Kant's thought. Hume awakened Kant to what may be called the *immanent* problem involved in the very conception of *a priori* knowledge as such. The primary problem to be solved is not how we advance by means of *a priori* ideas to the independently real, but how we are able to advance beyond a subject term to a predicate which it does not appear to contain. The problem is indeed capable of solution, just because it takes this *logical* form. Here as elsewhere, ontological questions are viewed by Kant as soluble only to the extent

to which they can be restated in logical terms. Now also the enquiry becomes twofold: how and in what degree are *a priori* synthetic judgments possible, first in their employment within the empirical sphere (the problem of immanent metaphysics) and secondly in their application to things in themselves (the problem of transcendent metaphysics). The outcome of the Critical enquiry is to establish the legitimacy of immanent metaphysics and the impossibility of all transcendent speculation.

The argument of Kant's *Introduction* follows the above sequence. It starts by defining the problem of metaphysical knowledge *a priori*, and through it leads up to the logical problem of the *a priori* synthetic judgment. In respect of time all knowledge begins *with* experience. But it does not therefore follow that it all arises *from* experience. Our experience may be a compound of that which we receive through impressions, and of that which pure reason supplies from itself. The question as to whether or not any such *a priori* actually exists, is one that can be answered only after further enquiry. The two inseparable criteria of the *a priori* are necessity and universality. That neither can be imparted to a proposition by experience was Kant's confirmed and unquestioned belief. He inherited this view both from Leibniz and from Hume. It is one of the presuppositions of his argument. Experience can reveal only co-existence or sequence. It enables us only to assert that so far as we have hitherto observed, there is no exception to this or that rule. A generalisation, based on observation, can never possess a wider universality than the limited experience for which it stands. If, therefore, necessary and universal judgments can anywhere be found in our knowledge, the existence of an *a priori* that originates independently of experience is *ipso facto* demonstrated.

The contrast between empirical and *a priori* judgments, as formulated from the dogmatic standpoint, is the most significant and striking fact in the whole range of human knowledge. *A priori* judgments claim absolute necessity. They allow of no possible exception. They are valid not only for us, but also for all conceivable beings, however different the specific conditions of their existence, whether they live on the planet Mars or in some infinitely remote region of stellar space, and no matter how diversely their bodily senses may be organised. Through these judgments a creature five feet high, and correspondingly limited by temporal conditions, legislates for all existence and for all time. Empirical judgments, on the other hand, possess only a hypothetical certainty. We recognise that they may be overturned through some addition to our present experience, and that they may not hold for beings on other planets or for beings with senses differently constituted. Whereas the opposite of a rational judgment is not even conceivable, the opposite of an empirical judgment is always possible. The one depends upon the inherent and inalienable nature of our thinking; the other is bound up with the contingent material of sense. The one claims absolute or metaphysical truth: the other is a merely tentative *résumé* of a limited experience.

The possibility of such *a priori* judgments had hitherto been questioned only by those who sought to deny to them all possible objective validity. Kant, as a rationalist, has no doubt as to their actual existence. In the *Introduction* to the second edition he bluntly asserts their *de facto* existence, citing as instances the propositions of mathematics and the fundamental principles of physical science. Their possibility can be accounted for through the assumption of *a priori* forms and principles. But with equal emphasis he questions the validity of their *metaphysical* employment. For that is an entirely different matter. We then completely transcend the world of the senses and pass into a sphere where experience can neither guide nor correct us. In this sphere the *a priori* is illegitimately taken as being at once the source of our professed knowledge and also the sole criterion of its own claims.

This is the problem, semi-Critical, semi-dogmatic, which is formulated in the letter of 1772 to Herz. What right have we to regard ideas, which as *a priori* originate from within, as being valid of things in themselves? In so doing we are assuming a pre-established harmony between our human faculties and the ultimately real; and that is an assumption which by its very nature is incapable of demonstration. The proofs offered by Malebranche and by Leibniz are themselves speculative, and consequently presuppose the conclusion which they profess to establish. As above stated, Kant obtained his answer to this problem

by way of the logical enquiry into the nature and conditions of *a priori* judgment.

One of the chief causes, Kant declares, why hitherto metaphysical speculation has passed unchallenged among those who practise it, is the confusion of two very different kinds of judgment, the analytic and the synthetic. Much the greater portion of what reason finds to do consists in the analysis of our concepts of objects.

"As this procedure yields real knowledge *a priori*, which progresses in secure and useful fashion, reason is so far misled as surreptitiously to introduce, without itself being aware of so doing, assertions of an entirely different order, in which reason attaches to given concepts others completely foreign to them — and moreover attaches them *a priori*. And yet one does not know how reason comes to do this. This is a question which is never as much as thought of."

The concepts which are analytically treated may be either empirical or *a priori*. When they are empirical, the judgments which they involve can have no wider application than the experience to which they give expression; and in any case can only reveal what has all along been thought, though confusedly, in the term which serves as subject of the proposition. They can never reveal anything different in kind from the contents actually experienced. This limitation, to which the analysis of empirical concepts is subject, was admitted by both empiricists and rationalists. The latter sought, however, to escape its consequences by basing their metaphysics upon concepts which are purely *a priori*, and which by their *a priori* content may carry us beyond the experienced. But here also Kant asserts a *non possibile*. *A priori* concepts, he seeks to show, are in all cases purely logical functions without content, and accordingly are as little capable as are empirical concepts of carrying us over to the supersensible. This is an objection which holds quite independently of that already noted, namely, that their objective validity would involve a pre-established harmony.

What, then, is the nature and what are the generating conditions of synthetic judgments that are also *a priori*? In all judgments there is a relation between subject and predicate, and that can be of two kinds. Either the predicate B belongs to the subject A, or B lies outside the sphere of the concept A though somehow connected with it. In the former case the judgment is analytic; in the latter it is synthetic. The one simply unfolds what has all along been conceived in the subject concept; the other ascribes to the concept of the subject a predicate which cannot be found in it by any process of analysis. Thus the judgment 'all bodies are extended' is analytic. The concept of body already contains that of extension, and is impossible save through it. On the other hand, the judgment 'all bodies are heavy' is synthetic. For not body as such, but only bodies which are in interaction with other bodies, are found to develop this property. Bodies can very well be conceived as not influencing one another in any such manner.

There is no difficulty in accounting for analytic judgments. They can all be justified by the principle of contradiction. Being analytic, they can be established *a priori*. Nor, Kant here claims, is there any difficulty in regard to synthetic judgments that are empirical. Though the predicate is not contained in the subject concept, they belong to each other (though accidentally) as parts of a given empirical whole. Experience is the *x* which lies beyond the concept A, and on which rests the possibility of the synthesis of B with A. In regard, however, to synthetic judgments which are likewise *a priori*, the matter is very different. Hitherto, both by the sensationalists and by the rationalists, all synthetic judgments have been regarded as empirical, and all *a priori* judgments as analytic. The only difference between the opposed schools lies in the relative value which they ascribe to the two types of judgment. For Hume the only really fruitful judgments are the synthetic judgments *a posteriori*; analytic judgments are of quite secondary value; they can never extend our knowledge, but only clarify its existing content. For Leibniz, on the other hand, true knowledge consists only in the analysis of our *a priori* concepts, which he regards as possessing an intrinsic and fruitful content; synthetic judgments are always empirical, and as such are purely contingent.

Thus for pre-Kantian philosophy analytic is interchangeable with *a priori*, and synthetic with *a*

posteriori. Kant's Critical problem arose from the startling discovery that the *a priori* and the synthetic do not exclude one another. A judgment may be synthetic and yet also *a priori*. He appears to have made this discovery under the influence of Hume, through study of the general principle of causality — every event must have a cause. In that judgment there seems to be no connection of any kind discoverable between the subject (the conception of an event as something happening in time) and the predicate (the conception of another event preceding it as an originating cause); and yet we not merely ascribe the one to the other but assert that they are necessarily connected. We can conceive an event as sequent upon a preceding empty time; none the less, in physical enquiry, the causal principle is accepted as an established truth. Here, then, is a new and altogether unique type of judgment, of thoroughly paradoxical nature. So entirely is it without apparent basis, that Hume, who first deciphered its strange character, felt constrained to ascribe our belief in it to an unreasoning and merely instinctive, 'natural' habit or custom.

Kant found, however, that the paradoxical characteristics of the causal principle also belong to mathematical and physical judgments. This fact makes it impossible to accept Hume's sceptical conclusion. If even the assertion 7 + 5 = 12 is both synthetic and *a priori*, it is obviously impossible to question the validity of judgments that possess these characteristics. But they do not for that reason any the less urgently press for explanation. Such an enquiry might not, indeed, be necessary were we concerned only with scientific knowledge. For the natural sciences justify themselves by their practical successes and by their steady unbroken development. But metaphysical judgments are also of this type; and until the conditions which make *a priori* synthetic judgment possible have been discovered, the question as to the legitimacy of metaphysical speculation cannot be decided. Such judgments are plainly mysterious, and urgently call for further enquiry.

The problem to be solved concerns the ground of our ascription to the subject concept, as necessarily belonging to it, a predicate which seems to have no discoverable relation to it. What is the unknown *x* on which the understanding rests in asserting the connection? It cannot be repeated experience; for the judgments in question claim necessity. Nor can such judgments be proved by means of a logical test, such as the inconceivability of the opposite. The absence of all apparent connection between subject and predicate removes that possibility. These, however, are the only two methods of proof hitherto recognised in science and philosophy. The problem demands for its solution nothing less than the discovery and formulation of an entirely novel method of proof.

The three main classes of *a priori* synthetic judgments are, Kant proceeds, the mathematical, the physical, and the metaphysical. The synthetic character of mathematical judgments has hitherto escaped observation owing to their being proved (as is required of all apodictic certainty) according to the principle of contradiction. It is therefrom inferred that they rest on the authority of that principle, and are therefore analytic. That, however, is an illegitimate inference; for though the truth of a synthetic proposition can be thus demonstrated, that can only be if another synthetic principle is first presupposed. It can never be proved that its truth, as a separate judgment, is demanded by the principle of contradiction. That 7 + 5 must equal 12 does not follow analytically from the conception of the sum of seven and five. This conception contains nothing beyond the union of both numbers into one; it does not tell us what is the single number that combines both. That five should be added to seven is no doubt implied in the conception, but not that the sum should be twelve. To discover that, we must, Kant maintains, go beyond the concepts and appeal to intuition. This is more easily recognised when we take large numbers. We then clearly perceive that, turn and twist our concepts as we may, we can never, by means of mere analysis of them, and without the help of intuition, arrive at the sum that is wanted. The fundamental propositions of geometry, the so-called axioms, are similarly synthetic, *e.g.* that the straight line between two points is the shortest. The concept 'straight' only defines direction; it says nothing as to quantity.

As an instance of a synthetic *a priori* judgment in physical science Kant cites the principle: the quantity of matter remains constant throughout all changes. In the conception of matter we do not conceive its

permanency, but only its presence in the space which it fills. The opposite of the principle is thoroughly conceivable.

Metaphysics is *meant* to contain *a priori* knowledge. For it seeks to determine that of which we can have no experience, as *e.g.* that the world must have a first beginning. And if, as will be proved, our *a priori* concepts have no content, which through analysis might yield such judgments, these judgments also must be synthetic.

Here, then, we find the essential problem of pure reason. Expressed in a single formula, it runs: How are synthetic *a priori* judgments possible? To ask this question is to enquire, first, how pure mathematics is possible; secondly, how pure natural science is possible; and thirdly, how metaphysics is possible. That philosophy has hitherto remained in so vacillating a state of ignorance and contradiction is entirely due to the neglect of this problem of *a priori* synthesis. "Its solution is the question of life and death to metaphysics." Hume came nearest to realising the problem, but he discovered it in too narrow a form to appreciate its full significance and its revolutionary consequences.

"Greater firmness will be required if we are not to be deterred by inward difficulties and outward opposition from endeavouring, through application of a method entirely different from any hitherto employed, to further the growth and fruitfulness of a science indispensable to human reason — a science whose every branch may be cut away but whose root cannot be destroyed."

These statements are decidedly ambiguous, owing to Kant's failure to distinguish in any uniform and definite manner between immanent and transcendent metaphysics. The term metaphysics is used to cover both. Sometimes it signifies the one, sometimes the other; while in still other passages its meaning is neutral. But if we draw the distinction, Kant's answer is that a genuine and valid immanent metaphysics is for the first time rendered possible by his *Critique*; its positive content is expounded in the *Analytic*. Transcendent metaphysics, on the other hand, is criticised in the *Dialectic*; it is never possible. The existing speculative sciences transgress the limits of experience and yield only a pretence of knowledge. This determination of the limits of our possible *a priori* knowledge is the second great achievement of the *Critique*. Thus the *Critique* serves a twofold purpose. It establishes a new *a priori* system of metaphysics, and also determines on principles equally *a priori* the ultimate limits beyond which metaphysics can never advance. The two results, positive and negative, are inseparable and complementary. Neither should be emphasised to the neglect of the other.

Comment on the Argument of Kant's *Introduction*

This *Introduction*, though a document of great historical importance as being the first definite formulation of the generating problem of Kant's new philosophy, is extremely unsatisfactory as a statement of Critical teaching. The argument is developed in terms of distinctions which are borrowed from the traditional logic, and which are not in accordance with the transcendental principles that Kant is professing to establish. This is, indeed, a criticism which may be passed upon the *Critique* as a whole. Though Kant was conscious of opening a new era in the history of philosophy, and compares his task with that of Thales, Copernicus, Bacon and Galileo, it may still be said that he never fully appreciated the greatness of his own achievement. He invariably assumes that the revolutionary consequences of his teaching will not extend to the sphere of pure logic. They concern, as he believed, only our metaphysical theories regarding the nature of reality and the determining conditions of our human experience. As formal logic prescribes the axiomatic principles according to which all thinking must proceed, its validity is not affected by the other philosophical disciplines, and is superior to the considerations that determine their truth or falsity. Its distinctions may be securely relied upon in the pioneer labours of Critical investigation. This was, of course, a very natural assumption for Kant to make; and many present-day thinkers will maintain that it is entirely justified. Should that be our attitude, we may approve of Kant's general method of procedure, but shall be compelled to dissent from much in his argument and from many of his chief conclusions. If, on the other hand, we regard formal logic as in any degree adequate only as a

theory of the thought processes involved in the formation and application of the generic or class concept, we shall be prepared to find that the equating of this highly specialised logic with logic in general has resulted in the adoption of distinctions which may be fairly adequate for the purposes in view of which they have been formulated, but which must break down when tested over a wider field. So far from condemning Kant for departing in his later teaching from these hard and fast distinctions, we shall welcome every sign of his increasing independence.

Kant was not, of course, so blind to the real bearing of his principles as to fail to recognise that they have logical implications. He speaks of the new metaphysics which he has created as being a transcendental logic. It is very clear, however, that even while so doing he does not regard it as in any way alternative to the older logic, but as moving upon a different plane, and as yielding results which in no way conflict with anything that formal logic may teach. Indeed Kant ascribes to the traditional logic an almost sacrosanct validity. Both the general framework of the *Critique* and the arrangement of the minor subdivisions are derived from it. It is supposed to afford an adequate account of discursive thinking, and such supplement as it may receive is regarded as simply an extension of its carefully delimited field. There are two logics, that of discursive or analytic reasoning, and that of synthetic interpretation. The one is formal; the other is transcendental. The one was created by Aristotle, complete at a stroke; Kant professes to have formulated the other in an equally complete and final manner.

This latter claim, which is expressed in the most unqualified terms in the *Prefaces* to the first and second editions, is somewhat startling to a modern reader, and would seem to imply the adoption of an ultra-rationalistic attitude, closely akin to that of Wolff.

"In this work I have made completeness my chief aim, and I venture to assert that there is not a single metaphysical problem which has not been solved, or for the solution of which the key at least has not been supplied. Reason is, indeed, so perfect a unity that if its principle were insufficient for the solution of even a single one of all the questions to which it itself gives birth, we should be justified in forthwith rejecting it as incompetent to answer, with perfect certainty, any one of the other questions." "Metaphysics has this singular advantage, such as falls to the lot of no other science which deals with objects (for *logic* is concerned only with the form of thought in general), that should it, through this *Critique*, be set upon the secure path of science, it is capable of acquiring exhaustive knowledge of its entire field. It can finish its work and bequeath it to posterity as a capital that can never be added to. For metaphysics has to deal only with principles, and with the limits of their employment as determined by these principles themselves. Since it is a fundamental science, it is under obligation to achieve this completeness. We must be able to say of it: *nil actum reputans, si quid superesset agendum*."

These sanguine expectations — by no means supported by the after-history of Kant's system — are not really due to Kant's immodest over-estimate of the importance of his work. They would rather seem to be traceable, on the one hand to his continuing acceptance of rationalistic assumptions proper only to the philosophy which he is displacing, and on the other to his failure to appreciate the full extent of the revolutionary consequences which his teaching was destined to produce in the then existing philosophical disciplines. Kant, like all the greatest reformers, left his work in the making. Both his results and his methods call for modification and extension in the light of the insight which they have themselves rendered possible. Indeed, Kant was himself constantly occupied in criticising and correcting his own acquired views; and this is nowhere more evident than in the contrast between the teaching of this *Introduction* and that of the central portions of the *Analytic*. But even the later expressions of his maturer views reveal the persisting conflict. They betray the need for further reconstruction, even in the very act of disavowing it. Not an additional logic, but the demonstration of the imperative need for a complete revisal of the whole body of logical science, is the first, and in many respects the chief, outcome of his Critical enquiries.

The broader bearings of the situation may perhaps be indicated as follows. If our account of Kant's

awakening from his dogmatic slumber be correct, it consisted in his recognition that self-evidence will not suffice to guarantee any general principle. The fundamental principles of our experience are synthetic. That is to say, their opposite is in all cases conceivable. Combining this conclusion with his previous conviction that they can never be proved by induction from observed facts, he was faced with the task of establishing rationalism upon a new and altogether novel basis. If neither empirical facts nor intuitive self-evidence may be appealed to, in what manner can proof proceed? And how can we make even a beginning of demonstration, if our very principles have themselves to be established? Principles are never self-evident, and yet principles are indispensable. Such was Kant's unwavering conviction as regards the fundamental postulates alike of knowledge and of conduct.

This is only another way of stating that Kant is the real founder of the *Coherence* theory of truth. He never himself employs the term Coherence, and he constantly adopts positions which are more in harmony with a *Correspondence* view of the nature and conditions of knowledge. But all that is most vital in his teaching, and has proved really fruitful in its after-history, would seem to be in line with the positions which have since been more explicitly developed by such writers as Lotze, Sigwart, Green, Bradley, Bosanquet, Jones and Dewey, and which in their tenets all derive from Hegel's restatement of Kant's logical doctrines. From this point of view principles and facts mutually establish one another, the former proving themselves by their capacity to account for the relevant phenomena, and the latter distinguishing themselves from irrelevant accompaniments by their conformity to the principles which make insight possible. In other words, all proof conforms in general type to the hypothetical method of the natural sciences. Kant's so-called transcendental method, the method by which he establishes the validity of the categories, is itself, as we have already observed, of this character. Secondly, the distinction between the empirical and the *a priori* must not be taken (as Kant himself takes it in his earlier, and occasionally even in his later utterances) as marking a distinction between two kinds of knowledge. They are elements inseparably involved in all knowledge. And lastly, the contrast between analysis and synthesis becomes a difference not of kind but of degree. Nothing can exist or be conceived save as fitted into a system which gives it meaning and decides as to its truth. In the degree to which it can be studied in relative independence of the supporting system analysis will suffice; in the degree to which it refers us to this system it calls for synthetic interpretation. But ultimately the needs of adequate understanding must constrain us to the employment of both methods of enquiry. Nothing can be known save in terms of the wider whole to which it belongs.

There is, however, one important respect in which Kant diverges in very radical fashion from the position of Hegel. The final whole to which all things must be referred is represented to us only through an "Idea," for which no corresponding reality can ever be found. The system which decides what is to be regarded as *empirically* real is the mechanical system of natural science. We have no sufficient theoretical criterion of absolute reality.

These somewhat general considerations may be made more definite if we now endeavour to determine in what specific respects the distinctions employed in the *Introduction* fail to harmonise with the central doctrines of the *Analytic*.

In the first place, Kant states his problem in reference only to the attributive judgment. The other types of relational judgment are entirely ignored. For even when he cites judgments of other relational types, such as the propositions of arithmetic and geometry, or that which gives expression to the causal axiom, he interprets them on the lines of the traditional theory of the categorical proposition. As we shall find, it is with the relational categories, and consequently with the various types of relational judgment to which they give rise, that the *Critique* is alone directly concerned. Even the attributive judgment is found on examination to be of this nature. What it expresses is not the inclusion of an attribute within a given group of attributes, but the organisation of a complex manifold in terms of the dual category of substance and attribute.

Secondly, this exclusively attributive interpretation of the judgment leads Kant to draw, in his *Introduction*, a hard and fast distinction between the analytic and the synthetic proposition — a distinction which, when stated in such extreme fashion, obscures the real implications of the argument of the *Analytic*. For Kant here propounds as an exhaustive division the two alternatives: (*a*) inclusion of the predicate concept within the subject concept, and (*b*) the falling of the predicate concept entirely outside it. He adds, indeed, that in the latter case the two concepts may still be in some way connected with one another; but this is a concession of which he takes no account in his subsequent argument. He leaves unconsidered the third possibility, that every judgment is both analytic and synthetic. If concepts are not independent entities, as Kant, in agreement with Leibniz, still continues to maintain, but can function only as members of an articulated system, concepts will be distinguishable from one another, and yet will none the less involve one another. In so far as the distinguishable elements in a judgment are directly related, the judgment may *seem* purely analytic; in so far as they are related only in an indirect manner through a number of intermediaries, they may *seem* to be purely synthetic. But in every case there is an internal articulation which is describable as synthesis, and an underlying unity that in subordinating all differences realises more adequately than any mere identity the demand for connection between subject and predicate. In other words, all judgments will, on this view, be of the relational type. Even the attributive judgment, as above noted, is no mere assertion of identity. It is always expressed in terms of the dual category of substance and attribute, connecting by a *relation* contents that as contents may be extremely diverse.

This would seem to be the view to which Kant's Critical teaching, when consistently developed, is bound to lead. For in insisting that the synthetic character of a judgment need not render it invalid, and that all the fundamental principles and most of the derivative judgments of the positive sciences are of this nature, Kant is really maintaining that the justification of a judgment is always to be looked for beyond its own boundaries in some implied context of coherent experience. But though the value of his argument lies in clear-sighted recognition of the synthetic factor in all genuine knowledge, its cogency is greatly obscured by his continued acceptance of the possibility of judgments that are purely analytic. Thus there is little difficulty in detecting the synthetic character of the proposition: all bodies are heavy. Yet the reader has first been required to admit the analytic character of the proposition: all bodies are extended. The two propositions are really identical in logical character. Neither can be recognised as true save in terms of a comprehensive theory of physical existence. If matter must exist in a state of distribution in order that its parts may acquire through mutual attraction the property of weight, the size of a body, or even its possessing any extension whatsoever, may similarly depend upon specific conditions such as may conceivably not be universally realised. We find the same difficulty when we are called upon to decide whether the judgment 7 + 5 = 12 is analytic or purely synthetic. Kant speaks as if the concepts of 7, 5, and 12 were independent entities, each with its own quite separate connotation. But obviously they can only be formed in the light of the various connected concepts which go to constitute our system of numeration. The proposition has meaning only when interpreted in the light of this conceptual system. It is not, indeed, a self-evident identical proposition; but neither is the connection asserted so entirely synthetic that intuition will alone account for its possibility. That, however, brings us to the third main defect in Kant's argument.

When Kant states that in synthetic judgments we require, besides the concept of the subject, something else on which the understanding can rely in knowing that a predicate, not contained in the concept, nevertheless belongs to it, he entitles this something *x*. In the case of empirical judgments, this *x* is brute experience. Such judgments, Kant implies, are *merely* empirical. No element of necessity is involved, not even in an indirect manner; in reference to empirical judgments there is no problem of *a priori synthesis*. Now in formulating the issue in this way, Kant is obscuring the essential purpose of his whole enquiry. He may, without essential detriment to his central position, still continue to preserve a hard-and-fast distinction between analytic and synthetic judgments. In so doing he is only failing to perceive the ultimate

consequences of his final results. But in viewing empirical judgments as lacking in every element of necessity, he is destroying the very ground upon which he professes to base the *a priori* validity of general principles. All judgments involve relational factors of an *a priori* character. The appeal to experience is the appeal to an implied system of nature. Only when fitted into the context yielded by such a system can an empirical proposition have meaning, and only in the light of such a presupposed system can its truth be determined. It can be true at all, only if it can be regarded as necessarily holding, under the same conditions, for all minds constituted like our own. Assertion of a contingent relation — as in the proposition: this horse is white — is not equivalent to contingency of assertion. Colour is a variable quality of the genus horse, but in the individual horse is necessarily determined in some particular mode. If a horse is naturally white, it is necessarily white. Though, therefore, in the above proposition, necessity receives no explicit verbal expression, it is none the less implied.

In other words, the distinction between the empirical and the *a priori* is not, as Kant inconsistently assumes in this *Introduction*, a distinction between two kinds of synthesis or judgment, but between two elements inseparably involved in every judgment. Experience is transcendentally conditioned. Judgment is in all cases the expression of a relation which implies an organised system of supporting propositions; and for the articulation of this system *a priori* factors are indispensably necessary.

But the most flagrant example of Kant's failure to live up to his own Critical principles is to be found in his doctrine of pure intuition. It represents a position which he adopted in the pre-Critical period. It is prefigured in *Ueber die Deutlichkeit der Grundsätze* (1764), and in *Von dem ersten Grunde des Unterschiedes der Gegenden im Raume* (1768), and is definitely expounded in the *Dissertation* (1770). That Kant continued to hold this doctrine, and that he himself regarded it as an integral part of his system, does not, of course, suffice to render it genuinely Critical. As a matter of fact, it is really as completely inconsistent with his Critical standpoint as is the view of the empirical proposition which we have just been considering. An appeal to our fingers or to points is as little capable, in and by itself, of justifying any *a priori* judgment as are the sense-contents of grounding an empirical judgment. Even when Kant is allowed the benefit of his own more careful statements, and is taken as asserting that arithmetical propositions are based on a pure *a priori* intuition which can find only approximate expression in sensuous terms, his statements run counter to the main tendencies of his Critical teaching, as well as to the recognised methods of the mathematical sciences. Intuition may, as Poincaré and others have maintained, be an indispensable element in all mathematical concepts; it cannot afford *proof* of any general theorem. The conceptual system which directs our methods of decimal counting is what gives meaning to the judgment $7 + 5 = 12$; it is also what determines that judgment as true. The appeal to intuition in numerical judgments must be regarded only as a means of imaginatively realising in a concrete form the abstract relations of some such governing system, or else as a means of detecting relations not previously known. The last thing in the world which such a method can yield is universal demonstration. This is equally evident in regard to geometrical propositions. That a straight line is the shortest distance between two points, cannot be proved by any mere appeal to intuition. The judgment will hold if it can be assumed that space is Euclidean in character; and to justify that assumption it must be shown that Euclidean concepts are adequate to the interpretation of our intuitional data. Should space possess a curvature, the above proposition might cease to be universally valid. Space is not a simple, unanalysable datum. Though intuitionally apprehended, it demands for its precise determination the whole body of geometrical science.

The comparative simplicity of Kant's intuitional theory of mathematical science, supported as it is by the seemingly fundamental distinction between abstract concepts of reflective thinking and the construction of concepts in geometry and arithmetic, has made it intelligible even to those to whom the very complicated argument of the *Analytic* makes no appeal. It would also seem to be inseparably bound up with what from the popular point of view is the most striking of all Kant's theoretical doctrines,

namely, his view that space and time are given subjective forms, and that the assertion of their independent reality must result in those contradictions to which Kant has given the title antinomy. For these reasons his intuitional theory of mathematical science has received attention out of all proportion to its importance. Its pre-Critical character has been more or less overlooked, and instead of being interpreted in the light of Critical principles, it has been allowed to obscure the sounder teaching of the *Analytic*. In this matter Schopenhauer is a chief culprit. He not only takes the views of mathematical science expounded in the *Introduction* and *Aesthetic* as being in line with Kant's main teaching, but expounds them in an even more unqualified fashion than does Kant himself.

There are thus four main defects in the argument of this *Introduction*, regarded as representative of Critical teaching. (1) Its problems are formulated exclusively in terms of the attributive judgment; the other forms of relational judgment are ignored. (2) It maintains that judgments are either merely analytic or completely synthetic. (3) It proceeds in terms of a further division of judgments into those that are purely empirical and those that are *a priori*. (4) It seems to assert that the justification for mathematical judgments is intuitional. All these four positions are in some degree retained throughout the *Critique*, but not in the unqualified manner of this *Introduction*. In the *Analytic*, judgment in all its possible forms is shown to be a synthetic combination of a given manifold in terms of relational categories. This leads to a fourfold conclusion. In the first place, judgment must be regarded as essentially relational. Secondly, the *a priori* and the empirical must not be taken as two separate kinds of knowledge, but as two elements involved in all knowledge. Thirdly, analysis and synthesis must not be viewed as co-ordinate processes; synthesis is the more fundamental; it conditions all analysis. And lastly, it must be recognised that nothing is merely given; intuitional experience, whether sensuous or *a priori*, is conditioned by processes of conceptual interpretation. Though the consequences which follow from these conclusions, if fully developed, would carry us far beyond any point which Kant himself reached in the progressive maturing of his views, the next immediate steps would still be on the strict lines of the Critical principles, and would involve the sacrifice only of such pre-Critical doctrines as that of the intuitive character of mathematical proof. Such correction of Kant's earlier positions is the necessary complement of his own final discovery that sense-intuition is incapable of grounding even the so-called empirical judgment.

The *Introduction* to the first edition bears all the signs of having been written previous to the central portions of the *Analytic*. That it was not, however, written prior to the *Aesthetic* seems probable. The opening sections of the *Aesthetic* represent what is virtually an independent introduction which takes no account of the preceding argument, and which redefines terms and distinctions that have already been dwelt upon. The extensive additions which Kant made in recasting the *Introduction* for the second edition are in many respects a great improvement. In the first edition Kant had not, except when speaking of the possibility of constructing the concepts of mathematical science, referred to the synthetic character of mathematical judgments. This is now dwelt upon in adequate detail. Kant's reason for not making the revision more radical was doubtless his unwillingness to undertake the still more extensive alterations which this would have involved. Had he expanded the opening statement of the second edition *Introduction*, that even our empirical knowledge is a compound of the sensuous and the *a priori*, an entirely new *Introduction* would have become necessary. The additions made are therefore only such as will not markedly conflict with the main tenor of the argument of the first edition.

How Are Synthetic *a priori* Judgments Possible?

Treatment of detailed points will be simplified if we now consider in systematic fashion the many difficulties that present themselves in connection with Kant's mode of formulating his central problem: *How are synthetic* a priori *judgments possible?* This formula is less definite and precise than would at first sight appear. The central phrase 'synthetic *a priori*' is sufficiently exact (the meaning to be attached to the *a priori* has already been considered), but ambiguities of the most various kinds lurk in the

seemingly innocent and simple terms with which the formula begins and ends:

A. 'How' has two very different meanings:

(*a*) *How* possible = *in what manner* possible = wie.

(*b*) *How* possible = *in how far* possible, *i.e. whether* possible = *ob*.

In connection with these two meanings of the term 'how,' we shall have to consider the distinction between the synthetic method employed in the *Critique* and the analytic method employed in the *Prolegomena*.

B. 'Possible' has a still wider range of application. Vaihinger distinguishes within it no less than three pairs of alternative meanings:

(*a*) Psychological and logical possibility.

(*b*) Possibility of explanation and possibility of existence.

(*c*) Real and ideal possibility.

A. Kant personally believed that the possibility of valid *a priori* synthetic judgment is proved by the existing sciences of mathematics and physics. And that being so, there were for Kant two very different methods which could be employed in accounting for their possibility, the synthetic or progressive, and the analytic or regressive. The synthetic method would start from given, ordinary experience (in its simplest form, as consciousness of time), to discover its conditions, and from them to prove the validity of knowledge that is *a priori*. The analytic method would start "from the sought as if it were given," that is, from the existence of *a priori* synthetic judgments, and, assuming them as valid, would determine the conditions under which alone such validity can be possible. The precise formulation of these two methods, the determination of their interrelations, of their value and comparative scope, is a matter of great importance, and must therefore be considered at some length.

The synthetic method may easily be confounded with the analytic method. For in the process of its argument it makes use of analysis. By analysing ordinary experience in the form in which it is given, it determines (in the *Aesthetic* and in the *Analytic of Concepts*) the fundamental elements of which knowledge is composed, and the generating conditions from which it results. From these the validity of the *a priori* principles that underlie mathematics and physics can (in the *Analytic of Principles*) be directly deduced. The fundamental differentiating feature, therefore, of the so-called synthetic method is not its synthetic procedure, since in great part, in the solution of the most difficult portion of its task, it employs an analytic method, but only its attitude towards the one question of the validity of *a priori* synthetic knowledge. It does not postulate this validity as a premiss, but proves it as a consequence of conditions which are independently established. By a preliminary regress upon the conditions of our *de facto* consciousness it acquires data from which it is enabled to advance by a synthetic, progressive or deductive procedure to the establishment of the validity of synthetic *a priori* judgments. The analytic method, on the other hand, makes no attempt to prove the validity of *a priori* knowledge. It seeks only to discover the conditions under which such knowledge, if granted to exist, can possess validity, and in the light of which its paradoxical and apparently contradictory features can be viewed as complementary to one another. The conditions, thus revealed, will render the validity of knowledge conceivable, will account for it once it has been assumed; but they do not prove it. The validity is a premiss; the whole argument rests upon the assumption of its truth. The conditions are only postulated *as conditions*; and their reality becomes uncertain, if the validity, which presupposes them, is itself called in question. Immediately we attempt to reverse the procedure, and to prove validity from these conditions, our argument must necessarily adopt the synthetic form; and that, as has been indicated, involves the prior application of a very different and much more thorough process of analysis. The distinction between the two methods may therefore be stated as follows. In the synthetic method the grounds which are employed to explain *a priori* knowledge are such as also at the same time suffice to prove its validity. In the analytic

method they are grounds of explanation, but not of proof. They are themselves proved only in so far as the assumption of validity is previously granted.

The analytic procedure which is involved in the complete synthetic method ought, however, for the sake of clearness, to be classed as a separate, third, method. And as such I shall henceforth regard it. It establishes by an independent line of argument the existence of *a priori* factors, and also their objective validity as conditions necessary to the very possibility of experience. So viewed, it is the most important and the most fundamental of the three methods. The argument which it embodies constitutes the very heart of the *Critique*. It is, indeed, Kant's new transcendental method; and in the future, in order to avoid confusion with the analytic method of the *Prolegomena*, I shall refer to it always by this title. It is because the transcendental method is an integral part of the complete, synthetic method, but cannot be consistently made a part of the analytic method, that the synthetic method alone serves as an adequate expression of the Kantian standpoint. This new transcendental method is proof by reference to the possibility of experience. Experience is given as psychological fact. The conditions which can alone account for it, as psychological fact, also suffice to prove its objective validity; but at the same time they limit that validity to the phenomenal realm.

We have next to enquire to what extent these methods are consistently employed in the *Critique*. This is a problem over which there has been much controversy, but which seems to have been answered in a quite final manner by Vaihinger. It is universally recognised that the *Critique* professes to follow the synthetic method, and that the *Prolegomena*, for the sake of a simpler and more popular form of exposition, adopts the analytic method. How far these two works live up to their professions, especially the *Critique* in its two editions, is the only point really in question. Vaihinger found two diametrically opposed views dividing the field. Paulsen, Riehl, and Windelband maintain the view that Kant starts from the fact that mathematics, pure natural science, and metaphysics contain synthetic *a priori* judgments claiming to be valid. Kant's problem is to test these claims; and his answer is that they are valid in mathematics and pure natural science, but not in metaphysics. Paulsen, and those who follow him, further contend that in the first edition this method is in the main consistently held to, but that in the second edition, owing to the occasional employment (especially in the *Introduction*) of the analytic method of the *Prolegomena*, the argument is perverted and confused: Kant assumes what he ought first to have proved. Fischer, on the other hand, and in a kindred manner also B. Erdmann, maintain that Kant never actually doubted the validity of synthetic *a priori* judgments; starting from their validity, in order to explain it, Kant discovers the conditions upon which it rests, and in so doing is able to show that these conditions are not of such a character as to justify the professed judgments of metaphysics.

Vaihinger combines portions of both views, while completely accepting neither. Hume's profound influence upon the development and formulation of Kant's Critical problem can hardly be exaggerated, but it ought not to prevent us from realising that this problem, *in its first form*, was quite independently discovered. As the letter of 1772 to Herz clearly shows, Kant was brought to the problem, how an idea in us can relate to an object, by the inner development of his own views, through reflection upon the view of thought which he had developed in the *Dissertation* of 1770. The conformity between thought and things is in that letter presented, not as a sceptical objection, but as an actual fact calling for explanation. He does not ask whether there is such conformity, but only how it should be possible. Even after the further complication, that thought is synthetic as well as *a priori*, came into view through the influence of Hume, the problem still continued to present itself to Kant in this non-sceptical light. And this largely determines the wording of his exposition, even in passages in which the demands of the synthetic method are being quite amply fulfilled. Kant, as it would seem, never himself doubted the validity of the mathematical sciences. But since their validity is not beyond possible impeachment, and since metaphysical knowledge, which is decidedly questionable, would appear to be of somewhat similar type, Kant was constrained to recognise that, from the point of view of strict proof, such assumption of validity is not really legitimate.

Though, therefore, the analytic method would have resolved Kant's own original difficulty, only the synthetic method is fully adequate to the situation.

Kant accordingly sets himself to prove that whether or not we are ready (as he himself is) to recognise the validity of scientific judgments, the correctness of this assumption can be firmly established. And being thus able to prove its correctness, he for that very reason does not hesitate to employ it in his introductory statement. The problem, he says, is that of 'understanding' how synthetic *a priori* judgments can be valid. A 'difficulty,' a 'mystery,' a 'secret,' lies concealed in them. How can a predicate be ascribed to a subject term which does not contain it? And even more strangely (if that be possible), how can *a priori* judgments legislate for objects which are independent existences? Such judgments, even if valid beyond all disputing, would still call for explanation. This is, indeed, Kant's original and ground problem. As already indicated, no one, save only Hume, had hitherto perceived its significance. Plato, Malebranche, and Crusius may have dwelt upon it, but only to suggest explanations still stranger and more mystical than the mysterious fact itself.

Paulsen is justified in maintaining that Kant, in both editions of the *Critique*, recognises the validity of mathematics and pure natural science. The fact of their validity is less explicitly dwelt upon in the first edition, but is none the less taken for granted. The sections transferred from the *Prolegomena* to the *Introduction* of the second edition make no essential change, except merely in the emphasis with which Kant's belief in the existence of valid *a priori* synthetic judgments is insisted upon. As has already been stated, only by virtue of this initial assumption is Kant in position to maintain that there is an alternative to the strict synthetic method. The *problem* from which he starts is common to both methods, and for that reason the formulation used in the *Prolegomena* can also be employed in the *Introduction* to the *Critique*. Only in their manner of solving the problem need they differ. Kant's Critical problem first begins with this presupposition of validity, and does not exist save through it. He does not first seek to discover whether such judgments are valid, and then to explain them. He accepts them as valid, but develops a method of argument which suffices for proof as well as for explanation. The argument being directed to both points simultaneously, and establishing both with equal cogency, it may legitimately be interpreted in either way, merely as explanation, or also as proof. Kant does not profess or attempt to keep exclusively to any one line of statement. Against the dogmatists he insists upon the necessity of *explaining* the validity of *a priori* synthetic judgments, against the sceptics upon the possibility of *proving* their validity. And constantly he uses ambiguous terms, such as 'justification' (*Rechtfertigung*), 'possibility,' that may indifferently be read in either sense. But though the fundamental demand which characterises the synthetic method in its distinction from the analytic thus falls into the background, and is only occasionally insisted upon, it is none the less fulfilled. So far as regards the main argument of the *Critique* in either edition, the validity of synthetic *a priori* judgments is not required as a premiss. It is itself independently proved.

The manner in which Kant thus departs from the strict application of the synthetic method may be illustrated by an analysis of his argument in the *Aesthetic*. Only in the arguments of the first edition in regard to space and time is the synthetic method employed in its ideal and rigorous form. For the most part, even in the first edition, instead of showing how the *a priori* character of pure and applied mathematics follows from conclusions independently established, he assumes both pure and applied mathematics to be given as valid, and seeks only to show how the independently established results of the *Aesthetic* enable him to explain and render comprehensible their recognised characteristics. This is not, indeed, any very essential modification of the synthetic method; for his independently established results suffice for deducing all that they are used to explain. The validity of mathematics is not employed as a premiss. Kant's argument is, however, made less clear by the above procedure.

Further difficulty is caused by Kant's occasional employment, even in the first edition, of the analytic method. He several times cites as an argument in support of his view of space the fact that it alone will account for the existing science of geometry. That is to say, he employs geometry, viewed as valid, to

prove the correctness of his view of space. Starting from that science as given, he enquires what are the conditions which can alone render it possible. These conditions are found to coincide with those independently established. Now this is a valid argument when employed in due subordination to the main synthetic method. It offers welcome *confirmation* of the results of that method. It amounts in fact to this, that having proved (by application of the transcendental method) the mathematical sciences to be valid, everything which their validity necessarily implies must be granted. Kant's reasoning here becomes circular, but it is none the less valid on that account. This further complication of the argument is, however, dangerously apt to mislead the reader. It is in great part the cause of the above division among Kant's commentators. The method employed in the *Prolegomena* is simply this form of argument systematised and cut free from all dependence upon the transcendental method of proof.

The whole matter is, however, still further complicated by the distinction, which we have already noted, between real and ideal possibility. Are the given synthetic *a priori* judgments valid? That is one question. Can the Critical philosophy discover, completely enumerate, and prove in a manner never before done, all the possible synthetic *a priori* principles? That is a very different problem, and when raised brings us to the further discussion of Kant's transcendental method. The question at issue is no longer merely whether or not certain given judgments are valid, and how, if valid, they are to be accounted for. The question is now that of discovering and of proving principles which have not been established by any of the special sciences. This shifting of the problem is concealed from Kant himself by his omission to distinguish between the undemonstrated axioms of the mathematical sciences and their derivative theorems, between the principles employed by the physicist without enquiry into their validity and the special laws based upon empirical evidence.

As regards the mathematical axioms, the problem is fairly simple. As we shall see later, in the *Aesthetic*, they do not require a deduction in the strict transcendental sense. They really fall outside the application of the transcendental method. They require only an "exposition." But in regard to the fundamental principles of natural science we are presented with the problem of discovery as well as of proof. Unlike the axioms of the mathematician, they are frequently left unformulated. And many postulates, such as that there is a *lex continui in natura*, are current in general thought, and claim equal validity with the causal principle. Kant has thus to face the question whether in addition to those principles employed more or less explicitly by the scientist, others, such as might go to form an immanent metaphysics of nature, may not also be possible.

B. (*a*) Psychological and logical possibility. — Both have to be recognised and accounted for. Let us consider each in order.

(1) Psychological possibility. — What are the *subjective* conditions of *a priori* synthetic judgments? *Through what mental faculties* are they rendered possible? Kant replies by developing what may be called a transcendental psychology. They depend upon space and time as forms of sensibility, upon the *a priori* concepts of understanding, and upon the synthetic activities by which the imagination schematises these concepts and reduces the given manifold to the unity of apperception. This transcendental psychology is the necessary complement of the more purely epistemological analysis. But on this point Kant's utterances are extremely misleading. His Critical enquiry has, he declares, nothing in common with psychology. In the *Preface* to the first edition we find the following passage: "This enquiry ... [into] the pure understanding itself, its possibility and the cognitive faculties upon which it rests ..., although of great importance for my chief purpose, does not form an essential part of it." The question, he adds, "how is the faculty of thought itself possible?... is as it were a search for the cause of a given effect, and therefore is of the nature of an hypothesis [or 'mere opinion'], though, as I shall show elsewhere, this is not really so." The concluding words of this passage very fairly express Kant's hesitating and inconsistent procedure. Though he has so explicitly eliminated from the central enquiry of the *Critique* all psychological determination of the mental powers, statements as to their constitution are none the less

implied, and are involved in his epistemological justification alike of *a priori* knowledge and of ordinary experience. If we bear in mind that Kant is here attempting to outline the possible causes of given effects, and that his conclusions are therefore necessarily of a more hypothetical character than those obtained by logical analysis, we shall be prepared to allow him considerable liberty in their formulation. But in certain respects his statements are precise and definite — the view, for instance, of sensations as non-spatial, of time as a form of inner sense, of the productive imagination as pre-conditioning our consciousness, of spontaneity as radically distinct from receptivity, of the pure forms of thought as not acquired through sense, etc. No interpretation which ignores or under-estimates this psychological or subjective aspect of his teaching can be admitted as adequate.

(2) Logical or epistemological possibility. — How can synthetic *a priori* judgments be *valid*? This question itself involves a twofold problem. How, despite their synthetic character, can they possess truth, *i.e.* how can we pass from their subject terms to their predicates? And secondly, how, in view of their origin in our human reason, can they be objectively valid, *i.e.* legislate for the independently real? How can we pass beyond the subject-predicate relation to real things? This latter is the Critical problem in the form in which it appears in Kant’s letter of 1772 to Herz. The former is the problem of synthesis which was later discovered.

(*b*) (1) Possibility of explanation and (2) possibility of existence. — (1) How can synthetic *a priori* judgments be *accounted for*? How, despite their seemingly inconsistent and apparently paradoxical aspects, can their validity (their validity as well as their actuality being taken for granted) be rendered *comprehensible*? (2) The validity of such judgments has been called in question by the empiricists, and is likewise inexplicable even from the dogmatic standpoint of the rationalists. How, then, can these judgments *be possible at all*? These two meanings of the term ‘possible’ connect with the ambiguity, above noted, in the term ‘how.’ The former problem can be solved by an analytic method; the latter demands the application of the more radical method of synthetic reconstruction.

(*c*) Real and ideal possibility. — We have to distinguish between the possible validity of those propositions which the mathematical and physical sciences profess to have established and the possible validity of those principles such as that of causality, which are postulated by the sciences, but which the sciences do not attempt to prove, and which in certain cases they do not even formulate. The former constitute an actually existent body of scientific knowledge, demonstrated in accordance with the demands of scientific method. The latter are employed by the scientist, but are not investigated by him. The science into which they can be fitted has still to be created; and though some of the principles composing it may be known, others remain to be discovered. All of them demand such proof and demonstration as they have never yet received. This new and ideal science is the scientific metaphysics which Kant professes to inaugurate by means of the *Critique*. In reference to the special sciences, possibility means the conditions of the actually given. In reference to the new and ideal metaphysics, possibility signifies the conditions of the realisation of that which is sought. In view of this distinction, the formula — How are synthetic *a priori* judgments possible? — will thus acquire two very different meanings. (1) How are the existing *a priori* synthetic judgments to be accounted for? (2) How may all the really fundamental judgments of that type be exhaustively discovered and proved? Even in regard to immanent metaphysics Kant interprets the formula in both ways. This is due to his frequent confusion of immanent metaphysics with the principles of natural science. Its propositions are then regarded as given, and only their general validity calls for proof. It is, however, in the problem of ideal possibility that the essential problem of the *Critique* lies; and that is a further reason why it cannot be adequately dealt with, save by means of the synthetic method.

Experience. — Throughout the *Introduction* the term *experience* has (even at times in one and the same sentence) two quite distinct meanings, (1) as product of sense and understanding acting co-operatively, and (2) as the raw material (the impressions) of sense. Considerable confusion is thereby caused.

Understanding and reason are here, as often elsewhere in the *Critique*, used as equivalent terms. Throughout the entire two first sections of the *Introduction* to the second edition the term reason does not occur even once. As first mentioned, it is taken as the source of metaphysical judgments.

General (a priori) truths have an inner necessity and must be clear and certain by themselves. — These statements are not in accordance with Kant’s new Critical teaching. They have remained uncorrected from a previous way of thinking. This must be one reason for the recasting of this paragraph in the second edition.

Even with (unter) our experiences there is mingled knowledge which must be of a priori origin. — Kant is here distinguishing the *immanent a priori*, such as that involved in any causal judgment, from the *transcendent a priori* dwelt upon in the next paragraph. The latter is expressed through metaphysical judgments, such as ‘God exists,’ ‘the soul is immortal.’

Original concepts and judgments derived from them. — Cf. B 5-6.

Pure. — In the title of the section the term *pure* (*rein*) is, as the subsequent argument shows, taken as exactly equivalent to *a priori*. As Vaihinger notes, the adjective *apriorisch* had not yet been invented. The opposite of pure is here empirical (*empirisch*).

All our knowledge begins with experience. — This is a stronger statement than any in the corresponding paragraphs of the first edition. Had Kant proceeded to develop its consequences, he would have had to recast the entire *Introduction*, setting the problem of empirical knowledge alongside that of the *a priori*. As it is, he is forced to subdivide the absolutely *a priori* into the pure and the mixed.

By objects which affect (rühren) our senses. The raw material of sensuous impressions. — These incidental statements call for discussion. Cf. below, p-8, 120-1, 274 ff.

A knowledge of objects which we call experience. — Kant does not keep to this definition. The term experience is still used in its other and narrower sense, as in the very next paragraph, when Kant states that knowledge does not, perhaps, arise solely from experience (= sense impressions).

In respect of time. — This statement, taken as an account of Kant's teaching in the *Critique*, is subject to two reservations. In the *Aesthetic* Kant sometimes claims a temporal antecedence for the *a priori*. And secondly, the *a priori* is not for Kant merely logical. It also possesses a dynamical priority.

Even experience itself is a compound. — The "even" seems to refer to the distinction drawn in A 2 between the immanent and the transcendent *a priori*.

It is therefore a question whether there exists such knowledge independent of experience. — This question was not raised in the first edition. The alternative methods, analytic and synthetic, are discussed above, ff.

Such knowledge is called a priori and is distinguished from empirical knowledge. — Throughout the *Introduction*, in both editions equally, Kant fails to state the problems of the *Critique* in a sufficiently comprehensive manner. He speaks as if the *Critique* dealt only with the absolutely *a priori*, in its two forms, as immanent scientific knowledge and as transcendent speculation. It also deals with the equally important and still more fundamental problem of accounting for the possibility of *experience*. Our empirical knowledge involves an *a priori* element, and may not therefore be opposed to *a priori* knowledge in the manner of the passage before us.

This term a priori is not yet definite enough. — It is frequently employed in a merely relative sense. Thus we can say of a person who undermines the foundations of his house that he might have known *a priori* that it would collapse, that is, that he need not wait for the experience of its actual fall. But still he could not know this entirely *a priori*; he had first to learn from experience that bodies are heavy, and will fall when their supports are taken away. But as dealt with in the *Critique* the term *a priori* is used in an absolute sense, to signify that knowledge which is independent, not of this or that experience only, but of all impressions of the senses. Thus far Kant's position is comparatively clear; but he proceeds to distinguish two forms within the absolutely *a priori*, namely, mixed and pure. The absolutely *a priori* is mixed when it contains an empirical element, pure when it does not. ("Pure" is no longer taken in the meaning which it has in the title of the section. It signifies not the *a priori* as such, but only one subdivision of it.) Thus after defining absolutely *a priori* knowledge as independent of all experience, Kant takes it in one of its forms as involving empirical elements. The example which he gives of an absolutely *a priori* judgment, which yet is not pure, is the principle: every change has its cause. "Change" is an empirical concept, but the synthetic relation asserted is absolutely *a priori*. In the next section this same proposition is cited as a *pure* judgment *a priori*— "pure" being again used in its more general meaning as synonymous with *a priori*. This confusion results from Kant's exclusive preoccupation with the *a priori*, and consequent failure to give due recognition to the correlative problem of the empirical judgment. The omitted factor retaliates by thus forcing its way into Kant's otherwise clean-cut divisions. Also, it is not true that the relative *a priori* falls outside the sphere of the Critical enquiry. Such judgment expresses necessity or objectivity, and for that reason demands a transcendental justification no less urgently than the absolutely *a priori*. The finding of such justification is, indeed, the central problem of the *Analytic*.

The subdivisions of the *a priori* may be tabulated thus:

A priori knowledge —

Relative, *e.g.* every unsupported house must fall.

Absolute —

Mixed, *e.g.* every change has its cause.

Pure, *e.g.* a straight line is the shortest

distance between two points.

The term *pure* (*rein*) thus acquires a second meaning distinct from that defined above. It is no longer employed as identical with *a priori*, but as a subdivision of it, meaning *unmixed*. Its opposite is no longer the empirical, but the impure or mixed. Owing, however, to the fact that "pure" (in its first meaning) is identical with the *a priori*, it shares in all the different connotations of the latter, and accordingly is also employed to denote that which is *not relative*. But "pure" has yet another meaning peculiar to itself. The phrase "independent of experience" has in reference to "pure" an ambiguity from which it does not suffer in its connection with "*a priori*" (since mathematical knowledge, whether pure or applied, is always regarded by Kant as *a priori*). It may signify either independence as regards *content and validity*, or independence as regards *scope*. The latter meaning is narrower than the former. By the former meaning it denotes that which originates, and can possess truth, independently of experience. By the latter it signifies that which is not only independent of sense but also applies to the non-sensuous. In this latter meaning pure knowledge therefore signifies transcendent knowledge. Its opposite is the immanent. The various meanings of "pure" (four in number) may be tabulated as follows:

(*a*) (1) *A priori*: independent of experience as regards origin and validity. (Its opposite = empirical.)

(2) Absolutely independent of experience. (Its opposite = relative.)

(3) Unmixed with experience. (Its opposite = impure or mixed.)

(*b*) (4) Independent of experience as regards scope = transcendent. (Its opposite = immanent.)

All these varied meanings contribute to the ambiguity of the title of the *Critique*. Kant himself employs the title in all of the following senses:

1. Critique of absolutely pure *a priori* knowledge, determination of its sources, conditions, scope and limits.
2. Critique of all *a priori* knowledge, relative as well as absolute, in so far as it depends upon *a priori* principles, determination, etc.
3. Critique of all knowledge, whether *a priori* or empirical, determination, etc.
4. Critique of transcendent knowledge, its sources and limits.

Further meanings could also be enumerated but can be formulated by the reader for himself in the light of the ambiguities just noted. The special context in each case can alone decide how the title is to be understood. If a really adequate definition of the purpose and scope of the *Critique* is sought by the reader, he must construct it for himself. The following may perhaps serve. *The* Critique *is an enquiry into the sources, conditions, scope and limits of our knowledge, both a priori and empirical, resulting in the construction of a new system of immanent metaphysics; in the light of the conclusions thus reached, it also yields an analysis and explanation of the transcendental illusion to which transcendent metaphysics, both as a natural disposition and as a professed science, is due.*

Kant further complicates matters by offering a second division of the absolutely *a priori*, viz. into the original and the derivative. Also, by implication, he classes relative *a priori* judgments among the propositions to be reckoned with by the *Critique*; and yet in B 4 he speaks of the proposition, all bodies are heavy, as merely empirical.

A criterion. — Necessity and universality are valid criteria of the *a priori* (= the non-empirical). This follows from Kant's view of the empirical as synonymous with the contingent (*zufällig*). Experience gives

only the actual; the *a priori* alone yields that which cannot be otherwise.

"Necessity and strict universality are thus safe criteria of *a priori* knowledge, and are inseparable from one another. But since in the employment of these criteria the empirical limitation of judgments is sometimes more easily shown than their contingency, or since, as frequently happens, their unlimited universality can be more convincingly proved than their necessity, it is advisable to use the two criteria separately, each being by itself infallible."

Now Kant is here, of course, assuming the main point to be established, namely, that experience is incapable of accounting for such universality and necessity as are required for our knowledge, both ordinary and scientific. We have already considered this assumption, and have also anticipated misunderstanding by noting the important qualifications to which, from Kant's new Critical standpoint, the terms 'necessity' and 'universality' become subject. The very specific meaning in which Kant employs the term *a priori* must likewise be borne in mind. Though negatively the *a priori* is independent of experience, positively it originates in our human reason. The necessity and universality which differentiate the *a priori* distinguish it only from the humanly accidental. The *a priori* has no absolute validity. From a metaphysical standpoint, it is itself contingent. As already stated, all truth is for Kant merely *de facto*. The necessary is not that which cannot be conceived to be otherwise, nor is it the unconditioned. Our reason legislates only for the world of appearance. But as yet Kant gives no hint of this revolutionary reinterpretation of the rationalist criteria. One of the chief unfortunate consequences of the employment in this *Introduction* of the analytic method of the *Prolegomena* is that it tends to mislead the reader by seeming to commit Kant to a logical *a priori* of the Leibnizian type.

To show that, if experience is to be possible, [pure a priori propositions] are indispensable, and so to prove their existence a priori. — At first sight Kant would seem to be here referring to the alternative synthetic method of procedure, *i.e.* to the *transcendental* proof of the *a priori*. The next sentence shows, however, that neither in intention nor in fact is that really so. He argues only that *a priori* principles, such as the principle of causality, are necessary in order to give "certainty" to our experience; such a principle must be postulated if inductive inference is to be valid. Experience could have no [scientific] certainty, "if all rules according to which it proceeds were themselves in turn empirical, and therefore contingent. They could hardly be regarded as first principles." There is no attempt here to prove that empirical knowledge *as such* necessarily involves the *a priori*. Also the method of argument, though it seeks to establish the *necessity* of the *a priori*, is not transcendental or Critical in character. It is merely a repetition of the kind of argument which both Hume and Leibniz had already directed against the sensationalist position. Very strangely, considering that these sentences have been added in the second edition, and therefore subsequent to the writing of the objective deduction, Kant gives no indication of the deeper problem to which he finally penetrated. The explanation is, probably, that to do so would have involved the recasting of the entire *Introduction*. Even on the briefest reference, the hard-and-fast distinction between the *a priori* and the empirical, as two distinct and separate classes of judgment, would have been undermined, and the reader would have been made to feel the insufficiency of the analysis upon which it is based. The existence of the deeper view is betrayed only through careless employment of the familiar phrase "possibility of experience." For, as here used, it is not really meant. "Certainty of experience" — a very different matter — is the meaning that alone will properly fit the context.

Reason and understanding. — They are here distinguished, having been hitherto, in A 1-2, employed as synonymous. The former carries us beyond the field of all possible experience; the latter is limited to the world of sense. Thus both *Reason* and *understanding* are here used in their narrowest meaning.

These inevitable problems of pure Reason itself are God, freedom, and immortality. The science which, with all its methods, is in its final intention directed solely to the solution of these problems, is called metaphysics. — These sentences are characteristic of the second edition with its increased

emphasis upon the positive results of the *Critique* on the one hand, and with its attitude of increased favour towards transcendent metaphysics on the other. The one change would seem to be occasioned by the nature of the criticisms passed upon the first edition, as, for instance, by Moses Mendelssohn who describes Kant as “the all-destroyer” (*der alles zermalmende*). The other is due to Kant’s preoccupation with the problems of ethics and of teleology. The above statements are repeated with even greater emphasis in B 395 *n*. The definition here given of metaphysics is not strictly kept to by Kant. As above noted, Kant really distinguishes within it two forms, immanent and transcendent. In so doing, however, he still regards transcendent metaphysics as the more important. Immanent metaphysics is chiefly of value as contributing to the solution of the “inevitable problems of pure Reason.”

A 3-4 = B 7-8. — The reasons, here cited by Kant, for the failure of philosophical thinking to recognise the difference between immanent and transcendent judgments are: (1) the misunderstood character, and consequent misleading influence, of *a priori* mathematical judgments; (2) the fact that once we are beyond the sensible sphere, experience can never contradict us; (3) natural delight in the apparent enlargement of our knowledge; (4) the ease with which logical contradictions can be avoided; (5) neglect of the distinction between analytic and synthetic *a priori* judgments. Vaihinger points out that in the *Fortschritte* Kant adds a sixth reason — confusion of the concepts of understanding with the Ideas of Reason. Upon the first of the above reasons the best comment is that of the *Methodology*. But the reader must likewise bear in mind that in B xvi Kant develops his new philosophical method on the analogy of the mathematical method. The latter is, he claims, *mutatis mutandis*, the true method of *legitimate* speculation, *i.e.* of immanent metaphysics. The one essential difference (as noted by Kant), which has been overlooked by the dogmatists, is that philosophy gains its knowledge from concepts, mathematics from the construction of concepts.

Remain investigations only. — Cf. *Prolegomena*, § 35.

The analysis of our concepts of objects. — Vaihinger’s interpretation, that the concepts here referred to are those which we “form *a priori* of things,” seems correct. The rationalists sought to deduce the whole body of rational psychology from the *a priori* conception of the soul as a simple substance, and of rational theology from the *a priori* conception of God as the all-perfect Being.

Analytic and synthetic judgments.— “All analytic judgments depend wholly on the law of contradiction, and are in their nature *a priori* cognitions, whether the concepts that supply them with matter be empirical or not. For the predicate of an affirmative analytic judgment is already contained in the concept of the subject, of which it cannot be denied without contradiction. In the same way its opposite is necessarily denied of the subject in an analytic, but negative, judgment by the same law of contradiction.... For this very reason all analytic judgments are *a priori* even when the concepts are empirical, as, for example, gold is a yellow metal; for to know this I require no experience beyond my concept of gold as a yellow metal: it is, in fact, the very concept, and I need only analyse it, without looking beyond it elsewhere.... [Synthetic judgments, *a posteriori* and *a priori*] agree in this, that they cannot possibly spring solely from the principle of analysis, the law of contradiction. They require a quite different principle. From whatever they may be deduced, the deduction must, it is true, always be in accordance with the principle of contradiction. For that principle must never be violated. But at the same time everything cannot be deduced from it.”

In A 594 = B 622 analytic judgments are also spoken of as identical; but in the *Fortschritte* this use of terms is criticised:

“Judgments are analytic if their predicate only represents clearly (*explicite*) what was thought obscurely (*implicite*) in the concept of the subject, *e.g.* all bodies are extended. Were we to call such judgments identical only confusion would result. For identical judgments contribute nothing to the clearness of the concept, and that must be the purpose of all judging. Identical judgments are therefore empty, *e.g.* all bodies are bodily (or to use another term material) beings. Analytic judgments do, indeed,

ground themselves upon identity and can be resolved into it; but they are not identical. For they demand analysis and serve for the explanation of the concept. In identical judgments, on the other hand, *idem* is defined *per idem*, and nothing at all is explained.”

Vaihinger cites the following contrasted examples of analytic and synthetic judgments:

Analytic. — (*a*) Substance is that which exists only as subject in which qualities inhere. (*b*) Every effect has a cause. (*c*) Everything conditioned presupposes a condition.

Synthetic. — (*a*) Substance is permanent. (*b*) Every event has a cause. (c) Everything conditioned presupposes an unconditioned.

B 11-12. — The first half of this paragraph is transcribed practically word for word from the *Prolegomena*. The second half is a close restatement of an omitted paragraph of the first edition. The chief addition lies in the concluding statement, that “experience is itself a synthetic connection of intuitions.” This is in keeping with statements made in the deduction of the categories in the second edition, and in the paragraph inserted in the proof of the second analogy in the second edition. The *x* has strangely been omitted in the second edition in reference to empirical judgments, though retained in reference to synthetic *a priori* judgments.

The proposition: everything which happens has its cause. — As we have already observed, Hume influenced Kant at two distinct periods in his philosophical development — in 1756-1763, and again at some time (not quite definitely datable) after February 1772. The first influence concerned the character of concrete causal judgments; the second related to the causal axiom. Though there are few distinctions which are more important for understanding the *Critique* than that of the difference between these two questions, it has nowhere been properly emphasised by Kant, and in several of the references to Hume, which occur in the *Critique* and in the *Prolegomena*, the two problems are confounded in a most unfortunate manner. The passages in the *Introduction* are clear and unambiguous; the influence exercised by Hume subsequent to February 1772 is quite adequately stated. The causal axiom claims to be *a priori*, and is, as Hume asserts, likewise synthetic. Consequently there are only two alternatives, each decisive and far-reaching. Either valid *a priori* synthesis must, contrary to all previous philosophical belief, be possible, or “everything which we call metaphysics must turn out to be a mere delusion of reason.” The solution of this problem is “a question of life and death to metaphysics.” To this appreciation of Hume, Kant adds criticism. Hume did not sufficiently universalise his problem. Had he done so, he would have recognised that pure mathematics involves *a priori* synthesis no less necessarily than do the metaphysical disciplines. From denying the possibility of mathematical science “his good sense would probably have saved him.” Hume’s problem, thus viewed, finds its final and complete expression in the formula: How are synthetic *a priori* judgments possible?

In A 760 = B 788 the account differs in two respects: first, it discusses the metaphysical validity of the causal axiom as well as its intrinsic possibility as a judgment; and secondly, reference is made to the conception of causality as well as to the axiom. The implied criticism of Hume is correspondingly modified. Otherwise, it entirely harmonises with the passages in the *Introduction*.

“Hume dwelt especially upon the principle of causality, and quite rightly observed that its truth, and even the objective validity of the concept of efficient cause in general, is based on no insight, *i.e.* on no *a priori* knowledge, and that its authority cannot therefore be ascribed to its necessity, but merely to its general utility in the course of experience and to a certain subjective necessity which it thereby acquires, and which he entitles custom. From the incapacity of our reason to make use of this principle in any manner that transcends experience he inferred the nullity of all pretensions of reason to advance beyond the empirical.”

Now so far, in these references to Hume, Kant has had in view only the problems of mathematical and physical science and of metaphysics. The problems involved in the possibility of empirical knowledge are left entirely aside. His account of Hume’s position and of his relation to Hume suffers change

immediately these latter problems are raised. And unfortunately it is a change for the worse. The various problems treated by Hume are then confounded together, and the issues are somewhat blurred. Let us take the chief passages in which this occurs. In A 764 = B 792 ff. Kant gives the following account of Hume's argument. Hume, recognising the impossibility of predicting an effect by analysis of the concept of the cause, or of discovering a cause from the concept of the effect, viewed all concrete causal judgments as merely contingent, and therefrom inferred the contingency of the causal axiom. In so doing Hume, Kant argues, confuses the legitimate and purely *a priori* inference from a given event to *some* antecedent with the very different inference, possible only through special experience, to a *specific* cause. Now this is an entire misrepresentation of Hume's real achievement, and may perhaps be explained, at least in part, as being due to the fact that Kant was acquainted with Hume's *Treatise* only through the indirect medium of Beattie's quotations. Hume committed no such blunder. He clearly recognised the distinction between the problem of the validity of the causal axiom and the problem of the validity of concrete causal judgments. He does not argue from the contingency of concrete causal laws to the contingency of the universal principle, but shows, as Kant himself recognises, that the principle is neither self-evident nor demonstrable *a priori*. And as necessity cannot be revealed by experience, neither is the principle derivable from that source. Consequently, Hume concludes, it cannot be regarded as objectively valid. It must be due to a subjective instinct or natural belief. (The two problems are similarly confounded by Kant in A 217 = B 264.)

In the *Introduction* to the *Prolegomena* there is no such confusion of the two problems, but matters are made even worse by the omission of all reference to Hume's analysis of the causal axiom. Only Hume's treatment of the concept of causality is dwelt upon. This is the more unfortunate, and has proved the more misleading, in that it is here that Kant makes his most explicit acknowledgment of his indebtedness to Hume. In §§ 27 ff. of the *Prolegomena* both problems reappear, but are again confounded. The section is preceded by sentences in which the problem of experience is emphasised; and in keeping with these prefatory remarks, Kant represents "Hume's *crux metaphysicorum*" as concerning only the concept of causality (viewed as a synthetic, and professedly *a priori*, connection between concrete existences). Yet in § 30 the causal axiom is also referred to, and together they are taken as constituting "Hume's problem."

Now if we bear in mind that Hume awakened Kant to both problems — how *a priori* knowledge is possible, and how experience is possible — this confusion can easily be understood. Kant had already in the early 'sixties studied Hume with profound admiration and respect. In the period subsequent to 1772 this admiration had only deepened; and constantly, as we may believe, Kant had returned with fresh relish to Hume's masterly analyses of causality and of inductive inference. It is not, therefore, surprising that as the years passed, and as the other elements in Hume's teaching revealed to him, through the inner growth of his own views, their full worth and significance, he should allow the contribution that had more specifically awakened him to fall into the background, and should, in vague fashion, ascribe to Hume's teaching as a whole the specific influence which was really due to one particular part. By 1783, the date of the *Prolegomena*, Kant's first enthusiasm over the discovery of the fundamental problem of *a priori* synthesis had somewhat abated, and the problem of experience had more or less taken its place. This would seem to be the reason why in the *Prolegomena* he thus deals with both aspects of Hume's problem, and why in so doing he gives a subordinate place to Hume's treatment of the causal axiom. But though the misunderstanding may be thus accounted for, it must none the less be deplored. For the reader is seriously misled, and much that is central to the Critical philosophy is rendered obscure. The influence which Kant in the *Prolegomena* thus ascribes to Hume was not that which really awakened him from his dogmatic slumber, but is in part that which he had assimilated at least as early as 1763, and in part that which acted upon him with renewed force when he was struggling (probably between 1778 and 1780) with the problems involved in the deduction of the categories. It was Hume's treatment of the causal axiom, and that alone, which, at some time subsequent to February 1772, was the really effective influence in

producing the Copernican change.

Purely a priori and out of mere concepts. — Vaihinger's comment seems correct: Kant means only that neither actual experience nor pure intuition can be resorted to. This does not contradict the complementary assertion, that the principle, everything which happens has its cause, can be known *a priori*, not immediately from the concepts involved in it, but only indirectly through the relation of these concepts to possible experience. "Possible experience," even though it stands for "something purely contingent," is itself a concept. Vaihinger quotes Apelt upon this "mysterious" type of judgment.

"Metaphysics is synthetic knowledge from mere concepts, not like mathematics from their construction in intuition, and yet these synthetic propositions cannot be known from bare concepts, *i.e.* not analytically. The necessity of the connection in those propositions is to be apprehended through thought alone, and yet is not to rest upon the form of thought, the principle of contradiction. The conception of a kind of knowledge which arises from bare concepts, and yet is synthetic, eludes our grasp. The problem is: How can one concept be necessarily connected with another, without also at the same time being contained in it?"

The paragraphs in B 14 to B 17 are almost verbal transcripts from *Prolegomena*, § 2 *c*, 2 ff.

Mathematical judgments are one and all (insgesammt) synthetic. — This assertion is carelessly made, and does not represent Kant's real view. In B 16 he himself recognises the existence of analytic mathematical judgments, but unduly minimises their number and importance.

All mathematical conclusions proceed according to the principle of contradiction. — To the objection made by Paulsen that Kant, in admitting that mathematical judgments can be deduced from others by means of the principle of contradiction, ought consistently to have recognised as synthetic only axioms and principles, Vaihinger replies as follows:

"The proposition — the angles of a triangle are together equal to two right angles — Kant regards as synthetic. It is indeed deduced from the axiom of parallels (with the aid of auxiliary lines), and to that extent is understood in accordance with the principle of contradiction.... The angles in the triangle constitute a special case of the angles in the parallel lines which are intersected by other lines. The principle of contradiction thus serves as vehicle in the deduction, because once the identity of A and A´ is recognised, the predicate *b*, which belongs to A, must also be ascribed to A´. But the proposition is not for that reason itself analytic in the Kantian sense. In the analytic proposition the predicate is derived from the analysis of the subject concept. But that does not happen in this case. The synthetic proposition can never be derived *in and by itself* from the principle of contradiction; ... but only with the aid of that principle *from other propositions*. Besides, in this deduction intuition must always be resorted to; and that makes an essential difference. Without it the identity of A and A´ cannot become known."

Pure mathematics.— "Pure," as thus currently used, is opposed only to applied, not to empirical. Kant here arbitrarily reads the latter opposition into it. Under this guise he begs the point in dispute.

7 + 5 = 12. — Though 7 + 5 = 12 expresses an identity or equality, it is an equality of the *objects* or *magnitudes*, 7 + 5 and 12, not of the concepts through which we think them. Analysis of the concepts can never reveal this equality. Only by constructing the concepts in intuition can it be recognised by the mind. This example has been already cited in the first edition. It is further elaborated in the *Prolegomena*, § 2 *c*, and is here transcribed. Kant's mode of stating his position is somewhat uncertain. He alternates between "the representation of 7 and 5," "the representation of the combination of 7 and 5," and "the concepts 7 and 5." His view would seem to be that there are *three* concepts involved. For the concept of 7 we must substitute the intuition of 7 points, for the concept of 5 the intuition of 5 points, and for the concept of their sum the intuitive operation of addition.

Call in the assistance of intuition, for instance our five fingers. — This statement, repeated from the *Prolegomena*, does not represent Kant's real position. The views which he has expressed upon the nature of arithmetical science are of the most contradictory character, but to one point he definitely commits

himself, namely, that, like geometrical science, it rests, not (as here asserted) upon empirical, but upon pure intuition. Except indirectly, by the reference to larger numbers, Kant here ignores his own important distinction between image and schema. The above statement would also make arithmetic dependent upon space.

Segner: Anfangsgründe der Arithmetik, translated from the Latin, second edition, Halle, 1773.

Natural science (physica) contains synthetic a priori judgments. — There is here a complication to which Vaihinger has been the first to draw attention. In the *Prolegomena* Kant emphasises the distinction between physics and pure or universal science of nature. The latter treats only the *a priori* form of nature (*i.e.* its necessary conformity to law), and is therefore a propaedeutic to physics which involves further empirical factors. For two reasons, however, this universal natural science falls short of its ideal. First, it contains empirical elements, such as the concepts of motion, impenetrability, inertia, etc. Secondly, it refers only to the objects of external sense, and not, as we should expect in a universal science, to natural existences without exception, *i.e.* to the objects of psychology as well as of physics. But among its principles there are, Kant adds, a few which are purely *a priori* and possess the universality required: *e.g.* such propositions as that *substance is permanent*, and that *every event has a cause*. Now these are the examples which ought to have been cited in the passage before us. Those actually given fall entirely outside the scope of the *Critique*. They are treated only in the *Metaphysische Anfangsgründe*. They belong to the relatively, not to the absolutely, pure science of nature. The source of the confusion Vaihinger again traces to Kant's failure to hold fast to the important distinction between immanent and transcendent metaphysics. His so-called pure or universal natural science (nature, as above noted, signifying for Kant "all that is") is really *immanent metaphysics*, and the propositions in regard to substance and causality ought therefore to be classed as metaphysical. This, indeed, is how they are viewed in the earlier sections of the *Prolegomena*. The distinction later drawn in § 15 is ignored. Pure natural science is identified with mathematical physics, and the propositions which in § 15 are spoken of as belonging to pure universal natural science are now regarded as metaphysical. "Genuinely metaphysical judgments are one and all synthetic.... For instance, the proposition — everything which in things is substance is permanent — is a synthetic, and properly metaphysical judgment." In § 5 the principle of causality is also cited as an example of a synthetic *a priori* judgment in metaphysics. But Kant still omits to draw a distinction between immanent and transcendent metaphysics; and as a consequence his classification of synthetic *a priori* judgments remains thoroughly confused. They are taken as belonging to three spheres, mathematics, physics (in the relative sense), and metaphysics. The implication is that this threefold distinction corresponds to the threefold division of the *Doctrine of Elements* into *Aesthetic*, *Analytic*, and *Dialectic*. Yet, as a matter of fact, the propositions of mathematical physics, in so far as they are examples of applied mathematics, are dealt with in the *Aesthetic*, and in so far as they involve concepts of motion and the like fall entirely outside the scope of the *Critique*, while the *Analytic* deals with those *metaphysical* judgments (such as the principle of causality) which are of immanent employment.

As the new paragraphs in the *Introduction* to the second edition are transferred without essential modification from the *Prolegomena*, they are open to the same criticism. To harmonise B 17 with the real teaching of the *Critique*, it must be entirely recast. Instead of "natural science" (*physica*) we must read "pure universal natural science [= immanent metaphysics]," and for the examples given we must substitute those principles of substance and causality which are dealt with in the *Analytic*. The next paragraph deals with metaphysics in its transcendent form, and accordingly states the problem peculiar to the *Dialectic*.

Metaphysics. — This paragraph deals *explicitly* only with transcendent judgments, but as the terms used are ambiguous, it is possible that those of immanent metaphysics are also referred to. The paragraph is not taken from the *Prolegomena*. The corresponding passage in the *Prolegomena* deals only with the judgments of immanent metaphysics.

The real problem of pure reason is contained in the question: How are synthetic a priori judgments possible? — Cf. above, p ff., 33 ff., 43 ff.

David Hume. — Cf. above, p ff.

A theoretical knowledge. — *i.e.* Kant explicitly leaves aside the further problem, whether such judgments may not also be possible in the practical (moral) and other spheres.

How is pure natural science possible? — The note which Kant appends shows that he is here taking natural science in the relative sense. The same irrelevant instances are again cited.

As these sciences really exist. — Cf. below, ff.

The poor progress which metaphysics has hitherto made. — Cf. *Preface* to the second edition; *Prolegomena*, § 4, and A 175 ff.

How is metaphysics as a science possible? — We may now consider how this and the three preceding questions are related to one another and to the various divisions of the *Critique*. The four subordinate questions within the main problem — How are synthetic *a priori* judgments possible? — are here stated by Kant as:

1. How is pure mathematics possible?
2. How is pure natural science possible?
3. How is metaphysics as natural disposition possible?
4. How is metaphysics as science possible?

There is little difficulty as regards 1 and 2. The first is dealt with in the *Aesthetic*, and the second in the *Analytic*, though, owing to the complexity of the problems, the *Aesthetic* and *Analytic* are wider than either query, and cannot be completely separated. Applied mathematics is dealt with in the *Analytic* as well as in the *Aesthetic*, and in both the determination of the limits of scientific knowledge is equally important with that of accounting for its positive acquisitions. The third and fourth questions raise all manner of difficulties. Notwithstanding the identical mode of formulation, they do not run on all fours with the two preceding. The first two are taken as referring to actually existing and valid sciences. It is the ground of their *objective validity* that is sought. But what is investigated in the third question falsely lays claim to the title of science; we can enquire only as to the ground of its *subjective* possibility. In the fourth question, the problem takes still another form. Kant now seeks to determine *whether* a new, not yet existing, science of metaphysics is possible, and *in what manner* it can be validly constructed. The manifoldness of the problems is thus concealed by the fixity of the common formula. Now with what divisions of the *Critique* are the two last questions connected? It has been suggested that the third question is dealt with in the *Dialectic* and the fourth in the *Methodology*, the four questions thus corresponding to the four main divisions of the *Critique*. But this view is untenable, especially in its view of the fourth question. The division of the *Critique* is by dichotomy into *doctrine of elements* and *doctrine of methods*, the former including the *Aesthetic* and *Logic*, and the *Logic* being again divided into *Analytic* and *Dialectic*. Its problems stand in an equally complex subordination; they cannot be isolated from one another, and set merely side by side. Secondly, it has been maintained that the third question is dealt with in the introduction to the *Dialectic* (in its doctrine of Ideas), and the fourth in the *Dialectic* proper. This view is fairly satisfactory as regards the third question, but would involve the conclusion that the fourth question refers only to transcendent metaphysics, and that it therefore receives a negative answer. But that is not Kant's view of metaphysics *as a science*. The *Critique* is intended to issue in a new and genuine body of metaphysical teaching.

The key to the whole problem of the four questions is not to be found in the *Critique*. This section is transcribed from §§ 4-5 of the *Prolegomena*, and is consequently influenced by the general arrangement of the latter work. This fourfold division was indeed devised for the purposes of the argument of the *Prolegomena*, which is developed on the analytic method, and for that reason it cannot be reconciled with the very different structure of the *Critique*. Yet even the *Prolegomena* suffers from confusion, due to

Kant's failure to distinguish between universal and relative natural science on the one hand, and between immanent and transcendent metaphysics on the other. The four questions do not coincide with those of the *Critique*. Instead of the third — how is metaphysics as natural disposition possible? — we find: *how is metaphysics in general possible?* In §§ 4, 5, Kant's argument is clear and straightforward. Pure mathematical science and mathematical physics are actually existing sciences. The synthetic *a priori* judgments which they contain must be recognised as valid. Metaphysics makes similar claims. But, as is sufficiently proved by the absence of agreement among philosophers, its professions are without ground. It transgresses the limits of possible experience, and contains only pretended knowledge. This false transcendent metaphysics is refuted in the *Dialectic*. Kant was, however, equally convinced that an *immanent* metaphysics is possible, and that its grounds and justification had been successfully given in the *Analytic*. His problem as formulated in the *Prolegomena* is accordingly threefold: (1) how are the existing rational sciences, mathematical and physical, possible? (2) *in the light of the insight acquired by this investigation*, what is the origin and explanation of the existing pretended sciences of transcendent metaphysics? and (3) in what manner can we establish a positive metaphysics that will harmonise with reason's true vocation? So far all is clear and definite. But the unresolved difficulty, as to the relation in which natural science and immanent metaphysics stand to one another, brings confusion in its train. As already noted, in § 15 natural science is displaced by immanent metaphysics (though not under that name); and as a result the fourth question reduces to the second, and the above threefold problem has to be completely restated. The *Prolegomena* has, however, already been divided into four parts; and in the last division Kant still continues to treat the fourth question as distinct from that which has been dealt with in the second division, though, as his answer shows, they are essentially the same. The answer given is that metaphysics as a science is possible only in and through the *Critique*, and that though the whole *Critique* is required for this purpose, the *content* of the new science is embodied in the *Analytic*.

In the second edition of the *Critique* the confusion between natural science and immanent metaphysics still persists, and a new source of ambiguity is added through the reformulation of the third question. It is now limited to the problem of the *subjective* origin of metaphysics as a natural disposition. The fourth question has therefore to be widened, so as to include transcendent as well as immanent, the old as well as the new, metaphysics. But save for this one alteration the entire section is inspired by considerations foreign to the *Critique*; this section, like B 17, must be recast before it will harmonise with the subsequent argument.

Every kind of knowledge is called pure, etc. — These sentences are omitted in the second edition. They have been rendered unnecessary by the further and more adequate definition of "pure" given in B 3 ff.

Reason is the faculty which supplies the principles of knowledge a priori. — This statement should, as Vaihinger points out, be interpreted in the light of A 299 = B 355.

"Reason, like understanding, can be employed in a merely formal, *i.e.* logical manner, wherein it abstracts from all content of knowledge. But it is also capable of a real use, since it contains within itself the source of certain concepts and principles, which it does not borrow either from the senses or from the understanding."

Reason is taken in the first of the above meanings. Reason in its real use, when extended so as to include pure sensibility and understanding, is the pure reason referred to in the next sentence of the *Critique*. *A priori* is here used to signify the relatively *a priori*; in the next sentence it denotes the absolutely *a priori*.

An Organon of pure reason. — What follows, from this point to the middle of the next section, is a good example of Kant's patchwork method of piecing together old manuscript in the composition of the *Critique*. There seems to be no way of explaining its bewildering contradictions save by accepting Vaihinger's conclusion that it consists of three separate accounts, written at different times, and

representing different phases in the development of Kant's views.

I. The first account, beginning with the above words and ending with "already a considerable gain" (*schon sehr viel gewonnen ist*), is evidently the oldest. It reveals the influence of the *Dissertation*. It distinguishes:

1. Critique of pure reason (= *Propaedeutic*).
2. Organon of pure reason.
3. System of pure reason.

1. Critique is a critical examination (*Beurtheilung*) of pure reason, its sources and limits. The implication (obscured by the direct relating of *Critique* to *System*) is that it prepares the way for the *Organon*.

2. Organon comprehends all the principles by which pure knowledge can be acquired and actually established.

3. System is the complete application of such an *Organon*.

This classification is, as Paulsen was the first to remark, an adaptation of the *Dissertation* standpoint.

II. The second account begins: "I entitle all knowledge transcendental," but is broken by the third account — from "Such a *Critique*" to the end of the paragraph — which has been inserted into the middle of it. It is then continued in the next section. It distinguishes:

1. Critique of pure reason.

2. Transcendental philosophy.

1. Critique contains the principles of all *a priori synthetical* knowledge, tracing an architectonic plan which guarantees the completeness and certainty of all the parts.

2. Transcendental philosophy contains their complete analytic development, and is therefore the system of such knowledge.

III. The third account ("Such a *Critique*" to end of paragraph) in its main divisions follows the first account: 1. *Critique*, 2. *Organon* or *Canon*, 3. *System*. But they are now defined in a different manner. *Critique* is a propaedeutic for the *Organon*. But *Organon*, which signifies the totality of the principles through which pure knowledge is attained and extended, may not be possible. In that case the *Critique* is a preparation only for a *Canon*, *i.e.* the totality of the principles of the *proper* employment of reason. The *Organon* or *Canon*, in turn, will render possible a *System* of the philosophy of pure reason, the former yielding a system in extension of *a priori* knowledge, the latter a system which defines the limits of *a priori* knowledge.

It is impossible to reduce these divergencies to a single consistent view. They illustrate the varying sense in which Kant uses the term "metaphysics." In the first account, even though that account is based on a distinction drawn in the *Dissertation*, the *system* of metaphysics is immanent; in the second it is also transcendent; in the third it is neutral.

Propaedeutic. — That the *Critique* is only propaedeutic to a *System* of pure reason was later denied by Kant in the following emphatic terms:

"I must here observe that I cannot understand the attempt to ascribe to me the view that I have sought to supply only a Propaedeutic to transcendental philosophy, not the System of this philosophy. Such a view could never have entered my thoughts, for I have myself praised the systematic completeness (*das vollendete Ganze*) of the pure philosophy in the *Critique of Pure Reason* as the best mark of its truth."

Kant thus finally, after much vacillation in his use of the terms, came to the conclusion that *Critique*, *Transcendental Philosophy*, and *System* all coincide. Meantime he has forgotten his own previous and conflicting utterances on this point.

As regards speculation negative only.— “Speculation” here signifies the theoretical, as opposed to the practical. The qualifying phrase is in line with other passages of the second edition, in which it is emphasised that the conclusions of the *Critique* are positive in their practical (moral) bearing.

Transcendental — transcendent. — Kant was the first to distinguish between these two terms. In the scholastic period, in which they first appear, they were exactly synonymous, the term transcendent being the more usual. The verb, to transcend, appears in Augustine in its widest metaphysical sense. “Transcende et te ipsum.” “Cuncta corpora transcenderunt [Platonici] quaerentes Deum; omnem animam mutabilesque omnes spiritus transcenderunt quaerentes summum Deum.” The first employment of the term in a more specific or technical sense occurs in a treatise, *De natura generis*, falsely ascribed to Thomas Aquinas. In this treatise *ens*, *res*, *aliquid*, *unum*, *bonum*, *verum* are entitled *transcendentia*. To understand the meaning in which the word is here used, we have, it would seem, to take account of the influence exercised upon Aquinas by a mystical work of Arabian origin, entitled *De causis*. It contained reference to the Neo-Platonic distinction between the Aristotelian categories, which the Neo-Platonists regarded as being derivative, and the more universal concepts, *ens*, *unum*, *verum*, *bonum*. To these latter concepts Aquinas gave a theological application. *Ens* pertains to essence, *unum* to the person of the Father, *verum* to the person of the Son, *bonum* to the person of the Holy Ghost. In the *De natura generis* the number of these supreme concepts is increased to six by the addition of *res* and *aliquid*, and as just stated the title *transcendentia* is also now applied for the first time. In this meaning the term transcendent and its synonym transcendental are of frequent occurrence in Scholastic writings. The *transcendentia* or *transcendentalia* are those concepts which so transcend the categories as to be themselves predicable of the categories. They are the “*termini vel proprietates rebus omnibus cuiusque generis convenientes*.” Thus Duns Scotus speaks of *ens* as the highest of the “*transcendental*” concepts. The term also occurs in a more or less similar sense in the writings of Campanella, Giordano Bruno, Francis Bacon, and Spinoza. The last named gives a psychological explanation of the “termini *Transcendentales* ... ut Ens, Res, Aliquid” as standing for ideas that are in the highest degree confused owing to the multiplicity of the images which have neutralised one another in the process of their generation. Berkeley also speaks of the “transcendental maxims” which lie outside the field of mathematical enquiry, but which influence all the particular sciences. Evidently the term has become generalised beyond its stricter scholastic meaning. Lambert employs transcendent in an even looser sense to signify concepts which represent what is common to both the corporeal and the intellectual world. We may, indeed, assert that in Kant’s time the terms transcendent and transcendental, while still remaining synonymous, and though used on the lines of their original Scholastic connotation, had lost all definiteness of meaning and all usefulness of application. Kant took advantage of this situation to distinguish sharply between them, and to impose upon each a meaning suitable to his new Critical teaching.

“Transcendental” is primarily employed by Kant as a name for a certain kind of knowledge. Transcendental knowledge is knowledge not of objects, but of the nature and conditions of our *a priori* cognition of them. In other words, *a priori* knowledge must not be asserted, simply because it is *a priori*, to be transcendental; this title applies only to such knowledge as constitutes a *theory* or *science* of the *a priori*. Transcendental knowledge and transcendental philosophy must therefore be taken as coinciding; and as thus coincident, they signify the science of the possibility, nature, and limits of *a priori* knowledge. The term similarly applies to the subdivisions of the *Critique*. The *Aesthetic* is transcendental in that it establishes the *a priori* character of the forms of sensibility; the *Analytic* in that it determines the *a priori* principles of understanding, and the part which they play in the constitution of knowledge; the *Dialectic* in that it defines and limits the *a priori* Ideas of Reason, to the perverting power of which all false metaphysics is due. That this is the primary and fundamental meaning common to the various uses of the term is constantly overlooked by Max Müller. Thus in A 15 = B 30 he translates *transcendentale Sinnenlehre* “doctrine of transcendental sense” instead of as “transcendental doctrine of sense.” In

transforming *transcendentale Elementarlehre* into "elements of transcendentalism" he avoids the above error, but only by inventing a word which has no place in Kant's own terminology.

But later in the *Critique* Kant employs the term transcendental in a second sense, namely, to denote the *a priori* factors in knowledge. All representations which are *a priori* and yet are applicable to objects are transcendental. The term is then defined through its distinction from the empirical on the one hand, and from the transcendent on the other. An intuition or conception is transcendental when it originates in pure reason, and yet at the same time goes to constitute an *a priori* knowledge of objects. The contrast between the transcendental and the transcendent, as similarly determined upon by Kant, is equally fundamental, but is of quite different character. That is transcendent which lies entirely beyond experience; whereas the transcendental signifies those *a priori* elements which underlie experience as its necessary conditions. The transcendent is always unknowable. The transcendental is that which by conditioning experience renders all knowledge, whether *a priori* or empirical, possible. The direct opposite of the transcendent is the immanent, which as such includes both the transcendental and the empirical. Thus while Kant employs the term transcendental in a very special sense which he has himself arbitrarily determined, he returns to the original etymological meaning of the term transcendent. It gains a specifically Critical meaning only through being used to expound the doctrine that all knowledge is limited to sense-experience. The attempt to find some similar etymological justification for Kant's use of the term transcendental has led Schopenhauer and Kuno Fischer to assert that Kant entitles his philosophy transcendental because it transcends both the dogmatism and the scepticism of all previous systems! Another attempt has been made by Stirling and Watson, who assert, at least by implication, that the transcendental is a species of the transcendent, in that while the latter transcends the scope of experience, the former transcends its sense-content. Kant himself, however, nowhere attempts to justify his use of the term by any such argument.

A third meaning of the term transcendental arises through its extension from the *a priori* intuitions and concepts to the processes and faculties to which they are supposed to be due. Thus Kant speaks of the transcendental syntheses of apprehension, reproduction, and recognition, and of the transcendental faculties of imagination and understanding. In this sense the transcendental becomes a title for the conditions which render experience possible. And inasmuch as processes and faculties can hardly be entitled *a priori*, Kant has in this third application of the term departed still further from his first definition of it.

The distinction between the transcendental and the transcendent may be illustrated by reference to the Ideas of reason. Regarded as regulative only, *i.e.* merely as ideals which inspire the understanding in the pursuit of knowledge, they are transcendental. Interpreted as constitutive, *i.e.* as representing absolute realities, they are transcendent. Yet, despite the fundamental character of this distinction, so careless is Kant in the use of his technical terms that he also employs transcendental as exactly equivalent in meaning to transcendent. This is of constant occurrence, but only two instances need here be cited. In the important phrase "transcendental ideality of space and time" the term transcendental is used in place of the term transcendent. For what Kant is asserting is that judged from a *transcendent* point of view, *i.e.* from the point of view of the thing in itself, space is only subjectively real. The phrase is indeed easily capable of the orthodox interpretation, but, as the context clearly shows, that is not the way in which it is actually being used by Kant. Another equally surprising example is to be found in the title "transcendental dialectic." Though it is defined in A 63-4 = B 88 in correct fashion, in A 297 = B 354 and A 308-9 = B 365-6 it is interpreted as treating of the illusion involved in transcendent judgments, and so virtually as meaning *transcendent* dialectic.

Not a Critique of books and systems. — Kant here inserts a statement from the omitted *Preface* to the first edition. He now adds that the *Critique* will supply a criterion for the valuation of all other systems.

A 13 = B 27. — Kant's reason for omitting the title of Section II in the second edition was no doubt its inconsistency with the assertion of its opening sentence, viz. that the *Critique* is *not* transcendental

philosophy, but only a preparation for it. Instead of it, Kant has introduced the more appropriate heading placed over the preceding paragraph.

The highest principles of morals do not belong to transcendental philosophy. — Cf. A 801 = B 829. The alteration made in this passage in the second edition indicates a transition towards the opposite view which Kant developed in the *Critique of Practical Reason*.

The division of this science. — Kant in this paragraph alternates in the most bewildering fashion between the *Critique* and *Transcendental Philosophy*. In this first sentence the *Critique* seems to be referred to. Later it is *Transcendental Philosophy* that is spoken of.

Doctrine of Elements and Doctrine of Methods. — Cf. A 707 ff. = B 735 ff., and below, p, 563.

Two stems, sensibility and understanding, which may perhaps spring from a common root. — Kant sometimes seems to suggest that imagination is this common root. It belongs both to sensibility and to understanding, and is passive as well as spontaneous. But when so viewed, imagination is virtually regarded as an unknown supersensuous power, "concealed in the depths of the soul." The supersensuous is the point of union of our disparate human faculties, as well as of nature and freedom, mechanism and teleology.

The transcendental doctrine of sense would necessarily constitute the first part of the Science of Elements.— "Necessarily constitute the first part" translates *zum ersten Theile gehören müssen*. This Vaihinger explains as an archaic mode of expression, equivalent to *ausmachen*. The point is important because, if translated quite literally, it might seem to conflict with the division actually followed, and to support the alternative division given in the *Critique of Practical Reason*. The first *Critique* is divided thus:

I. Doctrine of Elements.

1. Aesthetic.
2. Logic.
   (*a*) Analytic.
   (*b*) Dialectic.

II. Doctrine of Methods.

In the *Critique of Practical Reason* a much more satisfactory division is suggested:

I. Doctrine of Elements.

1. Analytic.
   (*a*) Aesthetic (Sense).
   (*b*) Logic (Understanding).
2. Dialectic.

II. Doctrine of Methods.

The first division rests on somewhat irrelevant distinctions derived from the traditional logic; the other is more directly inspired by the distinctions which naturally belong to Kant's own philosophical system.

THE TRANSCENDENTAL DOCTRINE OF ELEMENTS

PART I. THE TRANSCENDENTAL AESTHETIC

THE *Aesthetic* opens with a series of definitions. Intuition (*Anschauung*) is knowledge (*Erkenntnis*) which is in immediate relation to objects (*sich auf Gegenstände unmittelbar bezieht*). Each term in this definition calls for comment. *Anschauung* etymologically applies only to visual sensation. Kant extends it to cover sensations of all the senses. The current term was *Empfindung*. Kant's reason for introducing the term intuition in place of sensation was evidently the fact that the latter could not be made to cover space and time. We can speak of pure intuitions, but not of pure sensations. *Knowledge* is used in a very wide sense, not strictly consistent with A 50-1 = B 74-5. The phrase *sich bezieht* is quite indefinite and ambiguous. Its meaning will depend upon the interpretation of its context. *Object* is used in its widest and most indefinite meaning. It may be taken as signifying content (*Inhalt*, a term which does not occur in this passage, but which Kant elsewhere employs). That, at least, is the meaning which best fits the context. For when Kant adds that intuition relates itself to objects *immediately*, it becomes clear that he has in mind its distinction from conception (*Begriff*) which as expressing the universal is related to objects only indirectly, representing some one or more attributes of the *given* objects. Ultimately the whole content of conception must be given. The phrase "relates itself to objects" may, therefore, be paraphrased "has some content, such as red or cold, as its immediate object." Through the content of intuition the whole material of thought is supplied. Intuition in itself is blind, but not empty. "Thoughts without content are empty; intuitions without concepts are blind."

But the phrase "is in relation to objects" has also for Kant a second meaning, implied in the above, but supplementary to it. As he states in the very next sentence, intuition can have an object, meaning thereby a content, only in so far as that content is *given*. The material of thought must be supplied; it cannot be invented. The only mode, however, in which it can be supplied, at least to the human mind, is through the affecting of the mind by "the object." This is an excellent instance of Kant's careless mode of expressing himself. In the first part of the sentence object means *object of intuition*. In the latter part it signifies the *cause of intuition*. And on Kant's view the two cannot coincide. The object which affects the mind is independently real; the immediate object of the intuition is a sense-content, which Kant, following the universally accepted view of his time, regards as purely subjective. The term object is thus used in two quite distinct meanings within one and the same sentence.

Kant's definition of intuition, when stated quite explicitly, and cleared of all ambiguity, is therefore as follows. *Intuition is the immediate apprehension of a content which as given is due to the action of an independently real object upon the mind*. This definition is obviously not meant to be a description of intuition as it presents itself to introspection, but to be a reflective statement of its indispensable conditions. Also it has in view only empirical intuitions. It does not cover the pure intuitions space and time. Though space and time are given, and though each possesses an intrinsic content, these contents are not due to the action of objects upon the sensibility.

"An intuition is such a representation as immediately depends upon the presence of the object. Hence it seems impossible *originally* to intuit *a priori* because intuition would in that event take place without either a former or a present object to refer to, and by consequence could not be intuition."

This interpretation is borne out by Kant's answer to Beck when the latter objected that only through subsumption under the categories can a representation become objective. Kant replies in a marginal note, the meaning of which, though difficult to decipher, admits of a fairly definite interpretation.

"The determining of a concept through intuition so as to yield knowledge of the object falls within the province of the faculty of judgment, but not the relation of the intuition to an object in general [*i.e.* the view of it as having a content which is given and which is therefore due to some object], for that is merely

the logical use of the representation, whereby it is thought as falling within the province of knowledge. On the other hand, if this single representation is related only to the subject, the use is aesthetic (feeling), and the representation cannot be an act of knowledge."

Mind (*Gemüt*) is a neutral term without metaphysical implications. It is practically equivalent to the term which is substituted for it in the next paragraph, power of representation (*Vorstellungsfähigkeit*). Representation (*Vorstellung*) Kant employs in the widest possible meaning. It covers any and every cognitive state. The definition here given of sensibility— "the capacity (receptivity) to obtain representations through the mode in which we are affected by objects" — is taken directly over from the *Dissertation*. In this definition, as in that of intuition, Kant, without argument or question, postulates the existence of independently existing objects. The existence of given sensations presupposes the existence of things in themselves. Sensibility is spoken of as the source both of objects and of intuitions. This is legitimate since object and intuition mutually imply one another; the latter is the apprehension of the former. By "objects" is obviously meant what in the third paragraph is called the matter of appearances, *i.e.* sensations in their objective aspect, as qualities or contents. The term "object" is similarly employed in the last line of this first paragraph.

Understanding (*Verstand*) is defined only in its logical or discursive employment. Kant wisely defers all reference to its more fundamental synthetic activities. *In us* (*bei uns*) is an indirect reference to the possibility of intellectual (non-sensuous) intuition which is further developed in other parts of the *Aesthetic*. Sensuous intuition is due to affection by an object. In intellectual intuition the mind must produce the object in the act of apprehending it.

Kant's definition of intuition applies, as already noted, only to empirical intuition. He proceeds to define the relation in which sensation (*Empfindung*) stands to empirical intuition. What he here says amounts to the assertion that through sensation intuition acquires its object, *i.e.* that *sensation is the content of intuition*. And that being so, it is also through sensation that empirical intuition acquires its relation to the object (= thing in itself) which causes it. (That would seem to be the meaning of the ambiguous second sentence; but it still remains uncertain whether the opposition intended is to pure or to intellectual intuition.) If this interpretation of the paragraph be correct, sensation is counted as belonging exclusively to the content side of subjective apprehension. But Kant views sensation in an even more definite manner than he here indicates. Though sensation is given, it likewise involves a reaction of the mind.

"Whatever is sensuous in knowledge depends upon the subject's peculiar nature, in so far as it is capable of this or that modification upon the presence of the object."

Thus for Kant sensation is a modification or state of the subject, produced by affection through an object. The affection produces a modification or state of the subject, and this subjective modification is the sensation.

"Sensation is a perception [*Perception*] which relates itself solely to the subject as the modification of its state."

This view of sensation, as subjective, was universally held in Kant's day. He accepts it without argument or question. That it could possibly be challenged never seems to have occurred to him. He is equally convinced that it establishes the existence of an actually present object.

"Sensation argues the presence of something, but depends as to its quality upon the nature of the subject." "Sensation presupposes the actual presence of the object."

Kant's view of sensation, as developed in the *Aesthetic*, thus involves three points: (1) It must be counted as belonging to the content side of mental apprehension. (2) Though a quality or content, it is purely subjective, depending upon the nature of our sensibility. (3) It is due to the action of some object upon the sensibility.

Kant distinguishes between sensation (*Empfindung*) and feeling (*Gefühl*). It had been usual to employ

them as synonyms.

“We understand by the word sensation an objective representation of the senses; and in order to preclude the danger of being misunderstood, we shall denote that which must always remain merely subjective and can constitute absolutely no representation of an object by the ordinary (*sonst üblichen*) term feeling.”

Appearance (*Erscheinung*) is here defined as the undetermined object of an intuition. By undetermined object is meant, as we have seen, the object in so far as it consists of the given sense contents. When these contents are interpreted through the categories they become *phenomena*.

“Appearances so far as they are thought as objects according to the unity of the categories are called phenomena.”

But this distinction between appearance and phenomenon is not held to by Kant. He more usually speaks of the categorised objects as appearances. The term phenomenon is of comparatively rare occurrence in the *Critique*. This has been concealed from English readers, as both Meiklejohn and Max Müller almost invariably translate *Erscheinung* phenomenon. The statement that appearance is the *object* of an empirical intuition raises a very fundamental and difficult question, namely, as to the relation in which representation stands to the represented. Frequently Kant’s argument implies this distinction, yet constantly he speaks and argues as if it were non-existent. We have to recognise two tendencies in Kant, subjectivist and phenomenalist. When the former tendency is in the ascendent, he regards all appearances, all phenomena, all empirical objects, as representations, modifications of the sensibility, merely subjective. When, on the other hand, his thinking is dominated by the latter tendency, appearances gain an existence independent of the individual mind. They are known through subjective representations, but must not be directly equated with them. They have a genuine objectivity. To this distinction, and its consequences, we shall have frequent occasion to return.

The phenomenalist standpoint is dominant in these first two paragraphs of the *Aesthetic*, and it finds still more pronounced expression in the opening of the third paragraph. “That in the appearances which *corresponds* (*correspondirt*) to sensation, I call its matter.” This sentence, through the use of the term corresponds, clearly implies a distinction between sensation and the real object apprehended in and through it. That, in turn, involves a threefold distinction, between sensation as subjective content (= appearance in the strict sense), the real enduring object in space (= phenomenon, the categorised object, appearance in its wider and more usual sense), and the thing in itself. Yet in the immediately following sentence Kant says that “the matter of all appearance is given *a posteriori*.” By “matter of appearance” Kant must there mean sensations, for they alone are given *a posteriori*. On this view the phenomena or empirical objects reduce to, and consist of, sensations. The intermediate term of the above threefold distinction is eliminated. The matter of appearance does not correspond to, but itself *is*, sensation. Thus in these successive sentences the two conflicting tendencies of Kant’s teaching find verbal expression. They intervene even in the preliminary definition of his terms. This fundamental conflict cannot, however, be profitably discussed at this stage.

The manifold of appearance (*das Mannichfaltige der Erscheinung*). The meaning to be assigned to this phrase must depend upon the settlement of the above question. But in this passage it allows only of a subjectivist interpretation, whereby sensations *are* appearance. The given sensations as such constitute a manifold; as objects in space they are already ordered. Kant’s more usual phrase is “the manifold of intuition.” His adoption of the term “manifold” (the *varia* of the *Dissertation*) expresses his conviction that synthesis is indispensable for all knowledge, and also his correlative view that nothing absolutely simple can be apprehended in sense-experience. By the manifold Kant does not mean, however, as some of his commentators would seem to imply, the chaotic or disordered. The emphasis is on manifoldness or plurality, as calling for reduction to unity and system. The unity has to be *found* in it, not introduced into it forcibly from the outside. The manifold has to be *interpreted*, even though the principles of interpretation

may originate independently of it. Though, for instance, the manifold as given is not in space and time, the specific space and time relations assigned by us are determined for us by the inherent nature of the manifold itself.

The form of appearance is defined — if the definition given in the first edition be translated literally — as “that which causes (*dasjenige, welches macht dass*) the manifold of appearance to be intuited as ordered in certain relations.” This phrase is employed by Kant in other connections, and, as Vaihinger points out, need not necessarily indicate activity. “Sensation is that in our knowledge which causes it to be called *a posteriori* knowledge.” In the second edition Kant altered the text from “*geordnet angeschaut wird*” to “*geordnet werden kann*.” The reason probably was that the first edition’s wording might seem to imply that the form is (as the *Dissertation* taught) capable in and by itself of ordering the manifold. Throughout the second edition Kant makes more prominent the part which understanding plays in the apprehension of space.

This distinction between matter and form is central in Kant’s system. As he himself says:

“These are two conceptions which underlie all other reflection, so inseparably are they bound up with all employment of the understanding. The one [matter] signifies the determinable in general, the other [form] its determination.”

On the side of matter falls the manifold, given, empirical, contingent material of sense; on the side of form fall the unifying, *a priori*, synthetic, relational instruments of sensibility and thought. For Kant these latter are no mere abstractions, capable of being *distinguished* by the mind; they differ from the matter of experience in nature, in function, and in origin. Upon this dualistic mode of conceiving the two factors depends the strength as well as the weakness of his position. To its perverting influence most of the unsatisfactory features of his doctrine of space and time can be directly traced. But to it is also due his appreciation of the new Critical problems, with their revolutionary consequences, as developed in the *Analytic*.

Kant proceeds to argue: (*a*) that the distinction is between two elements of fundamentally different nature and origin. The matter is given *a posteriori* in sensation; the form, as distinct from all sensation, must lie ready *a priori* in the mind. (*b*) Kant also argues that form, because of its separate origin, is capable of being contemplated apart from all sensation. The above statements rest upon the unexpressed assumption that sensations have no spatial attributes of any kind. In themselves they have only intensive, not extensive, magnitude. Kant assumes this without question, and without the least attempt at proof. The assumption appears in Kant’s writings as early as 1768 as a self-evident principle; and throughout the *Critique* is treated as a premiss for argument, never as a statement calling for proof. The only kind of supporting argument which is even indirectly suggested by Kant is that space cannot by itself act upon the senses. This would seem to be his meaning when he declares that it is no object, but only an *ens imaginarium*. “Space is no object of the senses.” Such argument, however, presupposes that space can be conceived apart from objects. It is no proof that an extended object may not yield extended sensations. Kant completely ignores the possibility that formal relations may be given in and with the sensations. If our sensibility, in consequence of the action of objects upon it, is able to generate qualitative sensations, why, as Vaihinger very pertinently enquires, should it be denied the power of also producing, in consequence of these same causes, impressions of quantitative formal nature? Sensations, on Kant’s view, are the product of mind much more than of objects. Why, then, may not space itself be sensational? From the point of view of empirical science there is no such radical difference between cause and effect in the latter case as exists in the former. As Herbert Spencer has remarked, Kant makes the enormous assumption

“...that no differences among our sensations are determined by any differences in the *non-ego* (for to say that they are so determined is to say that the form under which the *non-ego* exists produces an effect upon the *ego*); and as it similarly follows that the order of coexistence and sequence among these

sensations is not determined by any order in the *non-ego*; we are compelled to conclude that all these differences and changes in the *ego* are self-determined."

Kant's argument in the *Dissertation* is exactly of this nature.

"Objects do not strike the senses by their form. In order, therefore, that the various impressions from the object acting on the sense may coalesce into some whole of representation, there is required an inner principle of the mind through which in accordance with stable and innate laws that manifold may take on some form."

In the paragraph before us Kant may, at first sight, seem to offer an argument. He is really only restating his premiss. "That wherein alone sensations can be arranged (*sich ordnen*) and placed in a certain form cannot itself again be sensation." Now, of course, if the term sensation is to be limited to the sense qualities, *i.e.* to content or matter, conceived as existing apart from all formal relations, the formal elements cannot possibly be sensational. The legitimacy of that limitation is, however, the question at issue. It cannot be thus decided by an arbitrary verbal distinction.

"Were the contention that the relations of sensations are not themselves sensed correct, the inference to the pure apriority of the form of our perception would be inevitable. For sensation is the sole form of interaction between consciousness and reality.... But that contention is false. The relations of sensations, their determined coexistence and sequence, impress consciousness, just as do the sensations. We feel this impression in the compulsion which the determinateness of the empirical manifolds lays upon the perceiving consciousness. The mere affection of consciousness by these relations does not, indeed, by itself suffice for their apprehension; but neither does it suffice for the apprehension of the sensation itself. Thus there is in these respects no difference between the matter and the form of appearance."

In this way, then, by means of his definition of sensation, Kant surreptitiously introduces his fundamental assumption. That assumption reappears as the conclusion that since the form of appearance cannot be sensation, it does not arise through the action of the object, and consequently must be *a priori*. Though the paragraph seems to offer an argument in support of the apriority of space and time, it is found on examination merely to unfold a position adopted without the slightest attempt at proof.

The form of appearance must lie ready in the mind. — Comment upon this, in order to be adequate, had best take the form of a systematic discussion of Kant's views, here and elsewhere, of space as an *a priori* form of intuition. As already stated, the definition which Kant gives of intuition — as knowledge which stands in immediate relation to objects — applies only to empirical intuition. Though by the term object Kant, in so far as he is definite, means content, that content is such as can arise only through the action of some independent object upon the sensibility. In other words, the content apprehended must be sensuous. Now such a view of intuition obviously does not apply to pure intuition. As the concluding line of the paragraph before us states, pure intuition "can be contemplated in separation from all sensation;" and as the next paragraph adds, it exists in the mind "without any actual object of the senses." Yet Kant does not mean to imply that it is without content of any kind. "This pure form of sensibility may also itself be called pure intuition." "It can be known before all actual perception, and for that reason is called pure intuition." Though, therefore, pure intuition has an intrinsic content, and is the immediate apprehension of that content, it stands in no relation to any actual independent object. The content as well as the form is *a priori*. That, however, raises wider questions, and these we must now discuss.

Here, as in most of his fundamental positions, Kant entertains divergent and mutually contradictory doctrines. Only in his later utterances does he in any degree commit himself to one consistent view. The position to which he finally inclines must not, however, be allowed to dominate the interpretation of his earlier statements. The *Aesthetic* calls for its own separate exegesis, quite as if it formed by itself an independent work. Its problems are discussed from a standpoint more or less peculiar to itself. The commentator has the twofold task of stating its argumentation both in its conflict with, and in its relation to, the other parts of the *Critique*.

One essential difference between Kant's earlier and later treatments of space is that in his earlier utterances it is viewed almost exclusively as a psychological *a priori*. The logical aspect of the problem first receives anything like adequate recognition in the *Analytic*. If we keep this important fact in mind, two distinct and contradictory views of the psychological nature of space intuition can be traced throughout the *Aesthetic*. On one view, it antedates experience as an actual, completed, conscious intuition. On the other view, it precedes experience only as a potential disposition. We rule ourselves out from understanding Kant's most explicit utterances if we refuse to recognise the existence of both views. Kant's commentators have too frequently shut their eyes to the first view, and have then blamed Kant for using misleading expressions. It is always safer to take Kant quite literally. He nearly always means exactly what he says at the time when he says it. Frequently he holds views which run completely counter to present-day psychology, and on several occasions he flatly contradicts what he has with equal emphasis maintained in other contexts. The aspects of Kant's problems are so complex and various, and he is so preoccupied in doing complete justice to each in turn, that the question of the mutual consistency of his results is much less considered than is ideally desirable.

The two views can be more explicitly formulated. The first view alone is straightforward and unambiguous. Space lies ready (*liegt bereit*) in the mind, *i.e.* it does not arise. Prior even to sense-experience it exists as a *conscious* intuition. For this reason it can be contemplated apart from all sensation. It still remains when all sense content is thought away, and yet is not a mere form. In independence of the sensuous manifold it possesses a pure manifold of its own. The ground thesis of the second view — that space, prior to sense-experience, exists only as a permanent endowment of the mind — is likewise unambiguous. But in its development Kant throws consistency to the winds. The possible ways in which, on the second view, consciousness of space may be gained, can be tabulated as follows:

(*a*) By reflection upon the activity of the mind in the
construction of experience, yielding the intuition of a pure
manifold; or (*b*) by reflection upon the space-endowed
products of experience. The latter mode of reflection may reveal:

(α) A pure manifold distinct from the manifold of sense; or

(β) Space as a form of the sensuous manifold.

There are thus three different ways (*a*, α, β) in which the second view can be developed: (*a*) represents the view of the *Dissertation* (1770), of the reply to Eberhard (1790), and of those parts of the first edition's deduction of the categories which are of very early origin; (α) represents the final standpoint of the *Analytic*; (β), the prevailing view of the present day, is nowhere accepted by Kant.

Kant's utterances in the *Aesthetic* are all of them coloured by the first main view. We can best approach them by way of the contrasted teaching of the *Dissertation* of 1770. The teaching there formulated practically coincides, as above stated, with (*a*) of the second main view. Space, he maintains, is neither innate nor acquired from sense-experience.

"Certainly both conceptions [of time and of space] are undoubtedly acquired, not indeed by abstraction from our sensations of objects (for sensation gives the matter, not the form of human cognition), but from the mind's own action in co-ordinating its sensations in accordance with unchanging laws. Each represents, as it were, an immutable type, and so can be known intuitively. Sensations excite this act of mind but do not contribute to the intuition. There is here nothing innate except this law of the mind

according to which it conjoins in a certain manner the sensations derived from the presence of some object.”

How this view is to be reconciled with the contention, no less explicitly maintained, that space is not only a form of intuition but itself a pure intuition, Kant does not make clear. Reflection upon an activity of the mind may yield the representation of space as a form; it is difficult to comprehend how it should also yield an *a priori* content.

Kant nowhere in the *Critique* directly discusses the question whether the representation of space is innate or acquired. Such suggestions as occur refer (with the solitary exceptions of A 196 = B 241 and B 166 ff.) only to the categories, or as in the *Prolegomena* to the Ideas of reason. But in 1790 Kant in his reply to Eberhard again formulates the view of the *Dissertation*. The *Critique* allows, he there says, of no innate representations. All, without exception, are acquired. But of certain representations there is an original acquisition (*ursprüngliche Erwerbung*). Their ground (*Grund*) is inborn. In the case of space this ground is the mind’s peculiar capacity for acquiring sensations in accordance with its subjective constitution.

“This first formal ground is alone inborn, not the space representation itself. For it always requires impressions to determine the faculty of knowledge to the representation of an object (which in every case is its own action). Thus arises the formal intuition, which we name space, as an originally acquired representation (the form of outer objects in general), the ground of which (as mere receptivity) is likewise inborn, and the acquisition of which long antedates the determinate *conception* of things which are in accordance with this form.”

That last remark is confusing. Kant cannot mean that the representation of space is acquired prior to sense-experience, but only that since the mind gains it by reflection upon its own activity, it is among the first things to be apprehended — an extremely questionable assertion, could the premisses be granted. If “the determinate conception of things” comes late, still later must come the determinate conception of anything so abstract as pure space. The above passage thus repeats without essential modification the teaching of the *Dissertation*, and is open to the same objections. This teaching coincides with that of Leibniz in his *Nouveaux Essais*; and in formulating it in the *Dissertation* Kant was very probably influenced by Leibniz. Though it is an improvement upon the more extreme forms of the Cartesian doctrine of innate ideas, it does not go sufficiently far.

Now while Kant thus in 1770 and in 1790 so emphatically teaches that the representation of space is not innate, he none the less, in the intermediate period represented by the *Aesthetic*, would seem to maintain the reactionary view. Space is no mere potential disposition. As a conscious representation it lies ready in the mind. What, then, were the causes which constrained Kant to go back upon his own better views and to adopt so retrograde a position? The answer must be conjectural, but may perhaps be found in the other main point in which the teaching of the *Aesthetic* is distinguished from that of the *Dissertation*. Throughout the *Critique* Kant insists that space is a form of *receptivity*. It is *given* to the mind. It has nothing to do with spontaneity or understanding, and therefore cannot be acquired by reflection upon any activity of the mind. But neither can it, as *a priori*, be acquired from without. Consequently it cannot be acquired at all. But if given, and yet not acquired, it must as a representation lie ready in the mind from the very birth of consciousness. Constrained by such reasoning, Kant views it as given in all its completeness just as truly as is a sensation of colour or sound. This conclusion may not be satisfactory. Kant’s candid recognition of it is, however, greatly preferable to the blurring of the issue by most of his commentators.

Kant came, no doubt, to the more consistent position of the *Aesthetic* chiefly through further reflection upon the arguments of the *Dissertation*, and especially by recognition of the fact that though reflection upon an activity of the mind may be regarded as yielding a form of intuition, it can hardly be capable of yielding a pure manifold which can be substituted for, and take the place of, the manifold of sense. There

are for Kant only two ways of escape from this unhappy quandary: (*a*) Either he must return to the *Dissertation* position, and admit that the mind is active in the construction of space. This he does in the 1790 reply to Eberhard, but only by misrepresenting his own teaching in the *Critique*. In order consistently to maintain that space is acquired by reflection upon an activity of the mind, he would have to recast the entire *Aesthetic*, as well as much of the *Analytic*, and to do so in ways which cannot genuinely harmonise with the main tendencies of his teaching. (*b*) No such obstacle lay in the way of an alternative modification of his position. Kant might very easily have given up the contention that space is a pure intuition. If he had been willing to recognise that the sole possible manifold of intuition is sensuous, he could then have maintained that though space is innate as a potential form of receptivity, it is acquired only through reflection upon the space-endowed products of sensibility. So obvious are the advantages of this position, so completely does it harmonise with the facts of experience and with the teaching of modern psychology, and so obscure are the various passages in which Kant touches on this central issue, that many of his most competent commentators are prepared to regard it as being the actual teaching of the *Critique*. The evidence seems to me, however, to refute this interpretation of Kant's position. The traditional, Cartesian, semi-mystical worship of mathematical truth, as altogether independent of the contingencies of sense-experience, and as a body of knowledge absolutely distinct in origin from the merely empirical sciences, influences Kant's thinking even at the very moment when he is maintaining, in opposition to the Cartesians, that its subject matter is a merely subjective intuition. Kant, as it would seem, still maintains that there is a pure manifold of intuition distinct from the manifold of sense; and so by the inevitable logic of his thought is constrained to view space as innate in conscious form. This is not, of course, a conclusion which he could permanently stand by, but its elimination would have involved a more radical revision of his whole view of pure intuition and of mathematical science than he was willing to undertake. Though in the *Analytic* he has come to recognise that it is acquired by reflection upon *objects*, to the end he would seem to persist in the difficult contention that such reflection yields a pure manifold distinct from the manifold of sense. His belief that mathematical science is based upon pure intuition prevented him from recognising that though space may be a pure form of intuition, it can never by itself constitute a complete intuition. Its sole possible *content* is the manifold of sense. But even apart from the fact that our apprehension of space is always empirically conditioned, Kant's view of mathematical propositions as grounded in intuition is, as already observed, not itself tenable. For though intuitions may perhaps be the ultimate subject matter of geometry, concepts are its sole possible instruments. Intuitions yield scientific insight in exact proportion to our powers of restating their complex content in the terms of abstract thought. Until the evidence which they supply has been thus intellectually tested and defined, they cannot be accepted as justifying even the simplest proposition.

The complicated ambiguities of Kant's treatment of space may be illustrated and further clarified by discussion of another difficulty. Is space a *totum analyticum* or a *totum syntheticum*? Does the whole precondition the parts, or does it arise through combination of the parts? Or to ask another but connected question, do we intuit infinitude, or is it conceptually apprehended only as the presupposition of our limited intuitions? To these questions diametrically opposite answers can be cited from the *Critique*. As we have above noted, Kant teaches in the *Aesthetic* that space is given as a whole, and that the parts arise only by limitation of it. But in A 162 = B 203 we find him also teaching that a magnitude is to be entitled extensive

"...when the representation of the parts makes possible, and therefore necessarily precedes, the representation of the whole. I cannot represent to myself a line, however small, without drawing it in thought, *i.e.* generating from a point all its parts one after another, and thus for the first time recording this intuition."

He adds in the second edition that extensive magnitude cannot be apprehended save through a "synthesis of the manifold," a "combination of the homogeneous."

The note which Kant appends to B 136 is a very strange combination of both views. It first of all reaffirms the doctrine of the *Aesthetic* that space and time are not concepts, but intuitions within which as in a unity a multitude of representations are contained; and then proceeds to argue that space and time, as thus *composite*, must presuppose an antecedent synthesis. In A 505 = B 533 we find a similar attempt to combine both assertions.

"The parts of a given appearance are first given through and in the regress of *decomposing synthesis* (*decomponirenden Synthesis*)."

The clash of conflicting tenets which Kant is striving to reconcile could hardly find more fitting expression than in this assertion of an *analytic synthesis*. The same conflict appears, though in a less violent form, in A 438 = B 466.

"Space should properly be called not *compositum* but *totum*, since its parts are possible only in the whole, not the whole through the parts. It might, indeed, be said to be a *compositum* that is *ideale*, but not *reale*. That, however, is a mere subtlety."

The arguments by which Kant proves space to be an *a priori* intuition rest upon the view that *space is given as infinite*, and that *its parts arise through limitation of this prior-existent whole*. But a principle absolutely fundamental to the entire *Critique* is the counter principle, that all analysis rests upon and presupposes a previously exercised synthesis. *Synthesis or totality as such can never be given*. Only in so far as a whole is synthetically constructed can it be apprehended by the mind. *Representation of the parts precedes and renders possible representation of the whole.*

The solution of the dilemma arising out of these diverse views demands the drawing of two distinctions. First, between a synthesised totality and a principle of synthesis; the former may involve a prior synthesis; the latter does not depend upon synthesis, but expresses the predetermined nature of some special form of synthesis. Secondly, it demands a distinction between the *a priori* manifolds of space and time and the empirical manifold which is apprehended in and through them. This, as we have already noted, is a distinction difficult to take quite seriously, and is entirely unsupported by psychological evidence. But it would seem to be insisted upon by Kant, and to have been a determining factor in the formulation of several of his main doctrines.

In terms of the first distinction we are compelled to recognise that the view of space which underlies the *Aesthetic* is out of harmony with the teaching of the *Analytic*. In the *Aesthetic* Kant interprets space not merely as a form of intuition but also as a formal intuition, which is given complete in its totality, and which is capable of being apprehended independently of its empirical contents, and even prior to them. That would seem to be the view of space which is presupposed in Kant's explanation of pure mathematical science. The passages from the *Analytic*, quoted above, are, however, its express recantation. Space, as the intuition of a manifold, is a *totum syntheticum*, not a *totum analyticum*. It is constructed, not given. The divergence of views between the *Aesthetic* and the *Analytic* springs out of the difficulty of meeting at once the logical demands of a world which Kant conceives objectively, and the psychological demands which arise when this same world is conceived as subjectively conditioned. In principle, the whole precedes the parts; in the process of being brought into existence as an intuition, the parts precede the whole. The principle which determines our apprehension of any space, however small or however large, is that it exists in and through universal space. This is the principle which underlies both the synthetic construction of space and also its apprehension once it is constructed. In principle, therefore, *i.e.* in the order of logical thought, the whole precedes the parts. The process, however, which this principle governs and directs, cannot start with space as a whole, but must advance to it through synthesis of smaller parts.

But Kant does not himself recognise any conflict between this teaching and the doctrine of the *Aesthetic*. He seems to himself merely to be making more definite a position which he has consistently held all along; and this was possible owing to his retention and more efficient formulation of the second

of the two distinctions mentioned above, viz. that between the manifold of sense and the manifold of intuition. This distinction enables him to graft the new view upon the old, and so in the very act of insisting upon the indispensableness of the conceptual syntheses of understanding, none the less to maintain his view of geometry as an intuitive science.

"Space and time contain a manifold of pure *a priori* intuition, but at the same time are conditions of the receptivity of our mind — conditions under which alone it can receive representations of objects, and which therefore must also affect the concept of them. But if this manifold is to be known, the spontaneity of our thinking requires that it be gone through in a certain way, taken up, and connected. This action I name synthesis.... Such a synthesis is pure, if the manifold is not empirical, but is given *a priori*, as is that of space and of time."

Thus Kant recognises that space, as apprehended by us, is constructed, not given, and so by implication that the infinitude of space is a principle of apprehension, not a given intuition. But he also holds to the view that it contains a pure, and presumably infinite, manifold, given as such. In what this pure manifold consists, and how the description of it as a manifold, demanding synthesis for its apprehension, is to be reconciled with its continuity, Kant nowhere even attempts to explain. Nor does he show what the simple elements are from which the synthesis of apprehension and reproduction in pure intuition might start. The unity and multiplicity of space are, indeed, as he himself recognises, inseparably involved in one another; and recognition of this fact must render it extremely difficult to assign them to separate faculties. For the same reason it is impossible to distinguish temporally, as Kant so frequently does, the processes of synthesis and of analysis, making the former in all cases precede the latter in time. The very nature of space and time, and, as he came to recognise, the very nature of all Ideas of reason, in so far as they involve the notion of the unconditioned, conflict with such a view.

Even when Kant is dealing with space as a principle of synthesis, he speaks with no very certain voice. In the *Analytic* it is ascribed to the co-operation of sensibility and understanding. In the *Dialectic* it is, by implication, ascribed to Reason; and in the *Metaphysical First Principles* it is explicitly so ascribed.

"Absolute space cannot be object of experience; for space without matter is no object of perception, and yet it is a necessary conception of Reason, and therefore nothing but a mere Idea." "Absolute space is not necessary as a conception of an actual object, but as an Idea which can serve as rule...."

Kant's teaching in the *Critique of Judgment* is a further development of this position.

"The mind listens to the voice of Reason which, for every given magnitude — even for those that can never be entirely apprehended, although (in sensible representation) they are judged as entirely given — requires totality.... It does not even except the infinite (space and past time) from this requirement; on the contrary, it renders it unavoidable to think the infinite (in the judgment of common reason) as *entirely given* (in its totality). But the infinite is absolutely (not merely comparatively) great. Compared with it everything else (of the same kind of magnitudes) is small. But what is most important is that the mere ability to think it as *a whole* indicates a faculty of mind which surpasses every standard of sense.... The *bare capability of thinking* the given infinite without contradiction requires in the human mind a faculty itself supersensible. For it is only by means of this faculty and its Idea of a noumenon ... that the infinite of the world of sense, in the pure intellectual estimation of magnitude, can be *completely* comprehended *under* one concept.... Nature is, therefore, sublime in those of its phenomena, whose intuition brings with it the Idea of its infinity.... For just as imagination and *understanding,* in judging of the beautiful, generate a subjective purposiveness of the mental powers by means of their harmony, so imagination and *Reason* do so by means of their conflict."

Kant has here departed very far indeed from the position of the *Aesthetic*.

THE TRANSCENDENTAL AESTHETIC

SECTION I

SPACE

METAPHYSICAL EXPOSITION OF THE CONCEPTION OF SPACE

Space: First Argument.— “Space is not an empirical concept (*Begriff*) which has been abstracted from outer experiences. For in order that certain sensations be related to something outside me (*i.e.* to something in another region of space from that in which I find myself), and similarly in order that I may be able to represent them as outside [and *alongside*] one another, and accordingly as not only [qualitatively] different but as in different places, the representation of space must be presupposed (*muss schon zum Grunde liegen*). The representation of space cannot, therefore, be empirically obtained at second-hand from the relations of outer appearance. This outer experience is itself possible at all only through that representation.”

The first sentence states the thesis of the argument: *space is not an empirical concept abstracted from outer experiences*. The use of the term *Begriff* in the title of the section, and also in this sentence, is an instance of the looseness with which Kant employs his terms. It is here synonymous with the term representation (*Vorstellung*), which covers intuitions as well as general or discursive concepts. Consequently, the contradiction is only verbal, not real, when Kant proceeds to prove that the concept of space is an intuition, not a concept. But this double employment of the term is none the less misleading. When Kant employs it in a strict sense, it signifies solely the general class concept. All true concepts are for Kant of that single type. He has not re-defined the term concept in any manner which would render it applicable to the relational categories. For unfortunately, and very strangely, he never seems to have raised the question whether categories are not also concepts. The application to the forms of understanding of the separate title categories seems to have contented him. Much that is obscure and even contradictory in his teaching might have been prevented had he recognised that the term concept is a generic title which includes, as its sub-species, both general notions and relational categories.

Kant’s limitation of the term concept to the merely generic, and his consequent equating of the categorical proposition with the assertion of the substance-attribute relation, would seem in large part to be traceable to his desire to preserve for himself, in the pioneer labours of his Critical enquiries, the guiding clues of the distinctions drawn in the traditional logic. Kant insists on holding to them, at least in outward appearance, at whatever sacrifice of strict consistency. Critical doctrine is made to conform to the exigencies of an artificial framework, with which its own tenets are only in very imperfect harmony. Appreciation of the ramifying influence, and, as regards the detail of exposition, of the far-reaching consequences, of this desire to conform to the time-honoured rubrics, is indeed an indispensable preliminary to any adequate estimate whether of the strength or of the defects of the Critical doctrines. As a separate and ever-present influence in the determining of Kant’s teaching, this factor may conveniently and compendiously be entitled Kant’s logical *architectonic*. We shall have frequent occasion to observe its effects.

The second sentence gives expression to the fact through which Kant proves his thesis. Certain sensations, those of the special senses as distinguished from the organic sensations, are related to

something which stands in a different region of space from the embodied self, and consequently are apprehended as differing from one another not only in quality but also in spatial position. As is proved later in the *Analytic*, thought plays an indispensable part in constituting this reference of sensations to objects. Kant here, however, makes no mention of this further complication. He postulates, as he may legitimately do at this stage, the fact that our sensations are thus objectively interpreted, and limits his enquiry to the spatial factor. Now the argument, as Vaihinger justly points out, hinges upon the assumption which Kant has already embodied in his definition of the "form" of sense, viz. that sensations are non-spatial, purely qualitative. Though this is an assumption of which Kant nowhere attempts to give proof, it serves none the less as an unquestioned premiss from which he draws all-important conclusions. This first argument on space derives its force entirely from it.

The proof that the representation of space is non-empirical may therefore be explicitly stated as follows. As sensations are non-spatial and differ only qualitatively, the representation of space must have been added to them. And not being supplied by the given sensations, it must, as the only alternative, have been contributed by the mind. The representation of space, so far from being derived from external experience, is what first renders it possible. As a subjective form that lies ready in the mind, it precedes experience and co-operates in generating it. This proof of the apriority of space is thus proof of the priority of the *representation* of space to every empirical perception.

In thus interpreting Kant's argument as proving more than the thesis of the first sentence claims, we are certainly reading into the proof more than Kant has himself given full expression to. But, as is clearly shown by the argument of the next section, we are only stating what Kant actually takes the argument as having proved, namely, that the representation of space is not only non-empirical but is likewise of subjective origin and precedes experience in temporal fashion.

The point of view which underlies and inspires the argument can be defined even more precisely. Kant's conclusion may be interpreted in either of two ways. The form of space may precede experience only as a potentiality. Existing as a power of co-ordination, it will come to consciousness only indirectly through the addition which it makes to the given sensations. Though subjective in origin, it will be revealed to the mind only in and through experience. This view may indeed be reconciled with the terms of the proof. But a strictly literal interpretation of its actual wording is more in keeping with what, as we shall find, is the general trend of the *Aesthetic* as a whole. We are then confronted by a very different and extremely paradoxical view, which may well seem too naive to be accepted by the modern reader, but which we seem forced, none the less, to regard as the view actually presented in the text before us. Kant here asserts, in the most explicit manner, that the mind, in order to construe sensations in spatial terms, must already be in possession of a *representation* of space, and that it is in the light of this representation that it apprehends sensations. The conscious representation of space precedes in time external experience. Such, then, would seem to be Kant's first argument on space. It seeks to establish a negative conclusion, viz. that space is not derived from experience. But, in so doing, it also yields a positive psychological explanation of its origin.

Those commentators who refuse to recognise that Kant's problem is in any degree psychological, or that Kant himself so regards it, and who consequently seek to interpret the *Aesthetic* from the point of view of certain portions of the *Analytic*, give a very different statement of this first argument. They state it in purely logical terms. Its problem, they claim, is not that of determining the origin of our representation of space, but only its logical relation to our specific sense-experiences. The notion of space in general precedes, as an indispensable logical presupposition, all particular specification of the space relation. Consciousness of space as a whole is not constructed from consciousness of partial spaces; on the contrary, the latter is only possible in and through the former.

Such an argument does of course represent a valuable truth; and it alone harmonises with much in Kant's maturer teaching; but we must not therefore conclude that it is also the teaching of the *Aesthetic*.

The *Critique* contains too great a variety of tendencies, too rich a complexity of issues, to allow of such simplification. It loses more than it gains by such rigorous pruning of the luxuriant secondary tendencies of its exposition and thought. And above all, this procedure involves the adoption by the commentator of impossible responsibilities, those of deciding what is essential and valuable in Kant's thought and what is irrelevant. The value and suggestiveness of Kant's philosophy largely consist in his sincere appreciation of conflicting tendencies, and in his persistent attempt to reduce them to unity with the least possible sacrifice. But in any case the logical interpretation misrepresents this particular argument. Kant is not here distinguishing between space in general and its specific modifications. He is maintaining that no space relation can be revealed in sensation. It is not only that the apprehension of any limited space presupposes the representation of space as a whole. Both partial and infinite space are of mental origin; sensation, as such, is non-spatial, purely subjective. And lastly, the fact that Kant means to assert that space is not only logically presupposed but is subjectively generated, is sufficiently borne out by his frequent employment elsewhere in the *Aesthetic* of such phrases as "the subjective condition of sensibility," "lying ready in our minds," and "necessarily preceding [as the form of the subject's receptivity] all intuitions of objects."

Second Argument. — Having proved by the first argument that the representation of space is not of empirical origin, Kant in the second argument proceeds to establish the positive conclusion that it is *a priori*. The proof, when all its assumptions are rendered explicit, runs as follows. *Thesis*: Space is a necessary representation, and consequently is *a priori*. *Proof*: It is impossible to imagine the absence of space, though it is possible to imagine it as existing without objects to fill it. A representation which it is impossible for the mind to be without is a necessary representation. But necessity is one of the two criteria of the *a priori*. The proof of the necessary character of space is therefore also a proof of its being *a priori*.

The argument, more freely stated, is that what is empirically given from without can be thought away, and that since space cannot be thus eliminated, it must be grounded in our subjective organisation, *i.e.* must be psychologically *a priori*. The argument, as stated by Kant, emphasises the apriority, not the subjectivity, of space, but none the less the asserted apriority is psychological, not logical in character. For the criterion employed is not the impossibility of thinking otherwise, but our incapacity to represent this specific element as absent. The ground upon which the whole argument is made to rest is the merely brute fact (asserted by Kant) of our incapacity to think except in terms of space.

The argument is, however, complicated by the drawing of a further consequence, which follows as a corollary from the main conclusion. From the subjective necessity of space follows its objective necessity. Space being necessary *a priori*, objects can only be apprehended in and through it. Consequently it is not dependent upon the objects apprehended, but itself underlies outer appearances as the condition of their possibility. This corollary is closely akin to the first argument on space, and differs from it only in orientation. The first argument has a psychological purpose. It maintains that the representation of space precedes external experience, causally conditioning it. The corollary has a more objective aim. It concludes that space is a necessary constituent of the external experience thus generated. The one proves that space is a necessary *subjective antecedent*; the other that it is a necessary *objective ingredient*.

To consider the proof in detail. The exact words which Kant employs in stating the *nervus probandi* of the argument are that we can never *represent* (*eine Vorstellung davon machen*) space as non-existent, though we can very well *think* (*denken*) it as being empty of objects. The terms *Vorstellung* and *denken* are vague and misleading. Kant himself recognises that it is possible to conceive that there are beings who intuit objects in some other manner than in space. He cannot therefore mean that we are unable to *think* or *conceive* space as non-existent. He must mean that we cannot in imagination intuit it as absent. It is the necessary form of all our intuitions, and therefore also of imagination, which is intuitive in character. Our consciousness is dependent upon given intuitions for its whole content, and to that extent

space is a form with which the mind can never by any possibility dispense. Pure thought enables it to realise this *de facto* limitation, but not to break free from it. Even in admitting the possibility of other beings who are not thus constituted, the mind still recognises its own ineluctable limitations.

Kant offers no proof of his assertion that space can be intuited in image as empty of all sensible content; and as a matter of fact the assertion is false. Doubtless the use of the vague term *Vorstellung* is in great part responsible for Kant's mistaken position. So long as imagination and thought are not clearly distinguished, the assertion is correspondingly indefinite. Pure space may possibly be *conceived*, but it can also be conceived as altogether non-existent. If, on the other hand, our imaginative power is alone in question, the asserted fact must be categorically denied. With the elimination of all sensible content space itself ceases to be a possible image. Kant's proof thus rests upon a misstatement of fact.

In a second respect Kant's proof is open to criticism. He takes the impossibility of imagining space as absent as proof that it originates from within. The argument is valid only if no other psychological explanation can be given of this necessity, as for instance through indissoluble association or through its being an invariable element in the given sensations. Kant's ignoring of these possibilities is due to his unquestioning belief that sensations are non-spatial, purely qualitative. That is a presupposition whose truth is necessary to the cogency of the argument.

Third Argument. — This argument, which was omitted in the second edition, will be considered in its connection with the transcendental exposition into which it was then merged.

Fourth (in second edition, Third) Argument. — The next two arguments seek to show that space is not a discursive or general concept but an intuition. The first proof falls into two parts, (*a*) We can represent only a single space. For though we speak of many spaces, we mean only parts of one and the same single space. Space must therefore be an intuition. For only intuition is thus directly related to a single individual. A concept always refers indirectly, *per notas communes*, to a plurality of individuals. (*b*) The parts of space cannot precede the one all-comprehensive space. They can be thought only in and through it. They arise through limitation of it. Now the parts (*i.e.* the attributes) which compose a concept precede it in thought. Through combination of them the concept is formed. Space cannot, therefore, be a concept. Consequently it must, as the only remaining alternative, be an intuition. Only in an intuition does the whole precede the parts. In a concept the parts always precede the whole. Intuition stands for multiplicity in unity, conception for unity in multiplicity.

The first part of the argument refers to the extension, the second part to the intension of the space representation. In both aspects it appears as intuitional.

Kant, in repeating his thesis as a conclusion from the above grounds, confuses the reader by an addition which is not strictly relevant to the argument, viz. by the statement that this intuition must be non-empirical and *a priori*. This is simply a recapitulation of what has been established in the preceding proofs. It is not, as might at first sight appear, part of the conclusion established by the argument under consideration. The reader is the more apt to be misled owing to the fact that very obviously arguments for the non-empirical and for the *a priori* character of space *can* be derived from proof (*b*). That space is non-empirical would follow from the fact that representation of space as a whole is necessary for the apprehension of any part of it. Empirical intuition can only yield the apprehension of a limited space. The apprehension of the comprehensive space within which it falls must therefore be non-empirical.

"As we intuitively apprehend (*anschauend erkennen*) not only the space of the object which affects our senses, but the whole space, space cannot arise out of the actual affection of the senses, but must precede it in time (*vor ihr vorhergehen*)."

But in spite of its forcibleness this argument is nowhere presented in the *Critique*.

Similarly, in so far as particular spaces can be conceived only in and through space as a whole, and in so far as the former are limitations of the one antecedent space, the intuition which underlies all external perception must be *a priori*. This is in essentials a stronger and more cogent mode of formulating the

second argument on space. But again, and very strangely, it is nowhere employed by Kant in this form.

The concluding sentence, ambiguously introduced by the words *so werden auch*, is tacked on to the preceding argument. Interpreted in the light of § 15 C of the *Dissertation*, and of the corresponding fourth argument on time, it may be taken as offering further proof that space is an intuition. The concepts of line and triangle, however attentively contemplated, will never reveal the proposition that in every triangle two sides taken together are greater than the third. An *a priori* intuition will alone account for such apodictic knowledge. This concluding sentence thus really belongs to the transcendental exposition; and as such ought, like the third argument, to have been omitted in the second edition.

Kant's proof rests on the assumption that there are only two kinds of representation, intuitions and concepts, and also in equal degree upon the further assumption that all concepts are of one and the same type. Intuition is, for Kant, the apprehension of an individual. Conception is always the representation of a class or genus. Intuition is immediately related to the individual. Conception is reflective or discursive; it apprehends a plurality of objects indirectly through the representation of those marks which are common to them all. Intuition and conception having been defined in this manner, the proof that space is single or individual, and that in it the whole precedes the parts, is proof conclusive that it is an intuition, not a conception. Owing, however, to the narrowness of the field assigned to conception, the realm occupied by intuition is proportionately wide, and the conclusion is not as definite and as important as might at first sight appear. By itself, it amounts merely to the statement, which no one need challenge, that space is not a generic class concept. Incidentally certain unique characteristics of space are, indeed, forcibly illustrated; but the implied conclusion that space on account of these characteristics must belong to receptivity, not to understanding, does not by any means follow. It has not, for instance, been proved that space and time are radically distinct from the categories, *i.e.* from the relational forms of understanding.

In 1770, while Kant still held to the metaphysical validity of the pure forms of thought, the many difficulties which result from the ascription of independent reality to space and time were, doubtless, a sufficient reason for regarding the latter as subjective and sensuous. But upon adoption of the Critical standpoint such argument is no longer valid. If all our forms of thought may be subjective, the existence of antinomies has no real bearing upon the question whether space and time do or do not have a different constitution and a different mental origin from the categories. The antinomies, that is to say, may perhaps suffice to prove that space and time are subjective; they certainly do not establish their sensuous character.

But though persistence of the older, un-Critical opposition between the intellectual and the sensuous was partly responsible for Kant's readiness to regard as radical the very obvious differences between a category such as that of substance and attribute and the visual or tactual extendedness with which objects are endowed, it can hardly be viewed as the really decisive influence. That would rather seem to be traceable to Kant's conviction that mathematical knowledge is unique both in fruitfulness and in certainty, and to his further belief that it owes this distinction to the *content* character of the *a priori* forms upon which it rests. For though the categories of the physical sciences are likewise *a priori*, they are exclusively *relational*, and serve only to organise a material that is empirically given. To account for the superiority of mathematical knowledge Kant accordingly felt constrained to regard space and time as not merely *forms* in terms of which we interpret the matter of sense, but as also themselves intuited *objects*, and as therefore possessing a character altogether different from anything which can be ascribed to the pure understanding. The opposition between forms of sense and categories of the understanding, in the strict Kantian mode of envisaging that opposition, is thus inseparably bound up with Kant's doctrine of space and time as being not only forms of intuition, but as also in their purity and independence themselves intuitions. *Even the sensuous subject matter of pure mathematics* — so Kant would seem to contend — *is* a priori *in nature*. If this latter view be questioned — and to the modern reader it is indeed a stone of stumbling — much of the teaching of the *Aesthetic* will have to be modified or at least restated.

Fifth (in second edition, Fourth) Argument. — This argument is quite differently stated in the two editions of the *Critique*, though the purpose of the argument is again in both cases to prove that space is an intuition, not a general concept. In the first edition this is proved by reference to the fact that space is given as an infinite magnitude. This characteristic of our space representation cannot be accounted for so long as it is regarded as a concept. A general conception of space which would abstract out those properties and relations which are common to all spaces, to a foot as well as to an ell, could not possibly determine anything in regard to magnitude. For since spaces differ in magnitude, any one magnitude cannot be a common quality. Space is, however, given us as determined in magnitude, namely, as being of infinite magnitude; and if a general conception of space relations cannot determine magnitude, still less can it determine infinite magnitude. Such infinity must be derived from limitlessness in the progression of intuition. Our conceptual representations of infinite magnitude must be derivative products, acquired from this intuitive source.

In the argument of the second edition the thesis is again established by reference to the infinity of space. But in all other respects the argument differs from that of the first edition. A general conception, which abstracts out common qualities from a plurality of particulars, contains an infinite number of possible different representations *under* it; but it cannot be thought as containing an infinite number of representations *in* it. Space must, however, be thought in this latter manner, for it contains an infinite number of coexisting parts. Since, then, space cannot be a concept, it must be an intuition.

The definiteness of this conclusion is somewhat obscured by the further characterisation of the intuition of space as *a priori*, and by the statement that it is the *original* (*ursprüngliche*) representation which is of this intuitive nature. The first addition must here, again, just as in the fourth argument, be regarded as merely a recapitulation of what has already been established, not a conclusion from the present argument. The introduction of the word ‘original’ seems to be part of Kant’s reply to the objections which had already been made to his admission in the first edition that there is a conception as well as an intuition of space. It is the *original given intuition* of space which renders such reflective conception possible.

The chief difficulty of these proofs arises out of the assertion which they seem to involve that space is given as actually infinite. There are apparently, on this point, two views in Kant, which were retained up to the very last, and which are closely connected with his two representations of space, on the one hand as a *formal intuition* given in its purity and in its completeness, and on the other hand as the *form of intuition*, which exists only so far as it is constructed, and which is dependent for its content upon given matter.

Third Argument, and Transcendental Exposition of Space. — The distinction between the metaphysical and the transcendental expositions, introduced in the second edition of the *Critique*, is one which Kant seems to have first made clear to himself in the process of writing the *Prolegomena*. It is a genuine improvement, marking an important distinction. It separates out two comparatively independent lines of argument. The terms in which the distinction is stated are not, however, felicitous. Kant’s reason for adopting the title metaphysical is indicated in the *Prolegomena*:

“As concerns the sources of metaphysical cognition, its very concept implies that they cannot be empirical.... For it must not be physical but metaphysical knowledge, *i.e.* knowledge lying beyond experience.... It is therefore *a priori* knowledge, coming from pure understanding and pure Reason.”

The metaphysical exposition, it would therefore seem, is so entitled because it professes to prove that space is *a priori*, not empirical, and to do so by analysis of its concept. Now by Kant’s own definition of the term transcendental, as the theory of the *a priori*, this exposition might equally well have been named the transcendental exposition. In any case it is an essential and chief part of the *Transcendental Aesthetic*. Such division of the *Transcendental Aesthetic* into a metaphysical and a transcendental part involves a twofold use, wider and narrower, of one and the same term. Only as descriptive of the whole *Aesthetic* is transcendental employed in the sense defined.

Exposition (*Erörterung*, Lat. *expositio*) is Kant's substitute for the more ordinary term definition. Definition is the term which we should naturally have expected; but as Kant holds that no given concept, whether *a priori* or empirical, can be defined in the strict sense, the substitutes the term exposition, using it to signify such definition of the nature of space as is possible to us. To complete the parallelism Kant speaks of the transcendental enquiry as also an exposition. It is, however, in no sense a definition. Kant's terms here, as so often elsewhere, are employed in a more or less arbitrary and extremely inexact manner.

The distinction between the two expositions is taken by Kant as follows. The metaphysical exposition determines the nature of the concept of space, and shows it to be a given *a priori* intuition. The transcendental exposition shows how space, when viewed in this manner, renders comprehensible the possibility of synthetic *a priori* knowledge.

The omission of the third argument on space from the second edition, and its incorporation into the new transcendental exposition, is certainly an improvement. In its location in the first edition, it breaks in upon the continuity of Kant's argument without in any way contributing to the further definition of the concept of space. Also, in emphasising that mathematical knowledge depends upon the *construction* of concepts, Kant presupposes that space is intuitional; and that has not yet been established.

The argument follows the strict, rigorous, synthetic method. From the already demonstrated *a priori* character of space, Kant deduces the apodictic certainty of all geometrical principles. But though the paragraph thus expounds a consequence that follows from the *a priori* character of space, not an argument in support of it, something in the nature of an argument is none the less implied. The fact that this view of the representation of space alone renders mathematical science possible can be taken as confirming this interpretation of its nature. Such an argument, though circular, is none the less cogent. Consideration of Kant's further statements, that were space known in a merely empirical manner we could not be sure that in all cases only one straight line is possible between two points, or that space will always be found to have three dimensions, must meantime be deferred.

In the new transcendental exposition Kant adopts the analytic method of the *Prolegomena*, and accordingly presents his argument in independence of the results already established. He starts from the assumption of the admitted validity of geometry, as being a body of synthetic *a priori* knowledge. Yet this, as we have already noted, does not invalidate the argument; in both the first and the last paragraphs it is implied that the *a priori* and intuitive characteristics of space have already been proved. From the synthetic character of geometrical propositions Kant argues that space must be an intuition. Through pure concepts no synthetic knowledge is possible. Then from the apodictic character of geometry he infers that space exists in us as pure and *a priori*; no experience can ever reveal necessity. But geometry also exists as an applied science; and to account for our power of anticipating experience, we must view space as existing only in the perceiving subject as the form of its sensibility. If it precedes objects as the necessary subjective condition of their apprehension, we can to that extent predetermine the conditions of their existence.

In the concluding paragraph Kant says that this is the only explanation which can be given of the possibility of geometry. He does not distinguish between pure and applied geometry, though the proof which he has given of each differs in a fundamental respect. Pure geometry presupposes only that space is an *a priori* intuition; applied geometry demands that space be conceived as the *a priori* form of external sense. Only in reference to applied geometry does the Critical problem arise: — viz. how we can form synthetic judgments *a priori* which yet are valid of objects; or, in other words, how judgments based upon a subjective form can be objectively valid. But any attempt, at this point, to define the nature and possibility of applied geometry must anticipate a result which is first established in *Conclusion b*. Though, therefore, the substitution of this transcendental exposition for the third space argument is a decided improvement, Kant, in extending it so as to cover applied as well as pure mathematics, overlooks the real sequence of his argument in the first edition. The employment of the analytic method, breaking in,

as it does, upon the synthetic development of Kant's original argument, is a further irregularity.

It may be noted that in the third paragraph Kant takes the fact that geometry can be applied to objects as proof of the subjectivity of space. He refuses to recognise the possibility that space may be subjective as a form of receptivity, and yet also be a mode in which things in themselves exist. This, as regards its conclusion, though not as regards its argument, is therefore an anticipation of *Conclusion a*. In the last paragraph Kant is probably referring to the views both of Leibniz and of Berkeley.

CONCLUSIONS FROM THE ABOVE CONCEPTS

Conclusion a. — *Thesis*: Space is not a property of things in themselves, nor a relation of them to one another. Proof: The properties of things in themselves can never be intuited prior to their existence, *i.e. a priori*. Space, as already proved, is intuited in this manner. In other words, the apriority of space is by itself sufficient proof of its subjectivity.

This argument has been the subject of a prolonged controversy between Trendelenburg and Kuno Fischer. Trendelenburg was able to prove his main point, namely, that the above argument is quite inconclusive. Kant recognises only two alternatives, either space as objective is known *a posteriori*, or being an *a priori* representation it is subjective in origin. There exists a third alternative, namely, that though our intuition of space is subjective in origin, space is itself an inherent property of things in themselves. The central thesis of the rationalist philosophy of the Enlightenment was, indeed, that the independently real can be known by *a priori* thinking. Even granting the validity of Kant's later conclusion, first drawn in the next paragraph, that space is the subjective form of all external intuition, that would only prove that it does not belong to *appearances*, prior to our apprehension of them; nothing is thereby proved in regard to the character of things in themselves. We anticipate by *a priori* reasoning only the nature of appearances, never the constitution of things in themselves. Therefore space, even though *a priori*, may belong to the independently real. The above argument cannot prove the given thesis.

Vaihinger contends that the reason why Kant does not even attempt to argue in support of the principle, that the *a priori* must be purely subjective, is that he accepts it as self-evident. This explanation does not, however, seem satisfactory. But Vaihinger supplies the data for modification of his own assertion. It was, it would seem, the existence of the antinomies which first and chiefly led Kant to assert the subjectivity of space and time. For as he then believed that a satisfactory solution of the antinomies is possible only on the assumption of the subjectivity of space and time, he regarded their subjectivity as being conclusively established, and accordingly failed to examine with sufficient care the validity of his additional proof from their apriority. This would seem to be confirmed by the fact that when later, in reply to criticisms of the arguments of the first edition, he so far modified his position as to offer reasons in support of the above general principle, even then he nowhere discussed the principle in reference to the forms of sense. All his discussions concern only the possible independent reality of the forms of thought. To the very last Kant would seem to have regarded the above argument as an independent, and by itself a sufficient, proof of the subjectivity of space.

The refutation of Trendelenburg's argument which is offered by Caird is inconclusive. Caird assumes the chief point at issue, first by ignoring the possibility that space may be known *a priori* in reference to appearances and yet at the same time be transcendently real; and secondly by ignoring the fact that to deny spatial properties to things in themselves is as great a violation of Critical principles as to assert them. One point, however, in Caird's reply to Trendelenburg calls for special consideration, viz. Caird's contention that Kant did actually take account of the third alternative, rejecting it as involving the "absurd" hypothesis of a pre-established harmony. Undoubtedly Kant did so. But the contention has no relevancy to the point before us. The doctrine of pre-established harmony is a metaphysical theory which presupposes the possibility of gaining knowledge of things in themselves. For that reason alone Kant was

bound to reject it. A metaphysical proof of the validity of metaphysical judgments is, from the Critical point of view, a contradiction in terms. As the validity of *all* speculations is in doubt, a proof which is speculative cannot meet our difficulties. And also, as Kant himself further points out, the pre-established harmony, even if granted, can afford no solution of the Critical problem how *a priori* judgments can be passed upon the independently real. The judgments, thus guaranteed, could only possess *de facto* validity; we could never be assured of their necessity. It is chiefly in these two inabilities that Kant locates the "absurdity" of a theory of pre-established harmony. The refutation of that theory does not, therefore, amount to a disproof of the possibility which we are here considering.

Conclusion b. — The next paragraph maintains two theses: (*a*) that space is the form of all outer intuition; (*b*) that this fact explains what is otherwise entirely inexplicable and paradoxical, namely, that we can make *a priori* judgments which yet apply to the objects experienced. The first thesis, that the pure intuition of space is only conceivable as the form of appearances of outer sense, is propounded in the opening sentence without argument and even without citation of grounds. The statement thus suddenly made is not anticipated save by the opening sentences of the section on space. It is an essentially new doctrine. Hitherto Kant has spoken of space only as an *a priori* intuition. The further assertion that as such it must necessarily be conceived as the form of outer sense (*i.e.* not only as a formal intuition but also as a form of intuition), calls for the most definite and explicit proof. None, however, is given. It is really a conclusion from points all too briefly cited by Kant in the general *Introduction*, namely, from his distinction between the matter and the form of sense. The assertions there made, in a somewhat casual manner, are here, without notification to the reader, employed as premisses to ground the above assertion. His thesis is not, therefore, as by its face value it would seem to profess to be, an inference from the points established in the preceding expositions. It interprets these conclusions in the light of points considered in the *Introduction*; and thereby arrives at a new and all-important interpretation of the nature of the *a priori* intuition of space.

The second thesis employs the first to explain how prior to all experience we can determine the relations of objects. Since (*a*) space is merely the form of outer sense, and (*b*) accordingly exists in the mind prior to all empirical intuition, all appearances must exist in space, and we can predetermine them from the pure intuition of space that is given to us *a priori*. Space, when thus viewed as the *a priori* form of outer sense, renders comprehensible the validity of applied mathematics.

As we have already noted, Kant in the second edition obscures the sequence of his argument by offering in the new transcendental exposition a justification of applied as well as of pure geometry. In so doing he anticipates the conclusion which is first drawn in this later paragraph. This would have been avoided had Kant given two separate transcendental expositions. First, an exposition of pure mathematics, placed immediately after the metaphysical exposition; for pure mathematics is exclusively based upon the results of the metaphysical exposition. And secondly, an exposition of applied mathematics, introduced after *Conclusion b*. The explanation of applied geometry is really the more essential and central of the two, as it alone involves the truly Critical problem, how judgments formed *a priori* can yet apply to objects. *Conclusion b* constitutes, as Vaihinger rightly insists, the very heart of the *Aesthetic*. The arrangement of Kant's argument diverts the reader's attention from where it ought properly to centre.

The use which Kant makes of the *Prolegomena* in his statement of the new transcendental exposition is one cause of the confusion. The exposition is a brief summary of the corresponding *Prolegomena* sections. In introducing this summary into the *Critique* Kant overlooked the fact that in referring to applied mathematics he is anticipating a point first established in *Conclusion b*. The real cause, however, of the trouble is common to both editions, namely Kant's failure clearly to appreciate the fundamental distinction between the view that space is an *a priori* intuition and the view that it is the *a priori* form of all external intuition, *i.e.* of outer sense. He does not seem to have fully realised how very different are those two views. In consequence of this he fails to distinguish between the transcendental expositions of

pure and applied geometry.

Third paragraph. — Kant proceeds to develop the subjectivist conclusions which follow from *a* and *b*.

"We may say that space contains all things which can appear to us externally, but not all things in themselves, whether intuited or not, nor again all things intuited by any and every subject."

This sentence makes two assertions: (*a*) space does not belong to things in and by themselves; (*b*) space is not a necessary form of intuition for all subjects whatsoever.

The grounds for the former assertion are not here considered, and that is doubtless the reason why the *oder nicht* is excised in Kant's private copy of the *Critique*. As we have seen, Kant does not anywhere in the *Aesthetic* even attempt to offer argument in support of this assertion. In defence of (*a*) Kant propounds for the first time the view of sensibility as a limitation. Space is a limiting condition to which human intuition is subject. Whether the intuitions of other thinking beings are subject to the same limitation, we have no means of deciding. But for all human beings, Kant implies, the same conditions must hold universally.

In the phrase "transcendental ideality of space" Kant, it may be noted, takes the term ideality as signifying subjectivity, and the term transcendental as equivalent to transcendent. He is stating that judged from a *transcendent* point of view, *i.e.* from the point of view of the thing in itself, space has a merely subjective or "empirical" reality. This is an instance of Kant's careless use of the term transcendental. Space is empirically real, but taken *transcendently*, is merely ideal.

KANT'S ATTITUDE TO THE PROBLEMS OF MODERN GEOMETRY

This is an appropriate point at which to consider the consistency of Kant's teaching with modern developments in geometry. Kant's attitude has very frequently been misrepresented. As he here states, he is willing to recognise that the forms of intuition possessed by other races of finite beings may not coincide with those of the human species. But in so doing he does not mean to assert the possibility of other *spatial* forms, *i.e.* of spaces that are non-Euclidean. In his pre-Critical period Kant had indeed attempted to deduce the three-dimensional character of space as a consequence of the law of gravitation; and recognising that that law is in itself arbitrary, he concluded that God might, by establishing different relations of gravitation, have given rise to spaces of different properties and dimensions.

"A science of all these possible kinds of space would undoubtedly be the highest enterprise which a finite understanding could undertake in the field of geometry."

But from the time of Kant's adoption, in 1770, of the Critical view of space as being the universal form of our outer sense, he seems to have definitely rejected all such possibilities. Space, to be space at all, must be Euclidean; the uniformity of space is a presupposition of the *a priori* certainty of geometrical science. One of the criticisms which in the *Dissertation* he passes upon the empirical view of mathematical science is that it would leave open the possibility that "a space may some time be discovered endowed with other fundamental properties, or even perhaps that we may happen upon a two-sided rectilinear figure." This is the argument which reappears in the third argument on space in the first edition of the *Critique*. The same examples are employed with a somewhat different wording.

"It would not even be necessary that there should be only one straight line between two points, though experience invariably shows this to be so. What is derived from experience has only comparative universality, namely, that which is obtained through induction. We should therefore only be able to say that, so far as hitherto observed, no space has been found which has more than three dimensions."

But that Kant should have failed to recognise the possibility of other spaces does not by itself point to any serious defect in his position. There is no essential difficulty in reconciling the recognition of such spaces with his fundamental teaching. He admits that other races of finite beings may perhaps intuit through *non-spatial* forms of sensibility; he might quite well have recognised that those other forms of

intuition, though not Euclidean, are still spatial. It is in another and more vital respect that Kant's teaching lies open to criticism. Kant is convinced that space is given to us in intuition as being definitely and irrevocably Euclidean in character. Both our intuition and our thinking, when we reflect upon space, are, he implies, bound down to, and limited by, the conditions of Euclidean space. And it is in this positive assumption, and not merely in his ignoring of the possibility of other spaces, that he comes into conflict with the teaching of modern geometry. For in making the above assumption Kant is asserting that we definitely know physical space to be three-dimensional, and that by no elaboration of concepts can we so remodel it in thought that the axiom of parallels will cease to hold. Euclidean space, Kant implies, is *given* to us as an unyielding form that rigidly resists all attempts at conceptual reconstruction. Being quite independent of thought and being given as complete, it has no inchoate plasticity of which thought might take advantage. The modern geometer is not, however, prepared to admit that *intuitional* space has any definiteness or preciseness of nature apart from the concepts through which it is apprehended; and he therefore allows, as at least possible, that upon clarification of our concepts space may be discovered to be radically different from what it at first sight appears to be. In any case, the perfecting of the concepts must have some effect upon their object. But even — as the modern geometer further maintains — should our space be definitely proved, upon analytic and empirical investigation, to be Euclidean in character, other possibilities will still remain open for speculative thought. For though the nature of our intuitional data may constrain us to interpret them through one set of concepts rather than through another, the competing sets of alternative concepts will represent genuine possibilities beyond what the actual is found to embody.

Thus the defect of Kant's teaching, in regard to space, as judged in the light of the later teaching of geometrical science, is closely bound up with his untenable isolation of the *a priori* of sensibility from the *a priori* of understanding. Space, being thus viewed as independent of thought, has to be regarded as limiting and restricting thought by the unalterable nature of its initial presentation. And unfortunately this is a position which Kant continued to hold, despite his increasing recognition of the part which concepts must play in the various mathematical sciences. In the deduction of the first edition we find him stating that synthesis of apprehension is necessary to all representation of space and time. He further recognises that all arithmetical processes are syntheses *according to concepts*. And in the *Prolegomena* there occurs the following significant passage.

"Do these laws of nature lie in space, and does the understanding learn them by merely endeavouring to find out the fruitful meaning that lies in space; or do they inhere in the understanding and in the way in which it determines space according to the conditions of the synthetical unity towards which its concepts are all directed? Space is something so uniform and as to all particular properties so indeterminate, that we should certainly not seek a store of laws of nature in it. That which determines space to the form of a circle or to the figures of a cone or a sphere, is, on the contrary, the understanding, so far as it contains the ground of the unity of these constructions. The mere universal form of intuition, called space, must therefore be the substratum of all intuitions determinable to particular objects, and in it, of course, the condition of the possibility and of the variety of these intuitions lies. But the unity of the objects is solely determined by the understanding, and indeed in accordance with conditions which are proper to the nature of the understanding...."

Obviously Kant is being driven by the spontaneous development of his own thinking towards a position much more consistent with present-day teaching, and completely at variance with the hard and fast severance between sensibility and understanding which he had formulated in the *Dissertation* and has retained in the *Aesthetic*. In the above *Prolegomena* passage a plasticity is being allowed to space, sufficient to permit of essential modification in the conceptual processes through which it is articulated. But, as I have just stated, that did not lead Kant to disavow the conclusions which he had drawn from his previous teaching.

This defect in Kant's doctrine of space, as expounded in the *Aesthetic*, indicates a further imperfection in his argument. He asserts that the form of space cannot vary from one human being to another, and that for this reason the judgments which express it are universally valid. Now, in so far as Kant's initial datum is consciousness of time, he is entirely justified in assuming that everything which can be shown to be a necessary condition of such consciousness must be uniform for all human minds. But as his argument is not that consciousness of *Euclidean* space is necessary to consciousness of time, but only that consciousness of the *permanent* in space is a required condition, he has not succeeded in showing the necessary uniformity of the human mind as regards the specific mode in which it intuits space. The permanent might still be apprehended as permanent, and therefore as yielding a possible basis for consciousness of sequence, even if it were apprehended in some four-dimensional form.

Fourth Paragraph. — The next paragraph raises one of the central problems of the *Critique*, namely, the question as to the kind of reality possessed by appearances. Are they subjective, like taste or colour? Or have they a reality at least relatively independent of the individual percipient? In other words, is Kant's position subjectivism or phenomenalism? Kant here alternates between these positions. This fourth paragraph is coloured by his phenomenalism, whereas in the immediately following fifth paragraph his subjectivism gains the upper hand. The taste of wine, he there states, is purely subjective, because dependent upon the particular constitution of the gustatory organ on which the wine acts. Similarly, colours are not properties of the objects which cause them.

"They are only modifications of the sense of sight which is affected in a certain manner by the light.... They are connected with the appearances only as effects accidentally added by the particular constitution of the sense organs."

Space, on the other hand, is a necessary constituent of the outer objects. In contrast to the subjective sensations of taste and colour, it possesses objectivity. This mode of distinguishing between space and the matter of sense implies that extended objects are not mere ideas, but are sufficiently independent to be capable of acting upon the sense organs, and of thereby generating the sensations of the secondary qualities.

Kant, it must be observed, refers only to taste and colour. He says nothing in regard to weight, impenetrability, and the like. These are revealed through sensation, and therefore on his view ought to be in exactly the same position as taste or colour. But if so, the relative independence of the extended object can hardly be maintained. Kant's distinction between space and the sense qualities cannot, indeed, be made to coincide with the Cartesian distinction between primary and secondary qualities.

A second difference, from Kant's point of view, between space and the sense qualities is that the former can be represented *a priori*, in complete separation from everything empirical, whereas the latter can only be known *a posteriori*. This, as we have seen, is a very questionable assertion. The further statement that all determinations of space can be represented in the same *a priori* fashion is even more questionable. At most the difference is only between a homogeneous subjective form yielded by outer sense and the endlessly varied and consequently unpredictable contents revealed by the special senses. The contention that the former can be known apart from the latter implies the existence of a pure manifold additional to the manifold of sense.

Fifth Paragraph. — In the next paragraph Kant emphasises the distinction between the empirical and the transcendental meanings of the term appearance. A rose, viewed *empirically*, as a thing with an intrinsic independent nature, may appear of different colour to different observers.

"The *transcendental* conception of appearances in space, on the other hand, is a Critical reminder that nothing intuited in space is a thing in itself, that space is not a form inhering in things in themselves ... and that what we call outer objects are nothing but mere representations of our sensibility, the form of which is space."

In other words, the distinction drawn in the preceding paragraph between colour as a subjective effect and space as an objective existence is no longer maintained. Kant, when thus developing his position on subjectivist lines, allows no kind of independent existence to anything in the known world. Objects as known are mere Ideas (*blosse Vorstellungen unserer Sinnlichkeit*), the sole correlate of which is the unknowable thing in itself. But even in this paragraph both tendencies find expression. "Colour, taste, etc., must not rightly be regarded as properties of things, but only as changes in the subject." This implies a threefold distinction between subjective sensations, empirical objects in space, and the thing in itself. The material world, investigated by science, is recognised as possessing a relatively independent mode of existence.

Substituted Fourth Paragraph of second edition. — In preparing the second edition Kant himself evidently felt the awkwardness of this abrupt juxtaposition of the two very different points of view; and he accordingly adopts a non-committal attitude, substituting a logical distinction for the ontological. Space yields synthetic judgments *a priori*; the sense qualities do not. Only in the concluding sentence does there emerge any definite phenomenalist implication. The sense qualities, "as they are mere sensations and not intuitions, in themselves reveal no object, least of all [an object] *a priori*." The assertion that the secondary qualities have no *ideality* implies a new and stricter use of the term ideal than we find anywhere in the first edition — a use which runs counter to Kant's own constant employment of the term. On this interpretation it is made to signify what though subjective is also *a priori*. Here, as in many of the alterations of the second edition, Kant is influenced by the desire to emphasise the points which distinguish his idealism from that of Berkeley.

THE TRANSCENDENTAL AESTHETIC

SECTION II

TIME

METAPHYSICAL EXPOSITION OF THE CONCEPTION OF TIME

Time: First Argument. — This argument is in all respects the same as the first argument on space. The thesis is that the representation of time is not of empirical origin. The proof is based on the fact that this representation must be previously given in order that the perception of coexistence or succession be possible. It also runs on all fours with the first argument in the *Dissertation*.

"*The idea of time does not originate in, but is presupposed by the senses.* When a number of things act upon the senses, it is only by means of the idea of time that they can be represented whether as simultaneous or as successive. Nor does succession generate the conception of time; but stimulates us to form it. Thus the notion of time, even if acquired through experience, is very badly defined as being a series of actual things existing one *after* another. For I can understand what the word *after* signifies only if I already know what time means. For those things are *after* one another which exist at *different* times, as those are *simultaneous* which exist at one and the same time."

Second Argument. — Kant again applies to time the argument already employed by him in dealing with space. The thesis is that time is given *a priori*. Proof is found in the fact that it cannot be thought away, *i.e.* in the fact of its subjective necessity. From this subjective necessity follows its objective necessity, so far as all appearances are concerned. In the second edition Kant added a phrase— "as the general condition of their possibility" — which is seriously misleading. The concluding sentence is thereby made to read as

if Kant were arguing from the objective necessity of time, *i.e.* from its necessity as a constituent in the appearances apprehended, to its apriority. It is indeed possible that Kant himself regarded this objective necessity of time as contributing to the proof of its apriority. But no such argument can be accepted. Time may be necessary to appearances, *once appearances are granted*. This does not, however, prove that it must therefore precede them *a priori*. This alteration in the second edition is an excellent, though unfortunate, example of Kant's invincible carelessness in the exposition of his thought. It has contributed to a misreading by Herbart and others of this and of the corresponding argument on space.

"Let us not talk of an absolute space as the presupposition of all our constructed figures. Possibility is nothing but thought, and it arises only when it is thought. Space is nothing but possibility, for it contains nothing save images of the existent; and absolute space is nothing save the abstracted general possibility of such constructions, abstracted from it after completion of the construction. The necessity of the representation of space ought never to have played any rôle in philosophy. To think away space is to think away the *possibility* of that which has been previously posited as *actual*. Obviously that is impossible, and the opposite is necessary."

Were Kant really arguing here and in the second argument on space solely from the *objective* necessity of time and space, this criticism would be unanswerable. But even taking the argument in its first edition form, as an argument from the *psychological* necessity of time, it lies open to the same objection as the argument on space. It rests upon a false statement of fact. We cannot retain time in the absence of all appearances of outer and inner sense. With the removal of the given manifold, time itself must vanish.

Fourth Argument. — This argument differs only slightly, and mainly through omissions, from the fourth of the arguments in regard to space; but a few minor points call for notice. (*a*) In the first sentence, instead of intuition, which alone is under consideration in its contrast to conception, Kant employs the phrase "pure form of intuition." (*b*) In the third sentence Kant uses the quite untenable phrase "given through a single object (*Gegenstand*)." Time is not given from without, nor is it due to an object. (*c*) The concluding sentences properly belong to the transcendental exposition. They are here introduced, not in the ambiguous manner of the fourth argument on space, but explicitly as a further argument in proof of the intuitive character of time. The synthetic proposition which Kant cites is taken neither from the science of motion nor from arithmetic. It expresses the nature of time itself, and for that reason is immediately contained in the intuition of time.

Fifth Argument. — This argument differs fundamentally from the corresponding argument on space, whether of the first or of the second edition, and must therefore be independently analysed. The thesis is again that time is an intuition. Proof is derived from the fact that time is a representation in which the parts arise only through limitation, and in which, therefore, the whole must precede the parts. The original (*ursprüngliche*) time-representation, *i.e.* the fundamental representation through limitation of which the parts arise as secondary products, must be an intuition.

To this argument Kant makes two explanatory additions. (*a*) As particular times arise through limitation of one single time, time must in its original intuition be given as infinite, *i.e.* as unlimited. The infinitude of time is not, therefore, as might seem to be implied by the prominence given to it, and by analogy with the final arguments of both the first and the second edition, a part of the proof that it is an intuition, but only a consequence of the feature by which its intuitive character is independently established. The unwary reader, having in mind the corresponding argument on space, is almost inevitably misled. All reference to infinitude could, so far as this argument is concerned, have been omitted. The mode in which the argument opens seems indeed to indicate that Kant was not himself altogether clear as to the cross-relations between the arguments on space and time respectively. The real parallel to this argument is to be found in the second part of the fourth argument on space. That part was omitted by Kant in his fourth argument on time, and is here developed into a separate argument. This is, of course, a further cause of confusion to the reader, who is not prepared for such arbitrary rearrangement. Indeed it is not surprising

to find that when Kant became the reader of his own work, in preparing it for the second edition, he was himself misled by the intricate perversity of his exposition. In re-reading the argument he seems to have forgotten that it represents the second part of the fourth argument on space. Interpreting it in the light of the fifth argument on space which he had been recasting for the second edition, it seemed to him possible, by a slight alteration, to bring this argument on time into line with that new proof. This unfortunately results in the perverting of the entire paragraph. The argument demands an opposition between intuition in which the whole precedes the parts, and conception in which the parts precede the whole. In order to bring the opposition into line with the new argument on space, according to which a conception contains an infinite number of parts, not in it, but only under it, Kant substitutes for the previous parenthesis the statement that "concepts contain only partial representations," meaning, apparently, that their constituent elements are merely abstracted attributes, not real concrete parts, or in other words, not strictly parts at all, but only partial representations. But this does not at all agree with the context. The point at issue is thereby obscured.

(*b*) The main argument rests upon and presupposes a very definite view as to the manner in which alone, according to Kant, concepts are formed. Only if this view be granted as true of all concepts without exception is the argument cogent. This doctrine of the concept is accordingly stated by Kant in the words of the parenthesis. The partial representations, *i.e.* the different properties which go to constitute the object or content conceived, precede the representation of the whole. "The aggregation of co-ordinate attributes (*Merkmale*) constitutes the totality of the concept." Upon the use which Kant thus makes of the traditional doctrine of the concept, and upon its lack of consistency with his recognition of relational categories, we have already dwelt.

Third Argument and the Transcendental Exposition. — The third argument ought to have been omitted in the second edition, and its substance incorporated in the new transcendental exposition, as was done with the corresponding argument concerning space. The excuse which Kant offers for not making the change, namely, his desire for brevity, is not valid. By insertion in the new section the whole matter could have been stated just as briefly as before.

The purpose of the transcendental exposition has been already defined. It is to show how time, when viewed in the manner required by the results of the metaphysical deduction, as an *a priori* intuition, renders synthetic *a priori* judgments possible.

This exposition, as it appears in the third argument of the first edition, grounds the apodictic character of two axioms in regard to time on the proved apriority of the representation of time, and then by implication finds in these axioms a fresh proof of the apriority of time.

The new transcendental exposition extends the above by two further statements: (*a*) that only through the intuition of time can any conception of change, and therewith of motion (as change of place), be formed; and (*b*) that it is because the intuition of time is an *a priori* intuition that the synthetic *a priori* propositions of the "general doctrine of motion" are possible. To take each in turn. (*a*) Save by reference to time the conception of motion is self-contradictory. It involves the ascription to one and the same thing of contradictory predicates, *e.g.* that an object both is and is not in a certain place. From this fact, that time makes possible what is not possible in pure conception, Kant, in his earlier rationalistic period, had derived a proof of the subjectivity of time. (*b*) In 1786 in the *Metaphysical First Principles of Natural Science* Kant had developed the fundamental principles of the general science of motion. He takes the opportunity of the second edition (1787) of the *Critique* to assign this place to them in his general system. The implication is that the doctrine of motion stands to time in the relation in which geometry stands to space. Kant is probably here replying, as Vaihinger has suggested, to an objection made by Garve to the first edition, that no science, corresponding to geometry, is based on the intuition of time. For two reasons, however, the analogy between mechanics and geometry breaks down. In the first place, the conception of motion is empirical; and in the second place, it presupposes space as well as time.

Kant elsewhere explicitly disavows this view that the science of motion is based on time. He had already done so in the preceding year (1786) in the *Metaphysical First Principles*. He there points out that as time has only one dimension, mathematics is not applicable to the phenomena of inner sense. At most we can determine in regard to them (in addition, of course, to the two axioms already cited) only the law that all these changes are continuous. Also in Kant's *Ueber Philosophie überhaupt* (written some time between 1780 and 1790, and very probably in or about the year 1789) we find the following utterance:

"The general doctrine of time, unlike the pure doctrine of space (geometry), does not yield sufficient material for a whole science."

Why, then, should Kant in 1787 have so inconsistently departed from his own teaching? This is a question to which I can find no answer. Apparently without reason, and contrary to his more abiding judgment, he here repeats the suggestion which he had casually thrown out in the *Dissertation* of 1770:

"Pure mathematics treats of space in geometry and of time in pure mechanics."

But in the *Dissertation* the point is only touched upon in passing. The context permits of the interpretation that while geometry deals with space, mechanics deals with time in addition to space.

KANT'S VIEWS REGARDING THE NATURE OF ARITHMETICAL SCIENCE

In the *Dissertation*, and again in the chapter on *Schematism* in the *Critique* itself, still another view is suggested, namely, that the science of arithmetic is also concerned with the intuition of time. The passage just quoted from the *Dissertation* proceeds as follows:

"Pure mathematics treats of space in geometry and of time in pure mechanics. To these has to be added a certain concept which is in itself intellectual, but which demands for its concrete actualisation (*actuatio*) the auxiliary notions of time and space (in the successive addition and in the juxtaposition of a plurality). This is the concept of number which is dealt with in *Arithmetic*."

This view of arithmetic is to be found in both editions of the *Critique*. Arithmetic depends upon the synthetic activity of the understanding; the conceptual element is absolutely essential.

"Our counting (as is easily seen in the case of large numbers) is a synthesis according to concepts, because it is executed according to a common ground of unity, as, for instance, the decade (*Dekadik*)." "The pure image ... of all objects of the senses in general is time. But the pure *schema* of quantity, in so far as it is a concept of the understanding, is *number*, a representation which combines the successive addition of one to one (homogeneous). Thus number is nothing but the unity of the synthesis of the manifold of a homogeneous intuition in general, whereby I generate time itself in the apprehension of the intuition."

This is also the teaching of the *Methodology*. Now it may be observed that in none of these passages is arithmetic declared to be the *science of time*, or even to be based on the intuition of time. In 1783, however, in the *Prolegomena*, Kant expresses himself in much more ambiguous terms, for his words imply that there is a parallelism between geometry and arithmetic.

"Geometry is based upon the pure intuition of space. Arithmetic produces its concepts of number through successive addition of units in time, and pure mechanics especially can produce its concepts of motion only by means of the representation of time."

The passage is by no means explicit; the "especially" (*vornehmlich*) seems to indicate a feeling on Kant's part that the description which he is giving of arithmetic is not really satisfactory. Unfortunately this casual statement, though never repeated by Kant in any of his other writings, was developed by Schulze in his *Erläuterungen*.

"Since geometry has space and arithmetic has counting as its object (and counting can only take place by means of time), it is evident in what manner geometry and arithmetic, that is to say pure mathematics, is

possible.”

Largely, as it would seem, through Schulze, whose *Erläuterungen* did much to spread Kant’s teaching, this view came to be the current understanding of Kant’s position. The nature of arithmetic, as thus popularly interpreted, is expounded by Schopenhauer in the following terms:

“In time every moment is conditioned by the preceding. The ground of existence, as law of the sequence, is thus simple, because time has only one dimension, and no manifoldness of relations can be possible in it. Every moment is conditioned by the preceding; only through the latter can we attain to the former; only because the latter was, and has elapsed, does the former now exist. All counting rests upon this nexus of the parts of time; its words merely serve to mark the single steps of the succession. This is true of the whole of arithmetic, which throughout teaches nothing but the methodical abbreviations of counting. Every number presupposes the preceding numbers as grounds of its existence; I can only reach them through all the preceding, and only by means of this insight into the ground of its existence do I know that, where ten are, there are also eight, six, four.”

Schulze was at once challenged to show that this was really Kant’s teaching, and the passage which he cited was Kant’s definition of the schema of number, above quoted. It is therefore advisable that we should briefly discuss the many difficulties which this passage involves. What does Kant mean by asserting that in the apprehension of number we generate time? Does he merely mean that time is required for the process of counting? Counting is a process through which numerical relations are discovered; and it undoubtedly occupies time. But so do all processes of apprehension, in the study of geometry no less than of arithmetic. That this is not Kant’s meaning, and that it is not even what Schulze, notwithstanding his seemingly explicit mode of statement, intends to assert, is clearly shown by a letter written by Kant to Schulze in November 1788. Schulze, it appears, had spoken of this very matter.

“*Time, as you justly remark, has no influence upon the properties of numbers* (as pure determinations of quantity), such as it may have upon the nature of those changes (of quantity) which are possible only in connection with a specific property of inner sense and its form (time). *The science of number, notwithstanding the succession which every construction of quantity demands, is a pure intellectual synthesis which we represent to ourselves in thought*. But so far as *quanta* are to be numerically determined, they must be given to us in such a way that we can apprehend their intuition in successive order, and such that their *apprehension* can be subject to time....”

No more definite statement could be desired of the fact that though in arithmetical science as in other fields of study our processes of apprehension are subject to time, the quantitative relations determined by the science are independent of time and are intellectually apprehended.

But if the above psychological interpretation of Kant’s teaching is untenable, how is his position to be defined? We must bear in mind the doctrine which Kant had already developed in his pre-Critical period, that mathematical differs from philosophical knowledge in that its concepts can have concrete individual form. In the *Critique* this difference is expressed in the statement that the mathematical sciences alone are able to *construct* their concepts. And as they are *pure* mathematical sciences, this construction is supposed to take place by means of the *a priori* manifold of space and of time. Now though Kant had a fairly definite notion of what he meant by the construction of geometrical figures in space, his various utterances seem to show that in regard to the nature of arithmetical and algebraic construction he had never really attempted to arrive at any precision of view. To judge by the passage already quoted from the *Dissertation*, Kant regarded space as no less necessary than time to the construction or intuition of number. “[The intellectual concept of number] demands for its concrete actualisation the auxiliary notions of time *and space* (in the successive addition and in the *juxtaposition of a plurality*)” A similar view appears in the *Critique* in A 140 = B 179 and in B 15. In conformity, however, with the general requirements of his doctrine of *Schematism*, Kant defines the schema of number in exclusive reference to

time; and, as we have noted, it is to this definition that Schulze appeals in support of his view of arithmetic as the science of counting and therefore of time. It at least shows that Kant perceived *some* form of connection to exist between arithmetic and time. But in this matter Kant's position was probably simply a corollary from his general view of the nature of mathematical science, and in particular of his view of geometry, the "exemplar" of all the others. Mathematical science, as such, is based on intuition; therefore arithmetic, which is one of its departments, must be so likewise. No attempt, however, is made to define the nature of the intuitions in which it has its source. Sympathetically interpreted, his statements may be taken as suggesting that arithmetic is the study of *series* which find concrete expression in the order of sequent times. The following estimate, given by Cassirer, does ample justice both to the true and to the false elements in Kant's doctrine.

"[Even discounting Kant's insistence upon the conceptual character of arithmetical science, and] allowing that he derives arithmetical concepts and propositions from the *pure intuition of time*, this teaching, to whatever objections it may lie open, has certainly not the merely *psychological* meaning which the majority of its critics have ascribed to it. If it contained only the trivial thought, that the empirical act of counting requires time, it would be completely refuted by the familiar objection which B. Beneke has formulated: 'The fact that time elapses in the process of counting can prove nothing; for what is there over which time does not flow?' It is easily seen that Kant is only concerned with the 'transcendental' determination of the concept of time, according to which it appears as the type of an ordered sequence. William [Rowan] Hamilton, who adopts Kant's doctrine, has defined algebra as 'science of pure time or *order in progression*.' That the whole content of arithmetical concepts can really be obtained from the fundamental concept of *order* in unbroken development, is completely confirmed by Russell's exposition. As against the Kantian theory it must, of course, be emphasised, that it is not the *concrete* form of time intuition which constitutes the *ground* of the concept of number, but that on the contrary the pure logical concepts of sequence and of order are already implicitly contained and embodied in that concrete form."

Much of the unsatisfactoriness of Kant's argument is traceable to his mode of conceiving the "construction" of mathematical concepts. All concepts, he seems to hold, even those of geometry and arithmetic, are abstract class concepts — the concept of triangle representing the properties common to all triangles, and the concept of seven the properties common to all groups that are seven. Mathematical concepts differ, however, from other concepts in that they are capable of *a priori* construction, that is, of having their objects represented in pure intuition. Now this is an extremely unfortunate mode of statement. It implies that mathematical concepts have a dual mode of existence, first as abstracted, and secondly as constructed. Such a position is not tenable. The concept of seven, in its primary form, is not abstracted from a variety of particular groups of seven; it is already involved in the apprehension of each of them as being seven. Nor is it a concept that is itself constructed. It may perhaps be described as being the representation of something constructed; but that something is not itself. It represents the process or method generative of the complex for which it stands. Thus Kant's distinction between the intuitive nature of mathematical knowledge and the merely discursive character of conceptual knowledge is at once inspired by the very important distinction between the product of construction and the product of abstraction, and yet at the same time is also obscured by the quite inadequate manner in which that latter distinction has been formulated. Kant has again adhered to the older logic even in the very act of revising its conclusions; and in so doing he has sacrificed the Critical doctrines of the *Analytic* to the pre-Critical teaching of the *Dissertation* and *Aesthetic*. *Mathematical concepts are of the same general type as the categories; their primary function is not to clarify intuitions, but to make them possible.* They are derivable from intuition only in so far as they have contributed to its constitution. If intuition contains factors additional to the concepts through which it is interpreted, these factors must remain outside the realm of mathematical science, until such time as conceptual analysis has proved itself capable of further

extension.

I may now summarise this general discussion. Though Kant in the first edition of the *Critique* had spoken of the mathematical sciences as based upon the intuition of space and time, he had not, despite his constant tendency to conceive space and time as parallel forms of existence, based any separate mathematical discipline upon time. His definition of number, in the chapter on *Schematism*, had recognised the essentially conceptual character of arithmetic, and had connected it with time only in a quite indirect manner. A passage in the *Prolegomena* is the one place in all Kant's writings in which he would seem to assert, though in brief and quite indefinite terms, that arithmetic is related to time as geometry is related to space. No such view of arithmetic is to be found in the second edition of the *Critique*. In the transcendental exposition of time, added in the second edition, only pure mechanics is mentioned. This would seem to indicate that Kant had made the above statement carelessly, without due thought, and that on further reflection he found himself unable to stand by it. The omission is the more significant in that Kant refers to arithmetic in the passages added in the second edition *Introduction*. The teaching of these passages, apart from the asserted necessity of appealing to fingers or points, harmonises with the view so briefly outlined in the *Analytic*. Arithmetic is a conceptual science; though it finds in ordered sequence its intuitional material, it cannot be adequately defined as being the science of time.

CONCLUSIONS FROM THE PRECEDING CONCEPTS

These *Conclusions* do not run parallel with the corresponding *Conclusions* in regard to space. In the first paragraph there are two differences. (*a*) Kant takes account of a view not considered under space, viz. that time is a self-existing substance. He rejects it on a ground which is difficult to reconcile with his recognition of a manifold of intuition as well as a manifold of sense, namely that it would then be something real without being a real object. In A 39 = B 57 and B 70 Kant describes space and time, so conceived, as *unendliche Undinge*. (*b*) Kant introduces into his first *Conclusion* the argument that only by conceiving time as the form of inner intuition can we justify *a priori* synthetic judgments in regard to objects.

Second Paragraph (Conclusion b). — This latter statement is repeated at the opening of the second *Conclusion*. The emphasis is no longer, however, upon the term "form" but upon the term "inner"; and Kant proceeds to make assertions which by no means follow from the five arguments, and which must be counted amongst the most difficult and controversial tenets of the whole *Critique*. (*a*) Time is not a determination of outer appearances. For it belongs neither to their shape nor to their position — and prudently at this point the property of motion is smuggled out of view under cover of an etc. *Time does not determine the relation of appearances to one another, but only* the relation of representations *in our inner state*. It is the form only of the intuition of ourselves and of our inner state. Obviously these are assertions which Kant cannot possibly hold to in this unqualified form. In the very next paragraph they are modified and restated. (*b*) As this inner intuition supplies no shape (*Gestalt*), we seek to make good this deficiency by means of analogies. We represent the time-sequence through a line progressing to infinity in which the manifold constitutes a series of only one dimension. From the properties of this line, with the one exception that its parts are simultaneous whereas those of time are always successive, we conclude to all the properties of time.

The wording of the passage seems to imply that such symbolisation of time through space is helpful but not indispensably necessary for its apprehension. That it is indispensably necessary is, however, the view to which Kant finally settled down. But he has not yet come to clearness on this point. The passage has all the signs of having been written prior to the *Analytic*. Though Kant seems to have held consistently to the view that time has, in or by itself, only one dimension, the difficulties involved drove him to recognise that this is true only of time as the order of our representations. It is not true of the objective time

apprehended in and through our representations. When later Kant came to hold that consciousness of time is conditioned by consciousness of space, he apparently also adopted the view that, by reference to space, time indirectly acquires simultaneity as an additional mode. The objective spatial world is in time, but in a time which shows simultaneity as well as succession. In the *Dissertation* Kant had criticised Leibniz and his followers for neglecting simultaneity, “the most important consequence of time.”

“Though time has only one dimension, yet the *ubiquity* of time (to employ Newton’s term), through which all things sensuously thinkable are *at some time*, adds another dimension to the quantity of actual things, in so far as they hang, as it were, upon the same point of time. For if we represent time by a straight line extended to infinity, and simultaneous things at any point of time by lines successively erected [perpendicular to the first line], the surface thus generated will represent the *phenomenal world* both as to substance and as to accidents.”

Similarly in A 182 = B 226 of the *Critique* Kant states that simultaneity is not a mode of time, since none of the parts of time can be simultaneous, and yet also teaches in A 177 = B 219 that, as the order of *appearances*, time possesses in addition to succession the two modes, duration and simultaneity. The significance of this distinction between time as the order of our inner states, and time as the order of objective appearances, we shall consider immediately.

A connected question is as to whether or not Kant teaches the possibility of simultaneous apprehension. In the *Aesthetic* and *Dialectic* he certainly does so. Space is given as containing coexisting parts, and can be intuited as such without successive synthesis of its parts. In the *Analytic*, on the other hand, the opposite would seem to be implied. The apprehension of a manifold can only be obtained through the successive addition or generation of its parts.

(*c*) Lastly, Kant argues that the fact that all the relations of time can be expressed in an outer intuition is proof that the representation of time is itself intuition. But surely if, as Kant later taught, time can be apprehended at all only in and through space, that, taken alone, would rather be a reason for denying it to be itself intuition. In any case it is difficult to follow Kant in his contention that the intuition of time is similar in general character to that of space.

Third Paragraph (Conclusion c). — Kant now reopens the question as to the relation in which time stands to outer appearances. As already noted, he has argued in the beginning of the previous paragraph that it cannot be a determination of outer appearances, but only of representations in our inner state. External appearances, however, as Kant recognises, can be known only in and through representations. To that extent they belong to inner sense, and consequently (such is Kant’s argument) are themselves subject to time. Time, as the immediate condition of our representations, is also the mediate condition of appearances. Therefore, Kant concludes, “all *appearances*, *i.e.* all *objects* of the senses, are in time, and necessarily stand in time-relations.”

Now quite obviously this argument is invalid if the distinction between representations and their objects is a real and genuine one. For if so, it does not at all follow that because our *representations* of objects are in time that the objects themselves are in time. In other words, the argument is valid only from the standpoint of extreme subjectivism, according to which objects are, in Kant’s own phraseology, *blosse Vorstellungen*. But the argument is employed to establish a realist conclusion, that outer objects, as objects, stand in time-relations to one another. In contradiction of the previous paragraph he is now maintaining that time is a determination of outer appearances, and that it reveals itself in the motion of bodies as well as in the flux of our inner states.

The distinction between representations and their objects also makes it possible for Kant both to assert and to deny that simultaneity is a mode of time. “No two years can be coexistent. Time has only one dimension. But existence (*das Dasein*), measured through time, has two dimensions, succession and simultaneity.” There are, for Kant, two orders of time, subjective and objective. Recognition of the latter (emphasised and developed in the *Analytic*) is, however, irreconcilable with his contention that time is

merely the form of inner sense.

We have here one of the many objections to which Kant's doctrine of time lies open. It is the most vulnerable tenet in his whole system. A mere list of the points which Kant leaves unsettled suffices to show how greatly he was troubled in his own mind by the problems to which it gives rise. (1) The nature of the *a priori* knowledge which time yields. Kant ascribes to this source sometimes only the two axioms in regard to time, sometimes pure mechanics, and sometimes also arithmetic. (2) Whether time only allows of, or whether it demands, representation through space. Sometimes Kant makes the one assertion, sometimes the other. (3) Whether it is possible to apprehend the coexistent without successive synthesis of its parts. This possibility is asserted in the *Aesthetic* and *Dialectic*, denied in the *Analytic*. (4) Whether simultaneity is a mode of time. (5) Whether, and in what manner, appearances of outer sense are in time. Kant's answer to 4 and to 5 varies according as he identifies or distinguishes representations and empirical objects.

The manifold difficulties to which a theory of time thus lies open are probably the reason why Kant, in the *Critique*, reverses the order in which he had treated time and space in the *Dissertation*. But the placing of space before time is none the less unfortunate. It greatly tends to conceal from the reader the central position which Kant has assigned to time in the *Analytic*. Consciousness of time is the fundamental fact, taken as bare fact, by reference to which Kant gains his transcendental proof of the categories and principles of understanding. In the *Analytic* space, by comparison, falls very much into the background. A further reason for the reversal may have been Kant's Newtonian view of geometry as the mathematical science *par excellence*. In view of his formulation of the Critical problem as that of accounting for synthetic *a priori* judgments, he would then naturally be led to throw more emphasis on space.

To sum up our main conclusions. Kant's view of time as a form merely of inner sense, and as having only one dimension, connects with his subjectivism. His view of it as inhering in objects, and as having duration and simultaneity as two of its modes, is bound up with his phenomenalism. Further discussion of these difficulties must therefore be deferred until we are in a position to raise the more fundamental problem as to the nature of the distinction between a representation and its object. Motion is not an inner state. Yet it involves time as directly as does the flow of our feelings and ideas. Kant's assertion that "time can no more be intuited externally than space can be intuited as something in us," if taken quite literally, would involve both the subjectivist assertion that motion of bodies is non-existent, and also the phenomenalist contention that an extended object is altogether distinct from a representation.

The *fourth* and *fifth* paragraphs call for no detailed analysis. Time is empirically real, transcendentally ideal — these terms having exactly the same meaning and scope as in reference to space. The fourth sentence in the fifth paragraph is curiously inaccurate. As it stands, it would imply that time is given through the senses. In the concluding sentences Kant briefly summarises and applies the points raised in these fourth and fifth paragraphs.

ELUCIDATION

First and Second Paragraphs. — Kant here replies to a criticism which, as he tells us in his letter of 1772 to Herz, was first made by Pastor Schulze and by Lambert. In that letter the objection and Kant's reply are stated as follows.

"In accordance with the testimony of inner sense, changes are something real. But they are only possible on the assumption of time. Time is, therefore, something real which belongs to the determinations of things in themselves. Why, said I to myself, do we not argue in a parallel manner: 'Bodies are real, in accordance with the outer senses. But bodies are possible only under the condition of space. Space is, therefore, something objective and real which inheres in the things themselves.' The cause [of this differential treatment of space and of time] is the observation that in respect to outer things we cannot infer from the reality of representations the reality of their objects, whereas in inner sense the thought or the existing of the thought and of myself are one and the same. Herein lies the key to the difficulty.

Undoubtedly I must think my own state under the form of time, and the form of the inner sensibility consequently gives me the appearance of changes. Now I do not deny that changes are something real any more than I deny that bodies are something real, but I thereby mean only that something real corresponds to the appearance. I may not even say the inner appearance undergoes change (*verändere sich*), for how could I observe this change unless it appeared to my inner sense? *To the objection that this leads to the conclusion that all things in the world objectively and in themselves are unchangeable, I would reply that they are neither changeable nor unchangeable.* As Baumgarten states in § 18 of his *Metaphysica*, the absolutely impossible is hypothetically neither possible nor impossible, since it cannot be mentally entertained under any condition whatsoever; so in similar manner *the things of the world are objectively or in themselves neither in one and the same state nor in different states at different times, for thus understood [viz. as things in themselves] they are not represented in time at all*."

Thus Kant's contention, both in this letter and in the passage before us, is that even our inner states would not reveal change if they could be apprehended by us or by some other being apart from the subjective form of our inner sense. We may not say that our inner states undergo change, or that they succeed one another, but only that to us they necessarily appear as so doing. Time is no more than subjectively real. As Körner writes to Schiller: "Without time man would indeed *exist* but not *appear*. Not his reality but only his appearance is dependent upon the condition of time." "Man *is* not, but only *appears*, when he undergoes change." The objects of inner sense stand in exactly the same position as those of outer sense. Both are appearances, and neither can be identified with the absolutely real. As Kant argues later in the *Critique*, inner processes are not known with any greater certainty or immediacy than are outer objects; the reality of time as subjective proves its unreality in relation to things in themselves. The statement that the constitution of things in themselves is "problematic" is an exceptional mode of expression for Kant. Usually — as indeed throughout the whole context of this passage — he asserts that though things in themselves are unknowable, we can with absolute certainty maintain that they are neither in space nor in time. Upon this point we have already dwelt in discussing Trendelenburg's controversy with Fischer.

Third Paragraph. — The third and fourth paragraphs of this section ought to have had a separate heading. They summarise the total argument of the *Aesthetic* in regard to space as well as time, distinguish its tenets from those of Newton and of Leibniz, and draw a general conclusion. The summary follows the strict synthetic method. The opening sentences illustrate Kant's failure to distinguish between the problems of pure and of applied mathematics, and also show how completely he tends to conceive mathematics as typified by geometry. The criticism of alternative views traverses the ground of the famous controversy between Leibniz and Clarke. Their *Streitschriften* were, as we have good circumstantial grounds for believing, a chief influence in the development of Kant's own views. Kant, who originally held the Leibnizian position, was by 1768 more or less converted to the Newtonian teaching, and in the *Dissertation* of 1770 developed his subjectivist standpoint with the conscious intention of retaining the advantages while remedying the defects of both alternatives. For convenience we may limit the discussion to space. (*a*) The view propounded by Newton, and defended by Clarke, is that space has an existence in and by itself, independent alike of the mind which apprehends it and of the objects with which it is filled. (*b*) The view held by Leibniz is that space is an empirical concept abstracted from our confused sense-experience of the relations of real things.

The criticism of (*a*) is twofold. First, it involves belief in an eternal and infinite *Unding*. Secondly, it leads to metaphysical difficulties, especially in regard to the existence of God. If space is absolutely real, how is it to be reconciled with the omnipresence of God? Newton's view of space as the sensorium Dei can hardly be regarded as satisfactory.

The objection to (*b*) is that it cannot account for the apodictic certainty of geometry, nor guarantee its application to experience. The concept of space, when regarded as of sensuous origin, is something that

may distort (and according to the Leibnizian teaching does actually distort) what it professes to represent, and is something from which restrictions that hold in the natural world have been omitted. As empirical, it cannot serve as basis for the universal and necessary judgments of mathematical science.

The first view has, however, the advantage of keeping the sphere of appearances open for mathematical science. As space is infinite and all-comprehensive, its laws hold universally. The second view has the advantage of not subjecting reality to space conditions. These advantages are retained, while the objections are removed, by the teaching of the *Aesthetic*.

Kant further criticises the former view in A 46 ff. = B 64 ff. There is no possibility of accounting for the *a priori* synthetic judgments of geometry save by assuming that space is the pure form of outer intuition. For though the Newtonian view will justify the assertion that the laws of space hold universally, it cannot explain how we come to know them *a priori*. And assuming, as Kant constantly does, that space cannot be both an *a priori* form of intuition and also independently real, he concludes that it is the former only.

In B 71 Kant also restates the metaphysical difficulties to which the Newtonian view lies open. In natural theology we deal with an existence which can never be the object of sensuous intuition, and which has to be freed from all conditions of space and time. This is impossible if space is so absolutely real that it would remain though all created things were annihilated.

Fourth Paragraph. — Space and time are the only two forms of sensibility; all other concepts belonging to the senses, such as motion and change, are empirical. As Kant has himself stated, no reason can be given why space and time are the sole forms of our possible intuition:

“Other forms of intuition than space and time, ... even if they were possible, we cannot render in any way conceivable and comprehensible to ourselves, and even assuming that we could do so, they still would not belong to experience, the only kind of knowledge in which objects are given to us.”

The further statement, frequently repeated in the *Critique*, that time itself does not change, but only what is in time, indicates the extent to which Kant has been influenced by the Newtonian receptacle view. As Bergson very justly points out, time, thus viewed as a homogeneous medium, is really being conceived on the analogy of space. “It is merely the phantom of space obsessing the reflective consciousness.”

GENERAL OBSERVATIONS ON THE TRANSCENDENTAL AESTHETIC

I. First Paragraph.— “To avoid all misapprehension” Kant proceeds to state “as clearly as possible” his view of sensuous knowledge. With this end in view he sets himself to enforce two main points: (*a*) that as space and time are only forms of sensibility, everything apprehended is only appearance; (*b*) that this is not a mere hypothesis but is completely certain. Kant expounds (*a*) indirectly through criticism of the opposing views of Leibniz and of Locke. But before doing so he makes in the next paragraph a twofold statement of his own conclusions.

Second Paragraph. — This paragraph states (*a*) that through intuition we can represent only appearances, not things in themselves, and (*b*) that the appearances thus known exist only in us. Both assertions have implications, the discussion of which must be deferred to the *Analytic*. The mention of the “relations of things by themselves” may, as Vaihinger suggests, be a survival from the time when (as in the *Dissertation*) Kant sought to reduce spatial to dynamical relations. The assertion that things in themselves are completely unknown to us goes beyond what the *Aesthetic* can establish and what Kant here requires to prove. His present thesis is only that no knowledge of things in themselves can be acquired either through the forms of space and time or through sensation; space and time are determined solely by our pure sensibility, and sensations by our empirical sensibility. Failure to recognise this is, in Kant’s view, one of the chief defects of the Leibnizian system.

Third and Fourth Paragraphs. Criticism of the Leibniz-Wolff Interpretation of Sensibility and of Appearance. — Leibniz vitiates both conceptions. Sensibility does not differ from thought in clearness but in content. It is a difference of kind. They originate in different sources, and neither can by any transformation be reduced to the other.

"Even if an appearance could become completely transparent to us, such knowledge would remain *toto coelo* different from knowledge of the object in itself." "Through observation and analysis of appearances we penetrate to the secrets of nature, and no one can say how far this may in time extend.... [But however far we advance, we shall never be able by means of] so ill-adapted an instrument of investigation [as our sensibility] to find anything except still other appearances, the non-sensuous cause of which we yet long to discover."

We should still know only in terms of the two inalienable forms of our sensibility. The dualism of thought and sense can never be transcended by the human mind. By no extension of its sphere or perfecting of its insight can sensuous knowledge be transformed into a conceptual apprehension of purely intelligible entities.

Leibniz's conception of appearances as things in themselves confusedly apprehended is equally false, and for the same reasons. Appearance and reality are related as distinct existences, each of which has its own intrinsic character and content. Through the former there can be no hope of penetrating to the latter. Appearance is subjective in matter as well as in form. For Leibniz our knowledge of appearances is a confused knowledge of things in themselves. Properly viewed, it is the apprehension, whether distinct or confused, of objects which are never things in themselves. Sense-knowledge, such as we obtain in the science of geometry, has often the highest degree of clearness. Conceptual apprehension is all too frequently characterised by obscurity and indistinctness.

This criticism of Leibniz, as expounded in these two paragraphs, is thoroughly misleading if taken as an adequate statement of Kant's view of the relations between sense and understanding, appearance and reality. These paragraphs are really a restatement of a passage in the *Dissertation*.

"It will thus be seen that we express the nature of the sensuous very inappropriately when we assert that it is the *more confusedly* known, and the nature of the intellectual when we describe it as the *distinctly* known. For these are merely logical distinctions, and obviously have nothing to do with the given facts which underlie all logical comparison. The sensuous may be absolutely distinct, and the intellectual extremely confused. That is shown on the one hand in *geometry*, the prototype of sensuous knowledge, and on the other in *metaphysics*, the instrument of all intellectual enquiry. Every one knows how zealously metaphysics has striven to dispel the mists of confusion which cloud the minds of men at large and yet has not always attained the happy results of the former science. Nevertheless each of these kinds of knowledge preserves the mark of the stock from which it has sprung. The former, however distinct, is on account of its origin entitled sensuous, while the latter, however confused, remains intellectual — as *e.g.* the *moral* concepts, which are known not by way of experience, but through the pure intellect itself. I fear, however, that Wolff by this distinction between the sensuous and the intellectual, which for him is merely logical, has checked, perhaps wholly (to the great detriment of philosophy), that noblest enterprise of antiquity, the investigation of *the nature of phenomena and noumena*, turning men's minds from such enquiries to what are very frequently only logical subleties."

The paragraphs before us give expression only to what is common to the *Dissertation* and to the *Critique*, and do so entirely from the standpoint of the *Dissertation*. Thus the illustration of the conception of "right" implies that things in themselves can be known through the understanding. The conception, as Kant says, represents "a moral property which belongs to actions in and by themselves." Similarly, in distinguishing the sensuous from "the intellectual," he says that through the former we do not apprehend things in themselves, thus implying that things in themselves can be known through the pure intellect. The view developed in the *Analytic*, alike of sensibility and of appearance, is radically

different. Sensibility and understanding *may* have a common source; and both are indispensably necessary for the apprehension of appearance. Neither can function save in co-operation with the other. Appearance does not differ from reality solely through its sensuous content and form, but also in the intellectual order or dispensation to which it is subject. But in the very act of thus deepening the gulf between appearance and reality by counting even understanding as contributing to the knowledge only of the former, he was brought back to a position that has kinship with the Leibnizian view of their interrelation. Since understanding is just as essential as sensibility to the apprehension of appearances, and since understanding differs from sensibility in the universality of its range, it enables us to view appearances in their relation to ultimate reality, and so to apprehend them as being, however subjective or phenomenal, ways in which the thing in itself presents itself to us. Such a view is, however, on Kant's principles, quite consistent with the further contention, that appearance does not differ from reality in a merely logical manner. Factors that are peculiar to the realm of appearance have intervened to transform the real; and in consequence even completed knowledge of the phenomenal — if such can be conceived as possible — would not be equivalent to knowledge of things in themselves.

Fifth Paragraph. Criticism of Locke's View of Appearance. — This paragraph discusses Locke's doctrine that the secondary qualities are subjective, and that in the primary qualities we possess true knowledge of things in themselves. The distinction is drawn upon empirical grounds, namely, that while certain qualities are uniform for more than one sense, and belong to objects under all conditions, others are peculiar to the different senses, and arise only through the accidental relation of objects to the special senses. This distinction is, Kant says, entirely justified from the physical standpoint. A rainbow is an appearance of which the raindrops constitute the true empirical reality. But Locke and his followers interpret this distinction wrongly. They ignore the more fundamental transcendental (*i.e.* metaphysical) distinction between empirical reality and the thing in itself. From the transcendental standpoint the raindrops are themselves merely appearance. Even their round shape, and the very space in which they fall; are only modifications of our sensuous intuition. The 'transcendental object' remains unknown to us.

When Kant thus declares that the distinction between primary and secondary qualities is justified (*richtig*) from the physical standpoint, he is again speaking from a phenomenalist point of view. And it may be noted that in developing his transcendental distinction he does not describe the raindrops as mere representations. His phrase is much more indefinite. They are "modifications or fundamental forms (*Grundlagen*) of our sensuous intuition."

Kant does not here criticise the view of sensibility which underlies Locke's view of appearance. But he does so in A 271 = B 327, completing the parallel and contrast between Leibniz and Locke.

"Leibniz *intellectualised* appearances, just as Locke, according to his system of noogony (if I may be allowed these expressions), *sensualised* all concepts of the understanding, *i.e.* interpreted them as simply empirical or abstracted concepts of reflection. Instead of interpreting understanding and sensibility as two quite different sources of representations, which yet can supply objectively valid judgments of things only in *conjunction* with each other, each of these great men holds only to one of the two, viewing it as in immediate relation to things in themselves. The other faculty is regarded as serving only to confuse or to order the representations which this selected faculty yields."

Proof that the above View of Space and Time is not a mere Hypothesis, but completely certain. — The proof, which as here recapitulated and developed follows the analytic method, has already been considered in connection with A 39 = B 56. It proceeds upon the assumption that space cannot be both an *a priori* form of intuition and also independently real. The argument as a whole lacks clearness owing to Kant's failure to distinguish between the problems of pure and applied geometry, between pure intuition and form of intuition. This is especially obvious in the very unfortunate and misleading second application of the triangle illustration. Kant's tendency to conceive mathematical science almost exclusively in terms of geometry is likewise illustrated.

“There is in regard to both [space and time] a large number of *a priori* apodictic and synthetic propositions. This is especially true of space, which for this reason will be our chief illustration in this enquiry.”

II. Paragraphs added in the Second Edition. — Kant proceeds to offer further proof of the ideality of the appearances (*a*) of outer and (*b*) of inner sense. Such proof he finds in the fact that these appearances consist solely of relations. (*a*) Outer appearances reduce without remainder to relations of position in intuition (*i.e.* of extension), of change of position (motion), and to the laws which express in merely relational terms the motive forces by which such change is determined. What it is that is thus present in space, or what the dynamic agencies may be to which the motion is due, is never revealed. But a real existent (*Sache an sich*) can never be known through mere relations. Outer sense consequently reveals through its representations only the relation of an object to the subject, not the intrinsic inner nature of the object in itself (*Object an sich*). Kant’s avoidance of the term *Ding an sich* may be noted.

(*b*) The same holds true of inner sense, not only because the representations of outer sense constitute its proper (*eigentlichen*) material, but also because time, in which these are set, contains only relations of succession, coexistence, and duration. This time (which as consisting only of relations can be nothing but a form) is itself, in turn, a mere relation. It is only the manner in which through its own activity the mind is affected by itself. But in order to be affected by itself it must have receptivity, in other words, sensibility. Time, consequently, must be regarded as the form of this inner sense.

That everything represented in time, like that which is represented in space, consists solely of relations, Kant does not, however, attempt to prove. He is satisfied with repeating the conclusion reached in the first edition of the *Aesthetic*, that, as time is the object of a sense, it must of necessity be appearance. This, like everything which Kant wrote upon inner sense, is profoundly unsatisfactory. The obscurities of his argument are not to be excused on the ground that “the difficulty, how a subject can have an internal intuition of itself, is common to every theory.” For no great thinker, except Locke, has attempted to interpret inner consciousness on the analogy of the senses. Discussion of the doctrine must meantime be deferred.

III. B 69. — Kant here formulates the important distinction between appearance (*Erscheinung*) and illusion (*Schein*). The main text is clear so far as it goes; but the appended note is thoroughly confused. Together they contain no less than three distinct and conflicting views of illusion. According to the main text, *Schein* signifies a representation, such as may occur in a dream, to which nothing real corresponds. *Erscheinung*, on the other hand, is always the appearance of a *given* object; but since the qualities of that object depend solely on our mode of intuition, we have to distinguish the object as appearance from the object as thing in itself.

“[Every appearance] has two sides, the one by which the object is viewed in and by itself, ... the other by which the form of the intuition of the object is taken into account....”

Obviously, when illusion is defined in the above manner, the assertion that objects in space are mere appearances cannot be taken as meaning that they are illusory.

But this view of illusion is peculiar to the passage before us and to A 38 = B 55. It occurs nowhere else, either in the *Critique* or in the *Prolegomena*; and it is not, as Kant has himself admitted, really relevant to the purposes of the *Critique*. The issues are more adequately faced in the appended note, which, however, at the same time, shows very clearly that Kant has not yet properly disentangled their various strands. The above definition of appearance is too wide. It covers illusory sense perception as well as appearance proper. The further qualification must be added, that the predicates of appearance are constant and are inseparable from its representation. Thus the space predicates can be asserted of any external object. Redness and scent can be ascribed to the rose. All of these are genuine appearances. If, on the other hand, the two handles, as observed by Galileo, are attributed to Saturn, roundness to a distant

square tower, bentness to a straight stick inserted in water, the result is mere illusion. The predicates, in such cases, do not stand the test of further observation or of the employment of other senses. Only in a certain position of its rings, relatively to the observer, does Saturn *seem* (*scheint*) to have two handles. The distant tower only *seems* to be round. The stick only *seems* to be bent. But the rose *is* extended and *is* red. Obviously Kant is no longer viewing *Schein* as equivalent to a merely mental image. It now receives a second meaning. It is illusion in the modern, psychological sense. It signifies an abnormal perception of an actually present object. The distinction between appearance and illusion is now reduced to a merely relative difference in constancy and universality of appearance. Saturn necessarily appears to Galileo as possessing two handles. A square tower viewed from the distance cannot appear to the human eye otherwise than round. A stick inserted in water must appear bent. If, however, Saturn be viewed under more favourable conditions, if the distance from the tower be diminished, if the stick be removed from the water, the empirical object will appear in a manner more in harmony with the possible or actual experiences of touch. The distinction is practical, rather than theoretical, in its justification. It says only that certain sets of conditions may be expected to remain uniform; those, for instance, physical, physiological, and psychical, which cause a rose to appear red. Other sets of conditions, such as those which cause the stick to appear bent, are exceptional, and for that reason the bentness may be discounted as illusion. Among the relatively constant are the space and time properties of bodies. To employ the terms of the main text, it is not only by illusion that bodies seem to exist outside me; they actually are there.

So long as we keep to the sphere of ordinary experience, and require no greater exactitude than practical life demands, this distinction is, of course, both important and valid. But Kant, by his references to Saturn, raises considerations which, if faced, must complicate the problem and place it upon an entirely different plane. If, in view of scientific requirements, the conditions of observation are more rigorously formulated, and if by artificial instruments of scientific precision we modify the perceptions of our human senses, what before was ranked as appearance becomes illusion; and no limit can be set to the transformations which even our most normal human experiences may thus be made to undergo. Even the most constant perceptions then yield to variation. The most that can be asserted is that throughout all change in the conditions of observation objects still continue to possess, in however new and revolutionary a fashion, some kind of space and time predicates. The application of this more rigorous scientific standard of appearance thus leads to a fourfold distinction between ultimate reality, scientific appearances, the appearances of ordinary consciousness, and the illusions of ordinary consciousness. The appearances of practical life are the illusions of science, and the appearances of science would similarly be illusions to any being who through ‘intuitive understanding’ could apprehend things in themselves.

But if the distinction between appearance and illusion is thus merely relative to the varying nature of the conditions under which observation takes place, it can afford no sufficient answer to the criticisms which Kant is here professing to meet. Kant has in view those critics (such as Lambert, Mendelssohn, and Garve) who had objected that if bodies in space are representations existing, as he so often asserts, only “within us,” their appearing to exist “outside us” is a complete illusion. These critics have, indeed, found a vulnerable point in Kant’s teaching. The only way in which he can effectively meet it is by frank recognition and development of the phenomenalism with which his subjectivism comes into so frequent conflict. That certain perceptions are more constant than others does not prove that all alike may not be classed as illusory. The criticism concerns only the reality of extended objects. From Kant’s own extreme subjectivist position they *are* illusions of the most thoroughgoing kind. If, as Kant so frequently maintains, objects are representations and exist only “within us,” their existence “outside us” must be denied. The criticism can be met only if Kant is prepared consistently to formulate and defend his own alternative teaching, that sensations arise through the action of external objects upon the sense-organs, and that the world of physical science has consequently a reality not reducible to mere representations in the

individual mind.

It may be objected that Kant has in the main text cited one essential difference between his position and that which is being ascribed to him. Extended objects, though mere representations, are yet due to, and conditioned by, things in themselves. They are illusory only in regard to their properties, not in regard to their existence. But this distinction is not really relevant. The criticism, as just stated, is directed only against Kant's view of space. The fact that the spatial world is a grounded and necessary illusion is not strictly relevant to the matter in dispute. Kant has, indeed, elsewhere, himself admitted the justice of the criticism. In A 780 = B 808 he cites as a possible hypothesis, entirely in harmony with his main results, though not in any degree established by them, the view

"that this life is an appearance only, that is, a sensuous representation of purely spiritual life, and that the whole sensible world is a mere image (*ein blosses Bild*) which hovers before our present mode of knowledge, and like a dream has in itself no objective reality."

Kant's reply is thus really only verbal. He claims that illusion, if constant, has earned the right to be called appearance. He accepts the criticism, but restates it in his own terms. The underlying phenomenalism which colours the position in his own thoughts, and for which he has not been able to find any quite satisfactory formulation, is the sole possible justification, if any such exists, for his contention that the criticism does not apply. Such phenomenalism crops out in the sentence, already partially quoted:

"If I assert that the quality of space and time, according to which, as a condition of their existence, I posit both external objects and my own soul, lies in my mode of intuition and not in these objects in themselves, I am not saying that only by illusion do bodies seem to exist outside me or my soul to be given in my self-consciousness."

But, so far, I have simplified Kant's argument by leaving out of account a third and entirely different view of illusion which is likewise formulated in the appended note. In the middle of the second sentence, and in the last sentence, illusion is defined as the attribution to the thing in itself of what belongs to it only in its relation to the senses. Illusion lies not in the object apprehended, but only in the *judgment* which we pass upon it. It is due, not to sense, but to understanding. Viewing illusion in this way, Kant is enabled to maintain that his critics are guilty of "an unpardonable and almost intentional misconception," since this is the very fallacy which he himself has been most concerned to attack. As he has constantly insisted, appearance is appearance just because it can never be a revelation of the thing in itself.

Now the introduction of this third view reduces the argument of the appended note to complete confusion. Its first occurrence as a parenthesis in a sentence which is stating an opposed view would seem to indicate that the note has been carelessly recast. Originally containing only a statement of the second view, Kant has connected therewith the view which he had already formulated in the first edition and in the *Prolegomena*. But the two views cannot be combined. By the former definition, illusion is necessitated but abnormal perception; according to the latter, it is a preventable error of our conscious judgment. The opposite of illusion is in the one case *appearance*, in the other *truth*. The retention of the reference to Saturn, in the statement of the third view at the end of the note, is further evidence of hasty recasting. While the rose and the extended objects are there treated as also things in themselves, Saturn is taken only in its phenomenal existence. In view of the general confusion, it is a minor inconsistency that Kant should here maintain, in direct opposition to A 28-9, that secondary qualities can be attributed to the empirical object.

This passage from the second edition is a development of *Prolegomena*, § 13, iii. Kant there employs the term appearance in a quite indefinite manner. For the most part he seems to mean by it any and every sense-experience, whether normal or abnormal, and even to include under it dream images. But it is also employed in the second of the above meanings, as signifying those sense-perceptions which harmonise with general experience. Illusion is throughout employed in the third of the above meanings. Kant's illustration, that of the apparently retrograde movements of the planets, necessitates a distinction between

apparent and real motion in space, and consequently leads to the fruitful distinction noted above. Kant gives, however, no sign that he is conscious of the complicated problems involved.

In the interval between the *Prolegomena* (1783) and the second edition of the *Critique* (1787) Mendelssohn had published (1785) his *Morgenstunden*. In its introduction, entitled *Vorerkenntniss von Wahrheit, Schein und Irrthum*, he very carefully distinguishes between illusion (*Sinnenschein*) and error of judgment (*Irrthum*). This introduction Kant had read. In a letter to Schütz he cites it by title, and praises it as "acute, original, and of exemplary clearness." It is therefore the more inexcusable that he should again in the second edition of the *Critique* have confused these two so radically different meanings of the term *Schein*. Mendelssohn, however, drew no distinction between *Schein* and *Erscheinung*. They were then used as practically synonymous, though of course *Schein* was the stronger term. Kant seems to have been the first to distinguish them sharply and to attempt to define the one in opposition to the other. But the very fact that *Erscheinung* and *Schein* were currently employed as equivalent terms, and that the distinction, though one of his own drawing, had been mentioned only in the most cursory manner in the first edition of the *Critique*, removes all justification for his retort upon his critics of "unpardonable misconception." His anger was really due, not to the objection in itself, but to the implied comparison of his position to that of Berkeley. Such comparison never failed to arouse Kant's wrath. For however much this accusation might be justified by his own frequent lapses into subjectivism of the most extreme type, even its partial truth was more than he was willing to admit. Berkeley represents in his eyes, not merely a subjectivist interpretation of the outer world, but the almost diametrical opposite of everything for which he himself stood. Discussion of Kant's relation to Berkeley had best, however, be introduced through consideration of the passage immediately following in which Kant refers to Berkeley by name.

III. (Second Part) B 70. — Kant urges that his doctrine of the ideality of space and time, so far from reducing objects to mere illusion, is the sole means of defending their genuine reality. If space and time had an independent existence, they would have to be regarded as more real than the bodies which occupy them. For on this view space and time would continue to exist even if all their contents were removed; they would be antecedent necessary conditions of all other existences. But space and time thus interpreted are impossible conceptions. The reality of bodies is thereby made to depend upon *Undinge*. If this were the sole alternative, "the good Bishop Berkeley [could] not be blamed for degrading bodies to mere illusion." We should, Kant maintains, have to proceed still further, denying even our own existence. For had Berkeley taken account of time as well as of space, a similar argument, consistently developed in regard to time, would have constrained him to reduce the self to the level of mere illusion. Belief in the reality of things in themselves, whether spiritual or material, is defensible only if space and time be viewed as subjective. In other words, Berkeley's idealism is an inevitable consequence of a realist view of space. But it is also its *reductio ad absurdum*.

["Berkeley in his dogmatic idealism] maintains that space, with all the things of which it is the inseparable condition, is something impossible in itself, and he therefore regards the things in space as merely imaginary entities (*Einbildungen*). Dogmatic idealism is inevitable if space be interpreted as a property which belongs to things in themselves. For, when so regarded, space, and everything to which it serves as condition, is a non-entity (*Unding*). The ground upon which this idealism rests we have removed in the *Transcendental Aesthetic*."

The term *Schein* is not employed throughout this passage in either of the two meanings of the appended note, but in that of the main text. It signifies a representation, to which no existence corresponds.

KANT'S RELATION TO BERKELEY

By idealism Kant means any and every system which maintains that the sensible world does not exist in the form in which it presents itself to us. The position is typified in Kant's mind by the Eleatics, by Plato,

and by Descartes, all of whom are rationalists. With the denial of reality to sense-appearances they combine a belief in the possibility of rationally comprehending its supersensible basis. Failing to appreciate the true nature of the sensible, they misunderstand the character of geometrical science, and falsely ascribe to pure understanding a power of intellectual intuition. Kant's criticisms of Berkeley show very clearly that it is this more general position which he has chiefly in view. To Berkeley Kant objects that only in sense-experience is there truth, that it is sensibility, not understanding, which possesses the power of *a priori* intuition, and that through pure understanding, acting in independence of sensibility, no knowledge of any kind can be acquired. In other words, Kant classes Berkeley with the rationalists. And, as we have already seen, he even goes the length of regarding Berkeley's position as the *reductio ad absurdum* of the realist view of space. Kant does, indeed, recognise that Berkeley differs from the other idealists, in holding an empirical view of space, and consequently of geometry, but this does not prevent Kant from maintaining that Berkeley's thinking is influenced by certain fundamental implications of the realist position. Berkeley's insight — such would seem to be Kant's line of argument — is perverted by the very view which he is attacking. Berkeley appreciates only what is false in the Cartesian view of space; he is blind to the important element of truth which it contains. Empiricist though he be, he has no wider conception of the function and powers of sensibility than have the realists from whom he separates himself off; and in order to comprehend those existences to which alone he is willing to allow true reality, he has therefore, like the rationalists, to fall back upon pure reason.

That Kant's criticism of Berkeley should be extremely external is not, therefore, surprising. He is interested in Berkeley's positive teaching only in so far as it enables him to illustrate the evil tendencies of a mistaken idealism, which starts from a false view of the functions of sensibility and of understanding, and of the nature of space and time. The key to the true idealism lies, he claims, in the Critical problem, how *a priori* synthetic judgments can be possible. This is the fundamental problem of metaphysics, and until it has been formulated and answered no advance can be made.

"My so-called (Critical) idealism is thus quite peculiar in that it overthrows ordinary idealism, and that through it alone *a priori* cognition, even that of geometry, attains objective reality, a thing which even the keenest realist could not assert till I had proved the ideality of space and time."

In order to make Kant's account of Berkeley's teaching really comprehensible, we seem compelled to assume that he had never himself actually read any of Berkeley's own writings. Kant's acquaintance with the English language was most imperfect, and we have no evidence that he had ever read a single English book. When he quotes Pope and Addison, he does so from German translations. Subsequent to 1781 he could, indeed, have had access to Berkeley's *Dialogues between Hylas and Philonous* in a German translation; but in view of the account which he continues to give of Berkeley's teaching, it does not seem likely that he had availed himself of this opportunity. As to what the indirect sources of Kant's knowledge of Berkeley may have been, we cannot decide with any certainty, but amongst them must undoubtedly be reckoned Hume's statements in regard to Berkeley in the *Enquiry*, and very probably also the references to Berkeley in Beattie's *Nature of Truth*. From the former Kant would learn of Berkeley's empirical view of space and also of the sceptical tendencies of his idealist teaching. From it he might also very naturally infer that Berkeley denies all reality to objects. By Beattie Kant would be confirmed in this latter view, and also in his contention that Berkeley is unable to supply a criterion for distinguishing between reality and dreams. Kant may also have received some impressions regarding Berkeley from Hamann.

To take Kant's criticisms of Berkeley more in detail. In the first edition of the *Critique* Kant passes two criticisms, without, however, mentioning Berkeley by name: first, that he overlooks the problem of time, and, like Descartes, ascribes complete reality to the objects of inner sense. This is the cause of a second error, namely, that he views the objects of outer sense as mere illusion (*blosser Schein*). Proceeding, Kant argues that inner and outer sense are really in the same position. Though they yield only appearances,

these appearances are conditioned by things in themselves. Through this relation to things in themselves they are distinguished from all merely subjective images. Berkeley is again referred to in the fourth *Paralogism*. His idealism is distinguished from that of Descartes. The one is dogmatic; the other is sceptical. The one denies the existence of matter; the other only doubts whether it is possible to prove it. Berkeley claims, indeed, that there are contradictions in the very conception of matter; and Kant remarks that this is an objection which he will have to deal with in the section on the *Antinomies*. But this promise Kant does not fulfil; and doubtless for the reason that, however unwilling he may be to make the admission, on this point his own teaching, especially in the *Dialectic*, frequently coincides with that of Berkeley. So little, indeed, is Kant concerned in the first edition to defend his position against the accusation of subjectivism, that in this same section he praises the sceptical idealist as a "benefactor of human reason."

"He compels us, even in the smallest advances of ordinary experience, to keep on the watch, lest we consider as a well-earned possession what we perhaps obtain only in an illegitimate manner. We are now in a position to appreciate the value of the objections of the idealist. They drive us by main force, unless we mean to contradict ourselves in our commonest assertions, to view all our perceptions, whether we call them inner or outer, as a consciousness only of what is dependent on our sensibility. They also compel us to regard the outer objects of these perceptions not as things in themselves, but only as representations, of which, as of every other representation, we can become immediately conscious, and which are entitled outer because they depend on what we call 'outer sense' whose intuition is space. Space itself, however, is nothing but an inner mode of representation in which certain perceptions are connected with one another."

These criticisms are restated in A 491-2 = B 519-20, with the further addition that in denying the existence of extended beings "the empirical idealist" removes the possibility of distinguishing between reality and dreams. This is a new criticism. Kant is no longer referring to the denial of unknowable things in themselves. He is now maintaining that only the Critical standpoint can supply an immanent criterion whereby real experiences may be distinguished from merely subjective happenings. This point is further insisted upon in the *Prolegomena*, but is nowhere developed with any direct reference to Berkeley's own personal teaching. Kant assumes as established that any such criterion must rest upon the *a priori*; and in this connection Berkeley is conveniently made to figure as a thoroughgoing empiricist.

The *Critique*, on its publication, was at once attacked, especially in the Garve-Feder review, as presenting an idealism similar to that of Berkeley. As Erdmann has shown, the original plan of the *Prolegomena* was largely modified in order to afford opportunity for reply to this "unpardonable and almost intentional misconception." Kant's references to Berkeley, direct and indirect, now for the first time manifest a polemical tone, exaggerating in every possible way the difference between their points of view. Only the transcendental philosophy can establish the possibility of *a priori* knowledge, and so it alone can afford a criterion for distinguishing between realities and dreams. It alone will account for the possibility of geometrical science; Berkeley's idealism would render the claims of that science wholly illusory. The Critical idealism transcends experience only so far as is required to discover the conditions which make empirical cognition possible; Berkeley's idealism is 'visionary' and 'mystical.' Even sceptical idealism now comes in for severe handling. It may be called "dreaming idealism"; it makes things out of mere representations, and like idealism in its dogmatic form it virtually denies the existence of the only true reality, that of things in themselves. Sceptical idealism misinterprets space by making it empirical, dogmatic idealism by regarding it as an attribute of the real. Both entirely ignore the problem of time. For these reasons they underestimate the powers of sensibility (to which space and time belong as *a priori* forms), and exaggerate those of pure understanding.

"The position of all genuine idealists from the Eleatics to Berkeley is contained in this formula: 'All cognition through the senses and experience is nothing but mere illusion, and only in the ideas of pure

understanding and Reason is there truth.’ The fundamental principle ruling all my idealism, on the contrary, is this: ‘All cognition of things solely from pure understanding or pure Reason is nothing but mere illusion and only in experience is there truth.’”

This is an extremely inadequate statement of the Critical standpoint, but it excellently illustrates Kant’s perverse interpretation of Berkeley’s teaching.

To these criticisms Kant gives less heated but none the less explicit expression in the second edition of the *Critique*. He is now much more careful to avoid subjectivist modes of statement. His phenomenalist tendencies are reinforced, and come to clearer expression of all that they involve. The fourth *Paralogism* with its sympathetic treatment of empirical idealism is omitted, and in addition to the above passage Kant inserts a new section, entitled *Refutation of Idealism*, in which he states his position in a much more adequate manner.

IV. B 71. — Kant continues the argument of A 39. If space and time condition all existence, they will condition even divine existence, and so must render God’s omniscience, which as such must be intuitive, not discursive, difficult of conception. Upon this point Kant is more explicit in the *Dissertation*.

“*Whatever is, is somewhere and sometime*, is a spurious axiom.... By this spurious principle all beings, even though they be known intellectually, are restricted in their existence by conditions of space and time. Philosophers therefore discuss every form of idle question regarding the locations in the corporeal universe of substances that are immaterial — and of which for that very reason there can be no sensuous intuition nor any possible spatial representation — or regarding the seat of the soul, and the like. And since the sensuous mixes with the intellectual about as badly as square with round, it frequently happens that the one disputant appears as holding a sieve into which the other milks the he-goat. The presence of immaterial things in the corporeal world is virtual, not local, although it may conveniently be spoken of as local. Space contains the conditions of possible interaction only when it is between material bodies. What, however, in immaterial substances constitutes the external relations of force between them or between them and bodies, obviously eludes the human intellect.... But when men reach the conception of a highest and extra-mundane Being, words cannot describe the extent to which they are deluded by these shades that flit before the mind. They picture God as present in a place: they entangle Him in the world where He is supposed to fill all space at once. They hope to make up for the [spatial] limitation they thus impose by thinking of God’s place *per eminentiam*, *i.e.* as infinite. But to be present in different places at the same time is absolutely impossible, since different places are mutually external to one another, and consequently what is in several places is outside itself, and is therefore present to itself outside itself — which is a contradiction in terms. As to time, men have got into an inextricable maze by releasing it from the laws that govern sense knowledge, and what is more, transporting it beyond the confines of the world to the Being that dwells there, as a condition of His very existence. They thus torment their souls with absurd questions, for instance, why God did not fashion the world many centuries earlier. They persuade themselves that it is easily possible to conceive how God may discern present things, *i.e.* what is actual in the time in which He is. But they consider that it is difficult to comprehend how He should foresee the things about to be, *i.e.* the actual in the time in which He is not yet. They proceed as if the existence of the Necessary Being descended successively through all the moments of a supposed time, and having already exhausted part of His duration, foresaw the eternal life that still lies before Him together with the events which [will] occur simultaneously [with that future life of His]. All these speculations vanish like smoke when the notion of time has been rightly discerned.”

The references in B 71-2 to the intuitive understanding are among the many signs of Kant’s increased preoccupation, during the preparation of the second edition, with the problems which it raises. Such understanding is not sensuous, but intellectual; it is not derivative, but original; the object itself is created in the act of intuition. Or, as Kant’s position may perhaps be more adequately expressed, all of God’s activities are creative, and are inseparable from the non-sensuous intuition whereby both they and their

products are apprehended by Him. Kant's reason for again raising this point may be Mendelssohn's theological defence of the reality of space in his *Morgenstunden*. Mendelssohn has there argued that just as knowledge of independent reality is confirmed by the agreement of different senses, and is rendered the more certain in proportion to the number of senses which support the belief, so the validity of our spatial perceptions is confirmed in proportion as men are found to agree in this type of experience with one another, with the animals, and with angelic beings. Such inductive inference will culminate in the proof that even the Supreme Being apprehends things in this same spatial manner. Kant's reply is that however general the intuition of space may be among finite beings, it is sensuous and derivative, and therefore must not be predicated of a Divine Being. For obvious reasons Kant has not felt called upon to point out the inadequacy of this inductive method to the solution of Critical problems. In A 42 Kant, arguing that our forms of intuition are subjective, claims that they do not necessarily belong to all beings, though they must belong to all men. He is quite consistent in now maintaining that their characteristics, as sensuous and derivative, do not necessarily preclude their being the common possession of all finite beings.

THE PARADOX OF INCONGRUOUS COUNTERPARTS

The purpose, as already noted, of the above sections II. to IV., as added in the second edition, is to afford 'confirmation' of the ideality of space and time. That being so, it is noticeable that Kant has omitted all reference to an argument embodied, for this same purpose, in § 13 of the *Prolegomena*. The matter is of sufficient importance to call for detailed consideration.

As the argument of the *Prolegomena* is somewhat complicated, it is advisable to approach it in the light of its history in Kant's earlier writings. It was to his teacher Martin Knutzen that Kant owed his first introduction to Newton's cosmology; and from Knutzen he inherited the problem of reconciling Newton's mechanical view of nature and absolute view of space with the orthodox Leibnizian tenets. In his first published work Kant seeks to prove that the very existence of space is due to gravitational force, and that its three-dimensional character is a consequence of the specific manner in which gravity acts. Substances, he teaches, are unextended. Space results from the connection and order established between them by the balancing of their attractive and repulsive forces. And as the law of gravity is merely contingent, other modes of interaction, and therefore other forms of space, with more than three dimensions, must be recognised as possible.

"A science of all these possible kinds of space would undoubtedly be the highest enterprise which a finite understanding could undertake in the field of geometry."

In the long interval between 1747 and 1768 Kant continued to hold to some such compromise, retaining Leibniz's view that space is derivative and relative, and rejecting Newton's view that it is prior to, and pre-conditions, all the bodies that exist in it. But in that latter year he published a pamphlet in which, following in the steps of the mathematician, Euler, he drew attention to certain facts which would seem quite conclusively to favour the Newtonian as against the Leibnizian interpretation of space. The three dimensions of space are primarily distinguishable by us only through the relation in which they stand to our body. By relation to the plane that is at right angles to our body we distinguish 'above' and 'below'; and similarly through the other two planes we determine what is 'right' and 'left,' 'in front' and 'behind.' Through these distinctions we are enabled to define differences which cannot be expressed in any other manner. All species of hops — so Kant maintains — wind themselves around their supports from left to right, whereas all species of beans take the opposite direction. All snail shells, with some three exceptions, turn, in descending from their apex downwards, from left to right. This determinate direction of movement, natural to each species, like the difference in spatial configuration between a right and a left hand, or between a right hand and its reflection in a mirror, involves in all cases a reference of the given object to the wider space within which it falls, and ultimately to space as a whole. Only so can its

determinate character be distinguished from its opposite counterpart. For as Kant points out, though the right and the left hand are *counterparts*, that is to say, objects which have a common definition so long as the arrangement of the parts of each is determined in respect to its central line of reference, they are none the less inwardly *incongruent*, since the one can never be made to occupy the space of the other. As he adds in the *Prolegomena*, the glove of one hand cannot be used for the other hand. This inner incongruence compels us to distinguish them as different, and this difference is only determinable by location of each in a single absolute space that constrains everything within it to conform to the conditions which it prescribes. In three-dimensional space everything must have a right and a left side, and must therefore exhibit such inner differences as those just noted. Spatial determinations are not, as Leibniz teaches, subsequent to, and dependent upon, the relations of bodies to one another; it is the former that determine the latter.

"The reason why that which in the shape of a body exclusively concerns its relation to pure space can be apprehended by us only through its relation to other bodies, is that absolute space is not an object of any outer sensation, but a fundamental conception which makes all such differences possible."

Kant enforces his point by arguing that if the first portion of creation were a human hand, it would have to be either a right or a left hand. Also, a different act of creation would be demanded according as it was the one or the other. But if the hand alone existed, and there were no pre-existing space, there would be no inward difference in the relations of its parts, and nothing outside it to differentiate it. It would therefore be entirely indeterminate in nature, *i.e.* would suit either side of the body, which is impossible.

This adoption of the Newtonian view of space in 1768 was an important step forward in the development of Kant's teaching, but could not, in view of the many metaphysical difficulties to which it leads, be permanently retained; and in the immediately following year — a year which, as he tells us, "gave great light" — he achieved the final synthesis which enabled him to combine all that he felt to be essential in the opposing views. Though space is an absolute and preconditioning source of differences which are not conceptually resolvable, it is a merely subjective form of our sensibility.

Now it is significant that when Kant expounds this view in the *Dissertation* of 1770, the argument from incongruous counterparts is no longer employed to establish the absolute and pre-conditioning character of space, but only to prove that it is a pure non-conceptual intuition.

"Which things in a given space lie towards one side, and which lie towards the other, cannot by any intellectual penetration be discursively described or reduced to intellectual marks. For in solids that are completely similar and equal, but incongruent, such as the right and the left hand (conceived solely in terms of their extension), or spherical triangles from two opposite hemispheres, there is a diversity which renders impossible the coincidence of their spatial boundaries. This holds true, even though they can be substituted for one another in all those respects which can be expressed in marks that are capable of being made intelligible to the mind through speech. It is therefore evident that the diversity, that is, the incongruity, can only be apprehended by some species of pure intuition."

There is no mention of this argument in the first edition of the *Critique*, and when it reappears in the *Prolegomena* it is interpreted in the light of an additional premiss, and is made to yield a very different conclusion from that drawn in the *Dissertation*, and a *directly opposite conclusion* from that drawn in 1768. Instead of being employed to establish either the intuitive character of space or its absolute existence, it is cited as evidence in proof of its subjectivity. As in 1768, it is spoken of as strange and paradoxical, and many of the previous illustrations are used. The paradox consists in the fact that bodies and spherical figures, conceptually considered, can be absolutely identical, and yet for intuition remain diverse. This paradox, Kant now maintains in opposition to his 1768 argument, proves that such bodies and the space within which they fall are not independent existences. For were they things in themselves, they would be adequately cognisable through the pure understanding, and could not therefore conflict with its demands. Being conceptually identical, they would necessarily be congruent in every respect. But if

space is merely the form of sensibility, the fact that in space the part is only possible through the whole will apply to everything in it, and so will generate a fundamental difference between conception and intuition. Things in themselves are, as such, unconditioned, and cannot, therefore, be dependent upon anything beyond themselves. The objects of intuition, in order to be possible, must be merely ideal.

Now the new premiss which differentiates this argument from that of 1768, and which brings Kant to so opposite a conclusion, is one which is entirely out of harmony with the teaching of the *Critique*. In this section of the *Prolegomena* Kant has unconsciously reverted to the dogmatic standpoint of the *Dissertation*, and is interpreting understanding in the illegitimate manner which he so explicitly denounces in the section on *Amphiboly*.

"The mistake ... lies in employing the understanding contrary to its vocation transcendentally [*i.e.* transcendently] and in making objects, *i.e.* possible intuitions, conform to concepts, not concepts to possible intuitions, on which alone their objective validity rests."

The question why no mention of this argument is made in the second edition of the *Critique* is therefore answered. Kant had meantime, in the interval between 1783 and 1787, become aware of the inconsistency of the position. So far from being a paradox, this assumed conflict rests upon a false view of the function of the understanding. The relevant facts may serve to confirm the view of space as an intuition in which the whole precedes the parts; but they can afford no evidence either of its absoluteness or of its ideality. In 1768 they seem to Kant to prove its absoluteness, only because the other alternative has not yet occurred to him. In 1783 they seem to him to prove its ideality, only because he has not yet completely succeeded in emancipating his thinking from the dogmatic rationalism of the *Dissertation*.

As already noted, Kant's reason for here asserting that space is intuitive in nature, namely, that in it the parts are conditioned by the whole, is also his reason for elsewhere describing it as an Idea of Reason. The further implication of the argument of the *Prolegomena*, that in the noumenal sphere the whole is made possible only by its unconditioned parts, raises questions the discussion of which must be deferred. The problem recurs in the *Dialectic* in connection with Kant's definition of the Idea of the unconditioned. In the Ideas of Reason Kant comes to recognise the existence of concepts which do not conform to the reflective type analysed by the traditional logic, and to perceive that these Ideas can yield a deeper insight than any possible to the discursive understanding. The above rationalistic assumption must not, therefore, pass unchallenged. It may be that in the noumenal sphere all partial realities are conditioned by an unconditioned whole.

Concluding Paragraph. — The wording of this paragraph is in keeping with the increased emphasis which in the *Introduction* to the second edition is given to the problem, how *a priori* synthetic judgments are possible. Kant characteristically fails to distinguish between the problems of pure and applied mathematics, with resulting inconsecutiveness in his argumentation.

THE TRANSCENDENTAL DOCTRINE OF ELEMENTS

PART II. THE TRANSCENDENTAL LOGIC

Introduction

I. Concerning Logic in General. — This *Introduction* which falls into four divisions, is extremely diffuse, and contributes little that is of more than merely architectonic value. It is a repetition of the last section of the general *Introduction*, and of the introductory paragraphs of the *Aesthetic*, but takes no account of the definitions given in either of those two places. It does not, therefore, seem likely that it could have been written in immediate sequence upon the *Aesthetic*. It is probably later than the main body of the *Analytic*. In any case it is externally tacked on to it; as Adickes has noted, it is completely ignored in the opening section of the *Analytic*.

In treating of intuition in the first sentence, Kant seems to have in view only empirical intuition. Yet he at once proceeds to state that intuition may be pure as well as empirical. Also, in asserting that "pure intuition contains only the form under which something is intuited," Kant would seem to be adopting the view that it does not yield its own manifold, a conclusion which he does not, however, himself draw.

In defining sensibility, Kant again ignores pure intuition. Sensuous intuition, it is stated, is the mode in which we are affected by objects. Understanding, in turn, is defined only in its opposition to sensibility, in the ordinary meaning of that term. Understanding is the faculty which yields thought of the object to which sense-affection is due. It is "the power of thinking the object of sensuous intuition"; and acts, it is implied, in and through pure concepts which it supplies out of itself.

"Without sensibility objects would not be given to us [*i.e.* the impressions, in themselves merely subjective contents, through which alone independent objects can be revealed to us, would be wanting]; without understanding they would not be thought by us [*i.e.* they would be apprehended only in the form in which they are given, viz. as subjective modes of our sensibility]."

Kant has not yet developed the thesis which the central argument of the *Analytic* is directed to prove, namely, that save through the combination of intuition and conception no consciousness whatsoever is possible. In these paragraphs he still implies that though concepts without intuition are empty they are not meaningless, and that though intuitions without concepts are blind they are not empty. Their union is necessary for genuine knowledge, but not for the existence of consciousness as such.

"It is just as necessary to make our concepts sensuous, *i.e.* to add to them their object in intuition, as to make our intuitions intelligible, *i.e.* to bring them under concepts."

Kant's final Critical teaching is very different from this. Concepts are not first given in their purity, nor is "their object" added in intuition. Only through concepts is apprehension of an object possible, and only in and through such apprehension do concepts come to consciousness. Nor are intuitions "made intelligible" by being "brought under concepts." Only as thus conceptually interpreted can they exist for consciousness. The co-operation of concept and intuition is necessary for consciousness in any and every form, even the simplest and most indefinite. Consciousness of the subjective is possible only in and through consciousness of the objective, and *vice versa*. The dualistic separation of sensibility from understanding persists, however, even in Kant's later utterances; and, as above stated, to this sharp opposition are due both the strength and the weakness of Kant's teaching. Intuition and conception must, he here insists, be carefully distinguished. *Aesthetic* is the "science of the rules of sensibility in general." *Logic* is the "science of the rules of understanding in general."

Kant's classification of the various kinds of logic may be exhibited as follows:

Logic–

general–

pure

applied

special

transcendental

Adickes criticises Kant’s classification as defective, owing to the omission of the intermediate concept ‘ordinary.’ Adickes therefore gives the following table:

Logic

transcendental
ordinary

special
general

pure
applied

General logic is a logic of elements, *i.e.* of the absolutely necessary laws of thought, in abstraction from all differences in the objects dealt with, *i.e.* from all content, whether empirical or transcendental. It is a canon of the understanding in its general discursive or analytic employment. When it is pure, it takes no account of the empirical psychological conditions under which the understanding has to act. When it is developed as an applied logic, it proceeds to formulate rules for the employment of understanding under these subjective conditions. It is then neither canon, nor organon, but simply a catharticon of the ordinary understanding. Special logic is the organon of this or that science, *i.e.* of the rules governing correct thinking in regard to a certain class of objects. Only pure general logic is a pure doctrine of reason. It alone is absolutely independent of sensibility, of everything empirical, and therefore of psychology. Such pure logic is a body of demonstrative teaching, completely *a priori*. It stands to applied logic in the same relation as pure to applied ethics.

“Some logicians, indeed, affirm that logic presupposes *psychological* principles. But it is just as inappropriate to bring principles of this kind into logic as to derive the science of morals from life. If we were to take the principles from psychology, that is, from observations on our understanding, we should merely see *how* thought takes place, and *how* it is affected by the manifold subjective hindrances and conditions; so that this would lead only to the knowledge of *contingent* laws. But in logic the question is not of *contingent*, but of *necessary* laws; not how we do think, but how we ought to think. The rules of logic, then, must not be derived from the *contingent*, but from the *necessary* use of the understanding which without any psychology a man finds in himself. In logic we do not want to know how the understanding is and thinks, and how it has hitherto proceeded in thinking, but how it ought to proceed in thinking. Its business is to teach us the correct use of reason, that is, the use which is consistent with

itself.”

By a canon Kant means a system of *a priori* principles for the correct employment of a certain faculty of knowledge. By an organon Kant means instruction as to how knowledge may be extended, how new knowledge may be acquired. A canon formulates positive principles through the application of which a faculty can be directed and disciplined. A canon is therefore a discipline based on positive principles of correct use. The term discipline is, however, reserved by Kant to signify a purely negative teaching, which seeks only to prevent error and to check the tendency to deviate from rules. When a faculty has no correct use (as, for instance, pure speculative reason), it is subject only to a discipline, not to a canon. A discipline is thus “a separate, negative code,” “a system of caution and self-examination.” It is further distinguished from a canon by its taking account of other than purely *a priori* conditions. It is related to a pure canon much as applied is related to general logic. As a canon supplies principles for the *directing* of a faculty, its distinction from an organon obviously cannot be made hard and fast. But here as elsewhere Kant, though rigorous and almost pedantic in the drawing of distinctions, is correspondingly careless in their application. He describes special logic as the organon of this or that science. We should expect from the definition given in the preceding sentence that it would rather be viewed as a canon. In A 46 = B 63 Kant speaks of the *Aesthetic* as an organon.

II. Concerning Transcendental Logic. — It is with the distinction between general and transcendental logic that Kant is chiefly concerned. It is a distinction which he has himself invented, and which is of fundamental importance for the purposes of the *Critique*. Transcendental logic is the new science which he seeks to expound in this second main division of the *Doctrine of Elements*. The distinction, from which all the differences between the two sciences follow, is that while general logic abstracts from all differences in the objects known, transcendental logic abstracts only from empirical content. On the supposition, not yet proved by Kant, but asserted in anticipation, that there exist pure *a priori* concepts which are valid of objects, there will exist a science distinct in nature and different in purpose from general logic. The two logics will agree in being *a priori*, but otherwise they will differ in all essential respects.

The reference in A 55 = B 79 to the forms of intuition is somewhat ambiguous. Kant might be taken as meaning that in transcendental logic abstraction is made not only from everything empirical but also from all intuition. That is not, however, Kant’s real view, or at least not his final view. In sections A 76-7 = B 102, A 130-1 = B 170, and A 135-6 = B 174-5, which are probably all of later origin, he states his position in the clearest terms. Transcendental logic, he there declares, differs from general logic in that it is not called upon to abstract from the pure *a priori* manifolds of intuition. This involves, it may be noted, the recognition, so much more pronounced in the later developments of Kant’s Critical teaching, of space and time as not merely forms for the apprehension of sensuous manifolds but as themselves presenting to the mind independent manifolds of *a priori* nature.

As the term *transcendental* indicates, the new logic will have as its central problems the origin, scope, conditions and possibility of valid *a priori* knowledge of objects. None of these problems are treated in general logic, which deals only with the understanding itself. The question which it raises is, as Kant says in his *Logic*, *How can the understanding know itself?* The question dealt with by transcendental logic we may formulate in a corresponding way: *How can the understanding possess pure a priori knowledge of objects?* It is a canon of pure understanding in so far as that faculty is capable of synthetic, objective knowledge *a priori*. General logic involves, it is true, the idea of reference to objects, but the possibility of such reference is not itself investigated. In general logic the understanding deals only with itself. It assumes indeed that all objects must conform to its laws, but this assumption plays no part in the science itself.

A further point, not here dwelt upon by Kant, calls for notice, namely, that the activities of understanding dealt with by general logic are its merely discursive activities, — those of discrimination

and comparison; whereas those dealt with by transcendental logic are the originative activities through which it produces *a priori* concepts from within itself, and through which it attains, independently of experience, to an *a priori* determination of objects. Otherwise stated, general logic deals only with analytic thinking, transcendental logic with the synthetic activities that are involved in the generation of the complex contents which form the subject matter of the analytic procedure.

III. Concerning the Division of General Logic into Analytic and Dialectic. — The following passage from Kant's *Logic* forms an excellent and sufficient comment upon the first four paragraphs of this section:

"An important perfection of knowledge, nay, the essential and inseparable condition of all its perfection, is truth. Truth is said to consist in the agreement of knowledge with the object. According to this merely verbal definition, then, my knowledge, in order to be true, must agree with the object. Now I can only compare the object with my knowledge by this means, namely *by having knowledge of it*. My knowledge, then, is to be verified by itself, which is far from being sufficient for truth. For as the object is external to me, I can only judge whether my knowledge of the object agrees with my knowledge of the object. Such a circle in explanation was called by the ancients Diallelos. And, indeed, the logicians were accused of this fallacy by the sceptics, who remarked that this account of truth was as if a man before a judicial tribunal should make a statement, and appeal in support of it to a witness whom no one knows, but who defends his own credibility by saying that the man who had called him as a witness is an honourable man. The charge was certainly well-founded. The solution of the problem referred to is, however, absolutely impossible for any man.

"The question is in fact this: whether and how far there is a certain, universal, and practically applicable criterion of truth. For this is the meaning of the question, What is truth?...

"A *universal material* criterion of truth is not possible; the phrase is indeed self-contradictory. For being *universal* it would necessarily abstract from all distinction of objects, and yet being a material criterion, it must be concerned with just this distinction in order to be able to determine whether a cognition agrees with the very object to which it refers, and not merely with some object or other, by which nothing would be said. But *material* truth must consist in this agreement of a cognition with the definite object to which it refers. For a cognition which is true in reference to one object may be false in reference to other objects. It is therefore absurd to demand a universal material criterion of truth, which is at once to abstract and not to abstract from all distinction of objects.

"But if we ask for a universal *formal* criterion of truth, it is very easy to decide that there may be such a criterion. For formal truth consists simply in the agreement of the cognition with itself when we abstract from all objects whatever, and from every distinction of objects. And hence the universal formal criteria of truth are nothing but universal logical marks of agreement of cognitions with themselves, or, what is the same thing, with the general laws of the understanding and the Reason. These formal universal criteria are certainly not sufficient for objective truth, but yet they are to be viewed as its *conditio sine qua non*. For before the question, whether the cognition agrees with the object, must come the question, whether it agrees with itself (as to form). And this is the business of logic."

The remaining paragraphs of Section III. may similarly be compared with the following passage from an earlier section of Kant's *Logic*:

"Analytic discovers, by means of analysis, all the activities of reason which we exercise in thought. It is therefore an analytic of the form of understanding and of Reason, and is justly called the logic of truth, since it contains the necessary rules of all (formal) truth, without which truth our knowledge is untrue in itself, even apart from its objects. It is therefore nothing more than a canon for deciding on the formal correctness of our knowledge.

"Should we desire to use this merely theoretical and general doctrine as a practical art, that is, as an organon, it would become a *dialectic*, *i.e. a logic of semblance* (*ars sophistica disputatoria*), arising out

of an abuse of the analytic, inasmuch as by the mere logical form there is contrived the semblance of true knowledge, the characters of which must, on the contrary, be derived from agreement with objects, and therefore from the *content*.

"In former times dialectic was studied with great diligence. This art presented false principles in the semblance of truth, and sought, in accordance with these, to maintain things in semblance. Amongst the Greeks the dialecticians were advocates and rhetoricians who could lead the populace wherever they chose, because the populace lets itself be deluded with semblance. Dialectic was therefore at that time the art of semblance. In logic, also, it was for a long time treated under the name of the *art of disputation*, and during that period all logic and philosophy was the cultivation by certain chatterboxes of the art of semblance. But nothing can be more unworthy of a philosopher than the cultivation of such an art. Dialectic in this form, therefore, must be altogether suppressed, and instead of it there must be introduced into logic a critical examination of this semblance.

"We should then have two parts of logic: the *analytic*, which will treat of the formal criteria of truth, and the *dialectic*, which will contain the marks and rules by which we can know that something does not agree with the formal criteria of truth, although it seems to agree with them. Dialectic in this form would have its use as a *cathartic* of the understanding."

Dialectic is thus interpreted in a merely negative sense. It is, Kant says, a catharticon. So far from being an organon, it is not even a canon. It is merely a discipline. By this manner of defining dialectic Kant causes some confusion. It does not do justice to the scope and purpose of that section of the *Critique* to which it gives its name.

IV. Concerning the Division of Transcendental Logic into Transcendental Analytic and Dialectic. — The term object is used throughout this section in two quite distinct senses. In the second and third sentences it is employed in its wider meaning as equivalent to content or matter. In the fourth sentence it is used in the narrower and stricter sense, more proper to the term, namely, as meaning 'thing.' Again, in the fifth sentence content (*Inhalt*) would seem to be identified with object in the narrower sense, while in the sixth sentence matter (*Materie*, a synonym for content) appears to be identified with object in the wider sense. *Transcendental Dialectic*, in accordance with the above account of its logical correlate, is defined in a manner which does justice only to the negative side of its teaching. Its function is viewed as merely that of protecting the pure understanding against sophistical illusions.

THE TRANSCENDENTAL LOGIC

Division I

THE TRANSCENDENTAL ANALYTIC

The chief point of this section lies in its insistence that, as the *Analytic* is concerned only with the pure understanding, the *a priori* concepts with which it deals must form a unity or system. Understanding is viewed as a separate faculty, and virtually hypostatised. As a separate faculty, it must, it is implied, be an independent unity, self-containing and complete. Its concepts are determined in number, constitution, and interrelation, by its inherent character. They originate independently of all differences in the material which they are employed to organise.

BOOK I

THE ANALYTIC OF CONCEPTS

Introductory Paragraph. — Kant’s view of the understanding as a separate faculty is in evidence again in this paragraph. The *Analytic* is a “dissection of the faculty of the understanding.” *A priori* concepts are to be sought nowhere but in the understanding itself, as their birthplace. There “they lie ready till at last, on the occasion of experience, they become developed.” But such statements fail to do justice to Kant’s real teaching. They would seem to reveal the persisting influence of the pre-Critical standpoint of the *Dissertation*.

CHAPTER I

THE CLUE TO THE DISCOVERY OF ALL PURE CONCEPTS OF THE UNDERSTANDING

That the understanding is "an absolute unity" is repeated. From this assertion, thus dogmatically made, without even an attempt at argument, Kant deduces the important conclusion that the pure concepts, originating from such a source, "must be connected with each other according to *one* concept or idea (*Begriff oder Idee*)." And he adds the equally unproved assertion:

"But such a connection supplies a rule by which we are enabled to assign its proper place to each pure concept of the understanding and by which we can determine in an *a priori* manner their systematic completeness. Otherwise we should be dependent in these matters on our own discretionary judgment or merely on chance."

In the next section he sets himself to discover from an examination of analytic thinking what this rule or principle actually is, and in so doing he for the first time discloses, in any degree at all adequate, the real nature of the position which he is seeking to develop. He connects the required principle with the nature of the act of judging, considered as a function of unity.

Section I. The Logical Use of the Understanding. — This section, viewed as introductory to the metaphysical deduction of the categories, is extremely unsatisfactory. It directs attention to the wrong points, and conceals rather than defines Kant's real position. Its argumentation is also contorted and confused, and only by the most patient analysis can it be straightened out. The commentator has presented to him a twofold task from which there is no escape. He must render the argument consistent by such modification as will harmonise it with Kant's later and more deliberate positions, and he must explain why Kant has presented it in this misleading manner.

The title of the section would seem to imply that only the discursive activities of understanding are to be dealt with. That is, indeed, in the main true. Confusion results, however, from the clashing of this avowed intention with the ultimate purpose in view of which the argument is propounded. Kant is seeking to prove that we can derive from the more accessible procedure of the discursive understanding a clue sufficient for determining those pre-logical activities which have to be postulated in terms of his new Copernican hypothesis. But though that is the real intention of this section, it has, unfortunately, not been explicitly recognised, and can be divined by the reader only after he has mastered the later portions of the *Analytic*. Kant's argument has also the further defect that no sufficient statement is given either of the nature of the discursive concept or of its relation to judgment. These lacunae we must fill out as best we can from his utterances elsewhere. I shall first state Kant's view of the distinction between discursive and synthetic thinking, and then examine his treatment of the nature of the concept and of its relation to judgment.

As already noted, the distinction between transcendental and general logic marks for Kant all-important differences in the use of the understanding. In the one employment the understanding, by creative synthetic activities, generates from the given manifold the complex objects of sense-experience. In so doing it interprets and organises the manifold through concepts which originate *from within itself*. By the other it discriminates and compares, and thereby derives *from the content of sense-experience* the generic concepts of the traditional logic. Now Kant would seem to argue in this section that if the difference in the origin of the concepts in those two cases be left out of account, and if we attend only to the quite general character of their respective activities, they will be found to agree in one fundamental feature, namely, that they express functions of unity. Each is based on the spontaneity of thought — on the spontaneity of

synthetic interpretation on the one hand, of discrimination and comparison on the other. This feature common to the two types of activity can be further defined as being the unity of the act whereby a multiplicity is comprehended under a single representation. In the judgment "every metal is a body" the variety of metals is reduced to unity through the concept body. In an analogous manner the synthetic understanding organises a manifold of intuition through some such form of unity as that of substance and attribute. That is the category which underlies the above proposition, and which renders possible the specific unity of the total judgment. To quote the sentence with which in a later section Kant introduces his table of categories:

"The same understanding, and by the same operations by which in concepts, by means of analytic unity, it has produced the logical form of a judgment, introduces, by means of the synthetic unity of the manifold in intuition in general, a transcendental element into its representations...."

Now Kant's exposition is extremely misleading. As his later utterances show, his real argument is by no means that which is here given. We shall have occasion to observe that Kant is unable to prove, and does not ultimately profess to prove, that it is "the same understanding," and still less that it is "the same operations," which are exercised in discursive and in creative thinking. But this is a criticism which it would be premature to introduce at this stage. We must proceed to it by way of preliminary analysis of the above exposition. Kant's argument does not rest upon any such analogy as that just drawn, between the concepts formed by consciously comparing contents and the concepts which originate from within the understanding itself. Both, it is true, are functions of unity, but otherwise there is, according to Kant's own teaching, not the least resemblance between them. A generic or abstract concept expresses common qualities found in each of a number of complex contents. It is itself a content. A category, on the other hand, is always a function of unity whereby contents are interpreted. It is not a content, but a form for the organisation of content. It can gain expression only in the total act of judging, not in any one element such as the discursive concept. But though the analogy drawn by Kant thus breaks down, his argument is continued in a new and very different form. It is no longer made to rest on any supposed resemblance between discursive and creative thinking, regarded as co-ordinate and independent activities. It now consists in the proof that the former presupposes and is conditioned by the latter. Through study of the understanding in its more accessible discursive procedure, we may hope to discover the synthetic forms according to which it has proceeded in its pre-logical activities. When we determine the various forms of analytic judgment, the categories which are involved in synthetic thinking reveal themselves to consciousness.

Thus in spite of Kant's insistence upon the conceptual predicate, and upon the unity to which it gives expression, immediately he proceeds to the deduction of the categories, the emphasis is shifted to the unity which underlies the judgment as a whole. What constitutes such propositions as "all bodies are divisible," "every metal is a body," a unique and separate type of judgment is not the character of the predicate, but the category of substance and attribute whereby the predicate is related to the subject. To that category they owe their specific form; and it is a function of unity for which the discursive understanding can never account. As Kant states in the *Prolegomena*, if genuine judgments, that is, judgments that are "objectively valid," are analysed,

"...it will be found that they never consist of mere intuitions connected only (as is commonly believed) by comparison in a judgment. They would be impossible were not a pure concept of the understanding superadded to the concepts abstracted from intuition. The abstract concepts are subsumed under a pure concept, and in this manner only can they be connected in an objectively valid judgment."

Thus the analogy between discursive and *a priori* concepts is no sooner drawn than it is set aside as irrelevant. Though generic concepts rest upon functions of unity, and though (as we shall see immediately) they exist only as factors in the total act of judging, there is otherwise not the least resemblance between them and the categories. The clue to the categories is not to be found in the inherent characteristics of

analytic thinking, or of its specific products (namely, concepts), but solely in what, after all abstraction, it must still retain from the products which synthetic thinking creates. Each type of analytic judgment will be found on examination to involve some specific function whereby the conceptual factors are related to, and unified with, the other elements in the judgment. This function of unity is in each case an *a priori* category of the understanding. That is the thesis which underlies the concluding sentence of this section.

"The functions of the understanding [*i.e.* the *a priori* concepts of understanding] can be discovered in their completeness, if it is possible to state exhaustively the functions of unity [*i.e.* the forms of relation] in judgments."

The adoption of such a position involves, it may be noted, the giving up of the assertion, which is so emphatically made in the passage above quoted, that it is *by the same activities* that the understanding discursively forms abstract concepts and creatively organises the manifold of sense. That is in no respect true. There is no real identity — there is not even analogy — between the processes of comparison and abstraction on the one hand and those of synthetic interpretation on the other. The former are merely reflective: the latter are genuinely creative. Discursive activities are conscious processes, and are under our control: the synthetic processes, are non-conscious; only their finished products appear within the conscious field. This, however, is to anticipate a conclusion which was among the last to be realised by Kant himself, namely that there is no proof that these two types of activity are ascribable to one and the same source. The synthetic activities — as he himself finally came to hold — are due to a faculty of imagination.

"Synthesis in general ... is the mere result of the power of imagination, a blind but indispensable function of the soul, without which we should have no knowledge whatsoever, but of which we are scarcely ever conscious."

This sentence occurs in a passage which is undoubtedly a later interpolation. The "scarcely ever" (*selten nur einmal*) indicates Kant's lingering reluctance to recognise this fundamental fact, destructive of so much in his earlier views, even though it completes and reinforces his chief ultimate conclusions. With this admission Kant also gives up his sole remaining ground for the contention that there must be a complete parallelism between discursive and creative thinking. If they arise from such different sources, we have no right to assume, without specific proof, that they must coincide in the forms of their activity. This is a point to which we shall return in discussing Kant's formulation of the principle which is supposed to guarantee the completeness of the table of categories.

This unavowed change in point of view is the main cause of confusion in this section. Its other defects are chiefly those of omission. Kant fails to develop in sufficient detail his view of the nature of the discursive concept, or to make sufficiently clear the grounds for his assertion that conception as an activity of the understanding is identical with judgment. To take the former point first. Kant's mode of viewing the discursive concept finds expression in the following passage in the *Introduction* to his *Logic*:

"Human knowledge is on the side of the understanding *discursive*; that is, it takes place by means of ideas which make what is common to many things the ground of knowledge: and hence by means of attributes as such. We therefore cognise things only by means of attributes. An attribute is that in a thing which constitutes part of our cognition of it; or, what is the same, a partial conception so far as it is considered as a ground of cognition of the whole conception. *All our concepts, therefore, are attributes, and all thought is nothing but conception by means of attributes*."

The limitations of Kant's view of the concept could hardly find more definite expression. The only type of judgment which receives recognition is the categorical, interpreted in the traditional manner.

"To compare something as a mark with a thing, is called 'to judge.' The thing itself is the subject, the mark [or attribute] is the predicate. The comparison is expressed by the word 'is,' ... which when used without qualification indicates that the predicate is a mark [or attribute] of the subject, but when combined with the sign of negation states that the predicate is a mark opposed to the subject."

Kant's view of analytic thinking is entirely dominated by the substance-attribute teaching of the traditional logic. A concept must, in its connotation, be an abstracted attribute, and in its denotation represent a class. Relational thinking, and the concepts of relation, are ignored. Thus, in the *Aesthetic*, as we have already noted, Kant maintains that since space and time are not generic class concepts they must be intuitions. This argument, honestly employed by Kant, shows how completely unconscious he was of the revolutionary consequences of his new standpoint. Even in the very act of insisting upon the relational character of the categories, he still continues to speak of the concept as if it must necessarily conform to the generic type. In this, as in so many other respects, transcendental logic is not, as he would profess, supplementary to general logic; it is its tacit recantation. Modern logic, as developed by Lotze, Sigwart, Bradley, and Bosanquet, is, in large part, the recasting of general logic in terms of the results reached by Kant's transcendental enquiries. Meantime, sufficient has been said to indicate the strangely limited character of Kant's doctrine of the logical concept.

But on one fundamental point Kant breaks entirely free from the traditional logic. The following passage occurs in the above-quoted pamphlet on *The Mistaken Subtlety of the Four Syllogistic Figures*:

"It is clear that in the ordinary treatment of logic there is a serious error in that distinct and complete concepts are treated before judgments and ratiocinations, although the former are only possible by means of the latter." "I say, then, first, that a *distinct* concept is possible only by means of a *judgment*, a *complete* concept only by means of a *ratiocination*. In fact, in order that a concept should be distinct, I must clearly recognise something as an attribute of a thing, and this is a judgment. In order to have a distinct concept of body, I clearly represent to myself impenetrability as an attribute of it. Now this representation is nothing but the thought, 'a body is impenetrable.' Here it is to be observed that this judgment is not the distinct concept itself, but is the act by which it is realised; for the idea of the thing which arises after this act is distinct. It is easy to show that a complete concept is only possible by means of a ratiocination: for this it is sufficient to refer to the first section of this essay. We might say, therefore, that a distinct concept is one which is made clear by a judgment, and a complete concept one which is made distinct by a ratiocination. If the completeness is of the first degree, the ratiocination is simple; if of the second or third degree, it is only possible by means of a chain of reasoning which the understanding abridges in the manner of a sorites.... Secondly, as it is quite evident that the completeness of a concept and its distinctness do not require different faculties of the mind (since the same capacity which recognises something immediately as an attribute in a thing is also employed to recognise in this attribute another attribute, and thus to conceive the thing by means of a remote attribute), so also it is evident that understanding and reason, that is, the power of cognising distinctly and the power of forming ratiocinations, are not different faculties. Both consist in the power of judging, but when we judge mediately we reason."

In the section before us this same standpoint is maintained, but is expressed in a much less satisfactory manner. Concepts are no longer spoken of as complete judgments. In the above passages Kant always speaks of the concept as the subject of the proposition; it is now treated only as a predicate. This difference is significant. The concept as subject can represent the judgment as a whole (or at least it does so from the traditional standpoint to which Kant holds); the concept as predicate is merely one element, even though it be a unifying element, in the total act of judging. This falling away from his own maturer standpoint would seem to be due to Kant's lack of clearness as to the nature of the analogy which he is here drawing between analytic and synthetic thinking. It is connected with his mistaken, and merely temporary, comparison of *a priori* with discursive concepts. His position in 1762 alone harmonises with his essential teaching. Now, as then, he is prepared to view judgment as the sole ultimate activity of the understanding, and therefore to define understanding as the faculty of judging.

But the new Critical standpoint compels Kant to reinterpret this definition in a manner which involves a still more radical transformation of the traditional doctrine. The categories constitute a unique type of

concept, and condition the processes of discursive thought. They are embodied in the complex contents from which analytic thinking starts; and however far the processes of discursive comparison and abstraction be carried, one or other of these categories must still persist, determining the form which the analytic judgment is to take. The categorical judgment can formulate itself only by means of the *a priori* concept of subject and attribute, the hypothetical only by means of the pure concept of ground and consequence, and so with the others. And there are in consequence just as many categories as there are forms of the analytic judgment. This is how the principle of the metaphysical deduction must be interpreted when the later and deeper results of the transcendental deduction are properly taken into account. In deducing the forms of the understanding from the modes of discursive judgment Kant is virtually maintaining that analytic judgment involves the same problems as does judgment of the synthetic type. The categories can be derived from the forms of discursive judgment only because they are the conditions in and through which it becomes possible.

But though Kant, both here and in the central portions of the *Analytic,* seems to be on the very brink of this conclusion, it is never explicitly drawn. As we shall see, it would have involved the further admission that there is no absolute guarantee of the completeness of the table of categories, and no satisfactory method of determining their interrelations. To the very last general logic is isolated from transcendental logic. The Critical enquiry is formulated as if it concerned only such judgments as are explicitly synthetic. The principle of the metaphysical deduction is not, therefore, stated by Kant himself in the above manner; and we have still to decide the difficult question as to what the principle employed by Kant in the deduction actually is.

Kant makes a twofold demand upon the principle. It must enable us to discover the categories, and it must also in so doing enable us to view them as together forming a systematic whole, and so as having their completeness guaranteed by other than merely empirical considerations. The principle is stated sometimes in a broader and sometimes in a more specific form; for on this point also Kant speaks with no very certain voice. The broader formulation of the principle is that all acts of understanding are judgments, and that therefore the possible ultimate *a priori* forms of understanding are identical with the possible ultimate forms of the judgment. The more specific and correct formulation is that to every form of analytic judgment there corresponds a pure concept of understanding. The first statement of the principle is obviously inadequate. It merely reformulates the problem as being a problem not of conception but of judgment. If a principle is required to guarantee the completeness of our list of *a priori* concepts, it will equally be required to guarantee the completeness of our list of judgments. Even if the above principle be more explicitly formulated, as in the *Prolegomena*, where judging is defined as the act of understanding which comprises all its other acts, it will not enable us to guarantee the completeness of any list of the forms of judgment or to determine their systematic interrelation. We are therefore thrown back upon the second view. This, however, only brings us face to face with the further question, what principle guarantees the completeness of the table of analytic judgments. And to that query Kant has absolutely no answer. The reader's questionings break vainly upon his invincible belief in the adequacy and finality of the classification yielded by the traditional logic.

The *fons et origo* of all the confusions and obscurities of this section are thus traceable to Kant's attitude towards formal logic. He might criticise it for ignoring the interdependence of conception, judgment, and reasoning; he might reject the second, third, and fourth syllogistic figures; and he might even admit that its classification of the forms of judgment is not as explicit as might be desired; but however many provisos he made and defects he acknowledged, they were to him merely minor matters, and he accepted its teaching as complete and final. This unwavering faith in the fundamental distinctions of the traditional logic was indeed, as we shall have constant occasion to observe, an ever present influence in determining alike the general framework and much of the detail of Kant's Critical teaching. The defects of the traditional logic were very clearly indicated in his own transcendental logic. He

showed that synthetic thinking is fundamental; that by its distinctions the forms and activities of analytic thought are predetermined; that judgment in its various forms can be understood only by a regress upon the synthetic concepts to which these forms are due; that notions are not merely of the generic type, but that there are also categories of relation. None the less, to the very last, Kant persisted in regarding general logic as a separate discipline, and as quite adequate in its current form. He continued to ignore the fact that the analytic judgment, no less than the synthetic judgment, demands a transcendental justification.

The resulting situation is strangely perverse. In the very act of revolutionising the traditional logic, Kant relies upon its prestige and upon the assumed finality of its results to make good the shortcomings of the logic which is to displace it. By Kant's own admission transcendental logic is incapable of guaranteeing that completeness upon which, throughout the whole *Critique*, so great an emphasis is laid. General logic is allowed an independent status, sufficient to justify its authority being appealed to; and the principle which is supposed to guarantee the completeness of the table of categories is so formulated as to contain no suggestion of the dependence of discursive upon synthetic thinking. Formal logic, Kant would seem to hold, can supply a criterion for the classification of the ultimate forms of judgment just because its task is relatively simple, and is independent of all epistemological views as to the nature, scope, and conditions of the thought process. Since formal logic is a completed and perfectly *a priori* science, which has stood the test of 2000 years, and remains practically unchanged to the present day, its results can be accepted as final, and can be employed without question in all further enquiries. Analytic thinking is scientifically treated in general logic; the *Critique* is concerned only with the possibility and conditions of synthetic judgment. The table of analytic judgments therefore supplies a complete and absolutely guaranteed list of the possible categories of the understanding. But the perverseness of this whole procedure is shown by the manner in which, as we shall find, Kant recasts, extends, or alters, to suit his own purposes, the actual teaching of the traditional logic.

As noted above, the asserted parallelism of analytic and synthetic judgment rests upon the further assumption that discursive thinking and synthetic interpretation are the outcome of one and the same faculty of understanding. It is implied, in accordance with the attitude of the pre-Critical *Dissertation*, that understanding, viewed as the faculty to which all thought processes are due, has certain laws in accordance with which it necessarily acts in all its operations, and that these must therefore be discoverable from analytic no less than from synthetic thinking. The mingling of truth and falsity in this assumption has already been indicated. Such truth as it contains is due to the fact that analytic thinking is not co-ordinate with, but is dependent upon, and determined by, the forms of synthetic thinking. Its falsity consists in its ignoring of what thus gives it partial truth. The results of the transcendental deduction call for a complete recasting of the entire argument of the metaphysical deduction. And when this is done, there is no longer any ground for the contention that the number of the categories is determinable on *a priori* grounds. On Kant's own fundamental doctrine of the synthetic, and therefore merely *de facto*, character of all *a priori* principles, the necessity of the categories is only demonstrable by reference to the contingent fact of actual experience. The possible conceptual forms are relative to actual and ultimate differences in the contingent sensuous material; and being thus relative, they cannot possibly be systematised on purely *a priori* grounds. This Kant has himself admitted in a passage added in the second edition, though apparently without full consciousness of the important consequences which must follow.

"This peculiarity of our understanding that it can produce *a priori* unity of apperception solely by means of the categories, and only by such and so many, is as little capable of further explanation as why we have just these and no other functions of judgment, or why space and time are the only forms of our possible intuition."

THE DEVELOPMENT OF KANT'S METAPHYSICAL DEDUCTION

The character of the metaphysical deduction will be placed in a clearer light if we briefly trace the stages, so far as they can be reconstructed, through which it passed in Kant's mind. We may start from the *Dissertation* of 1770. Kant there modifies his earlier Wolffian standpoint, developing it, probably under the direct influence of the recently published *Nouveaux Essais*, on more genuinely Leibnizian lines.

"The use of the intellect ... is twofold. By the one use concepts, both of things and of relations, are themselves *given*. This is the *real use*. By the other use concepts, whencesoever given, are merely *subordinated* to each other, the lower to the higher (the common attributes), and compared with one another according to the principle of contradiction. This is called the *logical use*.... Empirical concepts, therefore, do not become intellectual in the *real sense* by reduction to greater universality, and do not pass beyond the type of sensuous cognition. However high the abstraction be carried, they must always remain sensuous. But in dealing with things *strictly intellectual*, in regard to which the *use of the intellect* is *real*, intellectual concepts (of objects as well as of relations), are given by the very nature of the intellect. They are not abstracted from any use of the senses, and do not contain any form of sensuous knowledge as such. We must here note the extreme ambiguity of the word *abstract*.... An intellectual concept *abstracts* from everything sensuous; it is not *abstracted* from things sensuous. It would perhaps be more correctly named *abstracting* than *abstract*. It is therefore preferable to call the intellectual concepts *pure ideas*, and those which are given only empirically *abstract ideas*." "I fear, however, that Wolff, by this distinction between the sensuous and the intellectual, which for him is merely logical, has checked, perhaps wholly (to the great detriment of philosophy), that noblest enterprise of antiquity, the investigation of *the nature of phenomena and noumena*, turning men's minds from such enquiries to what are very frequently only logical subtleties. Philosophy, in so far as it contains the *first principles* of the use of the *pure intellect*, is *metaphysics*.... As empirical principles are not to be found in metaphysics, the concepts to be met with in it are not to be sought in the senses but in the very nature of the pure intellect. They are not *connate* concepts, but are *abstracted* from laws inherent in the mind (*legibus menti insitis*), and are therefore *acquired*. Such are the concepts of possibility, existence, necessity, substance, cause, etc. with their opposites or correlates. They never enter as parts into any sensuous representation, and therefore cannot in any fashion be abstracted from such representations."

The *etcetera*, with which in that last passage Kant concludes his list of pure intellectual concepts, indicates a problem that must very soon have made itself felt. That it did so, appears from his letter to Herz (February 21, 1772). He there informs his correspondent, that, in developing his *Transcendentalphilosophie* (the first occurrence of that title in Kant's writings), he has

"...sought to reduce all concepts of completely pure reason to a fixed number of categories [this term also appearing for the first time], not in the manner of Aristotle, who in his ten predicaments merely set them side by side in a sort of order, just as he might happen upon them, but as they distribute themselves of themselves according to *some few principles* of the understanding."

Though in this same letter Kant professes to have solved his problems, and to be in a position to publish his *Critique of Pure Reason* (this title is already employed) "within some three months," the phrase "some few principles" clearly shows that he has not yet developed the teaching embodied in the metaphysical deduction. For its keynote is insistence upon the necessity of a *single* principle, sufficient to reduce them not merely to classes but to system. The difficulty of discovering such a principle must have been one of the causes which delayed completion of the *Critique*. The only data at our disposal for reconstructing the various stages through which Kant's views may have passed in the period between February 1772 and 1781 are the *Reflexionen*, but they are sufficiently ample to allow of our doing so with considerable definiteness.

In the *Dissertation* Kant had traced the concepts of space and time, no less than the concepts of understanding, to mental activities.

"Both concepts [space and time] are undoubtedly acquired. They are not, however, abstracted from the

sensing of objects (for sensation gives the matter, not the form of human cognition). As immutable types they are intuitively apprehended from the activity whereby the mind co-ordinates its sensuous data in accordance with perpetual laws."

Now the *Dissertation* is quite vague as to how the "mind" (*animus*), active in accordance with laws generative of the intuitions space and time, differs from "understanding" (*intellectus*), active in accordance with laws generative of pure concepts. Kant's reasons, apart from the intuitive character of space and time, for contrasting the former with the latter, as the sensuous with the intellectual, were the existence of the antinomies and his belief that through pure concepts the absolutely real can be known. When, however, that belief was questioned by him, and he had come to regard the categories as no less subjective than the intuitional forms, the antinomies ceased to afford any ground for thus distinguishing between them. The intuitional nature of space and time, while certainly peculiar to them, is in itself no proof that they belong to the sensuous side of the mind.

A difficulty which immediately faced Kant, from the new Critical standpoint, was that of distinguishing between space and time, on the one hand, and the categories on the other. This is borne out by the *Reflexionen* and by the following passage in the *Prolegomena*.

"Only after long reflection, expended in the investigation of the pure non-empirical elements of human knowledge, did I at last succeed in distinguishing and separating with certainty the pure elementary concepts of sensibility (space and time) from those of the understanding."

The first stage in the development of the metaphysical deduction would seem to have consisted in the attempt to view the categories as acquired by reflection upon the activities of the understanding in "comparing, combining, or separating"; and among the *notiones rationales*, *notiones intellectus puri*, thus gained, the idea of space is specially noted. The following list is also given:

"The concepts of existence (reality), possibility, necessity, ground, unity and plurality, parts, all, none, composite and simple, space, time, change, motion, substance and accident, power and action, and everything that belongs to ontology proper."

In *Reflexionen*, ii. 507 and 509, the fundamental feature of such rational concepts is found in their *relational* character. They all agree in being concepts of form.

Quite early, however, Kant seems to have developed the view, which has created so many more difficulties than it resolves, that space and time are given to consciousness through outer and inner sense. Though still frequently spoken of as concepts, they are definitely referred to the receptive, non-spontaneous, side of the mind. This is at once a return to the *Dissertation* standpoint, and a decided modification of its teaching. It holds to the point of view of the *Dissertation* in so far as it regards them as sensuous, and departs from it in tracing them to receptivity.

The passage quoted from the letter of 1772 to Herz may perhaps be connected with the stage revealed in the *Reflexionen* already cited. "Comparing, combining, and separating" may be the "some few principles of the understanding" there referred to. That, however, is doubtful, for the next stage in the development likewise resulted in a threefold division. This second stage finds varied expression in *Reflexionen*, ii. 483, 522, 528, 556-63. These, in so far as they agree, distinguish three classes of categories — of thesis, of analysis, and of synthesis. The first covers the categories of quality and modality, the second those of quantity, the third those of relation.

Reflexionen, ii. 528 is as follows:

[Thesis =]

"The metaphysical concepts are, first, absolute: possibility and existence; secondly, relative:

(*a*) Unity and plurality: *omnitudo* and *particularitas*.

[Analysis =]

(*b*) Limits: the first, the last: *infinitum, finitum*.
[Anticipates the later category of limitation.]

(*c*) Connection: co-ordination: whole and part

[Synthesis =]

[anticipates the later category of reciprocity],
simple and compound; subordination:

(1) Subject and predicate.

(2) Ground and consequence.

This, and the connected *Reflexionen* enumerated above, are of interest as proving that Kant's table of categories was in all essentials complete before the idea had occurred to him of further systematising it or of guaranteeing its completeness by reference to the logical classification of the forms of judgment. They also justify us in the belief that when Kant set himself to discover such a unifying principle the above list of categories and the existing logical classifications must have mutually influenced one another, each undergoing such modification as seemed necessary to render the parallelism complete. This, as we shall find, is what actually happened. The logical table, for instance, induced Kant to distinguish the categories of quality from those of modality, while numerous changes were made in the logical table itself in order that it might yield the categories required.

But the most important alteration, the introduction of the threefold division of each sub-heading, is not thus explicable, as exclusively due to one or other of the two factors. The adoption of this threefold arrangement in place of the dichotomous divisions of the logical classification and of the haphazard enumerations of Kant's own previous lists, seems to be due to the twofold circumstance that he had already distinguished three categories of synthesis or relation (always the most important for Kant), and that this sufficiently harmonised with the logical distinction between categorical, hypothetical, and disjunctive judgments. He then sought to modify the logical divisions by addition in each case of a third, and finding that this helped him to obtain the categories required, the threefold division became for him (as it remained for Hegel) an almost mystical dogma of transcendental philosophy. In so far as it involved recognition that the hard and fast opposites of the traditional logic (such as the universal and the particular, the affirmative and the negative) are really aspects inseparably involved in every judgment and in all existence, it constituted an advance in the direction both of a deeper rationalism and of a more genuine empiricism. But in so far as it was due to the desire to guarantee completeness on *a priori* grounds, and so was inspired by a persistent overestimate of our *a priori* powers, it has been decidedly harmful. Much of the useless "architectonic" of the *Critique* is due to this scholastic prejudice.

This fundamental alteration in the table of logical judgments is introduced with the naive assertion that "varieties of thought in judgments," unimportant in general logic, "may be of importance in the field of its pure *a priori* knowledge." In the *Critique of Judgment* we find the following passage:

"It has been made a difficulty that my divisions in pure philosophy have almost always been threefold.

But this lies in the nature of the case. If an *a priori* division is to be made, it must be either analytic, according to the principle of contradiction, and then it is always twofold (*quodlibet ens est aut A aut non A*); or else synthetic. And if in this latter case it is derived from *a priori* concepts (not as in mathematics from the *a priori* intuition corresponding to the concept) the division must necessarily be a trichotomy. For according to what is requisite for synthetic unity in general, there must be (1) a condition, (2) a conditioned, and (3) the concept which arises from the union of these two."

The last stage, as expressed in the *Critique*, was, as we have already noted, merely an application of his earlier position that all thinking is judging. This appreciation of the inseparable connection of the categories with the act of judging is sound in principle, and is pregnant with many of the most valuable results of the Critical teaching. But these fruitful consequences follow only upon the lines developed in the *transcendental* deduction. They are bound up with Kant's fundamental Copernican discovery that the categories are forms of *synthesis*, and accordingly express *functions* or *relations*. The categories can no longer be viewed, in the manner of the *Dissertation*, as yielding concepts of *objects*. The view of the concept which we find in the *Dissertation* is, indeed, applied in the *Critique* to space and time — they are taken as in themselves intuitions, not as merely *forms* of intuition — but the categories are recognised as being of an altogether relational character. Though *a priori*, they are not, in and by themselves, complete objects of consciousness, and accordingly can reveal no object. They are *functions*, not *contents*. That, however, is to anticipate. We must first discharge, as briefly as possible, the ungrateful task of dwelling further upon the laboured, arbitrary, and self-contradictory character of the detailed working out of the metaphysical deduction. The deduction is given in Sections II. and III.

Section II. The Logical Function of the Understanding in Judgment. — Kant's introductory statement may here be noted. If, he says, we leave out of consideration the content of any judgment, and attend only to the mere form, we "find" that the function of thought in a judgment "can" be brought under four heads, each with three subdivisions. But Kant himself, in this same section, recognises in the frankest and most explicit manner, that the necessary distinctions are only to be obtained by taking account of the matter as well as of the form of judgments. And even after this contradiction is discounted, the term "find" may be allowed as legitimate only if the word "can" is correspondingly emphasised. The distinctions were not derived from any existing logic. They were reached only by the freest possible handling of the classifications currently employed. Examination of the table of judgments, and comparison of it with the table of categories, supply conclusive evidence that the former has been rearranged, in highly artificial fashion, so as to yield a more or less predetermined list of required categories.

1. Quantity. — Kant here frankly departs from the classification of judgments followed in formal logic; and the reason which he gives for so doing is in direct contradiction to his demand that only the form of judgment must be taken into account. The "quantity of knowledge" here referred to is determinable, not from the form, but only from the content of the judgment. Also, the statement that the singular judgment stands to the universal as unity to infinity (*Unendlichkeit*) is decidedly open to question. The universal is itself a form of unity, as Kant virtually admits in deriving, as he does, the category of unity from the universal judgment.

2. Quality. — Kant makes a similar modification in the logical treatment of quality, by distinguishing between affirmative and infinite judgments. The proposition, A is not-B, is to be viewed as neither affirmative nor negative. As the *content* of the predicate includes the infinite number of things that are not-B, the judgment is infinite. Kant, in a very artificial and somewhat arbitrary manner, contrives to define it as limitative in character, and so as sharing simultaneously in the nature both of affirmation and of negation. The way is thus prepared for the "discovery" of the category of limitation.

3. Relation. — Wolff, Baumgarten, Meier, Baumeister, Reimarus, and Lambert, with very minor differences, agree in the following division:

Judgments–

Simple = Categorical

Complex–
Copulative (*i.e.* categorical with more than one subject or more than one predicate).

Hypothetical.

Disjunctive.

Kant omits the copulative judgment, and by ignoring the distinction between simple and complex judgments (which in Reimarus, and also less definitely in Wolff, is connected with the distinction between conditional and unconditional judgments) contrives to bring the remaining three types of judgment under the new heading of "relation." They had never before been thus co-ordinated, and had never before been subsumed under this particular title. It is by no means clear why such distinctions as those between simple and complex, conditioned and unconditioned, should be ignored, and why the copulative judgment should not be recognised as well as the hypothetical. Kant's criterion of importance and unimportance in the distinctions employed by the logicians of his day was wholly personal to himself; and, though hard to define, was certainly not dictated by any logic that is traceable to Aristotelian sources. His exposition is throughout controlled by foreknowledge of the particular categories which he desires to "discover."

4. Modality. — Neither Wolff nor Reimarus gives any account of modality. Baumgarten classifies judgments as pure or modal (existing in *four* forms, necessity, contingency, possibility, impossibility). Baumeister and Thomasius also recognise four forms of modality. Meier distinguishes between pure judgment (*judicium purum*) and impure judgment (*judicium modale*, *modificatum*, *complexum qua copula*), but does not classify the forms of modality. Lambert alone classifies judgments as "possible, actual (*wirklich*), necessary, and their opposite." But when Kant adopts this threefold division, the inclusion of actuality renders the general title "modality" inapplicable in its traditional sense. The expression of actuality in the assertoric judgment involves no adverbial modification of the predicate. Also, in its "affirmative" and "categorical" forms it has already been made to yield two other categories.

Kant speaks of the problematic, the assertoric, and the apodictic forms of judgment as representing the stages through which knowledge passes in the process of its development.

"These three functions of modality are so many momenta of thought in general."

This statement has been eulogised by Caird, as being an anticipation of the Hegelian dialectic. As a matter of fact, Kant's remark is irrelevant and misleading. The advance from consciousness of the problematic, through determination of it as actual to its explanation as necessary, represents only a psychological order in the mind of the individual. Logically, knowledge of the possible rests on and implies prior knowledge of the actual and of the necessities that constitute the actual.

Section III. The Categories or Pure Concepts of the Understanding. — The first three pages of this section, beginning "General logic abstracts," and concluding with the word "rest on the understanding," would seem to be a later interpolation. Embodying, as they do, some of the fundamental ideas of the transcendental deduction, they express Kant's final method of distinguishing between general and transcendental logic. But they are none the less out of harmony with the other sections of the metaphysical deduction. They are of the nature of an after-thought, even though that afterthought represents a more mature and adequate standpoint. In A 55-7, where Kant defines the distinction between general and

transcendental logic, the latter is formulated in entire independence of all reference to pure intuition. Kant, indeed, argues that just as there are both pure and empirical intuitions, so there are both pure and empirical concepts. But there is no indication that he has yet realised the close interdependence of the two types of *a priori* elements. Even when he proceeds in A 62 to remark that the empirical employment of pure concepts is conditioned by the fact that objects are given in intuition, no special reference is made to "the manifold of pure *a priori* intuition." Now, however, Kant emphasises, as the fundamental characteristic of transcendental logic, its possession of a pure manifold through reference to which its pure concepts gain meaning. Thus not only does transcendental logic not abstract from the pure *a priori* concepts, it likewise possesses an *a priori* material. It is in this twofold manner that it is now regarded as differing from formal logic.

The accounts given of the metaphysical deduction by Cohen, Caird, Riehl, and Watson are vitiated by failure to remark that this latter standpoint is a late development, and is out of keeping with the rest of the deduction. Riehl's exposition has, however, the merit of comparative consistency. He explicitly recognises the important consequence which at once follows from acceptance of this later view, namely, that it is by their implying space and time that the categories differ from the notions which determine the forms of judgment; in other words, that the *categories are actualised only as schemata*. The category of substance, for instance, differs from the merely logical notion of a propositional subject, in being the concept of that which is *always* a subject, and *never* a predicate; and such a conception has specific meaning for us only as the *permanent in time*. Logical subjects and predicates, quantitative relations apart, are interchangeable. The relation between them is the analytic relation of identity. The concept of subject, on the other hand, transcendentally viewed, that is, as a *category*, is the apprehension of what is *permanent*, in synthetic distinction from, and relation to, its changing attributes. In other words, the transcendental distinction between *substance* and *accidents* is substituted for that of *subject* and *predicate*. Similarly the logical relation of *ground* and *consequence*, conceived as expressive of logical identity, gives way to the synthetic temporal relation of *cause* and *effect*. And so with all the other pure forms. As categories, they are schemata. Kant has *virtually* recognised this by the names which he gives to the categories of relation. But the proper recognition of the necessary interdependence of the intuitional and conceptual forms came too late to prevent him from distinguishing between categories and schemata, and so from creating for himself the artificial difficulties of the section on schematism.

In A 82 Kant states that he intentionally omits definitions of the categories. He had good reason for so doing. The attempt would have landed him in manifold difficulties, since his views were not yet sufficiently ripe to allow of his perceiving the way of escape. In A 241 (omitted in second edition) Kant makes, however, the directly counter statement that definition of the categories is not possible, giving as his reason that, in isolation from the conditions of sensibility, they are merely logical functions, "without the slightest indication as to how they can possess meaning and objective validity."

It cannot be too often repeated that the *Critique* is not a unitary work, but the patchwork record of twelve years of continuous development. Certain portions of the transcendental deduction, of which A 76-9 is one, represent the latest of all the many stages; and their teaching, when accepted, calls for a radical recasting of the metaphysical deduction. The bringing of the entire *Critique* into line with its maturest parts would have been an Herculean task; and it was one to which Kant, then fifty-seven years of age, was very rightly unwilling to sacrifice the time urgently needed for the writing of his other *Critiques*. The passage before us is one of the many interpolations by which Kant endeavoured to give an external unity to what, on close study, is found to be the plain record of successive and conflicting views. Meantime, in dealing with this passage, we are concerned only to note that if this later mode of defining transcendental logic be accepted, far-reaching modifications in Kant's Critical teaching have to be made. The other points developed in A 76-9 we discuss below in their proper connection.

The same Function, etc. — This passage has already been sufficiently commented upon. Kant here expresses in quite inadequate fashion the standpoint of the transcendental deduction. The implication is that analytic and synthetic thinking are co-ordinate, one and the same faculty exercising, on these two levels, the same operations. The true Critical teaching is that synthetic thinking is alone fundamental, and that only by a regress upon it can judgments be adequately accounted for. This passage, like the preceding, may be of later origin than the main sections of the metaphysical deduction.

Term "Categories" borrowed from Aristotle. — Cf. below, .

Table of Categories. Quantity. — Kant derives the category of unity from the universal, and that of totality (*Allheit*) from the singular. These derivations are extremely artificial. In *Reflexionen*, ii. 563, Kant takes the more natural line of identifying totality with the universal, and unity with the singular. Probably the reason of Kant's change of view is the necessity of obtaining totality by combining unity with multiplicity. That can only be done if universality is thus equated with unity. Watson's explanation, that Kant has reversed the order of the categories, seems to be erroneous.

Quality. — Cf. above, .

Relation. — The correlation of the categorical judgment with the conception of substance and attribute is only possible owing to Kant's neglect of the relational judgment and to the dominance in his logical teaching of the Aristotelian substance-attribute view of predication. The correlation is also open to question in that the relation of subject and predicate terms in a logical judgment is a reversible one. It is a long step from the merely grammatical subject to the conception of that which is always a subject and never a predicate.

Kant's identification of the category of community or reciprocity with the disjunctive judgment, though at first sight the most arbitrary of all, is not more so than many of the others. Its essential correctness has been insisted upon in recent logic by Sigwart, Bradley, and Bosanquet. In Kant's own personal view co-ordination in the form of co-existence is only possible through reciprocal interaction. The relation of whole and part (the parts in their relations of reciprocal exclusion exhausting and constituting a genuine whole) thus becomes, in its application to actual existences, that of reciprocal causation. The reverse likewise holds; interaction is only possible between existences which together constitute a unity. Kant returns to this point in *Note* 3, added in the second edition. The objection which Kant there considers has been very pointedly stated by Schopenhauer.

"What real analogy is there between the problematical determination of a concept by disjunctive predicates and the thought of reciprocity? The two are indeed absolutely opposed, for in the disjunctive judgment the actual affirmation of one of the two alternative propositions is also necessarily the negation of the other; if, on the other hand, we think of two things in the relation of reciprocity, the affirmation of one is also necessarily the affirmation of the other, and *vice versa*."

The answer to this criticism is on the lines suggested by Kant. The various judgments which constitute a disjunction do not, *when viewed as parts of the disjunction*, merely negate one another; they mutually presuppose one another in the total complex. Schopenhauer also fails to observe that in locating the part of a real whole in one part of space, we exclude it from all the others.

Modality. — The existence of separate categories of modality seems highly doubtful. The concepts of the possible and of the probable may be viewed as derivative; the notion of existence does not seem to differ from that of reality; and necessity seems in ultimate analysis to reduce to the concept of ground and consequence. These are points which will be discussed later.

Aristotle's ten categories are enumerated by Kant in *Reflexionen*, ii. 522, as: (1) *substantia*, *accidens*, (2) *qualitas*, (3) *quantitas*, (4) *relatio*, (5) *actio*, (6) *passio*, (7) *quando*, (8) *ubi*, (9) *situs*, (10) *habitus*; and the five post-predicaments as: *oppositum*, *prius*, *simul*, *motus*, *habere*. Eliminating *quando*, *ubi*, *situs*, *prius*, and *simul* as being modes of sensibility; *actio* and *passio* as being complex and derivative; and also omitting *habitus* (condition) and *habere*, as being too general and indefinite in meaning to

constitute separate categories; we are then left with *substantia*, *qualitas*, *quantitas*, *relatio*, and *oppositum*. The most serious defect in this reduced list, from the Kantian point of view, is its omission of causality. It is, however, a curious coincidence that when substance is taken as a form of *relatio*, and *oppositum* as a form of quality, we are left with the three groups, quality, quantity, relation. Only modality is lacking to complete Kant's own fourfold grouping. None the less, as the study of Kant's *Reflexionen* sufficiently proves, it was by an entirely different route that Kant travelled to his metaphysical deduction. Watson does not seem to have any ground for his contention that the above modified list of Aristotle's categories "gave Kant his starting-point." It was there indeed, as the reference to Aristotle in his letter of 1772 to Herz shows, that he first looked for assistance, only, however, to be disappointed in his expectations.

Derivative concepts. — Cf. above, p, 71-2.

I reserve this task for another occasion. — Cf. A 204 = B 249; A 13; above, ff., and below, p-80.

Definitions of categories omitted. — Cf. above, p-6, and A 241 there cited; also below, p-42, 404-5.

Note 1. — On this distinction between mathematical and dynamical categories cf. below, p-7, 510-11.

Note 2. — This remark is inserted to meet a criticism which had been made by Johann Schulze, and to which Kant in February 1784 had replied in terms almost identical with those of the present passage.

"The third category certainly springs from the connection of the first and second, not, indeed, from their mere combination, but from a connection the possibility of which constitutes a concept that is a special category. For this reason the third category may not be applicable in instances in which the other two apply: *e.g. one* year, *many* years of future time, are real concepts, but the *totality* of future years, that is, the collective unity of a future eternity, conceived as entire (so to say, as completed), is something that cannot be thought. But even in those cases in which the third category is applicable, it always contains something more than the first and the second taken separately and together, namely the *derivation* of the second from the first, a process which is not always practicable. Necessity, for example, is nothing else than existence, *in so far as* it can be inferred from possibility. Community is the reciprocal *causality* of *substances* in respect of their determinations. But that determinations of one substance can be produced by another substance, is something that we may not simply assume; it is one of those connections without which there could be no reciprocal relation of things in space, and therefore no outer experience. In a word, I find that just as the conclusion of a syllogism indicates, in addition to the operations of understanding and judgment in the premisses, *a special operation peculiar to reason* ..., so also the third category is a special, and in part original, concept. For instance, the concepts, *quantum*, *compositum*, *totum*, come under the categories unity, plurality, totality, but a *quantum* thought as *compositum* would not yield the concept of totality unless the concept of the *quantum* is thought as determinable through the *composition*, and in certain *quanta*, such as infinite space, that cannot be done."

Kant's assertion that in certain cases the third category is not applicable is misleading. His proof of the validity of the category of reciprocity in the third *Analogy* really consists in showing that it is necessary to the apprehension of spatial co-existence; and if, as Kant maintains, consciousness of space is necessary to consciousness of time, it is thereby proved to be involved in each and every act of consciousness. It is presupposed in the apprehension even of substantial existence and of causal sequence. His proof that it is a unique category, distinct from the mere combination of the categories of substance and causality, does not, therefore, assume what his words in the above letter would seem to imply, that it is only occasionally employed. The same remark holds in regard to totality; it is presupposed even in the apprehension of a single year. Kant's references, both here and in other parts of the *Critique*, to totality in its bearing upon the conception of infinitude, reveal considerable lack of clearness as to the relation in which it stands to the Idea of the unconditioned. Sometimes, as in this letter, he would seem to be identifying them; elsewhere this confusion is avoided. In B 111 totality is defined as multiplicity regarded as unity, and in A 142-3 = B 182 its schema is defined as number. (The identification of totality with number has led Kant to

say in B 111 that number is not applicable in the representation of the infinite, a much more questionable assertion than that of the letter above quoted.) The statement that necessity is existence in so far as it can be inferred from possibility, or that it is existence given through possibility, is similarly misleading. Kant's true position is that all three are necessary to the conception of any one of the three.

Thus Kant's reply to Schulze, alike in his letter and in *Note 2*, fails to indicate with any real adequacy the true bearing of Critical teaching in this matter; and consequently fails to reveal the full force of his position. Only in terms of totality can unity and plurality be apprehended; only through the reciprocal relations which determine co-existence can we acquire consciousness of either permanence or sequence; only in terms of necessity can either existence or possibility be defined. The third category is not derived from a prior knowledge of the subordinate categories. It represents in each case a higher complex within which alone the simpler relations defined by the simpler concepts can exist or have meaning.

B 113-16, § 12. — This section, of no intrinsic importance, is an example of Kant's loving devotion to this "architectonic." His reasoning is extremely artificial, especially in its attempt to connect "unity, truth, and perfection" with the three categories of quantity. The *Reflexionen* show how greatly Kant was preoccupied with these three concepts, seeking either to base a table of categories upon them (B. Erdmann's interpretation), or to reduce them to categories (Adickes' interpretation). For some time Kant himself ranked with those who "incautiously made these criteria of thought to be properties of the things in themselves." In *Reflexionen*, ii. 903, we find the following statement: "Unity (connection, agreement), truth (quality), completeness (quantity)." In ii. 916 Kant makes trial to connect them, as conceptions of possibility, with the categories of relation. In ii. 911 and 912 the later view, that they are logical in character and function, appears, but leads to their being set in relation to the three faculties of understanding, judgment, and reason. This is conjectured by B. Erdmann to have been Kant's view at the time of the first edition. ii. 915, 919, 920 present the view expounded in the section before us. Erdmann remarks that in this section Kant "is settling accounts with certain thoughts which in the 'seventies had yielded suggestions for the transformation of ontology into the transcendental analytic."

CHAPTER II

DEDUCTION OF THE PURE CONCEPTS OF THE UNDERSTANDING

First edition Subjective and Objective Deductions. — In dealing with the transcendental deduction, as given in the first edition, we can make use of the masterly and convincing analysis which Vaihinger (building upon Adickes' previous results, but developing an independent and quite original interpretation) has given of its inconsecutive and strangely bewildering argumentation. Vaihinger's analysis is an excellent example of detective genius in the field of scholarship. From internal evidence, circumstantially supported by the *Reflexionen* and *Lose Blätter*, he is able to prove that the deduction is composed of manuscripts, externally pieced together, and representing no less than four distinct stages in the slow and gradual development of Kant's views. Like geological deposits, they remain to record the processes by which the final result has come to be. Though they do not in their present setting represent the correct chronological order, that may be determined once the proper clues to their disentanglement have been duly discovered. That discovery is itself, however, no easy task; for the unexpected, while lending colour and incident to the commentator's enterprise, baffles his natural expectations at every turn. The first stage is one in which Kant *dispenses* with the categories, and in which, when they are referred to, they are taken as applying *to things in themselves*. The last stage, worked out, as there is ground for believing, in the haste and excitement of the final revision, is not represented in the *Prolegomena* or in the second edition of the *Critique*, the author retracing his steps and resuming the standpoint of the stage which preceded it. The fortunate accident of Kant's having jotted down upon the back of a dated paper the record of his passing thought (one of the few *Lose Blätter* that are thus datable) is the culminating incident in this philosophical drama. It felicitously serves as a keystone in the body of evidence supported by general reasoning.

Before becoming acquainted with Vaihinger's analysis I had observed Kant's ascription to empirical concepts of the functions elsewhere allotted to the categories, but had been hopelessly puzzled as to how such teaching could be fitted into his general system. Vaihinger's view of it as a pre-Critical survival would seem to be the only possible satisfactory solution. For the view which I have taken of Kant's doctrine of the transcendental object as also pre-Critical, and for its employment as a clue to the dating of passages, I am myself alone responsible.

The order of my exposition will be as follows:

I. Enumeration, in chronological order, of the four stages which compose the deduction of the first edition, and citation of the passages which represent each separate stage.

II. Detailed analysis, again in chronological order, of each successive stage, with exposition of the views which it embodies.

III. Examination of the evidence yielded by the *Reflexionen* and *Lose Blätter* in support of the above analysis.

IV. Connected statement and discussion of the total argument of the deduction.

I. Enumeration of the Four Stages

(1) First Stage: That of the Transcendental Object, without Co-operation of the Categories. — This stage is represented by: (*a*) II. 3 (from beginning of the third paragraph to end of 3) = A 104-10; (*b*) I. § 13 (the entire section) = A 84-92 (retained in second edition as B 116-24). *a* discusses the problem of the reference of sensations to an object, *b* that of the objective validity of the categories. *b* is therefore transitional to the second stage.

(2) Second Stage: That of the Categories, without Co-operation of the Productive Imagination. — This

stage is represented by: (*a*) I. [§ 14] (with the exception of its concluding paragraph) = A 92-4 (retained in second edition as B 124-7); (*b*) II. (the first four paragraphs) = A 95-7; (*c*) II. 4 (the entire section) = A 110-14.

(3) Third Stage: That of the Productive Imagination, without Mention of the Threefold Transcendental Synthesis. — This stage is represented by (*a*) III.β (from beginning of seventh paragraph to end of twelfth) = A 119-23; (*b*) III. α (from beginning of third paragraph to end of sixth) = A 116-19; (*c*) I. § 14 (Concluding paragraph) = A 94-5; (*d*) III.δ (from beginning of sixteenth paragraph to end of section preceding summary) = A 126-8; (*e*) S(ummary) (in conclusion to III.) = A 128-30; (*f*) III.γ (from beginning of thirteenth paragraph to end of fifteenth) = A 123-6; (*g*) I(ntroduction) (from beginning of section to end of second paragraph) = A 115-16; (*h*) § 10 T(ransitional to the fourth stage) = A 76-9 (retained as B 102-4).

(4) Fourth Stage: That of the Threefold Transcendental Synthesis. — This stage is represented by: (*a*) II. 1-3 (from opening of 1 to end of second paragraph in 3) = A 98-104; (*b*) II. (the two paragraphs immediately preceding *a*) = A 97-8.

II. Detailed Analysis of the Four Stages

First Stage. — A 104-10; A 84-92 (B 116-24).

A 104-10; II. § 3. — This is the one passage in the *Critique* in which Kant explicitly defines his doctrine of the "transcendental object"; and careful examination of the text shows that by it he means the *thing in itself*, conceived as being the object of our representations. Such teaching is, of course, thoroughly un-Critical; and as I shall try to show, this was very early realised by Kant himself. The passages in which the phrase "transcendental object" occurs are, like the section before us, in every instance of early origin. It is significant that the transcendental object is not again referred to in the deduction of the first edition. Though it reappears in the chapter on phenomena and noumena, it does so in a passage which Kant excised in the second edition. The paragraphs which he then substituted make no mention of it. The doctrine is of frequent occurrence in the *Dialectic*, and combines with other independent evidence to show that the larger part of the *Dialectic* is of early origin. That the doctrine of the transcendental object is thus a pre-Critical or semi-Critical survival has, so far as I am aware, not hitherto been observed by any writer upon Kant. It has invariably been interpreted in the light of the sections in which it does not occur, and, as thus toned down and tempered to something altogether different from what it really stands for, has been taken as an essential and characteristic tenet of the Critical philosophy. It was in the course of an attempt to interpret Kant's entire argument in the light of his doctrine of the transcendental object that I first came to detect its absence from all his later utterances. But it is important to recognise that the difficulties which would result from its retention are quite insuperable, and would by themselves, even in the absence of all external evidence of Kant's rejection of it, compel us to regard it as a survival of pre-Critical thinking. As Vaihinger does not seem to have detected the un-Critical character of this doctrine, it is the more significant that he should, on other grounds, have felt constrained to regard the passage in which it is expounded as embodying the earliest stage in the development of the deduction. He would seem to continue in the orthodox view so far as to hold that though the doctrine of the transcendental object is here stated in pre-Critical terms, it was permanently retained by Kant in altered form.

The doctrine of the transcendental object, as here expounded, is as follows:

"Appearances are themselves nothing but sensuous representations which must not be taken as capable of existing in themselves (*an sich*) with exactly the same character (*in ebenderselben Art*) outside our power of representation."

These sense-representations are our only possible representations, and when we speak of an object corresponding to them, we must be conceiving an object in general, equal to *x*.

"They have their object, but an object which can never be intuited by us, and which may therefore be

named the non-empirical, *i.e.* transcendental object = *x*."

This object is conceived as being that which prevents our representations from occurring at haphazard, necessitating their order in such manner that, manifold and varied as they may be, they can yet be self-consistent in their several groupings, and so possess that unity which is essential to the concept of an object.

"The pure concept of this transcendental object, which in fact throughout all our knowledge is always one and the same, is that which can alone confer upon all our empirical concepts relation in general to an object, *i.e.* objective reality."

What renders this doctrine impossible of permanent retention was that it allowed of no objective existence mediate between the merely subjective and the thing in itself. On such teaching there is no room for the empirical object; and immediately upon the recognition of that latter phenomenal form of existence in space, Kant was constrained to recognise that it is in the empirical object, not in the thing in itself, that the contents of our representations are grounded and unified. Any other view must involve the application of the categories, especially those of substance and causality, to the thing in itself. The entire empirical world has still to be conceived as grounded in the non-empirical, but that is a very different contention from the thesis that the thing in itself is the object and the sole object of our representations. The doctrine of the transcendental object has thus a twofold defect: it advocates an extreme subjectivism, and yet at the same time applies the categories to the thing in itself.

But the latter consequence is one which could not, at the stage represented by this section, be appreciated by Kant. For, as we shall find, he is endeavouring to solve the problem of the reference of sense-representation to an object without assumption of *a priori* categories. It is in *empirical* concepts, conditioned only by a transcendental apperception, that he professes to discover the grounds and conditions of this objective reference. Let us follow Kant's argument in detail. The section opens with what may be a reference to the *Aesthetic*, and proceeds to deal with the first of the two problems cited in the 1772 letter to Herz — how *sense*-representations stand related to their object. The exact terms in which this question was there formulated should be noted.

"I propounded to myself this question: on what ground rests the relation of that in us which we name representation (*Vorstellung*) to the object. If the representation contains only the mode in which the subject is affected by the object, it is easily understood how it should accord (*gemäss sei*) with that object as an effect with its cause, and how [therefore] this determination of our mind should be able to *represent* something, *i.e.* have an object. The passive or sensuous representations have thus a comprehensible (*begreifliche*) relation to objects, and the principles, which are borrowed from the nature of our soul, have a comprehensible validity for all things in so far as they are to be objects of the senses."

Thus in 1772 there was here no real problem for Kant. The assumed fact, that our representations are generated in us by the action of independent existences, is taken as sufficient explanation of their being referred to objects.

The section of the *Critique* under consideration shows that Kant had come to realise the inadequacy of this explanation quite early, indeed prior to his solution of the second and further question which in that same letter is spoken of as "the key to the whole secret" of metaphysics. On what grounds, he now asks, is a subjective idea, *even though it be a sense impression*, capable of yielding consciousness of an object? In the letter to Herz the use of the term representation (*Vorstellung*) undoubtedly helped to conceal this problem. It is now emphasised that appearances are nothing but sense representations, and must never be regarded as objects capable of existing in themselves, with exactly the same character, outside our power of representation. Now also Kant employs, in place of the phrase "in accord with," the much more definite term "corresponding to." He points out that when we speak of an object *corresponding* to our knowledge, we imply that it is distinct from that knowledge. Consciousness of such an object must

therefore be acquired from some other source than the given impressions. In other words, Kant is now prepared to withdraw his statement that "the passive or sensuous representations have an [easily] comprehensible relation to objects." In and by themselves they are purely subjective, and can involve no such concept. The latter is a thought (*Gedanke*), a concept (*Begriff*), additional to, and distinct from, the given impressions. Its possibility, as regards both origin and validity, must be "deduced."

There then results this first and very peculiar form of the transcendental deduction. That part of it which persists in the successive stages rests upon an explicitly developed distinction between empirical and transcendental apperception. Kant teaches, in agreement with Hume, though, as we may believe, independently of his direct influence, that there is no single empirical state of the self which is constant throughout experience.

"The consciousness of the self, according to the determinations of our state in inner perception, is merely empirical, and always in process of change.... That which has to be represented as of necessity numerically identical cannot be thought as such through empirical data. There must be a condition which precedes all experience, and renders experience itself possible, if a transcendental pre-supposition of this kind is to be rendered valid.... This pure, original, unchangeable consciousness I shall name transcendental apperception."

Kant would seem to have first developed this view in a quite crude form. The consciousness of the self, he seems to have held, consists in its awareness of its own unceasing activities. As consciousness of *activity*, it is entirely distinct in nature and in origin from all apprehension of sense impressions. This teaching is a natural extension of the doctrine of the *Dissertation*, that such pure notions as those of possibility, existence, necessity, substance, cause, are "acquired by attending to the actions of the mind on the occasion of experience." Kant would very naturally hold that consciousness of the identity and unity of the self is obtained in a similar manner. Such, indeed, is the teaching of the section before us.

"No knowledge can take place in us ... without that unity of consciousness which precedes all data of intuitions, and in relation to which all representation of objects is alone possible." "It is precisely this transcendental apperception that constructs out of (*macht aus*) all possible appearances, which are capable of coexisting in one experience, a connection of all these representations according to laws. For this unity of consciousness would be impossible if the mind could not become conscious, in the knowledge of the manifold, of the identity of the function whereby it combines it synthetically in one knowledge. Thus the mind's original and necessary consciousness of the identity of itself is at the same time a consciousness of an equally necessary unity of the synthesis of all appearances according to concepts, *i.e.* according to rules.... For the mind could not possibly think the identity of itself in the manifold of its representations, and indeed *a priori*, if it did not have before its eyes the identity of its action...."

That is to say, the self is the sole source of all unity. As a pure and original unity it precedes experience; to its synthetic activities all conceptual unity is due; and by reflection upon the constancy of these activities it comes to consciousness of its own identity.

"...even the purest objective unity, namely that of the *a priori* concepts (space and time), is possible only through relation of the intuitions to [transcendental apperception]. The numerical unity of this apperception is therefore the *a priori* condition of all concepts, just as the manifoldness of space and of time is of the intuitions of sensibility."

To this consciousness of the abiding unity of the self Kant also traces the notion of the transcendental object. The latter, he would seem to argue, is formed by analogy from the former.

"This object is nothing else than the subjective representation (of the subject) itself, but made general, for I am the original of all objects." "The mind, through its original and underived thinking, is itself the pattern (*Urbild*) of such a synthesis." "I would not represent anything as outside me, and so make [subjective] appearances into objective experience if the representations were not related to something

which is parallel to my ego, and so in that way referred by me to another subject."

These quotations from the *Lose Blätter* would seem to contain the key to Kant's extremely enigmatic statement in A 105, that "the unity which the object makes necessary can be nothing else than the formal unity of consciousness in its synthesis of the manifold of its representations," and again in A 109, that "this relation [of representations to an object] is nothing else than the necessary unity of consciousness."

But this does not complete the sum-total of the functions which Kant is at this stage prepared to assign to apperception. It mediates our consciousness of the transcendental object in still another manner, namely, by rendering possible the formation of the *empirical* concepts which unify and direct its synthetic activities. This is, indeed, the feature in which this form of the deduction diverges most radically from all later positions. Space and time are, it would seem, regarded as being the sole *a priori* concepts. The instruments through which the unity of apperception acts, and through which the thought of an object becomes possible, are *empirical* concepts. Such general concepts as "body" or "triangle" serve as rules constraining the synthetic processes of apprehension and reproduction to take place in such unitary fashion as is required for unitary consciousness. The notion of objectivity is specified in terms of the necessities which these empirical concepts thus impose.

"We think a triangle as object in so far as we are conscious of the combination of three straight lines according to a rule by which such an intuition can at all times be generated. This unity of rule determines the whole manifold and limits it to conditions which make the unity of apperception possible; and the concept of this unity [of rule] is the representation of the object.... All knowledge demands a concept, ... and a concept is always, as regards its form, something general, something that serves as a rule. Thus the concept of body serves as a rule to our knowledge of outer appearances, in accordance with the unity of the manifold which is thought through it.... The concept of body necessitates ... the representation of extension, and therewith of impenetrability, shape, etc."

Such is the manner in which Kant accounts for our concept of the transcendental object. It consists of two main elements: first, the notion of an unknown *x*, to which representations may be referred; and secondly, the consciousness of this *x* as exercising compulsion upon the order of our thinking. The former notion is framed on the pattern of the transcendental subject; it is conceived as another but unknown subject. The consciousness of it as a source of external necessity is mediated by the empirical concepts which transcendental apperception also makes possible. And from this explanation of the *origin* of the concept of the transcendental object Kant derives the proof of its *validity*. It is indispensable for the realisation by the unitary self of a unitary consciousness.

"This relation [of representations to an object] is nothing else than the necessary unity of consciousness, and therefore also of the synthesis of the manifold, by a common (*gemeinschaftlich*) functioning of the mind, which unites it in one representation."

Through instruments empirical in origin, and subjectively necessary, the notion of an objective necessity is rendered possible to the mind.

It is not surprising that Kant did not permanently hold to this view of the empirical concept. The objections are obvious. Such a view of the function of general concepts renders unintelligible their own first formation. For as they are empirical, they can only be acquired by conscious processes that do not involve them. That is to say, consciousness of objects follows upon a prior consciousness in and through which concepts, such as that of body, are discovered and formed. Yet, as the argument claims, general concepts are the indispensable conditions of unitary consciousness. How through a consciousness that is not yet unified can general concepts be formed? Also it is difficult to see how empirical concepts can be viewed as directly conditioned by, and as immediately due to, anything so general as pure apperception. These objections Kant must have come very quickly to recognise. This was the first part of his teaching to be modified. In the immediately succeeding stage, so far as the stages can be reconstructed from the survivals in the *Critique*, the empirical concepts are displaced once and for all by the *a priori* categories.

The only sentences which can be regarded as possibly conflicting with the above interpretation are those two (in the second last and in the last paragraphs) in which the phrase "rules *a priori*" occurs. Even granting (what is at least questionable as regards the first) that the words are meant to be taken together, it does not follow that Kant is here speaking of categories. For contrary to his usual teaching he speaks of the concept of body as a source of necessity. If so, it may well, with equal looseness, be spoken of as *a priori*. That is indeed done, by implication, in the second and third paragraphs, where he speaks of a rule (referring to "body and triangle") as making the synthesis of reproduction "*a priori* necessary." Such assertions are completely inconsistent with Kant's Critical teaching, but so is the entire section.

The setting in which the passage before us occurs has its own special interest. When Kant, as it would seem, on the very eve of the publication of the *Critique,* developed the doctrine of a threefold synthesis culminating in a "synthesis of recognition in the concept," he must have bethought himself of this earlier position, and have completed his subjective deduction by incorporation, probably with occasional alterations of phrasing, of the older manuscript. This procedure has bewildered even the most discerning among Kant's readers; but now, thanks to Vaihinger's convincing analysis, it may be welcomed as of illuminating interest in the historical study of Kant's development.

I may here draw attention to the two important respects in which the positions revealed in this section continued to influence Kant's later teaching: namely, in the emphasis laid upon the transcendental unity of apperception, and in the view of objectivity as involving the thought of the thing in itself.

The excessive emphasis which in this first stage is laid upon the transcendental unity of apperception persists throughout the later forms of the deduction, and, as I shall try to show, does so to the detriment of the argument. Though its functions are considerably diminished, they are still exaggerated; this is perhaps in part due to its having been in this early stage regarded as in and by itself the sole ultimate ground of unitary experience. There were, however, two other influences at work. Kant continued to employ the terminology of his earlier view, and in his less watchful moments was betrayed thereby into conflict with his considered teaching. But even more important was the influence of his personal convictions. He was irrevocably committed in his own private thinking to a belief in the spiritual and abiding character of the self; and this belief frequently colours, in illegitimate ways, the expression of his views. This is especially evident in some of the alterations of the second edition, written as they were at a time when he was chiefly preoccupied with moral problems.

As regards the other factor, the view adopted in regard to the nature of objectivity, there is ample evidence that even after the empirical concepts had been displaced by the categories Kant still continued for some time (possibly for several years in the earlier and middle 'seventies) to hold to his doctrine of the transcendental object. Passages which expound it in this later form occur in the *Note on Amphiboly* and throughout the *Dialectic*. That this may not be taken for his final teaching is equally certain. The entire first layer of the deduction of the first edition, all the relevant passages in the chapter on phenomena and noumena, and some of those in the *Dialectic,* were omitted in the second edition; and nowhere, either in the other portions of the deduction of the first edition, or in the deduction of the second edition, or in any passages added elsewhere in the second edition, is such teaching to be found.

A brief statement of Kant's doctrine of the transcendental object *in its later form* seems advisable at this point; it is required in order to complete and to confirm the interpretation which I have given of the earlier exposition. At the same time I shall endeavour to show that the sections in which the doctrine occurs, though later than the first layer of the deduction of the first edition, are all of comparatively early origin, and that they reveal not the least trace of Kant's more mature, phenomenalist view of the empirical world in space.

We may begin with the passages in the chapter on phenomena and noumena. The meaning in which the term transcendental is employed is there made sufficiently clear.

"The transcendental employment of a concept in any principle consists in its being referred to things *in*

general and in themselves."

That is to say, the term transcendental, as used in the phrase transcendental object, is not employed in any sense which would oppose it to the transcendent. In so far as the thought of the thing in itself is a necessary ingredient in the concept of objectivity, it is a condition of apperception, and therefore of possible experience; in other words, *the thought of a transcendent object is one of the transcendental conditions of our experience*. As Kant is constantly interchanging the terms transcendent and transcendental, such an explanation of the phrase is perhaps superfluous; but if any is called for, the above would seem to suffice. As we shall have occasion to observe, other factors besides the *a priori* must be reckoned among the conditions of experience; and to both types of conditions Kant applies the epithet transcendental.

In the chapter on phenomena and noumena Kant enquires at considerable length whether the categories (meaning, of course, the pure forms of understanding, not their schematised correlates) allow of transcendental (*i.e.* transcendent) employment. The passages in which this discussion occurs would seem, however, to be highly composite; many paragraphs, or portions of paragraphs, are of much later date than others. We may therefore limit our attention to those in which the phrase transcendental object is actually employed, *i.e.* to those which appear only in the first edition.

"All our representations are referred by the understanding to some object; and since appearances are merely representations, the understanding refers them to a *something* as the object of sensuous intuition. But this something, thus conceived (*in so fern*), is only the transcendental object; and by that is meant a something = x, of which we know, and with the present constitution of our understanding can know, nothing whatsoever, but which, as a correlate of the unity of apperception, can serve only for the unity of the manifold in sensuous intuition. By means of this unity the understanding combines the manifold into the concept of an object. This transcendental object cannot be separated from the sense data, for nothing then remains over through which it might be thought. Consequently it is not in itself an object of knowledge, but only the representation of appearances under the concept of an object in general which is determinable through the manifold of those appearances. Precisely for this reason also the categories do not represent a special object given to the understanding alone, but only serve to specify the transcendental object (the concept of something in general) through that which is given in sensibility, in order thereby to know appearances empirically under concepts of objects." "The object to which I relate appearance in general is the transcendental object, *i.e.* the completely indeterminate thought of *something* in general. This cannot be entitled the *noumenon* [*i.e.* the thing in itself more specifically determined as being the object of a purely intelligible intuition]; for I know nothing of what it is in itself, and have no concept of it save as the object of a sensuous intuition in general, and so as being one and the same for all appearances."

Otherwise stated, Kant's teaching is as follows. The thought of the thing in itself remains altogether indeterminate; it does not *specify* its object, and therefore yields no knowledge of it; none the less it is a necessary ingredient in the concept of objectivity as such. The object as specified in terms of sense is *mere representation*; the object as genuinely objective can only be thought. The correlate of the unity of apperception is the thought of the thing in itself. This is what Kant is really asserting, though in a hesitating manner which would seem to indicate that he is himself already more or less conscious of its unsatisfactory and un-Critical character.

The phrase transcendental object occurs once in the second *Analogy* and twice in the *Note on Amphiboly*. The passage in the second *Analogy* may very well, in view of the kind of subjectivism which it expounds, be of early date of writing. By transcendental object Kant there quite obviously means the thing in itself. From the first reference in the *Note on Amphiboly* no definite conclusions can be drawn. The argument is too closely bound up with his criticism of Leibniz to allow of his own independent standpoint being properly developed. There is, however, nothing in it which compels us to regard it as of late origin; and quite evidently Kant here means by the transcendental object the thing in itself. The phrase

substantia phaenomenon is not, as might at first sight seem, equivalent to the empirical object of Kant's phenomenalist teaching. It is an adaptation of Leibnizian phraseology. The second reference in the *Note on Amphiboly* occurs in a passage which may perhaps be of later origin; but the transcendental object is there mentioned only in order to afford opportunity for the statements that it cannot be thought through any of the categories, that we are completely ignorant whether it is within or without us, and whether if sensibility were removed it would vanish or remain, and that it can therefore serve only as a limiting concept. We here observe it in the very process of being eliminated. As we shall find, Kant's teaching is ill-expressed in the sections on *Amphiboly*; so much so that they could not be recast without seriously disturbing the balance of his architectonic. They were therefore allowed to remain unaltered in the second edition.

We may now pass to the *Dialectic*. The subjectivist doctrine of the transcendental object is there expressed in a much more uncompromising manner. Let us first consider the references to the transcendental object in the *Paralogisms* and in the subsequent *Reflection*. The phrase transcendental object occurs twice in the second *Paralogism*, once in the third, twice in the fourth, and three times in the *Reflection*; and in all these cases there is not the least uncertainty as to its denotation. It is taken as equivalent to the thing in itself, and is expounded as a necessary ingredient in the consciousness of our subjective representations as noumenally grounded.

"What matter may be as a thing in itself (transcendental object) is completely unknown to us, though, owing to its being represented as something external, its permanence as appearance can indeed be observed." "We can indeed admit that something, which may be (in the transcendental sense) 'outside us,' is the cause of our outer intuitions, but this is not the object of which we are thinking in the representations of matter and of corporeal things, for these are merely appearances, *i.e.* mere kinds of representation which are never to be met with save in us, and whose actuality depends on immediate consciousness just as does the consciousness of my own thoughts. The transcendental object is equally unknown in respect to inner and to outer intuition."

Here Kant at one and the same time distinguishes between, and confounds together, representation and its empirical object. What is alone clear is that by the transcendental object he means simply the thing in itself viewed as the cause of our sensations. In A 358 it is used in a wider sense as also comprehending the noumenal conditions which underlie the conscious subject.

"...this something which underlies the outer appearances and which so affects our sense that it obtains the representations of space, matter, shape, etc., this something viewed as noumenon (or better as transcendental object) might also at the same time be the subject that does our thinking...."

Similarly in A 379-80:

"Though the I, as represented through inner sense in time, and objects in space outside me, are specifically quite distinct appearances, they are not for that reason thought as being different things. Neither the transcendental object which underlies outer appearances, nor that which underlies inner intuition, is in itself either matter or a thinking being, but is a ground (to us unknown) of the appearances which supply to us the empirical concepts of the former as well as of the latter kind."

The references in the *Reflection on the Paralogisms* are of the same general character and are equally definite. A 390-1 has special interest in that it explicitly states that to appearances, taken as Kant invariably takes them throughout the *Paralogisms* in the first edition as mere subjective representations, the category of causality, and therefore by implication the category of substance, is inapplicable.

"No one could dream of asserting that that which he has once come to recognise as mere representation is an outer cause."

We may now turn to the passages in the chapter on the *Antinomies*.

"The non-sensuous cause of our representations is completely unknown to us, and therefore we cannot

intuit it as object.... We may, however, entitle the purely intelligible cause of appearances in general the transcendental object.... To this transcendental object we can ascribe the whole extent and connection of our possible perceptions....”

Appearances can be regarded as real only to the extent to which they are actually experienced. Otherwise they exist only in some unknown noumenal form of which we can acquire no definite concept, and which is therefore really nothing to us. This, Kant declares, is true even of that immemorial past of which we are ourselves the product.

“...all the events which have taken place in the immense periods that have preceded my own existence mean really nothing but the possibility of extending the chain of experience from the present perception back to the conditions which determine it in time.”

In other words, we may not claim that such events, empirically conceived, have ever actually existed in any such empirical form. A similar interpretation is given to the assertion of the present reality of what has never been actually experienced.

“Moreover, in outcome it is a matter of indifference whether I say that in the empirical progress in space I can meet with stars a hundred times farther removed than the outermost now perceptible to me, or whether I say that they are perhaps to be met with in cosmical space even though no human being has ever perceived or ever will perceive them. For though they might be given as things in themselves, without relation to possible experience, they are still nothing for me, and therefore are not objects, save in so far as they are contained in the series of the empirical regress.” “The cause of the empirical conditions of this process, that which determines what members I shall meet with and how far by means of such members I can carry out the regress, is transcendental and is therefore necessarily unknown to me.”

Such is the form in which Kant’s pre-Critical doctrine of the transcendental object survives in the *Critique*. It contains no trace of the teaching of the objective deduction of the first and second edition or of the teaching of the refutation of idealism in the second edition. It closely resembles Mill’s doctrine of the permanent possibilities of sensation, and is almost equally subjectivist in character. As already noted, it also lies open to the further objection that it involves an illegitimate application of the categories to things in themselves. As Kant started from the naïve and natural assumption that reference of representations to objects must be their reference to things in themselves, he also took over the current Cartesian view that it is by an inference in terms of the category of causality that we advance from a representation to its cause. The thing in itself is regarded as the sole true substance and as the real cause of everything which happens in the natural world. Appearances, being representations merely, are wholly transitory and completely inefficacious. *Not only, therefore, are the categories regarded as valid of things in themselves, they are also declared to have no possible application to phenomena.* Sense appearances do not, on this view, constitute the mechanical world of the natural sciences; they have a purely subjective, more or less epi-phenomenal, existence in the mind of each separate observer. It was very gradually, in the process of developing his own Critical teaching, that Kant came to realise the very different position to which he was thereby committed. The categories, including that of causality, are pre-empted for the *empirical* object which is now regarded as immediately apprehended; and the function of mediating the reference of phenomena to things in themselves now falls to the Ideas of Reason. The distinction between appearance and reality is no longer that between representations and their noumenal causes, but between the limited and relative character of the entire world in space and time and the unconditioned demanded by Reason. But these are questions whose discussion must meantime be deferred.

I may now briefly summarise the evidence in favour of the view that the doctrine of the transcendental object is a pre-Critical or semi-Critical survival and must not be taken as forming part of Kant’s final and considered position. (I) Of the six sections in which the phrase transcendental object occurs, three were omitted in the second edition, and in the passages which were substituted for them it receives no mention.

There are various reasons which can be suggested in explanation of the retention of the other three in the second edition. The *Note on Amphiboly* was too unsatisfactory as a whole to encourage Kant to improve upon it in detail. The other two are outside the limit at which Kant thought good to terminate all attempts to improve, whether in major or in minor matters, the text of the first edition. To have recast the *Antinomies* as he had recast the *Paralogisms* would have involved alterations much too extensive. Also, there were no outside polemical influences — or at least none acting quite directly — such as undoubtedly reinforced his other reasons for revising the *Paralogisms*. (2) Secondly, the transcendental object is not mentioned in the later layers of the deduction of the first edition, nor in the deduction of the second edition, nor in any passage or note added in the second edition. That Kant should thus suddenly cease to employ a phrase to which he had accustomed himself is the more significant in view of his conservative preference for the adapting of familiar terminology to new uses. It can only be explained as due to his recognition of the completely untenable character of the teaching to which it had given expression. As the object of knowledge is always empirical, it can never legitimately be called transcendental. (3) Thirdly, the general teaching of the passages in which the phrase transcendental object occurs is by itself sufficient proof of their early origin. They reveal not the least trace of the deepened insight of his final standpoints. As we know, it was certain difficulties involved in the working out of the objective deduction that delayed the publication of the *Critique* for so many years; and the sections which deal with these difficulties contain Kant's maturest teaching. In them he seems to withdraw definitely from the positions to which he had unwarily committed himself by his un-Critical doctrine of the transcendental object. I now pass to the second section constitutive of the first stage.

A 84-92=B 116-24, I. § 13. — Just as in II. § 3 Kant deals solely with the first of the two questions formulated in the letter of 1772 to Herz — the reference of *sense*-representations to an object, — so in I. § 13 he raises only the second — that of the objective validity of *intellectual* representations (now spoken of as pure concepts of understanding, or pure *a priori* concepts, and only in one sentence as categories). And just as in the former section he carries the problem a step further, yet without attaining to the true Critical position, so in this latter he still assumes that it is the application of these pure concepts to real independent objects, *i.e.* to *things in themselves*, which calls for justification. We must again consider the exact terms in which this problem is formulated in the letter to Herz.

"Similarly, if that in us which is called a representation, were active in relation to the object, that is to say, if the object itself were produced by the representation (as on the view that the ideas in the Divine Mind are the archetypes of things), the conformity of representations with objects might be understood. We can thus render comprehensible at least the possibility of two kinds of intelligence — of an *intellectus archetypus*, on whose intuition the things themselves are grounded, and of an *intellectus ectypus* which derives the data of its logical procedure from the sensuous intuition of things. But our understanding (leaving moral ends out of account) is not the cause of the object through its representations, nor is the object the cause of its intellectual representations (*in sensu reali*). Hence, the pure concepts of the understanding cannot be abstracted from the data of the senses, nor do they express our capacity for receiving representations through the senses. But, whilst they have their sources in the nature of the soul, they originate there neither as the result of the action of the object upon it, nor as themselves producing the object. In the *Dissertation* I was content to explain the nature of these intellectual representations in a merely negative manner, viz. as not being modifications of the soul produced by the object. But I silently passed over the further question, how such representations, which refer to an object and yet are not the result of an affection due to that object, can be possible. I had maintained that the sense representations represent things as they appear, the intellectual representations things as they are. But how then are these things given to us, if not by the manner in which they affect us? And if such intellectual representations are due to our own inner activity, whence comes the agreement which they are supposed to have with objects, which yet are not their products? How comes it that the

axioms of pure reason about these objects agree with the latter, when this agreement has not been in any way assisted by experience? In mathematics such procedure is legitimate, because its objects only *are* quantities for us, and can only be represented as quantities, in so far as we can generate their representation by repeating a unit a number of times. Hence the concepts of quantity can be self-producing, and their principles can therefore be determined *a priori*. But when we ask how the understanding can form to itself completely *a priori* concepts of things in their *qualitative* determination, with which these things must of necessity agree, or formulate in regard to their possibility principles which are independent of experience, but with which experience must exactly conform, — we raise a question, that of the origin of the agreement of our faculty of understanding with the things in themselves, over which obscurity still hangs."

The section before us represents the same general standpoint as that given in the above letter. Here, too, it is the validity of the *a priori* concepts in reference to *things in themselves* that is under consideration. The implication of Kant's argument is that the categories, being neither determinable nor discoverable by means of experience, will only apply to appearances if they determine, or rather reveal, the actual non-experienced nature of things in themselves. These pure concepts, it is implied, owing to their combined *a priori* and intellectual characteristics, make this inherent claim. Either they are altogether empty and illusory, or such unlimited validity must be granted to them. Kant, that is to say, still holds, as in the *Dissertation*, that sense-representations reveal things as they *appear*, intellectual representations things as they *are*.

"We have either to surrender completely all claims to judgments of pure reason, in the most esteemed of all fields, that which extends beyond the limits of all possible experience, or we must bring this Critical investigation to perfection."

The pure concepts, unlike space, "apply to objects generally, apart from the conditions of sensibility." But here also, as in the letter to Herz, the strange and problematic character of such knowledge is clearly recognised.

Kant's discussion of the concept of causality in A 90 may seem to conflict with the above contention — that it is its applicability to things in themselves which Kant is considering. But this difficulty vanishes if we bear in mind that here, as in the *Dissertation*, there is no such distinction as we find in Kant's later more genuinely phenomenalist position, between the objects causing our sensations and *things in themselves*. The purely intelligible object, supposed to remain after elimination of the empirical and *a priori* sensory factors, is the thing in itself. The objects apprehended through sense are real, only not in their sensuous form.

There are two connected facts which together may perhaps be taken as evidence that I. § 13 is later than II. 3 *b*. Intellectual concepts are reinstated alongside the *a priori* concepts of space and time. Kant has evidently in the meantime given up the attempt to construe the former as empirical in origin. That that attempt was earlier in time would seem to be proved by the further fact, that the *a priori* concepts are here viewed as performing the same kind of function as that ascribed in II. 3 *b* to concepts that are empirical. They are conditions of the "synthetic unity of thought." This view of the function of concepts is certainly fundamental and important, and Kant permanently retained it from his previous abortive method of 'deduction.' But it was a long step from the discovery of the distinction between empirical and *a priori* concepts to its fruitful application. That involved appreciation of the further fact that the two problems, separately stated in the letter to Herz and separately dealt with in II. 3 *b* and in I. § 13 — the problem of the relation of *sense*-representations, and the problem of the relation of *intellectual* representations, to an object, — are indeed one and the same, soluble from one and the same standpoint, by one and the same method of deduction, namely, by reference to the possibility of experience. Only in and through relation to an object can sense-representations be apprehended; and only as conditions of such sense-experience are the categories objectively valid. Relation to an object is constituted by the categories, and is necessary in

reference to sense-representations, because only thereby is consciousness of any kind possible at all.

That this truly Critical position had not been attained when I. § 13 was written, is shown not only by its concentration on the single problem of the validity of *a priori* concepts, but also by its repeated assertion that representations can be consciously apprehended independently of all relation to the faculty of understanding. The directly counter assertion appears, however, in the sections (I. § 14, II.: first four paragraphs) which immediately follow in the text of the *Critique* — indicating that in the period represented by these latter the revolutionary discovery, the truly Copernican hypothesis, had at last been achieved. They constitute the second stage, and to it we may now proceed.

Second Stage. — A 92-4 = B 124-7; A 95-7; A 110-14.

A 92-4, I. § 14 (with the exception of the concluding classification of mental powers). — This section makes a fresh start; it stands in no necessary relation to any preceding section. The problem is still formulated, in its opening sentences, in terms reminiscent of the letter to Herz; but otherwise the standpoint is entirely new, and save for the wording of a single sentence (A 93: "if not intuited, yet"), is genuinely Critical. The phrase "possibility of experience" now appears, and is at once assigned the central rôle. The words "if not intuited, yet" in A 93 may possibly have been inserted later in order to tone down the flagrant contradiction with the preceding paragraphs. In any case, even this qualification is explicitly retracted in A 94.

A 95-7. — The same standpoint appears in the first three paragraphs of Section II. The categories are "the *a priori* conditions on which the possibility of experience depends." By the categories alone "can an object be thought." The further important point that only in their empirical employment do the categories have use and meaning is excellently developed.

"An *a priori* concept not referring to experience would be the logical form only of a concept, but not the concept itself by which something is thought."

A 110-14, II. 4. — In this section also the argument starts afresh, indicating (if such evidence were required) that, like I. § 14, it must have been written independently of its present context. But the argument is now advanced one step further. The categories are recognised as simultaneously conditioning both unity of consciousness and objectivity.

"There is but one experience ... as there is but one space and one time...." "The *a priori* conditions of a possible experience are at the same time conditions of the possibility of objects of experience" "...the necessity of these categories rests on the relation which our whole sensibility, and with it also all possible appearances, have to the original unity of apperception...."

Now also it is *emphasised* that save in and through *a priori* concepts no representations can exist for consciousness.

"They would then belong to no experience, would be without an object, a blind play of representations, less even than a dream." They "would be to us the same as nothing."

The wording is still not altogether unambiguous, but the main point is made sufficiently clear.

These paragraphs are the earliest in which traces of a genuine phenomenalism can be detected. The transcendental object, one and the same for all our knowledge, is not referred to. 'Objects' (in the plural) is the term which is used wherever the context permits. The empirical object is thus made to intervene between the thing in itself and the subjective representations. But the distinction between empirical objects and subjective representations on the one hand, and between empirical objects and things in themselves on the other, is not yet drawn in any really clear and definite manner.

A similar phenomenalist tendency crops out in Kant's distinction between objective affinity and subjective association.

"The ground of the possibility of the association of the manifold, so far as it lies in the object, is named the affinity of the manifold."

None the less Kant's subjectivism finds one of its most decided expressions in A 114.

Third Stage. — A 119-23 = III. β; A 116-19 = III. α; A 94-5 = I. § 14 C(oncluding paragraph); A 126-8 = III. δ; A 128-30 = S(ummary); A 123-6 = III. γ; A 115-16 = III. I(ntroduction); A 76-9 (B 102-4) = § 10 T(ransition to fourth stage).

A 119-23, III. β (from the beginning of the seventh paragraph to the end of the twelfth). The doctrine of objective affinity already developed in the above sections is now made to rest upon a new faculty, the productive imagination. As Vaihinger remarks, the wording of this section would seem to indicate that it is Kant's first attempt at formulating that new doctrine. He has not as yet got over his own surprise at the revolutionary nature of the conclusions to which he feels himself driven by the exigencies of Critical teaching. He finds that it is deepening into consequences which may lead very far from the current psychology and from his own previous views regarding the nature and conditions of the knowing process and of personality. As evidence that this section was not written continuously with II. 4, we have the further fact that though the doctrine of objective affinity is dwelt upon, it is described afresh, with no reference to the preceding account. Also, the empirical processes of apprehension and reproduction, already mentioned in A 104-10, are now ascribed to the empirical imagination which is carefully distinguished from the productive.

III. α repeats "from above" the argument given in III. β "from below." It insists upon the close connection between the categories (first introduced in II. 4) with the productive imagination of III. β.

Vaihinger places III. δ next in order, on account of the connection of its argument with III. α. But it dwells only upon the chief outcome of the total argument, viz. that the orderliness of nature is due to understanding. That productive imagination is not mentioned, is taken by Vaihinger to signify Kant's recognition that it can be postulated only hypothetically, and that as doctrine it is not absolutely essential to the strict deduction.

S summarises the entire argument, and in it "pure imagination" receives mention.

Within this third stage III. γ is subsequent to the above four sections. For it carries the doctrine of productive imagination one step further. In III. β, III. α, and S, productive imagination has been treated merely as an auxiliary function of pure understanding.

"The unity of apperception in relation to the synthesis of imagination is the *understanding*; and the same unity with reference to the transcendental synthesis of the imagination is the *pure understanding*."

It is now treated as a separate and distinct faculty. So far from being a function of understanding, its synthesis "by itself, though carried out *a priori*, is always sensuous." It is

"one of the fundamental faculties of the human soul.... The two extreme ends, sensibility and understanding, must be brought into connection with each other by means of this transcendental function of imagination."

In this section there also appears a new element which would seem to connect it with the next following stage, namely, the addition to the series, apprehension, association, and reproduction, of the further process, recognition. As here introduced it is extremely ambiguous in character. It is counted as being empirical, and yet as containing *a priori* concepts. This decidedly hybrid process would seem to represent Kant's first formulation of the even more ambiguous process, which corresponds to it in the fourth stage.

In III. I recognition is again mentioned, but this time in a form still more akin to its treatment in the fourth stage. It is not recognition through categories, but, as a form in apperception, is the

"empirical consciousness of the identity of the reproductive representations with the appearances by which they were given."

In all other respects, however, the above six sections agree (along with I. § 14 C) in holding to a threefold division of mental powers: sensibility, imagination, and apperception. This third stage is thereby marked off sufficiently clearly from the second stage in which pure imagination is wanting, and from the fourth stage in which it is dissolved into a threefold *a priori* synthesis.

In both I. § 14 C and in III. I the classification which underlies the third stage is explicitly formulated. Their statements harmoniously combine to yield the following tabular statement:

1. The *synopsis* of the manifold — *a priori* through sense, *i.e*. in pure intuition.
2. The synthesis of this manifold — through pure transcendental imagination.
3. The unity of this synthesis — through pure original transcendental apperception.

At this point Vaihinger adds to the above section the earlier passage § 10 T. It is even more definitely than III. γ and III. I transitional to the fourth stage. It must be classed within the third stage, as it holds to the above threefold classification. But it modifies that classification in two respects. First, in that it does not employ the term *synopsis*, but only speaks of pure intuition as required to yield us a manifold. The term synopsis, as used by Kant, is, however, decidedly misleading. His invariable teaching is that all connection is due to synthesis. By synopsis, therefore, which he certainly does not employ as synonymous with synthesis, can be meant only apprehension of external side-by-sideness. It never signifies anything except apprehension of the lowest possible order. Kant's omission of the term, therefore, tends to clearness of statement. Secondly, the classification is also modified by the substitution of understanding for the unity of apperception. Apperception is, however, so obscurely treated in all of the above sections, that this cannot be regarded as a vital alteration. What is new in this section, and seems to connect it in a curious and interesting manner with sections in the fourth stage, is its doctrine of

"a manifold of *a priori* sensibility." "Space and time contain a manifold of pure *a priori* intuition."

That is, in this connection, an entirely new doctrine. In all the previous sections of the deduction (previous in the assumed order of original writing) the manifold supplied through intuition is taken as being empirical, and as consisting of sensations. Kant here also adds that the manifold, "whether given empirically or *a priori*," must be synthesised before it can be known.

"The spontaneity of our thought requires that this manifold [of pure *a priori* intuition] should be run through in a certain manner, taken up, and connected, in order that a knowledge may be formed out of it. This action I call synthesis."

Fourth Stage. — A 98-104; A 97-8. — As already noted, there are in Kant two persistent but conflicting interpretations of the nature of the synthetic processes exercised by imagination and understanding, the subjectivist and the phenomenalist. Now, on the former view, imagination is simply understanding *at work*. In other words, imagination is merely the active synthesising side of a faculty whose complementary aspect appears in the logical unity of the concept. From this point of view the transcendental and the empirical factors may be taken as forming a single series. The transcendental and the empirical processes will vary together, some form of transcendental activity corresponding to every fundamental form of empirical activity and *vice versa*. Such an inference only follows *if* the subjectivist standpoint be accepted to the exclusion of the phenomenalist point of view. But since Kant constantly alternates between them, and never quite definitely formulates them in their distinction and opposition; since, in fact, they were rather of the nature of obscurely felt tendencies than of formulated standpoints, it is quite intelligible that an inference derived from the one should be drawn even at the very time when the other is being more explicitly developed. This, it would seem, is what actually happened. When we come to consider the evidence derivable from the *Reflexionen* and *Lose Blätter*, we shall find support for the view that after January 1780, on the very eve of the publication of the *Critique*, while the revolutionary, phenomenalist consequences of the Critical hypothesis were becoming clearer to him, he unguardedly allowed the above inference to lead him to recast his previous views in a decidedly subjectivist manner. The view that transcendental imagination has a special and unique activity altogether different in type from any of its empirical processes, namely, the "productive," is now allowed to drop; and in place of it Kant develops the view that transcendental functions run exactly parallel with the empirical processes of apprehension, reproduction, and recognition. Accordingly, in place of the classification presented in the

third stage, we find a new and radically different one introduced into the text, without the least indication that Kant's standpoint has meantime changed. It is given in A 97:

A. Synopsis of the manifold through sense.

B. Synthesis.

1. Synthesis of apprehension of representations in [inner] intuition.

2. Synthesis of reproduction of representations in imagination.

3. Synthesis of recognition of representations in the concept.

And Kant adds in explanation that "these point to three subjective sources of knowledge which make the understanding itself possible, and which in so doing make all experience possible, in so far as it is an empirical product of the understanding." What, now, are these three subjective sources of knowledge? They certainly are not those classified in the table of the third stage. *A* roughly coincides with its first member; consequently *B* 1 is left without proper correlate. *B* 2 is altogether different from the previous synthesis of imagination, for in the earlier table transcendental imagination is regarded as being solely productive, *never* reproductive. It is now asserted to be reproductive — a contradiction of one of his own most emphatic contentions, which can only be accounted for by some such explanation as we are here stating. Nothing is lacking as regards explicitness in the statement of this new position. "...the *reproductive* synthesis of imagination belongs to the transcendental acts of the soul, and, in reference to it [viz. to the reproductive synthesis], we will call this power too the transcendental power of the imagination." Lastly, even B 3 does not coincide with the pure apperception of the other table. B 3 is more akin to the recognition which in the third stage is declared to be always empirical. In any case, it is recognition *in the concept*; and though that may ultimately involve and condition transcendental apperception, it remains, in the manner in which it is here developed by Kant, something very different. But this is a point to which we shall return. There is an added complication, running through this entire stage, which first requires to be disentangled. The transcendental syntheses are declared to condition the pure representations of space and time no less than those of sense-experience.

"This synthesis of apprehension also must be executed *a priori*, *i.e.* in reference to representations which are not empirical. For without it we could not have the *a priori* representations either of space or of time, since these can be generated only through the synthesis of the manifold which sensibility presents in its original receptivity. Thus we have a pure synthesis of apprehension" "...if I draw a line in thought or desire to think of the time from one noon to another, or merely represent to myself a certain number, I must, firstly, apprehend these manifold representations one after the other. But if the preceding representations (the first parts of the line, the antecedent parts of time or the units serially represented) were always to drop out of my thought, and were not reproduced when I advance to those that follow, no complete representation, and none of all the aforementioned thoughts, not even the purest and first basal representations of space and time, could ever arise."

This, as Vaihinger remarks, is a point of sufficient importance to justify separate treatment. But it is introduced quite incidentally by Kant, and obscures quite as much as it clarifies the main argument.

It is convenient to start with the second synthesis. Kant's argument is much clearer in regard to it than in regard to the other two. He distinguishes between empirical and transcendental reproduction. Reproduction in ordinary experience, in accordance with the laws of association, is merely empirical. The *de facto* conformity of appearances to rules is what renders such empirical reproduction possible;

"...otherwise our faculty of empirical imagination would never find any opportunity of action suited to its capacities, and would remain hidden within the mind as a dead, and to us unknown power."

Kant proceeds to argue, consistently with his doctrine of objective affinity, that empirical reproduction is itself transcendentally conditioned. The form, however, in which this argument is developed is peculiar to the section before us, and is entirely new.

"If we can show that even our purest *a priori* intuitions yield no knowledge, save in so far as they

contain such connection of the manifold as will make possible a thoroughgoing synthesis of reproduction, this synthesis of the imagination must be grounded, prior to all experience, on *a priori* principles; and since experience necessarily presupposes that appearances can be reproduced, we shall have to assume a pure transcendental synthesis of the imagination as conditioning even the possibility of all experience."

In the concluding paragraph Kant makes clear that he regards this *transcendental* activity as being exercised in a twofold manner: in relation to the *empirically* given manifold as well as in relation to the *a priori* given manifold. How this transcendental activity is to be distinguished from the empirical is not further explained. I discuss this point below.

The argument of the section on the synthesis of *apprehension*, to which we may now turn back, suffers from serious ambiguity. It is not clear whether a distinction, analogous to that between empirical and transcendental reproduction, is being made in reference to apprehension. The actual wording of its two last paragraphs would lead to that conclusion. That, however, is a view which would seem to be excluded by the wider context. Kant is dealing with the synthesis of apprehension in *inner* intuition, *i.e.* in time. By the fundamental principles of his teaching such intuition must always be transcendental. Empirical apprehension can only concern the data of the special senses. The process of apprehension referred to in the middle paragraph must therefore itself be transcendental.

But it is in dealing with the synthesis of *recognition* that the argument is most obscure. It is idle attempting to discover any possible distinction between an empirical and a transcendental process of recognition. For the transcendental process here appears as being the consciousness that what we are thinking now is the same as what we thought a moment before; and it is illustrated not by reference to the pure intuitions of space and time, but only by the process of counting. It may be argued that empirical recognition is mediated by transcendental factors — by pure concepts and by apperception. But unless we are to take transcendental recognition as synonymous with transcendental apperception, which Kant's actual teaching does not seem to justify us in doing, such considerations will not enable us to distinguish two forms of recognition. Apart, however, from this difficulty, there is the further one that the concepts in and through which the recognition is executed are here described as being empirical. The only key that will solve the mystery of this extraordinary section, hopelessly inexplicable when viewed as a single continuous whole, is, it would seem, the theory of Vaihinger, namely, that from the third paragraph onwards (already dealt with as forming the first stage of the deduction) Kant is making use of manuscript which represents the *earliest* form in which his explanation of the consciousness of objects was developed, with the strange result that this section is a combination of the latest and of the earliest forms of the deduction. While seeking to make out a parallelism between the empirical, conscious activities of imagination and understanding on the one hand, and its transcendental functions on the other, he must have bethought himself of the earlier attempt to explain consciousness of objects through empirical concepts conditioned by transcendental apperception, and so have attempted to expound the third form of synthesis by means of it. As thus extended it involves a distinction between transcendental and empirical apperception, and upon that the discussion, so far as it concerns anything akin to recognition, altogether turns. But there is not the least further mention of recognition itself. As transcendental, it cannot be taken as the equivalent of empirical apperception; and as a synthesis through concepts, can hardly coincide with pure apperception. The title of the section, "the synthesis of recognition in the concept," is thus no real indication of the astonishing fare prepared for the reader. The doctrine of a threefold synthesis seems to have occurred to Kant on the very eve of the publication of the *Critique*. The passage expounding it may well have been hurriedly composed, and when unforeseen difficulties accumulated, especially in regard to recognition as a transcendental process, Kant must have resolved simply to close the matter by inserting the older manuscript.

III. Evidence yielded by the "Reflexionen" and "Lose Blätter" in support of the above analysis.

The evidence, derived by Vaihinger from the *Reflexionen* and *Lose Blätter*, briefly outlined, is as

follows. (1) In the *Reflexionen zur Anthropologie* relevant passages are few in number, and represent a standpoint very close to that of the 1770 *Dissertation*. Imagination is treated only as an empirical faculty. Recognition, which is only once mentioned, is also viewed as merely empirical. The understanding is spoken of as the faculty through which objects are thought. The categories are not mentioned, and it is stated that the understanding yields only ideas of reflection. “All knowledge of things is derived, as regards its matter, from sensation — the understanding gives only ideas of reflection.” So far, these *Reflexionen* would seem to coincide, more or less, with the first stage of the deduction. They contain, however, no reference to *transcendental* apperception; and are therefore regarded by Vaihinger as representing a still earlier standpoint.

(2) In the *Reflexionen zur Kritik der reinen Vernunft* there is a very large and valuable body of relevant passages. No. 925 must be of the same date as the letter of 1772 to Herz; it formulates its problem in practically identical terms. Nos. 946-52 and 955 may belong to the period of the first stage. For though the doctrine of the transcendental object as the opposite counterpart of the transcendental subject is not mentioned, the spiritualist view of the self is prominent. In No. 946 it is asserted that the representation of an object is “made by us through freedom.”

“Free actions are already given *a priori*, namely our own.” “To pass universal objective judgments, and to do so apodictically, reason must be free from subjective grounds of determination. For were it so determined the judgment would be merely accidental, namely in accordance with its subjective cause. Thus reason is conscious *a priori* of its freedom in objectively necessary judgments in so far as it apprehends them as exclusively grounded through their relation to the object.” “Transcendental freedom is the necessary hypothesis of all rules, and therefore of all employment of the understanding.” “Appearances are representations whereby we are affected. The representation of our free self-activity does not involve affection, and accordingly is not appearance, but apperception.”

It is significant that the categories receive no mention.

Almost all the other *Reflexionen* would seem to have originated in the period of the second stage of the deduction; but they still betray a strong spiritualist bias.

“Impressions are not yet representations, for they must be related to something else which is an action. Now the reaction of the mind is an action which relates to the impression, and which if taken alone may in its special forms receive the title categories.” “We can know the connection of things in the world only if we produce it through a universal action, and so out of a principle of inner power (*aus einem Prinzip der inneren Potestas*): substance, ground, combination.”

These *Reflexionen* recognise only the categories of relation, and must therefore be prior to the twelvefold classification. There is not the least trace of the characteristic doctrines of the third and fourth stages of the deduction, viz. of the transcendental function of the imagination or of a threefold transcendental synthesis. The nature of apprehension is also most obscure. It is frequently equated with apperception.

(3) The *Lose Blätter aus Kants Nachlass* (Heft I.) contains fragments which also belong to the second stage of the deduction, but which would seem to be of somewhat earlier date than the above *Reflexionen*. They have interesting points of contact with the first stage. Thus though the phrase transcendental object does not occur in them, the object of knowledge is equated with *x*, and is regarded in the manner of the first stage as the opposite counterpart of the unity of the self. These fragments belong, however, to the second stage in virtue of their recognition of the *a priori* categories of relation. There is also here, as is in the *Reflexionen*, great lack of clearness regarding the nature of apprehension; and there is still no mention of the transcendental faculty of imagination. Fragment 8 is definitely datable. It covers the free spaces of a letter of invitation dated May 20, 1775. Fragment B 12 belongs to a different period from the above. This is sufficiently evident from its contents; but fortunately the paper upon which it is written — an official document in the handwriting of the Rector of the Philosophical Faculty of Königsberg — enables us to

decide the exact year of its origin. It is dated January 20, 1780. The fragment must therefore be subsequent to that date. Now in it transcendental imagination appears as a third faculty alongside sensibility and understanding, and a distinction is definitely drawn between its empirical and its transcendental employment. The former conditions the synthesis of apprehension; the latter conditions the synthetic unity of apperception. It further distinguishes between reproductive and productive imagination, and ascribes the former exclusively to the empirical imagination. In all these respects it stands in complete agreement with the teaching of the third stage of the deduction. The fact that this fragment is subsequent to January 1780 would seem to prove that even at that late date Kant was struggling with his deduction. But the most interesting of all Vaihinger's conclusions has still to be mentioned. He points out that at the time when this fragment was composed Kant had not yet developed the doctrine characteristic of the fourth stage, namely, of a threefold transcendental synthesis. Moreover, as he observes, the statement which it explicitly contains, that reproductive imagination is always empirical, is inconsistent with any such doctrine. The teaching of the fourth stage must consequently be ascribed to an even later date.

(4) The *Lose Blätter* (Heft II.), though almost exclusively devoted to moral and legal questions, contain in E 67 a relevant passage which Reicke regards as belonging to the 'eighties, but which Adickes and Vaihinger agree in dating "shortly before 1781." On Vaihinger's view it is a preliminary study for the passages of the fourth stage of the deduction. But such exact dating is not essential to Vaihinger's argument. It is undoubtedly quite late, and contains the following sentence:

"All representations, whatever their origin, are yet ultimately as representations modifications of inner sense, and their unity must be viewed from this point of view. A spontaneity of synthesis corresponds to their receptivity: either of apprehension as sensations or of reproduction as images (*Einbildungen*) or of recognition as concepts."

This is the doctrine from which the deduction of the first edition *starts*; it was, it would seem, *the last to be developed*. That we find no trace of it in the *Prolegomena*, and that it is not only eliminated from the second edition, but is expressly disavowed, would seem to indicate that it had been hastily adopted on the very eve of publication, and that upon reflection Kant had felt constrained definitively to discard it. The threefold synthesis can be verified on the empirical level, but there is no evidence that there exist corresponding transcendental activities.

IV. Connected Statement and Discussion of Kant's Subjective and Objective Deductions in the First Edition

Such are the varying and conflicting forms in which Kant has presented his deduction of the categories. We may now apply our results to obtain a connected statement of the essentials of his argument. The following exposition, which endeavours to emphasise its main broad features, to distinguish its various steps, and to disentangle its complex and conflicting tendencies, will, I trust, yield to the reader such steady orientation as is necessary in so bewildering a labyrinth. In the meantime I shall take account only of the deductions of the first edition, and from them shall strive to construct the ideal statement to which they severally approximate. Any single relatively consistent and complete deduction that is thus to serve as a standard exposition must, like the root-languages of philology, be typical or archetypal, representing the argument at which Kant aimed; it cannot be one of the alternative expositions which he himself gives. Such reconstruction of an argument which Kant has failed to express in a final and genuinely adequate form must, of course, lie open to all the dangers of arbitrary and personal interpretation. It is an extremely adventurous undertaking, and will have to be carefully guarded by constant reference to Kant's *ipsissima verba*. Proof of its historical validity will consist in its capacity to render intelligible Kant's own departures from it, and in its power of explaining the reasons of his so doing. Its expository value will be in proportion to the assistance which it may afford to the reader in deciphering the actual texts.

Our first task is to make clear the nature of the distinction which Kant draws between the "subjective"

and the “objective” deductions. This is a distinction of great importance, and raises issues of a fundamental character. In regard to it students of Kant take widely different views. For it brings to a definite issue many of the chief controversies regarding Critical teaching. Kant has made some very definite statements in regard to it; and one of the opposing schools of interpretation finds its chief and strongest arguments in the words which he employs. But for reasons which will appear in due course, adherence to the letter of the *Critique* would in this case involve the commentator in great difficulties. We have no option except to adopt the invidious position of maintaining that we may now, after the interval of a hundred years and the labours of so many devoted students, profess to understand Kant better than he understood himself. For such procedure we may indeed cite his own authority.

“Not infrequently, upon comparing the thoughts which an author has expressed in regard to his subject, whether in ordinary conversation or in writing, we find that we can understand him better than he understood himself. As he has not sufficiently determined his concept, he has sometimes spoken, or even thought, in opposition to his own intention.”

Let us, then, consider first the distinction between the two types of deduction in the form in which it is drawn by Kant. In the *Preface* to the first edition, Kant states that his transcendental deduction of the categories has two sides, and assigns to them the titles subjective and objective.

“This enquiry, which is somewhat deeply grounded, has two sides. The one refers to the objects of pure understanding, and is intended to expound and render intelligible the objective validity of its *a priori* concepts. It is therefore essential to my purposes. The other seeks to investigate the pure understanding itself, its possibility and the cognitive faculties upon which it rests. Although this latter exposition is of great importance for my chief purpose, it does not form an essential part of it. For the chief question is always simply this, — what and how much can the understanding and Reason know apart from all experience? not — how is the faculty of thought itself possible? The latter is as it were a search for the cause of a given effect; and therefore is of the nature of an hypothesis (though, as I shall show elsewhere, this is not really so); and I would appear to be taking the liberty simply of expressing an opinion, in which case the reader would be free to express a different opinion. For this reason I must forestall the reader’s criticism by pointing out that the objective deduction, with which I am here chiefly concerned, retains its full force even if my subjective deduction should fail to produce that complete conviction for which I hope....”

The subjective deduction seeks to determine the subjective conditions which are required to render knowledge possible, or to use less ambiguous terms the generative processes to whose agency human knowledge is due. It is consequently psychological in character. The objective deduction, on the other hand, is so named because it deals not with psychological processes but with questions of objective validity. It enquires how concepts which are *a priori*, and which as *a priori* must be taken to originate in pure reason, can yet be valid of objects. In other words, the objective deduction is logical, or, to use a post-Kantian term, epistemological in character.

It is indeed true, as Kant here insists, that the subjective deduction does not concern itself in any quite direct fashion with the Critical problem — how *a priori* ideas can relate to objects. “Although of great importance for my chief purpose, it does not form an essential part of it.” This, no doubt, is one reason why Kant omitted it when he revised the *Critique* for the second edition. None the less it is, as he here says, important; and what exactly that importance amounts to, and whether it is really true that it has such minor importance as to be rightly describable as unessential, is what we have to decide.

Though empirical psychology, in so far as it investigates the temporal development of our experience, is, as Kant very justly claims, entirely distinct in aim and method from the Critical enquiry, the same cannot be said of a psychology which, for convenience, and on the lines of Kant’s own employment of terms, may be named transcendental. For it will deal, not with the temporal development of the concrete and varied aspects of consciousness, but with the more fundamental question of the generative conditions

indispensably necessary to consciousness as such, *i.e.* to consciousness in each and every one of its possible embodiments. In the definition above given of the objective deduction, I have intentionally indicated Kant's unquestioning conviction that the *a priori* originates independently of the objects to which it is applied. This independent origin is only describable in mental or psychological terms. The *a priori* originates from within; it is due to the specific conditions upon which human thinking rests. Now this interpretation of the *a priori* renders the teaching contained in the subjective deduction much more essential than Kant is himself willing to recognise. The conclusions arrived at may be highly schematic in conception, and extremely conjectural in detail; they are none the less required to supplement the results of the more purely logical analysis. For though in the second edition the sections devoted to the subjective deduction are suppressed, their teaching, and the distinctions which they draw between the different mental processes, continue to be employed in the exposition of the objective deduction, and indeed are presupposed throughout the *Critique* as a whole. They are indispensably necessary in order to render really definite many of the contentions which the objective deduction itself contains. To eliminate the subjective deduction is not to cut away these presuppositions, but only to leave them in the obscure region of the undefined. They will still continue to influence our mode of formulating and of solving the Critical problem, but will do so as untested and vaguely outlined assumptions, acting as unconscious influences rather than as established principles. For these reasons the omission of the subjective deduction is to be deplored. The explicit statement of the implied psychological conditions is preferable to their employment without prior definition and analysis. The deduction of the second edition rests throughout upon the initial and indispensable assumption, that though connection or synthesis can never be given, it is yet the generative source of all consciousness of order and relation. Factors which are transcendental in the strict or logical meaning of the term rest upon processes that are transcendental in a psychological sense.

This last phrase, 'transcendental in a psychological sense,' calls for a word of justification. The synthetic processes generative of experience are not, of course, transcendental in the strict sense. For they are not *a priori* in the manner of the categories. None the less they are discoverable by the same transcendental method, namely, as being, like the categories, indispensably necessary to the possibility of experience. They differ from the categories in that they are not immanent in experience, constituent of it, and cannot therefore be known in their intrinsic nature. As they fall outside the field of consciousness, they can only be hypothetically postulated. None the less, formal categories and generative processes, definable elements and problematic postulates, alike agree in being conditions *sine qua non* of experience. And further, in terms of Kant's presupposed psychology, the latter are the source to which the former are due. There would thus seem to be sufficient justification for extending the term transcendental to cover both; and in so doing we are following the path which Kant himself willingly travelled. For such would seem to have been his unexpressed reasons for ascribing, as he does, the synthetic generative processes to what he himself names transcendental faculties.

This disposes of Kant's chief reason for refusing to recognise the subjective deduction as a genuine part of the Critical enquiry, namely, the contention upon which he lays such emphasis in the prefaces both of the first and of the second edition, that in transcendental philosophy nothing hypothetical, nothing in any degree dependent upon general reasoning from contingent fact, can have any place. That contention proves untenable even within the domain of his purely logical analyses. The very essence of his transcendental method consists in the establishment of *a priori* elements through proof of their connection with factual experience. Kant is here revealing how greatly his mind is still biased by the Leibnizian rationalism from which he is breaking away. His *a priori* cannot establish itself save in virtue of hypothetical reasoning. His transcendental method, rightly understood, does not differ in essential nature from the hypothetical method of the natural sciences; it does so only in the nature of its starting-point, and in the character of the analyses which that starting-point prescribes. And if hypothetical reasoning may be allowed in the

establishment of the logical *a priori*, there is no sufficient reason why it may not also be employed for the determination of dynamical factors. The sole question is as to whether the hypotheses conform to the logical requirements and so raise themselves to a different level from mere opinion and conjecture. As Kant himself says, though his conclusions in the subjective deduction may seem to be hypothetical in the illegitimate sense, they are not really so. From the experience in view of which they are postulated they receive at once the proof of their actuality and the material for their specification.

We may now return to the question of the nature of the two deductions. The complex character of their interrelations may be outlined as follows:

1. Though the subjective deduction is in its later stages coextensive with its objective counterpart, in its earlier stages it moves wholly on what may be called the empirical level. The data which it analyses and the conditions which it postulates are both alike empirical. The objective deduction, on the other hand, deals from start to finish with the *a priori*.

2. The later stages of the subjective deduction are based upon the results of the objective deduction. The existence and validity of *a priori* factors having been demonstrated by transcendental, *i.e.* logical, analysis, the subjective deduction can be extended from the lower to the higher level, and can proceed to establish for the *a priori* elements what in its earlier stages it has determined for empirical consciousness, namely, the nature of the generative processes which require to be postulated as their ground and origin. When the two deductions are properly distinguished the objective deduction has, therefore, to be placed midway between the initial and the final stages of the subjective deduction.

3. The two deductions concentrate upon different aspects of experience. In the subjective deduction experience is chiefly viewed as a *temporal process* in which the given falls apart into successive events, which, in and by themselves, are incapable of constituting a unified consciousness. The fundamental characteristic of human experience, from this point of view, is that it is *serial* in character. Though it is an apprehension of time, it is itself also a process in time. In the objective deduction, on the other hand, the time element is much less prominent. Awareness of *objects* is the subject-matter to which analysis is chiefly devoted. This difference very naturally follows from the character of the two deductions. The subjective enquiry is mainly interested in the conditions generative of experience, and finds its natural point of departure in the problem by what processes a unified experience is constructed out of a succession of distinct happenings. The objective deduction presents the logical problem of validity in its most striking form, in our awareness of objects; the objective is contrasted with the subjective as being that which is universally and necessarily the same for all observers. Ultimately each of the two deductions must yield an analysis of both types of consciousness — awareness of time and awareness of objects; *a priori* factors are involved in the former no less than in the latter, and both are conditioned by generative processes. Unfortunately the manner in which this is done in the *Critique* causes very serious misunderstanding. The problem of the psychological conditions generative of consciousness of objects is raised before the logical analysis of the objective deduction has established the data necessary for its profitable discussion. The corresponding defect in the objective deduction is of a directly opposite character, but is even more unfortunate in its effects. The results obtained from the analysis of our awareness of objects are not, within the limits of the objective deduction, applied in further analysis of our consciousness of time. That is first done, and even then by implication rather than by explicit argument, in the *Analytic of Principles*. This has the twofold evil consequence, that the relations holding between the two deductions are very greatly obscured, and that the reader is not properly prepared for the important use to which the results of the objective deduction are put in the *Analytic of Principles*. For it is there assumed — a quite legitimate inference from the objective deduction, but one whose legitimacy Kant has nowhere dwelt upon and explained — that to be conscious of time we must be conscious of it as existing in two distinct orders, subjective and objective. To be conscious of time we must be conscious of objects, and to be conscious of objects we must be able to distinguish between the order of our ideas and

the order of the changes (if any) in that which is known by their means.

Thus the two deductions, properly viewed in their full scope, play into one another's hands. The objective deduction is necessary to complete the analysis of time-consciousness given in the subjective deduction, and the extension of the analysis of object-consciousness to the explanation of time-consciousness is necessary in order to make quite definite and clear the full significance of the conclusions to which the objective enquiry has led.

One last point remains for consideration. Experience is a highly ambiguous term, and to fulfil the rôle assigned to it by Kant's transcendental method — that of establishing the reality of the conditions of its own possibility — its actuality must lie beyond the sphere of all possible controversy. It must be itself a datum, calling indeed for explanation, but not itself making claims that are in any degree subject to possible challenge. Now if we abstract from all those particularising factors which are irrelevant in this connection, we are left with only three forms of experience — experience of self, experience of objects, and experience of time. The two former are open to question. They may be illusory, as Hume has argued. And as their validity, or rather actuality, calls for establishment, they cannot fulfil the demands which the transcendental method exacts from the experience whose possibility is to yield proof of its discoverable conditions. Consciousness of time, on the other hand, is a fact whose actuality, however problematic in its conditions, and however mysterious in its intrinsic nature, cannot, even by the most metaphysical of subtleties, be in any manner or degree challenged. It is an unquestioned possession of the human mind. Whether time itself is real we are not metaphysically certain, but that, whatever be its reality or unreality, we are conscious of it in the form of change, is beyond all manner of doubt. Consciousness of time is the *factual* experience, as conditions of whose possibility the *a priori* factors are transcendentally proved. In so far as they can be shown to be its indispensable conditions, its mere existence proves their reality. And such in effect is the ultimate character of Kant's proof of the objective validity of the categories. They are proved in that it is shown that only in and through them is consciousness of time possible.

The argument gains immeasurably in clearness when this is recognised; and the deduction of the first edition of the *Critique*, in spite of its contorted character, remains in my view superior to that of the second edition owing to this more explicit recognition of the temporal aspect of consciousness and to employment of it as the initial starting-point. Analysis at once reveals that though consciousness of time is undeniably actual, it is conditioned in complex ways, and that among the conditions indispensably necessary to its possibility are both consciousness of self and consciousness of an objective order of existence. Starting from the undeniable we are thus brought to the problematic; but owing to the factual character of the starting-point we can substantiate what would otherwise remain open to question.

As this method of formulating Kant's argument gives greater prominence to the temporal factor than Kant himself does in his statement of the deductions, the reader may very rightly demand further evidence that I am not, by this procedure, setting the deductions in a false or arbitrary perspective. Any statement of Kant's position in other than his own *ipsissima verba* is necessarily, in large part, a matter of interpretation, and proof of its correctness must ultimately consist in the success with which it can be applied in unravelling the manifold strands that compose his tortuous and many-sided argument; but the following special considerations may be cited in advance. Those parts of the *Critique,* such as the chief paragraphs of the subjective deduction and the chapter on *Schematism,* which are demonstrably late in date of writing, agree in assigning greater prominence to the temporal aspect of experience. This is also true of those numerous passages added in the second edition which deal with inner sense. All of these show an increasing appreciation of the central rôle which time must play in the Critical enquiries. Secondly, proof of the validity of *specific* categories is given, as we shall find, not in the objective deduction of the *Analytic of Concepts,* but only in the *Analytic of Principles*. What Kant gives in the former is only the quite general demonstration that forms of unity, such as are involved in all judgment, are demanded for the possibility of experience. Now when proof of the specific categories does come, in

the *Analytic of Principles*, it is manifestly based on the analysis of time-experience. In the three *Analogies*, for example, Kant's demonstration of the objective validity of the categories of relation consists in the proof that they are necessary conditions of the possibility of our time-consciousness. That is to say, the transcendental method of proof, when developed in full detail, in reference to some specific category, agrees with the formulation which I have given of the subjective and objective deductions. In the third place, Kant started from a spiritualist standpoint, akin to that of Leibniz, and only very gradually broke away from the many illegitimate assumptions which it involves. But this original starting-point reveals its persisting influence in the excessive emphasis which Kant continued to lay upon the unity of apperception. He frequently speaks as if it were an ultimate self-justifying principle, by reference to which the validity of all presupposed conditions can be established. But that, as I have already argued, is a legitimate method of procedure only if it has previously been established that self-consciousness is involved in all consciousness, that is, involved even in consciousness of sequence and duration. And as just stated, the deductions of specific categories, given in the *Analytic of Principles*, fulfil these requirements of complete proof. They start from the time-consciousness, not from apperception.

I shall now summarise these introductory discussions in a brief tabulated outline of the main steps in the argument of the two deductions, and shall add a concluding note upon their interconnection.

Subjective Deduction. — 1. Consciousness of time is an experience whose actuality cannot be questioned; by its actuality it will therefore establish the reality of everything that can be proved to be its indispensable condition.

2. Among the conditions indispensably necessary to all consciousness of time are synthetic processes whereby the contents of consciousness, occurring in successive moments, are combined and unified. These processes are processes of apprehension, reproduction, and recognition.

3. Recognition, in turn, is conditioned by self-consciousness.

4. As no consciousness is possible without self-consciousness, the synthetic processes must have completed themselves before such self-consciousness is possible, and consequently are not verifiable by introspection but only by hypothetical construction.

[1, 2, 3, and 4 are steps which can be stated independently of the argument of the objective deduction.]

5. Self-consciousness presupposes consciousness of objects, and consciousness of objects presupposes the synthetic activities of productive imagination whereby the matter of sense is organised in accordance with the categories. These productive activities also are verifiable only by conjectural inference, and only upon their completion can consciousness of any kind make its appearance.

6. Consciousness of self and consciousness of objects thus alike rest upon a complexity of non-phenomenal conditions. For anything that critical analysis can prove to the contrary, consciousness and personality may not be ultimates. They may be resultants due to realities fundamentally different from themselves.

[5 is a conclusion obtained only by means of the argument of the objective deduction. 6 is a further conclusion, first explicitly drawn by Kant in the *Dialectic*.]

Objective Deduction. — 1. The starting-point coincides with that of the subjective deduction. Consciousness of time is an experience by whose actuality we can establish the reality of its indispensable conditions.

2. Among the conditions necessary to all consciousness of time is self-consciousness.

3. Self-consciousness, in turn, is itself conditioned by consciousness of objects.

4. Consciousness of objects is possible only if the categories have validity within the sphere of sense-experience.

5. Conclusion. — The empirical validity of the categories, and consequently the empirical validity of our consciousness alike of the self and of objects, must be granted as a *conditio sine qua non* of our consciousness of time. They are the indispensable conditions of that fundamental experience.

As above stated, the preliminary stages of the subjective deduction prepare the way for the argument of

the objective deduction, while the results obtained by the latter render possible the concluding steps of the former. That is to say, the objective deduction has to be intercalated midway between the opening and the concluding stages of the subjective deduction. It may also be observed that whereas the objective deduction embodies the main positive teaching of the *Analytic*, in that it establishes the possibility of natural science and of a metaphysics of experience, the subjective deduction is more directly concerned with the subject-matter of the *Dialectic*, reinforcing, as it does, the more negative consequences which follow from the teaching of the objective deduction — the impossibility of transcendent speculation. It stands in peculiarly close connection with the teaching of the section on the *Paralogisms*. We may now proceed to a detailed statement of the argument of the two deductions.

THE SUBJECTIVE DEDUCTION IN ITS INITIAL EMPIRICAL STAGES

In the opening of the subjective deduction Kant is careful to give due prominence to the temporal aspect of our human experience.

"...all the contents of our knowledge are ultimately subject to the formal condition of inner sense, that is, to time, as that wherein they must all be ordered, connected, and brought into relation to one another. This is a general remark which the reader must bear in mind as being a fundamental presupposition of my entire argument."

Consciousness of time is thus the starting-point of the deduction. Analysis reveals it as highly complex; and the purpose of the deduction is to discover, and, as far as may be possible, to define its various conditions. The argument can best be expounded by reference to a single concrete example — say, our experience of a series of contents, *a*, *b*, *c*, *d*, *e*, *f*, as in succession to one another and as together making up the total six. In order that such an experience may be possible the successive members of the series must be held together simultaneously before the mind. Obviously, if the earlier members dropped out of consciousness before the mind reached *f*, *f* could not be apprehended as having followed upon them. There must be a synthesis of apprehension of the successive items.

Such a synthesis of apprehension is, however, only possible through reproduction of the earlier experiences. If when the mind has passed from *a* to *f*, *f* is apprehended as having followed upon *a*, *b*, *c*, *d*, *e*, such consciousness is only possible in so far as these earlier contents are reproduced in image. Synthesis of apprehension is conditioned by synthesis of reproduction in imagination.

"But if the preceding representations (the first parts of [a] line, the earlier moments of time or the units represented in sequent order) were always to drop out of my thought, and were not reproduced when I advance to those that follow, no complete representation, and none of all the aforementioned thoughts, not even the purest and first basal representations of space and time, could ever arise."

In order, however, that the reproduced images may fulfil their function, they must be recognised as standing for or representing contents which the self has just experienced.

"Without the consciousness that what we are thinking is the same as what we thought a moment before, all reproduction in the series of representations would be in vain."

Each reproduced image would in its present state be a new experience, and would not help in the least towards gaining consciousness of order or number in the succession of our experiences. Recognition is, therefore, a third form of synthesis, indispensably necessary to consciousness of time. But further, the recognition is recognition of a succession as forming a unity or whole, and that unity is always conceptual.

"The word concept (*Begriff*) might of itself have suggested this remark. For it is this unitary consciousness which unites into a single representation a manifold that has been successively intuited and then subsequently reproduced." "If in counting I forgot that the units ... have been added to one another in

succession, I should never recognise what the sum-total is that is being produced through the successive addition of unit to unit; and so would remain ignorant of the number. For the concept of this number is nothing but the consciousness of this unity of synthesis."

The synthesis of recognition is thus a synthesis which takes place in and through empirical concepts. In the instance which we have chosen, the empirical concept is that of the number six.

The analysis, however, is not yet complete. Just as reproduction conditions apprehension and both rest on recognition, so in turn recognition presupposes a still further condition, namely, self-consciousness. For it is obvious, once the fact is pointed out, that the recognition of reproduced images as standing for past experiences can only be possible in so far as there is an abiding self which is conscious of its identity throughout the succession. Such an act of recognition is, indeed, merely one particular form or concrete instance of self-consciousness. The unity of the empirical concept in and through which recognition takes place finds its indispensable correlate in the unity of an empirical self. Thus an analysis of our consciousness, even though conducted wholly on the empirical level, that is, without the least reference to the *a priori*, leads by simple and cogent argument to the conclusion that it is conditioned by complex synthetic processes, and that these syntheses in turn presuppose a unity which finds twofold expression for itself, objectively through a concept and subjectively in self-consciousness.

So far I have stated the argument solely in reference to serial consciousness. Kant renders his argument needlessly complex and diminishes its force by at once extending it so as to cover the connected problem, how we become aware of objects. This occurs in the section on the synthesis of reproduction. An analysis of our consciousness of objects, as distinct from consciousness of the immediately successive, forces us to postulate further empirical conditions. Since the reproductive imagination, to whose agency the apprehension of complex unitary existences is psychologically due, acts through the machinery of association, it presupposes constancy in the apprehended manifold.

"If cinnabar were sometimes red, sometimes black, sometimes light, sometimes heavy, if a man changed sometimes into this and sometimes into that animal form, if the country on the longest day were sometimes covered with fruits, sometimes with ice and snow, my empirical imagination would never even have occasion when representing red colour to bring to mind heavy cinnabar...."

This passage may be compared with the one which occurs in the section on the synthesis of recognition. Our representations, in order to constitute knowledge, must have the unity of some concept; the manifold cannot be apprehended save in so far as this is possible.

"All knowledge demands a concept, though that concept may be quite imperfect or obscure. But a concept is always, as regards its form, something general which serves as a rule. The concept of body, for instance, as the unity of the manifold which is thought through it, serves as a rule to our knowledge of outer appearances.... It necessitates in the perception of something outside us the representation of extension, and therewith the representations of impenetrability, form, etc."

So far the deduction still moves on the empirical level. When Kant, however, proceeds to insist that this empirical postulate itself rests upon a transcendental condition, the argument is thrown into complete confusion, and the reader is bewildered by the sudden anticipation of one of the most difficult and subtle conclusions of the objective deduction. The same confusion is also caused throughout these sections as a whole by Kant's description of the various syntheses as being transcendental. They cannot properly be so described. The concepts referred to as unifying the syntheses, and the self-consciousness which is proved to condition the syntheses, are all empirical. They present themselves in concrete form, and presuppose characteristics due to the special contingent nature of the given manifold; as Kant states in so many words in the second edition.

"Whether I can become *empirically* conscious of the manifold as simultaneous or as successive depends on circumstances or empirical conditions. The empirical unity of consciousness, through association of representations, therefore itself relates to an appearance, and is wholly contingent."

The argument in these preliminary stages of the subjective deduction, in so far as it is employed to yield proof that all consciousness involves the unity of concepts and the unity of self-consciousness, is independent of any reference to the categories, and consequently to transcendental conditions. In accordance with the plan of exposition above stated, we may now pass to the objective deduction.

OBJECTIVE DEDUCTION AS GIVEN IN THE FIRST EDITION

The transition from the preliminary stages of the subjective deduction to the objective deduction may be made by further analysis either of the objective unity of empirical concepts or of the subjective unity of empirical self-consciousness. It is the former line which the argument of the first edition follows. Kant is asking what is meant by an object corresponding to our representations, and answers by his objective deduction. He substitutes the empirical for the transcendental object, and in so doing propounds one of the central and most revolutionary tenets of the Critical philosophy. Existence takes a threefold, not a merely dual form. Besides representations and things in themselves, there exist the objects of our representations — the extended world of ordinary experience and of science. Such a threefold distinction is prefigured in the Leibnizian metaphysics, and is more or less native to every philosophy that is genuinely speculative. Kant himself claims Plato as his philosophical progenitor. The originality is not in the bare thesis, but in the fruitful, tenacious, and consistent manner in which it is developed through detailed analysis of our actual experience.

In its first stages the argument largely coincides with the argument of the paragraphs which deal with the transcendental object. When we examine the objective, we find that the primary characteristic distinguishing it from the subjective is that it lays a compulsion upon our minds, constraining us to think about it in a certain way. By an object is meant something which will not allow us to think at haphazard. Cinnabar is an object which constrains us to think it as heavy and red. An object is thus the external source of a necessity to which our thinking has to conform. The two arguments first begin to diverge when Kant sets himself to demonstrate that our consciousness of this external necessity is made possible by categories which originate from within.

For this conclusion Kant prepares the way by an analysis of the second main characteristic constitutive of an object, viz. its unity. This unity is of a twofold nature, involving either the category of substance and attribute or the category of cause and effect. The two categories are ultimately inseparable, but lead us to conceive the object in two distinct modes. When we interpret an object through the *a priori* concept of substance and attribute, we assert that all the contents of our perceptions of it are capable of being regarded as qualities of one and the same identical substance. No one of its qualities can be incongruent with any other, and all of them together, in their unity, must be expressive of its substantial nature.

The causal interpretation of the object is, however, the more important, and is that which is chiefly emphasised by Kant. It is, indeed, simply a further and more adequate mode of expressing the substantial unity of the object. All the qualities must be causally bound up with one another in such a way that the nature of each is determined by the nature of all the others, and that if any one quality be changed all the others must undergo corresponding alterations. Viewed in this manner, in terms of the category of causality, an object signifies a necessitated combination of interconnected qualities or effects. But since no such form of *necessitation* can be revealed in the manifold of sense, our *consciousness* of compulsion cannot originate from without, and must be due to those *a priori* forms which, though having their source within, control and direct our interpretation of the given. Though the objective compulsion is not itself due to the mind, our *consciousness* of it has this mental *a priori* source. The concept of an object consists in the thought of a manifold so determined in its specific order and groupings as to be interpretable in terms of the categories of substance and causality.

But the problem of the deduction proper is not yet raised. On the one hand, Kant has defined what the

concept of the objective must be taken as involving, and on the other, has pointed out that since the given as given is an unconnected manifold, any categories through which it may be interpreted must be of independent origin; but it still remains to be proved that the above is a valid as well as a possible mode of construing the given appearances. The categories, as *a priori* concepts, originate from within. By what right may we assert that they not only relate to an object, but even constitute the very concept of it? Are appearances legitimately interpretable in any such manner? It was, we may believe, in the process of answering this question that Kant came to realise that the objects of our representations must no longer be regarded as things in themselves. For, as he finds, a solution is possible only on the further assumption that the mind is legislating merely for the world of sense-experience, and is making no assertion in regard to the absolutely and independently real. Kant's method of proof is the transcendental, *i.e.* he seeks to demonstrate that this interpretation of the given is indispensably necessary as being a *sine qua non* of its possible apprehension. This is achieved by means of the conclusion already established through the preliminary steps of the subjective deduction, namely, that all consciousness involves self-consciousness. Kant's proof of the objective validity of the categories consists in showing that only by means of the interpretation of appearances as *empirically* objective is self-consciousness possible at all.

The self-consciousness of the subjective deduction, in the preliminary form above stated, is, however, itself empirical. Kant, developing on more strictly Critical lines the argument which had accompanied his earlier doctrine of the transcendental object, now proceeds to maintain in what is at once the most fruitful and the most misleading of his tenets, that the ultimate ground of the possibility of consciousness and therefore also of empirical self-consciousness is the transcendental unity of apperception. Such apperception, to use Kant's ambiguous phraseology, precedes experience as its *a priori* condition. The interpretation of given appearances through *a priori* categories is a necessity of consciousness because it is a condition of self-consciousness; and it is a condition of self-consciousness because it alone will account for the transcendental apperception upon which all empirical self-consciousness ultimately depends.

One chief reason why Kant's deduction is found so baffling and illusive is that it rests upon an interpretation of the unity of apperception which is very definitely drawn, but to which Kant himself gives only the briefest and most condensed expression. I shall therefore take the liberty of restating it in more explicit terms. The true or transcendental self has no content of its own through which it can gain knowledge of itself. It is mere identity, I am I. In other words, self-consciousness is a mere *form* through which contents that never themselves constitute the self are yet apprehended as being objects to the self. Thus though the self in being conscious of time or duration must be conscious of itself as *identical* throughout the succession of its experiences, that identity can never be discovered in those experiences; it can only be thought as a condition of them. The continuity of memory, for instance, is not a possible substitute for transcendental apperception. As the subjective deduction demonstrates, self-consciousness conditions memory, and cannot therefore be reduced to or be generated by it. When, however, such considerations are allowed their due weight, the necessity of postulating a transcendental unity becomes only the more evident. Though it can never itself be found among appearances, it is an interpretation which we are none the less compelled to give to appearances.

To summarise before proceeding. We have obtained two important conclusions: first, that all consciousness involves self-consciousness; and secondly, that self-consciousness is a mere form, in terms of which contents that do not constitute the self are apprehended as existing for the self. The first leads up to the second, and the second is equivalent to the assertion that there can be no such thing as a pure self-consciousness, *i.e.* a consciousness in which the self is aware of itself and of nothing but itself. Self-consciousness, to be possible at all, must at the same time be a consciousness of something that is not-self. Only one further step is now required for the completion of the deduction, namely, proof that this not-self, consciousness of which is necessary to the possibility of self-consciousness, must consist in

empirical objects apprehended in terms of the categories. For proof Kant again appeals to the indispensableness of apperception. As no intuitions can enter consciousness which are not capable of being related to the self, they must be so related to one another that, notwithstanding their variety and diversity, the self can still be conscious of itself as identical throughout them all. In other words, no intuition can be related to the self that is incapable of being combined together with all the other intuitions to form a unitary consciousness. I may here quote from the text of the second edition:

"...only in so far as I can grasp the manifold of the representations in one consciousness, do I call them one and all mine. For otherwise I should have as many-coloured and diverse a self as I have representations of which I am conscious to myself."

Or as it is stated in the first edition:

"We are *a priori* aware of the complete identity of the self in respect of all representations which belong to our knowledge ... as a necessary condition of the possibility of all representations."

These are the considerations which lead Kant to entitle the unity of apperception *transcendental*. He so names it for the reason that, though it is not itself *a priori* in the manner of the categories, we are yet enabled by its means to demonstrate that the unity which is necessary for possible experience can be securely counted upon in the manifold of all possible representations, and because (as he believed) it also enables us to prove that the forms of such unity are the categories of the understanding.

To the argument supporting this last conclusion Kant does not give the attention which its importance would seem to deserve. He points out that as the given is an unconnected manifold, its unity can be obtained only by synthesis, and that such synthesis must conform to the conditions prescribed by the unity of apperception. That these conditions coincide with the categories he does not, however, attempt to prove. He apparently believes that this has been already established in the metaphysical deduction. The forms of unity demanded by apperception, he feels justified in assuming, are the categories. They may be regarded as expressing the minimum of unity necessary to the possibility of self-consciousness. If sensations cannot be interpreted as the diverse attributes of unitary substances, if events cannot be viewed as arising out of one another, if the entire world in space cannot be conceived as a system of existences reciprocally interdependent, all unity must vanish from experience, and apperception will be utterly impossible.

The successive steps of the total argument of the deduction, as given in the first edition, are therefore as follows: Consciousness of time involves empirical self-consciousness; empirical self-consciousness is conditioned by a transcendental self-consciousness; and such transcendental self-consciousness is itself, in turn, conditioned by consciousness of objects. The argument thus completed becomes the proof of mutual interdependence. Self-consciousness and consciousness of objects, as polar opposites, mutually condition one another. Only through consciousness of both simultaneously can consciousness of either be attained. Only in and through reference to an object can an idea be related to a self, and so be accompanied by that self-consciousness which conditions recognition, and through recognition all the varying forms in which our consciousness can occur. From the point of view, however, of a Critical enquiry apperception is the more important of the two forms of consciousness. For though each is the *causa existendi* of the other, self-consciousness has the unique distinction of being the *causa cognoscendi* of the objective and *a priori* validity of the forms of understanding.

"The synthetic proposition, that all the variety of empirical consciousness must be combined in a single self-consciousness, is the absolutely first and synthetic principle of our thought in general."

We may at this point consider Kant's doctrine of "objective affinity." It excellently enforces the main thesis which he is professing to establish, namely, that the conditions of *unitary* consciousness are the conditions of *all* consciousness. The language, however, in which the doctrine is expounded is extremely obscure and difficult; and before commenting upon Kant's own methods of statement, it seems advisable to paraphrase the argument in a somewhat free manner, and also to defer consideration of the

transcendental psychology which Kant has employed in its exposition. Association can subsist only between ideas, both of which have occurred within the same conscious field. Now the fundamental characteristic of consciousness, the very condition of its existing at all, is its unity; and until this has been recognised, there can be no understanding of the associative connection which arises under the conditions which consciousness supplies. To attempt to explain the unity of consciousness through the mechanism of association is to explain an agency in terms of certain of its own effects. It is to explain the fundamental in terms of the derivative, the conditions in terms of what they have themselves made possible. Kant's argument is therefore as follows. Ideas do not become associated merely by co-existing. They must occur together in a unitary consciousness; and among the conditions necessary to the possibility of association are therefore the conditions of the possibility of experience. Association is transcendentally grounded. So far from accounting for the unity of consciousness, it presupposes the latter as determining the conditions under which alone it can come into play.

"...how, I ask, is association itself possible?... On my principles the thorough-going affinity of appearances is easily explicable. All possible appearances belong as representations to the totality of a possible self-consciousness. But as this self-consciousness is a transcendental representation, numerical identity is inseparable from it and is *a priori* certain. For nothing can come to our knowledge save in terms of this original apperception. Now, since this identity must necessarily enter into the synthesis of all the manifold of appearances, so far as the synthesis is to yield empirical knowledge, the appearances are subject to *a priori* conditions, with which the synthesis of their apprehension must be in complete accordance.... Thus all appearances stand in a thorough-going connection according to necessary laws, and therefore in a transcendental affinity of which the empirical is a mere consequence."

In other words, representations must exist in consciousness before they can become associated; and they can exist in consciousness only if they are consciously apprehended. But in order to be consciously apprehended, they must conform to the transcendental conditions upon which all consciousness rests; and in being thus apprehended they are set in thoroughgoing unity to one another and to the self. They are apprehended as belonging to an objective order or unity which is the correlate of the unity of self-consciousness. This is what Kant entitles their objective affinity; it is what conditions and makes possible their associative or empirical connection.

This main point is very definitely stated in A 101.

"If we can show that even our purest *a priori* intuitions yield no knowledge, save in so far as they contain such a connection of the manifold as will make possible a thoroughgoing synthesis of reproduction, this synthesis of the imagination" [which acts through the machinery of association] "must be grounded, prior to all experience, on *a priori* principles, and since experience necessarily presupposes that appearances can be reproduced, we shall have to assume a pure transcendental synthesis of the imagination" [*i.e.* such synthesis as is involved in the unity of consciousness] "as conditioning even the possibility of all experience."

In A 121-2 Kant expresses his position in a more ambiguous manner. He may seem to the reader merely to be arguing that a certain minimum of regularity is necessary in order that representations may be associated, and experience may be possible. But the general tenor of the passage as a whole, and especially its concluding sentences, enforce the stronger, more consistent, thesis.

"[The] subjective and empirical ground of reproduction according to rules is named the association of representations. If this unity of association did not also have an objective ground, which makes it impossible that appearances should be apprehended by the imagination except under the condition of a possible synthetic unity of this apprehension, it would be entirely accidental that appearances should fit into a connected whole of human knowledge. For even though we had the power of associating perceptions, it would remain entirely undetermined and accidental whether they would themselves be associable; and should they not be associable, there might exist a multitude of perceptions, and indeed an

entire sensibility, in which much empirical consciousness would arise in my mind, but in a state of separation, and without belonging to one consciousness of myself. That, however, is impossible. For only in so far as I ascribe all perceptions to one consciousness (original apperception), can I say in all perceptions that I am conscious of them. There must therefore be an objective ground (that is, one that can be recognised *a priori*, antecedently to all empirical laws of the imagination) upon which may rest the possibility, nay the necessity, of a law that extends to all appearances....”

Kant is not merely asserting that the associableness of ideas, and the regularity of connection which that implies, must be postulated as a condition of experience. That would be a mere begging of the issue; the correctness of the postulate would not be independently proved. Kant is really maintaining the much more important thesis, that the unity of experience, *i.e.* of consciousness, is what makes association possible at all. And since consciousness must be unitary in order to exist, there cannot be any empirical consciousness in which the conditions of association, and therefore of reproduction, are not to be found.

A further misunderstanding is apt to be caused by Kant’s statement that associative affinity rests upon objective affinity. This seems to imply, in the same manner as the passage which we have just considered, that instead of proving that appearances are subject to law and order, he is merely postulating that an abiding ground of such regularity must exist in the noumenal conditions of the sense manifold. But he himself again supplies the needful correction.

“This [objective ground of all association of appearances] can nowhere be found, except in the principle of the unity of apperception in respect of all forms of knowledge which can belong to me. In accordance with this principle all appearances must so enter the mind, or be so apprehended, that they fit together to constitute the unity of apperception. This would be impossible without synthetic unity in their connection, and that unity is therefore also objectively necessary. The objective unity of all empirical consciousness in one consciousness, that of original apperception, is therefore the necessary condition of all (even of all *possible*) perception; and the affinity of all appearances, near or remote, is a necessary consequence of a synthesis in imagination which is grounded *a priori* on rules.”

The fundamental characteristic of consciousness is the unified form in which alone it can exist; only when this unity is recognised as indispensably necessary, and therefore as invariably present whenever consciousness exists at all, can the inter-relations of the contents of consciousness be properly defined.

If this main contention of the Critical teaching be accepted, Hume’s associationist standpoint is no longer tenable. Association cannot be taken to be an ultimate and inexplicable property of our mental states. Nor is it a property which can be regarded as belonging to presentations viewed as so many independent existences. It is conditioned by the unity of consciousness, and therefore rests upon the “transcendental” conditions which Critical analysis reveals. Since the unity of consciousness conditions association, it cannot be explained as the outcome and product of the mechanism of association.

In restating the objective deduction in the second edition, Kant has omitted all reference to this doctrine of objective affinity. His reasons for this omission were probably twofold. In the first place, it has been expounded in terms of a transcendental psychology, which, as we shall find, is conjectural in character. And secondly, the phrase “objective affinity” is, as I have already pointed out, decidedly misleading. It seems to imply that Kant is postulating, without independent proof, that noumenal conditions must be such as to supply an orderly manifold of sense data. But though the doctrine of objective affinity is eliminated, its place is to some extent taken by the proof that all apprehension is an act of judgment and therefore involves factors which cannot be reduced to, or explained in terms of, association.

There are a number of points in the deduction of the first edition which call for further explanatory and critical comment. The first of these concerns the somewhat misleading character of the term *a priori* as applied to the categories. It carries with it rationalistic associations to which the Critical standpoint, properly understood, yields no support. The categories are for Kant of merely *de facto* nature. They have no intrinsic validity. They are proved only as being the indispensable conditions of what is before the

mind as brute fact, namely, conscious experience. By the *a priori* is meant merely those *relational* factors which are required to supplement the given manifold in order to constitute our actual consciousness. And, as Kant is careful to point out, the experience, as conditions of which their validity is thus established, is of a highly specific character, resting upon synthesis of a manifold given in space and time. That is to say, their indispensableness is proved only for a consciousness which in these fundamental respects is constituted like our own. And secondly, the validity of the *a priori* categories, even in our human thinking, is established only in reference to that empirical world which is constructed out of the given manifold in terms of the intuitive forms, space and time. Their validity is a merely phenomenal validity. They are valid of appearances, but not of things in themselves. The *a priori* is thus doubly *de facto*: first as a condition of brute fact, namely, the actuality of our human consciousness; and secondly, as conditioning a consciousness whose knowledge is limited to appearances. It is a relative, not an absolute *a priori*. Acceptance of it does not, therefore, commit us to rationalism in the ordinary meaning of that term. Its credentials are conferred upon it by what is mere fact; it does not represent an order superior to the actual and legislative for it. In other words, it is Critical, not Leibnizian in character. No transcendent metaphysics can be based upon it. In formulating this doctrine of the *a priori* as yielding objective insight and yet as limited in the sphere of its application, the *Critique of Pure Reason* marks an epoch in the history of scepticism, no less than in the development of Idealist teaching.

There is one important link in the deduction, as above given, which is hardly calculated to support the conclusions that depend upon it. Kant, as we have already noted, asserts that the categories express the minimum of unity necessary for the possibility of apperception. A contention so essential to the argument calls for the most careful scrutiny and a meticulous exactitude of proof. As a matter of fact, such proof is not to be found in any part of the deductions, whether of the first or of the second editions. It is attempted only in the later sections on the *Principles of Understanding*, and even there it is developed, in any really satisfactory fashion, only in regard to the categories of causality and reciprocity. This proof, however, as there given, is an argument which in originality, subtlety and force goes far to atone for all shortcomings. It completes the objective deduction by developing in masterly fashion (in spite of the diffuse and ill-arranged character of the text) the central contention for which the deduction stands. But in the transcendental deduction itself, we find only such an argument — if it may be called an argument — as follows from the identification of apperception with understanding.

“The unity of apperception, in relation to the synthesis of imagination, is the understanding.... In understanding there are pure *a priori* forms of knowledge which contain the necessary unity of pure synthesis of imagination in respect of all possible appearances. But these are the categories, *i.e.* pure concepts of understanding.”

The point is again merely assumed in A 125-6. So also in A 126:

“Although through experience we learn many laws, these are only special determinations of still higher laws, of which the highest, under which all others stand, originate *a priori* in the understanding itself....”

Again in A 129 it is argued that as we prescribe *a priori* rules to which all experience must conform, those rules cannot be derived from experience, but must precede and condition it, and can do so only as originating from ourselves (*aus uns selbst*).

“[They] precede all knowledge of the object as [their] intellectual form, and constitute a formal *a priori* knowledge of all objects in so far as they are thought (categories).”

But this is only to repeat that such forms of unity as are necessary to self-consciousness must be realised in all synthesis. It is no sufficient proof that those forms of relation coincide with the categories. As we shall find in considering the deduction of the second edition, Kant to some extent came to recognise the existence of this gap in his argument and sought to supply the missing steps. But his method of so doing still ultimately consists in an appeal to the results of the metaphysical deduction, and therefore rests upon his untenable belief in the adequacy of formal logic. It fails to obviate the objection in any

satisfactory manner.

As regards the negative aspect of the conclusion reached — that the validity of the categories is established only for appearances — Kant maintains that this is a necessary corollary of their validity being *a priori*. That things in themselves must conform to the conditions demanded by the nature of our self-consciousness is altogether impossible of proof. Even granting, what is indeed quite possible, that things in themselves embody the pure forms of understanding, we still cannot have any ground for maintaining that they must do so of necessity and will be found to do so universally. For even if we could directly experience things in themselves, and apprehend them as conforming to the categories, such conformity would still be known only as contingent. But when it is recognised that nature consists for us of nothing but appearances, existing only in the mode in which they are experienced, and therefore as necessarily conforming to the conditions under which experience is alone possible, the paradoxical aspect of the apriority ascribed to the categories at once vanishes. Proof of their *a priori* validity presupposes the phenomenal character of the objects to which they apply. They can be proved to be universal and necessarily valid of objects only in so far as it can be shown that they have antecedently conditioned and constituted them. The sole sufficient reason for asserting them to be universally valid throughout experience is that they are indispensably necessary for rendering it possible. The transcendental method of proof, *i.e.* proof by reference to the very possibility of experience, is for this reason, as Kant so justly emphasises, the sole type of argument capable of fulfilling the demands which have to be met. It presupposes, and itself enforces, the truth of the fundamental Critical distinction between appearances and things in themselves.

Kant entitles the unity of apperception *original* (*ursprünglich*); and we may now consider how far and in what sense this title is applicable. *From the point of view of method* there is the same justification for employing the term ‘original’ as for entitling the unity of apperception transcendental. Self-consciousness is more fundamental or original than consciousness of objects, in so far as it is only from the subjective standpoint which it represents that the objective deduction can demonstrate the necessity of synthesis, and the empirical validity of the pure forms of understanding. It is as a condition of the possibility of self-consciousness that the objective employment of the categories is proved to be legitimate. *In the development of the deduction* self-consciousness is, therefore, more original than consciousness of objects. Kant’s employment of the term is, however, extremely misleading. For it would seem to imply that the self has been proved to be original or ultimate in an ontological sense, as if it preceded experience, and through its antecedent reality rendered objective experience possible of achievement. Such a view is undoubtedly reinforced by Kant’s transformation of apperception into a faculty — *das Radicalvermögen aller unsrer Erkenntniss* — and his consequent identification of it with the understanding. It then seems as if he were maintaining that the transcendental ego is ultimate and is independent of all conditions, and that to its synthetic activities the various forms of objective consciousness are due.

This unfortunate phraseology is directly traceable to the spiritualistic or Leibnizian character of Kant’s earlier standpoint. In the *Dissertation* the self is viewed as an ultimate and unconditioned existence, antecedent to experience and creatively generative of it. We have already noted that a somewhat similar view is presented in the *Critique* in those paragraphs which Vaihinger identifies as embodying the earliest stage in the development of the argument of the deduction. The self is there described as coming to consciousness of its permanence through reflection upon the constancy of its own synthetic activities. Our consciousness of a transcendental object, and even the possibility of the empirical concepts through which such consciousness is, in these paragraphs, supposed to be mediated, are traced to this same source. To the last this initial excess of emphasis upon the unity of apperception remained characteristic of Kant’s Critical teaching; and though in the later statements of his theory, its powers and prerogatives were very greatly diminished, it still continued to play a somewhat exaggerated rôle. The early spiritualistic views

were embodied in a terminology which he continued to employ; and unless the altered meaning of his terms is recognised and allowed for, misunderstanding is bound to result. The terms, having been forged under the influence of the older views, are but ill adapted to the newer teaching which they are employed to formulate.

There was also a second influence at work. When Kant was constrained in the light of his new and unexpected results to recognise his older views as lacking in theoretical justification, he still held to them in his own personal thinking. For there is ample evidence that they continued to represent his *Privatmeinungen*.

Only, therefore, when these misleading influences, verbal, expository, and personal, are discounted, do the results of the deduction appear in their true proportions. Kant's Critical philosophy does not profess to prove that it is self-consciousness, or apperception, or a transcendental ego, or anything describable in kindred terms, which ultimately renders experience possible. The most that we can legitimately postulate, as noumenally conditioning experience, are "syntheses" (themselves, in their generative character, not definable) in accordance with the categories. For only upon the completion of such syntheses do consciousness of self and consciousness of objects come to exist. Consciousness of objects does, indeed, according to the argument of the deduction, involve consciousness of self; self-consciousness is the form of all consciousness. But, by the same argument, it is equally true that only in and through consciousness of objects is any self-consciousness possible at all. Consciousness of self and consciousness of objects *mutually* condition one another. Only through consciousness of both simultaneously can consciousness of either be attained. Self-consciousness is not demonstrably in itself any more ultimate or original than is consciousness of objects. Both alike are forms of experience which are conditioned in complex ways. Upon the question as to whether or not there is any such thing as abiding personality, the transcendental deduction casts no direct light. Indeed consciousness of self, as the more inclusive and complex form of awareness, may perhaps be regarded as pointing to a greater variety of contributory and generative conditions.

Unfortunately Kant, for the reasons just stated, has not sufficiently emphasised this more negative, or rather noncommittal, aspect of the results of the deduction. But when later in the chapter on the *Paralogisms* he is brought face to face with the issue, and has occasion to pronounce upon the question, he speaks with no uncertain voice. In the theoretical sphere there is, he declares, no sufficient proof of the spirituality, or unitary and ultimate character, of the self. Like everything else the unity of apperception must be noumenally conditioned, but it cannot be shown that in itself, *as self-consciousness or apperception*, it represents any noumenal reality. It may be a resultant, resting upon, and due to, a complexity of generative conditions; and these conditions may be fundamentally different in character from itself. They may, for all that we can prove to the contrary, be of a non-conscious and non-personal nature. There is nothing in our cognitive experience, and no result of the Critical analysis of it, which is inconsistent with such a possibility. Those commentators, such as Cohen, Caird, and Watson, who more or less follow Hegel in his criticism of Kant's procedure, give an interpretation of the transcendental deduction which makes it inconsistent with the sceptical conclusions which the *Critique* as a whole is made by its author to support. Unbiassed study of the *Analytic*, even if taken by itself in independence of the *Dialectic*, does not favour such a view. The argument of the transcendental deduction itself justifies no more than Kant is willing to allow in his discussion of the nature of the self in the section on the *Paralogisms*. It may, indeed, as Caird has so forcibly shown in his massive work upon the Critical philosophy, be developed upon Hegelian lines, but only through a process of essential reconstruction which departs very far from many of Kant's most cherished tenets, and which does so in a spirit that radically conflicts with that which dominates the *Critique* as a whole.

THE LATER STAGES OF THE SUBJECTIVE DEDUCTION

The reader will have noted that several of the factors in Kant's exposition have so far been entirely ignored. The time has now come for reckoning with them. They constitute, in my view, the later stages of the subjective deduction. That is to say, they refer to the transcendental generative powers which Kant, *on the strength of the results obtained in the more objective enquiry*, feels justified in postulating. Separate consideration of them tends to clearness of statement. Kant's constant alternation between the logical and the dynamical standpoints is one of the many causes of the obscurity in his argument. In this connection we shall also find opportunity to discuss the fundamental conflict, to which I have already had occasion to refer, between the subjectivist and the phenomenalist modes of developing the Critical standpoint.

The conclusions arrived at in the objective deduction compelled Kant to revise his previous psychological views. Hitherto he had held to the Leibnizian theory that *a priori* concepts are obtained by reflection upon the mind's native and fundamental modes of action. In the *Dissertation* he carefully distinguishes between the *logical* and the *real* employment of the understanding. Through the former empirical concepts are derived from concrete experience. Through the latter pure concepts are creatively generated. Logical and real thinking agree, however, Kant there argues, in being activities of the *conscious* mind. Both can be apprehended and adequately determined through the revealing power of reflective consciousness. Such a standpoint is no longer tenable for Kant. Now that he has shown that the consciousness of self and the consciousness of objects mutually condition one another, and that until both are attained neither is possible, he can no longer regard the mind as even possibly conscious of the activities whereby experience is brought about. The activities generative of consciousness have to be recognised as themselves falling outside it. Not even in its penumbra, through some vague form of apprehension, can they be detected. Only the finished products of such activities, not the activities themselves, can be presented to consciousness; and only by general reasoning, inferential of agencies that lie outside the conscious field, can we hope to determine them.

Now Kant appears to have been unwilling to regard the 'understanding' as ever unconscious of its activities. Why he was unwilling, it does not seem possible to explain; at most his rationalist leanings and Wolffian training may be cited as contributing causes. To the end he continued to speak of the understanding as the faculty whereby the *a priori* is brought to consciousness. In order to develop the distinctions demanded by the new Critical attitude, he had therefore to introduce a new faculty, capable of taking over the activities which have to be recognised as non-conscious. For this purpose he selected the imagination, giving to it the special title, *productive* imagination. The empirical reproductive processes hitherto alone recognised by psychologists are not, he declares, exhaustive of the nature of the imagination. It is also capable of *transcendental* activity, and upon this the "objective affinity" of appearances and the resulting possibility of their empirical apprehension is made to rest. The productive imagination is also viewed as rendering possible the understanding, that is, the conscious apprehension of the *a priori* as an element embedded in objective experience. Such apprehension is possible because in the pre-conscious elaboration of the given manifold the productive imagination has conformed to those *a priori* principles which the understanding demands for the possibility of its own exercise in conscious apprehension. Productive imagination acts in the manner required to yield experiences which are capable of relation to the unity of self-consciousness, *i.e.* of being found to conform to the unity of the categories. Why it should act in this manner cannot be explained; but it is none the less, on Critical principles, a legitimate assumption, since only in so far as it does so can experience, which *de facto* exists, be possible in any form. As a condition *sine qua non* of actual and possible experience, the existence of such a faculty is, Kant argues, a legitimate inference from the results of the transcendental deduction.

Though Kant's insistence upon the conscious character of understanding compels him to distinguish between it and the imagination, he has also to recognise their kinship. If imagination can never act save in conformity with the *a priori* forms of understanding, some reason must exist for their harmony. This

twofold necessity of at once distinguishing and connecting them is the cause of the hesitating and extremely variable account which in both editions of the *Critique* is given of their relation. In several passages the understanding is spoken of as simply imagination which has attained to consciousness of its activities. Elsewhere he explicitly states that they are distinct and separate. From this second point of view Kant regards imagination as mediating between sense and understanding, and, though reducible to neither, akin to both.

Only on one point is Kant clear and definite, namely, that it is to productive imagination that the *generation* of unified experience is primarily due. In it something of the fruitful and inexhaustible character of noumenal reality is traceable. Doubtless one chief reason for his choice of the title imagination is the creative character which in popular thought has always been regarded as its essential feature. As Kant, speaking of schematism, which is a process executed by the imagination, states in A 141: “This schematism ... is an *art* (*Kunst*) concealed in the depths of the human soul.” This description may perhaps be interpreted in the light of Kant’s account of the creative character of artistic genius in the *Critique of Judgment*, for there also imagination figures as the truly originative or creative faculty of the human spirit. To its noumenal character we may also trace its capacity of combining those factors of sense and understanding which in the realm of appearance remain persistently opposed. Imagination differs from the understanding chiefly in that it is at once more comprehensive and also more truly creative. It supplements the functional forms with a sensuous content, and applies them dynamically in the generation of experience.

The schemata, which the productive imagination is supposed to construct, are those generalised forms of temporal and spatial existence in which alone the unity of experience necessary to apperception can be realised. They are

“pure (without admixture of anything empirical), and yet are in one aspect intellectual and in another sensuous.”

Or as Kant describes the process in the chapter before us:

“We name the synthesis of the manifold in imagination transcendental, if without distinction of intuitions it is directed exclusively to the *a priori* combination of the manifold; and the unity of this synthesis is entitled transcendental, if it is represented as *a priori* necessary in relation to the original unity of apperception. As this unity of apperception conditions the possibility of all knowledge, the transcendental unity of the synthesis of imagination is the pure form of all possible knowledge. Hence, through it all objects of possible experience must be represented *a priori*.”

The schemata, thus transcendentally generated, are represented by Kant as limiting and controlling the empirical processes of apprehension, reproduction, and recognition. As no experience is attainable save in terms of the schemata, they enable us to determine, on *a priori* grounds, the degree of constancy and regularity that can be securely counted upon in all experience. This is Kant’s psychological explanation of what he has entitled “objective affinity.” The empirical ground of reproduction is the association of ideas; its transcendental ground is an objective affinity which is “a necessary consequence of a synthesis in imagination, grounded *a priori* on rules.”

“[The] subjective and empirical ground of reproduction according to rules is named the association of representations. If this unity of association did not also have an objective ground, which makes it impossible that appearances should be apprehended by the imagination except under the condition of a possible synthetic unity of this apprehension, it would be entirely accidental that appearances should fit into a connected whole of human knowledge.... There might exist a multitude of perceptions, and indeed an entire sensibility, in which much empirical consciousness would arise in my mind, but in a state of separation, and without belonging to one consciousness of myself. That, however, is impossible.” [As the subjective and objective deductions have demonstrated, where there is no self-consciousness there is no consciousness of any kind.] “There must therefore be an objective ground (that is, one that can be

determined *a priori*, antecedently to all empirical laws of the imagination) upon which may rest the possibility, nay, the necessity of a law that extends to all appearances — the law, namely, that all appearances must be regarded as data of the senses which are associable in themselves and subject to general rules of universal connection in their reproduction. This objective ground of all association of appearances I entitle their *affinity*.... The objective unity of all empirical consciousness in one consciousness, that of original apperception, is the necessary condition of all possible perception; and the affinity of all appearances, near or remote, is a necessary consequence of a synthesis in imagination which is grounded *a priori* on rules."

This part of Kant's teaching is apt to seem more obscure than it is. For the reader is not unnaturally disinclined to accept it in the very literal sense in which it is stated. That Kant means, however, exactly what he says, appears from the further consequence which he himself not only recognises as necessary, but insists upon as valid. The doctrine of objective affinity culminates in the conclusion that it is "we ourselves who introduce into the appearances that order and regularity which we name nature." The "we ourselves" refers to the mind in the transcendental activities of the productive imagination. The conscious processes of apprehension, reproduction, and recognition necessarily conform to schemata, non-consciously generated, which express the combined *a priori* conditions of intuition and understanding required for unitary consciousness.

Many points in this strange doctrine call for consideration. It rests, in the first place, upon the assumption of a hard and fast distinction, very difficult of acceptance, between transcendental and empirical activities of the mind. Secondly, Kant's assertion, that the empirical manifolds can be relied upon to supply a satisfactory content for the schemata, calls for more adequate justification than he himself adduces. It is upon independent reality that the fixity of empirical co-existences and sequences depends. Is not Kant practically assuming a pre-established harmony in asserting that as the mind creates the *form* of nature it can legislate *a priori* for all possible experience?

As regards the first assumption Kant would seem to have been influenced by the ambiguities of the term transcendental. It means, as we have already noted, either the science of the *a priori*, or the *a priori* itself, or the conditions which render experience possible. Even the two latter meanings by no means coincide. The conditions of the possibility of experience are not in all cases *a priori*. The manifold of outer sense is as indispensable a precondition of experience as are the forms of understanding, and yet is not *a priori* in any valid sense of that term. It does not, therefore, follow that because the activities of productive imagination "transcendentally" condition experience, they must themselves be *a priori*, and must, as Kant also maintains, deal with a pure *a priori* manifold. Further, the separation between transcendental and empirical activities of the mind must defeat the very purpose for which the productive imagination is postulated, namely, in order to account for the generation of a complex consciousness in which no one element can temporally precede any of the others. If the productive imagination generates only schemata, it will not account for that complex experience in which consciousness of self and consciousness of objects are indissolubly united. The introduction of the productive imagination seems at first sight to promise recognition of the dynamical aspect of our temporally sequent experience, and of that aspect in which as appearance it refers us beyond itself to non-experienced conditions. As employed, however, in the doctrines of schematism and of objective affinity, the imagination exhibits a formalism hardly less extreme than that of the understanding whose shortcomings it is supposed to make good.

In his second assumption Kant, as so often in the *Critique*, is allowing his old-time rationalistic leanings to influence him in underestimating the large part which the purely empirical must always occupy in human experience, and in exaggerating the scope of the inferences which can be drawn from the presence of the formal, relational factors. But this is a point which we are not yet in a position to discuss.

Fortunately, if Vaihinger's theory be accepted, section A 98-104 enables us to follow the movement of Kant's mind in the interval between the formulating of the doctrine of productive imagination and the

publication of the *Critique*. He himself would seem to have recognised the unsatisfactoriness of dividing up the total conditions of experience into transcendental activities that issue in schemata, and supplementary empirical processes which transform them into concrete, specific consciousness. The alternative theory which he proceeds to propound is at first sight much more satisfactory. It consists in duplicating each of the various empirical processes with a transcendental faculty. There are, he now declares, three transcendental powers — a transcendental faculty of apprehension, a transcendental faculty of reproduction (=imagination), and a transcendental faculty of recognition. Thus Kant's previous view that transcendental imagination has a special and unique activity, namely, the productive, altogether different in type from any of its empirical processes, is now allowed to drop; in place of it Kant develops the view that the transcendental functions run exactly parallel with the empirical processes. But though such a position may at first seem more promising than that which it displaces, it soon reveals its unsatisfactoriness. The two types of mental activity, transcendental and empirical, no longer, indeed, fall apart; but the difficulty now arises of distinguishing in apprehension, reproduction, and recognition any genuinely transcendental aspect. Apprehension, reproduction, and recognition are so essentially conscious processes that to view them as also transcendental does not seem helpful. They contain elements that are transcendental in the logical sense, but cannot be shown to presuppose in any analogous fashion mental powers that are transcendental in the dynamical sense. This is especially evident in regard to recognition, which is described as being "the *consciousness* that what we are thinking is the same as what we thought a moment before." In dealing with apprehension and reproduction the only real difference which Kant is able to suggest, as existing between their transcendental and their empirical activities, is that the former synthesise the pure *a priori* manifolds of space and time, and the latter the contingent manifold of sense. But even this unsatisfactory distinction he does not attempt to apply in the case of recognition. Nor can we hold that by the transcendental synthesis of recognition Kant means transcendental apperception. That is, of course, the suggestion which at once occurs to the reader. But however possible it might be to inject such a meaning into kindred passages elsewhere, it cannot be made to fit the context of this particular section.

Vaihinger's theory seems to be the only thread which will guide us through this labyrinth. Kant, on the eve of the publication of the *Critique*, recognising the unsatisfactoriness of his hard and fast separation of transcendental from empirical processes, adopted the view that some form of transcendental activity corresponds to every fundamental form of empirical activity and *vice versa*. Hastily developing this theory, he incorporated it into the *Critique* alongside his older doctrine. It does not, however, reappear in the *Prolegomena*, and its teaching is explicitly withdrawn in the second edition of the *Critique*. Its plausibility had entrapped him into its temporary adoption, but the defects which it very soon revealed speedily led him to reject it.

One feature of great significance calls for special notice. The breakdown of this doctrine of a threefold transcendental synthesis did not, as might naturally have been expected from what is stated in the prefaces to the *Critique* regarding the unessential and seemingly conjectural character of the subjective deduction, lead Kant to despair of developing a transcendental psychology. Though in the second edition he cuts away the sections containing the earlier stages of the subjective deduction, and in recasting the other sections gives greater prominence to the more purely logical analyses, the older doctrine of productive imagination is reinstated in full force, and is again developed in connection with the doctrine of pure *a priori* manifolds. Evidently, therefore, Kant was not disheartened by the various difficulties which lie in the path of a transcendental psychology, and it seems reasonable to conclude that there were powerful reasons inclining him to its retention. I shall now attempt, to the best of my powers, to explain — the task is a delicate and difficult one — what we may believe these reasons to have been.

THE DISTINCTION BETWEEN PHENOMENALISM AND SUBJECTIVISM

A wider set of considerations than we have yet taken into account must be borne in mind if certain broader and really vital implications of Kant's enquiry are to be properly viewed. The self has a twofold aspect. It is at once animal in its conditions and potentially universal in its powers of apprehension. Though man's natural existence is that of an animal organism, he can have consciousness of the spatial world out of which his organism has arisen, and of the wider periods within which his transitory existence falls. Ultimately such consciousness would seem to connect man cognitively with reality as a whole. Now it is to this universal or absolutist aspect of our consciousness, to its transcendence of the embodied and separate self, that Kant is seeking to do justice in his transcendental deductions, especially in his doctrine of the transcendental unity of apperception. For he views that apperception as conditioned by, and the correlate of, the consciousness of objectivity. It involves the consciousness of a single cosmical time and of a single cosmical space within which all events fall and within which they form a whole of causally interdependent existences. That is why he names it the *objective* unity of apperception. It is that aspect in which the self correlates with a wider reality, and through which it stands in fundamental contrast to the merely subjective states and to the individual conditions of its animal existence. The transcendental self, so far from being identical with the empirical self, would seem to be of directly opposite nature. The one would seem to point beyond the realm of appearance, the other to be in its existence merely natural. The fact that they are inextricably bound up with one another, and co-operate in rendering experience possible, only makes the more indispensable the duty of recognising their differing characters. Even should they prove to be inseparable aspects of sense-experience, without metaphysical implications, that would not obviate the necessity of clearly distinguishing them. The distinction remains, whatever explanation may be adopted of its speculative or other significance.

Now obviously in so fundamental an enquiry, dealing as it does with the most complicated and difficult problem in the entire field of metaphysics, no brief and compendious answer can cover all the various considerations which are relevant and determining. The problem of the deduction being what it is, the section dealing with it can hardly fail to be the most difficult portion of the whole *Critique*. The conclusions at which it arrives rest not merely upon the argument which it contains but also upon the results more or less independently reached in the other sections. The doctrine of the empirical object as appearance requires for its development the various discussions contained in the *Aesthetic*, in the sections on *Inner Sense* and on the *Refutation of Idealism*, in the chapters on *Phenomena and Noumena* and on the *Antinomies*. The metaphysical consequences and implications of Kant's teaching in regard to the transcendental unity of apperception are first revealed in the chapter on the *Paralogisms*. The view taken of productive imagination is expanded in the section on *Schematism*. In a word, the whole antecedent teaching of the *Critique* is focussed, and the entire subsequent development of the Critical doctrine is anticipated, in this brief chapter.

But there are, of course, additional causes of the difficulty and obscurity of the argument. One such cause has already been noted, namely, that the *Critique* is not a unitary work, developed from a previously thought-out standpoint, but in large part consists of manuscripts of very various dates, artificially pieced together by the addition of connecting links. In no part of the *Critique* is this so obvious as in the *Analytic of Concepts*. Until this is recognised all attempts to interpret the text in any impersonal fashion are doomed to failure. For this reason I have prefaced our discussion by a statement of Vaihinger's analysis. No one who can accept it is any longer in danger of underestimating this particular cause of the obscurity of Kant's deduction.

But the chief reason is one to which I have thus far made only passing reference, and to which we may now give the attention which its importance demands, namely, the tentative and experimental character of Kant's own final solutions. The arguments of the deduction are only intelligible if viewed as an expression of the conflicting tendencies to which Kant's thought remained subject. He sought to allow due

weight to each of the divergent aspects of the experience which he was analysing, and in so doing proceeded, as it would seem, simultaneously along the parallel lines of what appeared to be the possible, alternative methods of explanation. And to the end these opposing tendencies continued side by side, to the confusion of those readers who seek for a single unified teaching, but to the great illumination of those who are looking to Kant, not for clear-cut or final solutions, but for helpful analysis and for partial disentanglement of the complicated issues which go to constitute these baffling problems.

The two chief tendencies which thus conflicted in Kant's mind may be named the subjectivist and the phenomenalist respectively. This conflict remained, so to speak, underground, influencing the argument at every point, but seldom itself becoming the subject of direct discussion. As we shall find, it caused Kant to develop a twofold view of inner sense, of causality, of the object of knowledge, and of the unity of apperception. One of the few sections in the *Critique* where it seems on the point of emerging into clear consciousness is the section, added in the second edition, on the *Refutation of Idealism*. But this section owes its origin to polemical causes. It represents a position peculiar to the maturer portions of the *Analytic*; the rest of the *Critique* is not rewritten so as to harmonise with it, or to develop the consequences which consistent holding to it must involve.

I shall use the term *subjectivism* (and its equivalent *subjective idealism*) in the wide sense which makes it applicable to the teaching of Descartes and Locke, of Leibniz and Wolff, no less than to that of Berkeley and Hume. A common element in all these philosophies is the belief that subjective or mental states, "ideas" in the Lockean sense, are the objects of consciousness, and further are the sole possible objects of which it can have any direct or immediate awareness. Knowledge is viewed as a process entirely internal to the individual mind, and as carrying us further only in virtue of some additional supervening process, inferential, conjectural, or instinctive. This subjectivism also tends to combine with a view of consciousness as an ultimate self-revealing property of a merely individual existence. For Descartes consciousness is the very essence, both of the mind and of the self. It is indeed asserted to be exhaustive of the nature of both. Though the self is described as possessing a faculty of will as well as a power of thinking, all its activities are taken as being disclosed to the mind through the revealing power of its fundamental attribute. The individual mind is thus viewed as an existence in which everything takes place in the open light of an all-pervasive consciousness. Leibniz, it is true, taught the existence of subconscious perceptions, and so far may seem to have anticipated Kant's recognition of non-conscious processes; but as formulated by Leibniz that doctrine has the defect which frequently vitiates its modern counterpart, namely that it represents the subconscious as analogous in nature to the conscious, and as differing from it only in the accidental features of intensity and clearness, or through temporary lack of control over the machinery of reproductive association. The subconscious, as thus represented, merely enlarges the private content of the individual mind; it in no respect transcends it.

The genuinely Critical view of the generative conditions of experience is radically different from this Leibnizian doctrine of *petites perceptions*. It connects rather with Leibniz's mode of conceiving the origin of *a priori* concepts. But even that teaching it restates in such fashion as to free it from subjectivist implications. Leibniz's contention that the mind is conscious of its fundamental activities, and that it is by reflection upon them that it gains all ultimate *a priori* concepts, is no longer tenable in view of the conclusions established in the objective deduction. Mental processes, in so far as they are generative of experience, must fall outside the field of consciousness, and as activities dynamically creative cannot be of the nature of ideas or contents. They are not subconscious ideas but non-conscious processes. They are not the submerged content of experience, but its conditioning grounds. Their most significant characteristic has still, however, to be mentioned. They must no longer be interpreted in subjectivist terms, as originating in the separate existence of an individual self. In conditioning experience they generate the only self for which experience can vouch, and consequently, in the absence of full and independent proof, must not be conceived as individually circumscribed. The problem of knowledge,

properly conceived, is no longer how consciousness, individually conditioned, can lead us beyond its own bounds, but what a consciousness, which is at once consciousness of objects and also consciousness of a self, must imply for its possibility. Kant thus obtains what is an almost invariable concomitant of scientific and philosophical advance, namely a more correct and scientific formulation of the problem to be solved. The older formulation assumes the truth of the subjectivist standpoint; the Critical problem, when thus stated, is at least free from preconceptions of that particular brand. Assumptions which hitherto had been quite unconsciously held, or else, if reflected upon, had been regarded as axiomatic and self-evident, are now brought within the field of investigation. Kant thereby achieves a veritable revolution; and with it many of the most far-reaching consequences of the Critical teaching are closely bound up.

This new standpoint, in contrast to *subjective* idealism, may be named *Critical*, or to employ the term which Kant himself applies both to his transcendental deduction and to the unity of apperception, *objective* idealism. But as the distinction between appearance and reality is no less fundamental to the Critical attitude, we shall perhaps be less likely to be misunderstood, or to seem to be identifying Kant's standpoint with the very different teaching of Hegel, if by preference we employ the title *phenomenalism*.

In the transcendental deduction Kant, as above noted, is seeking to do justice to the universal or absolutist aspect of our consciousness, to its transcendence of the embodied and separate self. The unity of apperception is entitled *objective*, because it is regarded as the counterpart of a single cosmical time and of a single cosmical space within which all events fall. Its objects are not mental states peculiar to itself, nor even ideal contents numerically distinct from those in other minds. It looks out upon a common world of genuinely independent existence. In developing this position Kant is constrained to revise and indeed completely to recast his previous views both as to the nature of the synthetic processes, through which experience is constructed, and of the given manifold, upon which they are supposed to act. From the subjectivist point of view the synthetic activities consist of the various cognitive processes of the individual mind, and the given manifold consists of the sensations aroused by material bodies acting upon the special senses. From the objective or phenomenalist standpoint the synthetic processes are of a noumenal character, and the given manifold is similarly viewed as being due to noumenal agencies acting, not upon the sense-organs, which as appearances are themselves noumenally conditioned, but upon what may be called "outer sense." These distinctions may first be made clear.

Sensations, Kant holds, have a twofold origin, noumenal and mechanical. They are due in the first place to the action of things in themselves upon the noumenal conditions of the self, and also in the second place to the action of material bodies upon the sense-organs and the brain. To take the latter first. Light reflected from objects, and acting on the retina, gives rise to sensations of colour. For such causal interrelations there exists, Kant teaches, the same kind of empirical evidence as for the causal interaction of material bodies. Our sensational experiences are as truly events in time as are mechanical happenings in space. In this way, however, we can account only for the existence of our sensations and for the order in which they make their appearance in or to consciousness, not for our awareness of them. To state the point by means of an illustration. The impinging of one billiard ball upon another accounts causally for the motion which then appears in the second ball. But no one would dream of asserting that by itself it accounts for our consciousness of that second motion. We may contend that in an exactly similar manner, to the same extent, no more and no less, the action of an object upon the brain accounts only for the occurrence of a visual sensation as an event in the empirical time sequence. A sensation just as little as a motion can carry its own consciousness with it. To regard that as ever possible is ultimately to endow events in time with the capacity of apprehending objects in space. In dealing with causal connections in space and time we do not require to discuss the problem of knowledge proper, namely, how it is possible to have or acquire knowledge, whether of a motion in space or of a sensation in time. When we raise that further question we have to adopt a very different standpoint, and to take into account a much greater complexity of conditions.

Kant applies this point of view no less rigorously to feelings, emotions, and desires than to the sensations of the special senses. All of them, he teaches, are 'animal' in character. They are one and all conditioned by, and explicable only in terms of, the particular constitution of the animal organism. They one and all belong to the realm of appearance.

The term 'sensation' may also, however, be applied in a wider sense to signify the material of knowledge in so far as it is noumenally conditioned. Thus viewed, sensations are due, not to the action of physical stimuli upon the bodily organs, but to the affection by things in themselves of those factors in the noumenal conditions of the self which correspond to "sensibility." Kant is culpably careless in failing to distinguish those two very different meanings of the phrase 'given manifold.' The language which he employs is thoroughly ambiguous. Just as he frequently speaks as if the synthetic processes were conscious activities exerted by the self, so also he frequently uses language which implies that the manifold upon which these processes act is identical with the sensations of the special senses. But the sensations of the bodily senses, even if reducible to it, can at most form only part of it. The synthetic processes, interpreting the manifold in accordance with the fixed forms, space, time, and the categories, generate the spatial world within which objects are apprehended as causally interacting and as giving rise through their action upon the sense-organs to the various special sensations as events in time. Sensations, as mechanically caused, are thus on the same plane as other appearances. They depend upon the same generating conditions as the motions which produce them. As minor incidents within a more comprehensive totality they cannot possibly represent the material out of which the whole has been constructed. To explain the phenomenal world as constructed out of the sensations of the special senses is virtually to equate it with a small selection of its constituent parts. Such professed explanation also commits the further absurdity of attempting to account for the origin of the phenomenal world by means of events which can exist only under the conditions which it itself supplies. The manifold of the special senses and the primary manifold are radically distinct. The former is due to material bodies acting upon the material sense-organs. The latter is the product of noumenal agencies acting upon "outer sense," *i.e.* upon those noumenal conditions of the self which constitute our "sensibility"; it is much more comprehensive than the former; it must contain the material for all modes of objective existence, including many that are usually regarded as purely mental.

To turn, now, to the other aspect of experience. What are the factors which condition its form? What must we postulate in order to account for the existence of consciousness and for the unitary form in which alone it can appear? Kant's answer is again ambiguous. He fails sufficiently to insist upon distinctions which yet are absolutely vital to any genuine understanding of the new and revolutionary positions towards which he is feeling his way. The synthetic processes which in the subjective and objective deductions are proved to condition all experience may be interpreted either as conscious or as non-conscious activities, and may be ascribed either to the agency of the individual self or to noumenal conditions which fall outside the realm of possible definition. Now, though Kant's own expositions remain thoroughly ambiguous, the results of the Critical enquiry would seem — at least so long as the fundamental distinction between matter and form is held to and the temporally sequent aspect of experience is kept in view — to be decisive in favour of the latter alternative in each case. The synthetic processes must take place and complete themselves before any consciousness can exist at all. And as they thus precondition consciousness, they cannot themselves be known to be conscious; and not being known to be conscious, it is not even certain that they may legitimately be described as mental. We have, indeed, to conceive them on the analogy of our mental processes, but that may only be because of the limitation of our knowledge to the data of experience. Further, we have no right to conceive them as the activities of a noumenal self. We know the self only as conscious, and the synthetic processes, being the generating conditions of consciousness, are also the generating conditions of the only self for which our experience can vouch. Kant, viewing as he does the temporal aspect of human experience as fundamental, would

seem to be justified in naming these processes "synthetic." For consciousness in its very nature would seem to involve the carrying over of content from one time to other times, and the construction of a more comprehensive total consciousness from the elements thus combined. Kant is here analysing in its simplest and most fundamental form that aspect of consciousness which William James has described in the *Principles of Psychology*, and which we may entitle the telescoping of earlier mental states into the successive experiences that include them. They telescope in a manner which can never befall the successive events in a causal series, and which is not explicable by any scheme of relations derivable from the physical sphere.

Obviously, what Kant does is to apply to the interpretation of the noumenal conditions of our conscious experience a distinction derived by analogy from conscious experience itself — the distinction, namely, between our mental processes and the sensuous material with which they deal. The application of such a distinction may be inevitable in any attempt to explain human experience; but it can very easily, unless carefully guarded, prove a source of serious misunderstanding. Just as the synthetic processes which generate consciousness are not known to be themselves conscious, so also the manifold cannot be identified with the sensations of the bodily senses. These last are events in time, and are effects not of noumenal but of mechanical causes.

Kant's conclusion when developed on consistent Critical lines, and therefore in phenomenalist terms, is twofold: positive, to the effect that consciousness, for all that our analysis can prove to the contrary, may be merely a resultant, derivative from and dependent upon a complexity of conditions; and negative, to the effect that though these conditions may by analogy be described as consisting of synthetic processes acting upon a given material, they are in their real nature unknowable by us. Even their bare possibility we cannot profess to comprehend. We postulate them only because given experience is demonstrably not self-explanatory and would seem to refer us for explanation to some such antecedent generative grounds.

Kant, as we have already emphasised, obscures his position by the way in which he frequently speaks of the transcendental unity of apperception as the supreme condition of our experience. At times he even speaks as if it were the source of the synthetic processes. That cannot, however, be regarded as his real teaching. Self-consciousness (and the unity of apperception, in so far as it finds expression through self-consciousness) rests upon the same complexity of conditions as does outer experience, and therefore may be merely a product or resultant. It is, as he insists in the *Paralogisms*, the emptiest of all our concepts, and can afford no sufficient ground for asserting the self to be an abiding personality. We cannot by theoretical analysis of the facts of experience or of the nature of self-consciousness prove anything whatsoever in regard to the ultimate nature of the self.

Now Kant is here giving a new, and quite revolutionary, interpretation of the distinction between the subjective and the objective. The objective is for the Cartesians the independently real; the subjective is that which has an altogether different kind of existence in what is entitled the field of consciousness. Kant, on the other hand, from his phenomenalist standpoint, views existences as objective when they are determined by purely physical causes, and as subjective when they also depend upon physiological and psychological conditions. On this latter view the difference between the two is no longer a difference of kind; it becomes a difference merely of degree. Objective existences, owing to the simplicity and recurrent character of their conditions, are uniform. Subjective existences resting upon conditions which are too complex to be frequently recurrent, are by contrast extremely variable. But both types of existence are objective in the sense that they are objects, and immediate objects, for consciousness. Subjective states do not run parallel with the objective system of natural existences, nor are they additional to it. For they do not constitute our consciousness of nature; they are themselves part of the natural order which consciousness reveals. That they contrast with physical existences in being unextended and incapable of location in space is what Kant would seem by implication to assert, but he challenges Descartes' right to infer from this particular difference a complete diversity in their whole nature. Sensations, feelings,

emotions, and desires, so far as they are experienced by us, constitute the empirical self which is an objective existence, integrally connected with the material environment, in terms of which alone it can be understood. In other words, the distinction between the subjective and the objective is now made to fall within the system of natural law. The subjective is not opposite in nature to the objective, but is a subspecies within it.

The revolutionary character of this reformulation of Cartesian distinctions may perhaps be expressed by saying that what Kant is really doing is to substitute the distinction between appearance and reality for the Cartesian dualism of the mental and the material. The psychical is a title for a certain class of known existences, *i.e.* of appearances; and they form together with the physical a single system. But underlying this entire system, conditioning both physical and psychical phenomena, is the realm of noumenal existence; and when the question of the possibility of knowledge, that is, of the experiencing of such a comprehensive natural system, is raised, it is to this noumenal sphere that we are referred. Everything experienced, even a sensation or desire, is an event; but the experiencing of it is an act of awareness, and calls for an explanation of an altogether different kind.

Thus Kant completely restates the problem of knowledge. The problem is not how, starting from the subjective, the individual can come to knowledge of the independently real; but how, if a common world is alone immediately apprehended, the inner private life of the self-conscious being can be possible, and how such inner experience is to be interpreted. How does it come about that though sensations, feelings, etc., are events no less mechanically conditioned than motions in space, and constitute with the latter a single system conformed to natural law, they yet differ from all other classes of natural events in that they can be experienced only by a single consciousness. To this question Kant replies in terms of his fundamental distinction between appearance and reality. Though everything of which we are conscious may legitimately be studied in terms of the natural system to which it belongs, consciousness itself cannot be so regarded. In attempting to define it we are carried beyond the phenomenal to its noumenal conditions. In other words, it constitutes a problem, the complete data of which are not at our disposal. This is by itself a sufficient reason for our incapacity to explain why the states of each empirical self can never be apprehended save by a single consciousness, or otherwise stated, why each consciousness is limited, as regards sensations and feelings, exclusively to those which arise in connection with some one animal organism. It at least precludes us from dogmatically asserting that this is due to their being subjective in the dualistic and Cartesian sense of that term — namely, as constituting, or being states of, the knowing self.

A diagram may serve, though very crudely, to illustrate Kant’s phenomenalist interpretation of the cognitive situation.

ES^A = Empirical self of the conscious Being A.

ES^A = Empirical self of the conscious Being A.

ES^B = Empirical self of the conscious Being B.

NC^A = Noumenal conditions of the conscious Being A.

NC^B = Noumenal conditions of the conscious Being B.

l, m, n = Objects in space.

x, y, z = Sensations caused by objects l, m, n acting on the sense-organs of the empirical self A.

x, y, z= Sensations caused by 1, m, n acting on the sense-organs of the empirical self B.

NC^{EW} = Noumenal conditions of the empirical world.

Everything in this empirical world is equally open to the consciousness of both A and B, save only certain psychical events that are conditioned by physiological and psychological factors. x, y, z can be apprehended only by A; x, y, z can be apprehended only by B. Otherwise A and B experience one and the same world; the body of B is perceived by A in the same manner in which he perceives his own body. This is true *a fortiori* of all other material existences. Further, these material existences are known with the same immediacy as the subjective states. As regards the relation in which NC^A, NC^B, and NC^{EW} stand to one another, no assertions can be made, save, as above indicated, such conjectural statements as may precariously be derived through argument by analogy from distinctions that fall within our human experience.

Kant’s phenomenalism thus involves an objectivist view of individual selves and of their interrelations. They fall within the single common world of space. Within this phenomenal world they stand in external, mechanical relations to one another. They are apprehended as embodied, with known contents, sensations, feelings, and desires, composing their inner experience. There is, from this point of view, no problem of knowledge. On this plane we have to deal only with events known, not with any process of apprehension. Even the components of the empirical self, the subject-matter of empirical psychology, are not processes of apprehension, but apprehended existences. It is only when we make a regress beyond the phenomenal as such to the conditions which render it possible, that the problem of knowledge arises at all. And with this regress we are brought to the real crux of the whole question — the reconciliation of this phenomenalism with the conditions of our self-consciousness. For we have then to take into account the fundamental fact that each self is not only an animal existence within the phenomenal world, but also in its powers of apprehension coequal with it. The self known is external to the objects known; the self that knows is conscious of itself as comprehending within the field of its consciousness the wider universe in infinite space.

Such considerations would, at first sight, seem to force us to modify our phenomenalist standpoint in the direction of subjectivism. For in what other manner can we hope to unite the two aspects of the self, the known conditions of its finite existence and the consciousness through which it correlates with the universe as a whole? In the one aspect it is a part of appearance; in the other it connects with that which makes appearance possible at all.

Quite frequently it is the subjectivist solution which Kant seems to adopt. Objects known are “mere representations,” “states of the identical self.” Everything outside the individual mind is real; appearances are purely individual in origin. But such a position is inconsistent with the deeper implications of Kant’s Critical teaching, and would involve the entire ignoring of the many suggestions which point to a fundamentally different and much more adequate standpoint. The individual is himself known only as appearance, and cannot, therefore, be the medium in and through which appearances exist. Though appearances exist only in and through consciousness, they are not due to any causes which can legitimately be described as individual. From this standpoint Kant would seem to distinguish between the grounds and conditions of phenomenal existence and the special determining causes of individual consciousness. Transcendental conditions generate consciousness of the relatively permanent and objective world in space and time; empirical conditions within this space and time world determine the sensuous modes through which special portions of this infinite and uniform world appear diversely to different minds.

This, however, is a point of view which is only suggested, and, as we have already observed, the form in which it is outlined suggests many objections and difficulties. Consciousness of the objective world in space and time does not exist complete with one portion of it more specifically determined in terms of actual sense-perceptions. Rather the consciousness of the single world in space and time is gradually developed through and out of sense experience of limited portions of it. We have still to consider the

various sections in the *Analytic of Principles* (especially the section added in the second edition on the *Refutation of Idealism*) and in the *Dialectic*, in which Kant further develops this standpoint. But even after doing so, we shall be forced to recognise that Kant leaves undiscussed many of the most obvious objections to which his phenomenalism lies open. To the very last he fails to state in any really adequate manner how from the phenomenalist standpoint he would regard the world described in mechanical terms by science as being related to the world of ordinary sense-experience, or how different individual consciousnesses are related to one another. The new form, however, in which these old-time problems here emerge is the best possible proof of the revolutionary character of Kant's Critical enquiries. For these problems are no longer formulated in terms of the individualistic presuppositions which govern the thinking of all Kant's predecessors, even that of Hume. The concealed presuppositions are now called in question, and are made the subject of explicit discussion. But further comment must meantime be deferred.

TRANSCENDENTAL DEDUCTION OF THE CATEGORIES, IN THE SECOND EDITION

The argument of the second edition transcendental deduction can be reduced to the following eight points:

(1) It opens with the statement of a fundamental assumption which Kant does not dream of questioning and of which he nowhere attempts to offer proof. The representation of combination is the one kind of representation which can never be given through sense. It is not so given even in the pure forms of space and time yielded by outer and inner sense. It is due to an act of spontaneity, which as such must be performed by the understanding. As it is one and the same for every kind of combination, it may be called by the general name of synthesis. And as all combination, without exception, is due to this source, its dissolution, that is, analysis, which seems to be its opposite, always presupposes it.

(2) Besides the manifold and its synthesis a further factor is involved in the conception of combination, namely, *the representation of the unity* of the manifold. The combination which is necessary to and constitutes knowledge is *representation* of the synthetical unity of the manifold. This is a factor additional to synthesis and to the manifold synthesised. For such representation cannot arise out of any antecedent consciousness of synthesis. On the contrary, it is only through supervention upon the unitary synthesis that the conception of the combination becomes possible. In other words, the representation of unity conditions *consciousness* of synthesis, and therefore cannot be the outcome or product of it. This is an application, or rather generalisation, of a position which in the first edition is developed only in reference to the empirical process of recognition. Recognition preconditions consciousness, and therefore cannot be subsequent upon it.

(3) The unity thus represented is not, however, that which is expressed through the category of unity. The consciousness of unity which is involved in the conception of synthesis is that of apperception or transcendental self-consciousness. This is the highest and most universal form of unity, for it is a presupposition of the unity of all possible concepts, whether analytic or synthetic, in the various forms of judgment.

(4) A manifold though given is not for that reason also represented. It must be possible for the 'I think' to accompany it and all my other representations:

"...for otherwise something would be represented in me which could not be thought at all; and that is equivalent to saying that the representation would be impossible or at least would be nothing to me."

But to ascribe a manifold as my representations to the identical self is to comprehend them, as synthetically connected, in one apperception. Only what can be combined in one consciousness can be related to the 'I think.' The analytic unity of self-consciousness presupposes the synthetic unity of the manifold.

(5) The unity of apperception is analytic or self-identical. It expresses itself through the proposition, *I*

am I. But being thus pure identity without content of its own, it cannot be conscious of itself in and by itself. Its unity and constancy can have meaning only through contrast to the variety and changeableness of its specific experiences; and yet, at the same time, it is also true that such manifoldness will destroy all possibility of unity unless it be reconcileable with it. The variety can contribute to the conditioning of apperception only in so far as it is capable of being combined into a single consciousness. Through synthetic unifying of the manifold the self comes to consciousness both of itself and of the manifold.

(6) The transcendental original unity of apperception is an objective, not a merely subjective, unity. Its conditions are also the conditions in and through which we acquire consciousness of objects. An object is that in the conception of which the manifold of given intuitions is combined. (This point, though central to the argument, is more adequately developed in the first than in the second edition.) Such combination requires unity of consciousness. Thus the same unity which conditions apperception likewise conditions the relation of representations to an object. The unity of pure apperception may therefore be described as an *objective* unity for two reasons: first, because it can apprehend its own analytical unity only through discovery of unity in the given, and secondly, for the reason that such synthetical unifying of the manifold is also the process whereby representations acquire reference to objects.

(7) Kant reinforces this conclusion, and shows its further significance, by analysis of the act of judgment. The logical definition of judgment, as the representation of a relation between two concepts, has many defects. These, however, are all traceable to its initial failure to explain, or even to recognise, the nature of the assertion which judgment as such claims to make. Judgment asserts relations of a quite unique kind, altogether different from those which exist between ideas connected through association. If, for instance, on seeing a body the sensations of weight due to the attempt to raise it are suggested by association, there is nothing but subjective sequence; but if we form the judgment that the body is heavy, the two representations are then connected together *in the object*. This is what is intended by the copula 'is.' It is a relational term through which the objective unity of given representations is distinguished from the subjective. It indicates that the representations stand in objective relation under the pure unity of apperception, and not merely in subjective relation owing to the play of association in the individual mind. "Judgment is nothing but the mode of bringing cognitions to the objective unity of apperception," *i.e.* of giving to them a validity which holds independently of the subjective processes through which it is apprehended. Objective relations are not, of course, all necessary or universal; and a judgment may, therefore, assert a relation which is empirical and contingent. None the less the fundamental distinction between it and any mere relation of association still persists. The empirical relation is still in the judgment asserted to be objective. The subject and the predicate are asserted, in the particular case or cases to which the judgment refers, to be connected in the object and not merely in the mind of the subject. Or otherwise stated, though subject and predicate are not themselves declared to be necessarily and universally related to one another, their contingent relation has to be viewed as objectively, and therefore necessarily, grounded. Judgment always presupposes the existence of necessary relations even when it is not concerned to assert them. Judgment is the organ of objective knowledge, and is therefore bound up, indirectly when not directly, with the universality and necessity which are the sole criteria of knowledge. The judgment expressive of contingency is still judgment, and is therefore no less necessary in its conditions, and no less objective in its validity, than is a universal judgment of the scientific type. To use Kant's own terminology, judgment acquires objective validity through participation in the necessary unity of apperception. In so doing it is made to embody those principles of the objective determination of all representations through which alone cognition is possible.

(8) As judgment is nothing but the mode of bringing cognitions to the objective unity of apperception, it follows that the categories, which in the metaphysical deduction have been proved to be the possible functions in judging, are the conditions in and through which such pure apperception becomes possible. Apperception conditions experience, and the unity which both demand for their possibility is that of the

categories.

Before passing to the remaining sections of the deduction, which are supplementary rather than essential, I may add comment upon the above points. Only (7) and (8) call for special consideration. They represent a form of argument which has no counterpart in the first edition. As we noted, the first edition argument is defective owing to its failure to demonstrate that the categories constitute the unity which is necessary to knowledge. By introducing in the second edition this analysis of judgment, and by showing the inseparable connection between pure apperception, objective consciousness and judgment, this defect is in some degree removed. As the categories correspond to the possible functions of judgment, their objective validity is thereby established. By this means also the connection which in Kant's view exists between the metaphysical and the transcendental deductions receives for the first time proper recognition. The categories which in the former deduction are discovered and systematised through *logical* analysis of the *form* of judgment, are in the latter deduction, through *transcendental* analysis of the *function* of judgment, shown to be just those forms of relation which are necessary to the possibility of knowledge. It must, however, be noted that the transcendental argument is brought to completion only through assumption of the adequacy of the metaphysical deduction. No independent attempt is made to show that the particular categories obtained in the metaphysical deduction are those which are required, that there are no others, or that all the twelve are indispensable.

(7) is a development of an argument which first appears in the *Prolegomena*. The statement of it there given is, however, extremely confused, owing to the distinction which Kant most unfortunately introduces between judgments of experience and judgments of perception. That distinction is entirely worthless and can only serve to mislead the reader. It cuts at the very root of Kant's Critical teaching. Judgments of perception involve, Kant says, no category of the understanding, but only what he is pleased to call the "logical connection of perceptions in a thinking subject." What that may be he nowhere explains, save by adding that in it perceptions are "compared and conjoined in a consciousness of my state" (also spoken of by Kant as "empirical consciousness"), and not "in consciousness in general."

"All our judgments are at first mere judgments of perception; they hold good merely for us (that is, for the individual subject), and we do not till afterwards give them a new reference, namely, to an object.... To illustrate the matter: that the room is warm, sugar sweet, and wormwood bitter — these are merely subjectively valid judgments. I do not at all demand that I myself should at all times, or that every other person should, find the facts to be what I now assert; they only express a reference of two sensations to the same subject, to myself, and that only in my present state of perception. Consequently they are not intended to be valid of the object. Such judgments I have named those of perception. Judgments of experience are of quite a different nature. What experience teaches me under certain circumstances, it must teach me always and teach everybody, and its validity is not limited to the subject or to its state at a particular time."

The illegitimacy and the thoroughly misleading character of this distinction hardly require to be pointed out. Obviously Kant is here confusing assertion of contingency and contingency of assertion. A judgment of contingency, in order to be valid, must itself be necessary. Even a momentary state of the self is referable to an object in judgment only if that object is causally, and therefore necessarily, concerned in its production.

The distinction is repeated in § 22 as follows:

"Thinking is the combining of representations in one consciousness. This combination is either merely relative to the subject, and is contingent and subjective, or is absolute, and is necessary or objective. The combination of representations in one consciousness is judgment. Thinking, therefore, is the same as judging, or the relating of representations to judgments in general. Judgments, therefore, are either merely subjective, or they are objective. They are subjective when representations are related to a consciousness

in one subject only, and are combined in it alone. They are objective when they are united in a consciousness in general, that is, necessarily.”

To accept this distinction is to throw the entire argument into confusion. This Kant seems to have himself recognised in the interval between the *Prolegomena* and the second edition of the *Critique*. For in the section before us there is no trace of it. The opposition is no longer between subjective and objective judgment, but only between association of ideas and judgment which as such is always objective. The distinction drawn in the *Prolegomena* is only, indeed, a more definite formulation of the distinction which runs through the first edition of the *Critique* between the indeterminate and the determinate object of consciousness. The more definite formulation of it seems, however, to have had the happy effect of enabling Kant to realise the illegitimacy of any such distinction.

We may now proceed to consider the remaining sections. In section 21 Kant makes a very surprising statement. The above argument, which he summarises in a sentence, yields, he declares, “the *beginning* of a deduction of the pure concepts of understanding.” This can hardly be taken as representing Kant’s real estimate of the significance of the preceding argument, and would seem to be due to a temporary preoccupation with the problems that centre in the doctrine of schematism. So far, Kant adds in explanation, no account has been taken of the particular manner in which the manifold of empirical intuition is supplied to us. The necessary supplement, consisting of a very brief outline statement of the doctrine of schematism, is given in section 26. It differs from the teaching of the special chapter devoted to schematism in emphasising space equally with time. The doctrine of pure *a priori* manifolds is incidentally asserted. Section 26 concludes by consideration of the question why appearances must conform to the *a priori* categories. It is no more surprising, Kant claims, than that they should agree with the *a priori* forms of intuition. The categories and the intuitional forms are relative to the same subject to which the appearances are relative; and the appearances “as mere representations are subject to no law of connection save that which the combining faculty prescribes.”

The summary of the deduction given in section 27 discusses the three possible theories regarding the origin of pure concepts, viz. those of *generatio aequivoca* (out of experience), *epigenesis*, and *preformation*. The first is disproved by the deduction. The second is the doctrine of the deduction and fulfils all the requirements of demonstration. The proof that the categories are at once independent of experience and yet also universally valid for all experience is of the strongest possible kind, namely, that they make experience itself possible. The third theory, that the categories, while subjective and self-discovered, originate in faculties which are implanted in us by our Creator and which are so formed as to yield concepts in harmony with the laws of nature, lies open to two main objections. In the first place, this is an hypothesis capable of accounting equally well for any kind of *a priori* whatsoever; the predetermined powers of judgment can be multiplied without limit. But a second objection is decisive, namely, that on such a theory the categories would lack the particular kind of necessity which is required. They would express only the necessities imposed upon our thinking by the constitution of our minds, and would not justify any assertion of necessary connection *in the object*. Kant might also have added, that this hypothesis is metaphysical, and therefore offers in explanation of the *empirical* validity of *a priori* concepts a theory which rests upon and involves their *unconditioned* employment. That is a criticism which is reinforced by the teaching of the *Dialectic*.

To return now to the omitted sections 22 to 25. Section 22 makes no fresh contribution to the argument of the first edition. Its teaching in regard to pure intuition and mathematical knowledge has already been commented upon. In section 23 Kant dwells upon an interesting consequence of the argument of the deduction. The categories have a wider scope than the pure forms of sense. Since the argument of the deduction has shown that judgment is the indispensable instrument both for reducing a manifold to the unity of apperception and also for conferring upon representations a relation to an object, it follows that the categories which are simply the possible functions of unity in judgment are valid for any and every consciousness that is sensuously conditioned and whose knowledge is therefore acquired through synthesis of a given manifold. Though such consciousness may not intuit in terms of space and time, it must none the less apprehend objects in terms of the categories. The categories thus extend to *objects of sensuous intuition in general*. They are not, however, valid of objects as such, that is, of things in themselves. As empty relational forms they have *meaning* only in reference to a given matter; and as instruments for the reduction of variety to the unity of apperception their *validity* has been proved only for conscious and sensuous experience. Even if the possibility of a non-sensuous intuitive understanding, capable of apprehending things in themselves, be granted, we have no sufficient ground for asserting that the forms which such understanding will employ must coincide with the categories. These are points which will come up for discussion in connection with Kant's more detailed argument in the chapter on the distinction between phenomena and noumena.

The heading to section 24 is decidedly misleading. The phrase "objects of the senses in general" might be synonymous with "objects of intuition in general" of the preceding section. To interpret it, however, by the contents of the section, it means "objects of *our* senses." This section ought, therefore, to form part of section 26, which in its opening sentences supplies its proper introduction. (It may also be noted that the opening sentences of section 24 are a needless repetition of section 23. This would seem to show that it was not written in immediate continuation of it.) The first three paragraphs of section 24 expound the same doctrine of schematism as that outlined in section 26, save that time alone is referred to. The remaining paragraphs of section 24 deal with the connected doctrine of inner sense. Section 25 deals with certain consequences which follow from that doctrine of inner sense.

THE DOCTRINE OF INNER SENSE

We have still to consider a doctrine of great importance in Kant's thinking, that of inner sense. The significance of this doctrine is almost inversely proportionate to the scantiness and obscurity of the passages in which it is expounded and developed. Much of the indefiniteness and illusiveness of the current interpretations of Kant would seem to be directly traceable to the commentator's failure to appreciate the position which it occupies in Kant's system. Several of Kant's chief results are given as deductions from it, while it itself, in turn, is largely inspired by the need for a secure basis upon which these positions may be made to rest. The relation of the doctrine to its consequences is thus twofold. Kant formulates it in order to safeguard or rather to justify certain conclusions; and yet these conclusions have themselves in part been arrived at owing to his readiness to accept such a doctrine, and to what would seem to have been his almost instinctive feeling of its kinship (notwithstanding the very crude form in which alone he was able to formulate it) with Critical teaching. It was probably one of the earliest of the many new tenets which Kant adopted in the years immediately subsequent to the publication of the inaugural *Dissertation,* but it first received adequate statement in the second edition of the *Critique*. Kant took advantage of the second edition to reply to certain criticisms to which his view of time had given rise, and in so doing was compelled to formulate the doctrine of inner sense in a much more explicit manner. Hitherto he had assumed its truth, but had not, as it would seem, sufficiently reflected upon the various connected conclusions to which he was thereby committed. This is one of the many instances

which show how what is most fundamental in Kant's thinking is frequently that of which he was himself least definitely aware. Like other thinkers, he was most apt to discuss what he himself was inclined to question and feel doubt over. The sources of his insight as well as the causes of his failure often lay beyond the purview of his explicitly developed tenets; and only under the stimulus of criticism was he constrained and enabled to bring them within the circle of reasoned conviction. We may venture the prophecy that if Kant had been able to devote several years more to the maturing of the problems which in the face of so many difficulties he had brought thus far, the doctrine of inner sense, or rather the doctrines to which it gives expression, would have been placed in the forefront of his teaching, and their systematic interconnection, both in the way of ground and of consequence, with all his chief tenets would have been traced and securely established.

This would have involved, however, two very important changes. In the first place, Kant would have had to recognise the unsatisfactory character of the supposed analogy between inner and outer sense. As already remarked, no great thinker, except Locke, has attempted to interpret inner consciousness on the analogy of the senses; and the obscurities of Kant's argument are not, therefore, to be excused on the ground that "the difficulty, how a subject can have an internal intuition of itself, is common to every theory." Secondly, Kant would have had to define the relation in which he conceived this part of his teaching to stand to his theory of consciousness. But both these changes could have been made without requiring that he should give up the doctrines which are mainly responsible for his theory of inner sense, namely, that there can be no awareness of awareness, but only of existences which are objective, and that there is consequently no consciousness of the generative, synthetic processes which constitute consciousness on its subjective side. It is largely in virtue of these conclusions that Kant's phenomenalism differs from the subjective idealism of his predecessors. If we ignore or reject them, merely because of the obviously unsatisfactory manner in which alone Kant has been able to formulate them, we rule ourselves out from understanding the intention and purpose of much that is most characteristic of Critical teaching.

The doctrine of inner sense, as expounded by Locke, suffers from an ambiguity which seems almost inseparable from it, namely, the confusion between inner sense, on the one hand as a *sense* in some degree analogous in nature to what may be called outer sense, and on the other as consisting in self-conscious reflection. This same confusion is traceable throughout the *Critique*, and is, as we shall find, in large part responsible for Kant's failure to recognise, independently of outside criticism, the central and indispensable part which this doctrine is called upon to play in his system.

The doctrine is stated by Kant as follows. Just as outer sense is affected by noumenal agencies, and so yields a manifold arranged in terms of a form peculiar to it, namely, space, so inner sense is affected by the mind itself and its inner state. The manifold thereby caused is arranged in terms of a form peculiar to inner sense, namely, time. The content thus arranged falls into two main divisions. On the one hand we have feelings, desires, volitions, that is, states of the mind in the strict sense, subjective non-spatial existences. On the other hand we have sensations, perceptions, images, concepts, in a word, representations (*Vorstellungen*) of every possible type. These latter all refer to the external world in space, and yet, according to Kant, speaking from the limited point of view of a critique of *knowledge*, form the proper content of inner sense. "...the representations of the outer senses constitute the actual material with which we occupy our minds," "the whole material of knowledge even for our inner sense." (These statements, it may be observed, are first made in the second edition.) As Kant explains himself in B 67-8, he would seem to mean that the mind in the process of "setting" representations of outer sense in space affects itself, and is therefore constrained to arrange the given representations likewise in time. No new content, additional to that of outer sense, is thereby generated, but what previously as object of outer sense existed merely in space is now also subjected to conditions of time. The representations of outer sense are all by their very nature likewise representations of inner sense. To outer sense is due both their

content and their spatial form; to inner sense they owe only the additional form of time; their content remains unaffected in the process of being taken over by a second sense. This yields such explanation as is possible of Kant's assertion in A 33 that "time can never be a determination of outer appearances." He may be taken as meaning that time is never a determination of outer sense *as such*, but only of its contents as always likewise subject to the form of inner sense.

This is how Kant formulates his position from the extreme subjectivist point of view which omits to draw any distinction between representation and its object, between inner states of the self and appearances in space. All representations, he says, all appearances without exception, are states of inner sense, modifications of the mind. Some exist only in time, some exist both in space and in time; but all alike are modes of the identical self, mere representations (*blosse Vorstellungen*). Though appearances may exist outside one another in space, space itself exists only as representation, merely "in us."

Now without seeking to deny that this is a view which we find in the second edition of the *Critique* as well as in the first, and that even in passages which are obviously quite late in date of writing Kant frequently speaks in terms which conform to it, we must be no less insistent in maintaining that an alternative view more and more comes to the front in proportion as Kant gains mastery over the conflicting tendencies that go to constitute his new Critical teaching. From the very first he uses language which implies that *some* kind of distinction must be drawn between representations and objects represented, between subjective cognitive states in the proper sense of the term and existences in space.

"Time can never be a determination of outer appearances. It belongs neither to form nor position, etc. On the other hand it determines the relation of representations in our inner state."

Similarly in those very sentences in which he asserts all appearances to be *blosse Vorstellungen*, a distinction is none the less implied.

"Time is the formal *a priori* condition of all appearances in general. Space, as the pure form of all outer intuition, is as *a priori* condition limited exclusively (*bloss*) to outer appearances. On the other hand as all representations, *whether they have outer things as their object or not*, still in themselves belong, as determinations of the mind, to the inner state, and this inner state is subject to the formal condition of inner intuition, that is of time, time is an *a priori* condition of all appearance whatever. It is, indeed, the immediate condition of the inner appearance (of our souls), and thereby mediately likewise of outer appearances."

As the words which I have italicised show, Kant, even in the very sentence in which he asserts outer representations to be inner states, none the less recognises that appearances in space are not representations in the same meaning of that term as are subjective states. They are the *objects* of representation, not representation itself. The latter alone is correctly describable as a state of the mind. The former may be conditioned by representation, and may therefore be describable as appearances, but are not for that reason to be equated with representation. But before the grounds and nature of this distinction can be formulated in the proper Critical terms, we must consider the reasons which induced Kant to commit himself to this obscure and difficult doctrine of inner sense. As I shall try to show, it is no mere excrescence upon his system; on the contrary, it is inseparably bound up with all his main tenets.

One of the chief influences which constrained Kant to develop this doctrine is the conclusion, so essential to his position, that knowledge must always involve an intuitional manifold in addition to *a priori* forms and concepts. That being so, he was bound to deny to the mind all power of gaining knowledge by mere reflection. If our mental activities and states lay open to direct inspection, we should have to recognise in the mind a non-sensuous intuitional power. Through self-consciousness or reflection we should acquire knowledge independently of sense. Such apprehension, though limited to the mind's own operations and states, would none the less be *knowledge*, and yet would not conform to the conditions which, as the transcendental deduction has shown, are involved in all knowledge. In Kant's view the belief that we possess self-consciousness of this type, a power of reflection thus conceived, is

wholly illusory. To assume any such faculty would be to endow the mind with occult or mystical powers, and would throw us back upon the Leibnizian rationalism, which traces to such reflection our consciousness of the categories, and which rears upon this foundation the entire body of metaphysical science.

The complementary *negative* conclusion of the transcendental deduction is a no less fundamental and constraining influence in compelling Kant to develop a doctrine of inner sense. If all knowledge is knowledge of appearances, or if, as he states his position in the *Analytic of Principles*, our knowledge can extend no further than sense experience and inference from such experience, either knowledge of our inner states must be mediated, like our knowledge of outer objects, by sensation, or we can have no knowledge of them whatsoever. On Critical principles, consistently applied, there can be no middle course between acceptance of an indirect empirical knowledge of the mind and assertion of its unknowableness. Mental activities may perhaps be thought in terms of the pure forms of understanding, but in that case their conception will remain as purely problematic and as indeterminate as the conception of the thing in itself. It is impossible for Kant to admit *immediate* consciousness of the mind's real activities and states, and at the same time to deny that we can have knowledge of things in themselves. The *Aesthetic*, in proving that everything in space and time is appearance, implicitly assumes the impossibility of direct self-conscious reflection; and the transcendental deduction in showing that all knowledge involves as correlative factors both sense and thought, has reinforced this conclusion, and calls for its more explicit recognition, in reference to the more inward aspect of experience.

As we have already noted, Kant's doctrine of inner sense was probably adopted in the early 'seventies, and though it is not itself definitely formulated in the first edition, the chief consequence that follows from it is clearly recognised. Thus in the *Aesthetic* Kant draws the conclusion that, as time is the form of inner sense, everything apprehended in time, and consequently all inner states and activities, can be known only as appearances. The mind (meaning thereby the ultimate conditioning grounds of consciousness) is as indirectly known as is any other mode of noumenal existence. In the *Analytic*, whenever he is called upon to express himself upon this and kindred points, he continues to hold to this position; and in the section on the *Paralogisms* all the main consequences that follow from its acceptance are drawn in the most explicit and unambiguous manner. It is argued that as the inner world, the feelings, volitions and representations of which we are conscious, is a world constructed out of a given manifold yielded by inner sense, and is therefore known only as the appearance of a deeper reality which we have no power of apprehending, it possesses no superiority either of certainty or of immediacy over the outer world of objects in space. We have immediate consciousness of both alike, but in both cases this immediate consciousness rests upon the transcendental synthetic processes whereby such consciousness is conditioned and generated. The transcendental activities fall outside the field of empirical consciousness and therefore of knowledge.

Thus Kant would seem to be maintaining that the radical error committed by the subjective idealists, and with which all the main defects of their teaching are inseparably bound up, lies in their ascription to the mind of a power of direct self-conscious reflection, and consequently in their confusion of the transcendental activities which condition consciousness with the inner states and processes which such consciousness reveals. This has led them to ascribe priority and independence to our inner states, and to regard outer objects as known only by an inference from them. The Critical teaching insists on the distinction between appearance and reality, applies it to the inner life, and so restores to our consciousness of the outer world the certainty and immediacy of which subjective idealism would profess to deprive it. Such are the important conclusions at which Kant arrives in his various "refutations of idealism"; and it will be advisable to consider these refutations in full detail before attempting to complete our statement of his doctrine of inner sense.

KANT'S REFUTATIONS OF IDEALISM

Kant has in a number of different passages attempted to define his Critical standpoint in its distinction from the positions of Descartes and Berkeley. Consideration of these will enable us to follow Kant in his gradual recognition of the manifold consequences to which he is committed by his substitution of inner sense for direct self-conscious intuition or reflection, or rather of the various congenial tenets which it gives him the right consistently to defend and maintain. In Kant's Critical writings we find no less than seven different statements of his refutation of idealism: (I.) in the fourth *Paralogism* of the first edition of the *Critique*; (II.) in section 13 (*Anm.* ii. and iii.) of the *Prolegomena*; (III.) in section 49 of the *Prolegomena*; (IV.) in the second appendix to the *Prolegomena*; (V.) in sections added in the second edition at the conclusion of the *Aesthetic* (B 69 ff.); (VI.) in the "refutation of idealism" (B 274-8), in the supplementary section at the end of the section on the *Postulates* (B 291-4), and in the note to the new preface (B xxxix-xl); (VII.) in the "refutation of problematic idealism" given in the *Seven Small Papers* which originated in Kant's conversations with Kiesewetter. Consideration of these in the above order will reveal Kant's gradual and somewhat vacillating recognition of the new and revolutionary position which alone genuinely harmonises with Critical principles. But first we must briefly consider the various meanings which Kant at different periods assigned to the term idealism. Even in the *Critique* itself it is employed in a great variety of diverse connotations.

In the pre-Critical writings the term idealism is usually employed in what was its currently accepted meaning, namely, as signifying any philosophy which denied the existence of an independent world corresponding to our subjective representations. But even as thus used the term is ambiguous. It may signify either denial of a *corporeal* world independent of our representations or denial of an immaterial world "corresponding to" the represented material world, *i.e.* the denial of *Dinge an sich*. For there are traceable in Leibniz's writings two very different views as to the reality of the material world. Sometimes the monads are viewed as purely intelligible substances without materiality of any kind. The kingdom of the extended is set into the representing subjects; only the immaterial world of unextended purely spiritual monads remains as independently real. At other times the monads, though in themselves immaterial, are viewed as constituting through their coexistence an independent material world and a materially occupied space. Every monad has a spatial sphere of activity. The material world is an objective existence due to external relations between the monads, not a merely subjective existence internal to each of them. This alternation of standpoints enabled Leibniz's successors to deny that they were idealists; and as the more daring and speculative aspects of Leibniz's teaching were slurred over in the process of its popularisation, it was the second, less consistent view, which gained the upper hand. Wolff, especially in his later writings, denounces idealism; and in the current manuals, sections in refutation of idealism became part of the recognised philosophical teaching. Idealism still, however, continued to be used ambiguously, as signifying indifferently either denial of material bodies or denial of things in themselves. This is the dual meaning which the term presents in Kant's pre-Critical writings. In his *Dilucidatio* (1755) he refutes idealism by means of the principle that a substance cannot undergo changes unless it is a substance independent of other substances. Obviously this argument can at most prove the existence of an independent world, not that it is spatial or material. And as Vaihinger adds, it does not even rule out the possibility that changes find their source in a Divine Being. In the *Dreams of a Visionseer* (1766) Swedenborg is described as an idealist, but without further specification of the exact sense in which the term is employed. In the inaugural *Dissertation* (1770) idealism is again rejected, on the ground that sense-affection points to the presence of an intelligible object or *noumenon*.

In Kant's class lectures on metaphysics, which fall, in part at least, between 1770 and 1781, the term idealism is employed in a very different sense, which anticipates its use in the *Appendix* to the *Prolegomena*. The teaching of the *Dissertation*, that things in themselves are knowable, is now described as dogmatic, Platonic, mystical (*schwärmerischer*) idealism. He still rejects the idealism of Berkeley,

and still entitles it simply idealism, without limiting or descriptive predicates. But now also he employs the phrase "problematic idealism" as descriptive of his own new position. This is, of course, contrary to his invariable usage elsewhere, but is interesting as showing that about this time his repugnance to the term idealism begins to give way, and that he is willing to recognise that the relation of the Critical teaching to idealism is not one of simple opposition. He now begins to regard idealism as a factor, though a radically transformed factor, in his own philosophy.

Study of the *Critique* reinforces this conclusion. In the *Aesthetic* Kant teaches the "transcendental ideality" of space and time; and in the *Dialectic* (in the fourth *Paralogism*) describes his position as idealism, though with the qualifying predicate transcendental. But though this involves an extension of the previous connotation of the term idealism, and might therefore have been expected to increase the existing confusion, it has the fortunate effect of constraining Kant to recognise and discriminate the various meanings in which it may be employed. This is done somewhat clumsily, as if it were a kind of afterthought. In the introductory syllogism of the fourth *Paralogism* Descartes' position and his own are referred to simply as idealism and dualism respectively. The various possible sub-species of idealism as presented in the two editions of the *Critique* and in the *Prolegomena* may be tabulated as follows:

Idealism–

Material

Sceptical

Problematic (the position of Descartes).

Sceptical in the stricter and more usual sense (the position of Hume).

Dogmatic (the position of Berkeley).

Formal or Critical or Transcendental (Kant's own position).

The distinction between problematic idealism and idealism of the more strictly sceptical type is not clearly drawn by Kant. Very strangely Kant in this connection never mentions Hume: the reference in B xxxix *n*. is probably not to Hume but to Jacobi. Transcendental idealism is taken as involving an empirical realism and dualism, and is set in opposition to transcendental realism which is represented as involving empirical idealism. In B xxxix *n*. Kant speaks of "psychological idealism," meaning, as it would seem, material or non-Critical idealism.

In the second appendix to the *Prolegomena* Kant draws a further distinction, in line with that already noted in his lectures on metaphysics. Tabulated it is as follows:

Idealism–

Mystical, in the sense of belief in and reliance on a supposed human power of intellectual intuition. It is described as idealism in the strict (*eigentlich*) sense — the position of the Eleatics, of Plato and Berkeley.

Formal or Critical — Kant's own position.

This latter classification can cause nothing but confusion. The objections that have to be made against it from Kant's own critical standpoint are stated below.

Let us now consider, in the order of their presentation, the various refutations of idealism which Kant has given in his Critical writings.

I. Refutation of Idealism as given in First Edition of "Critique" (A 366-80). — This refutation is mainly directed against Descartes, who is mentioned by name in A 367. Kant, as Vaihinger suggests, was very probably led to recognise Descartes' position as a species of idealism in the course of a re-study of Descartes before writing the section on the *Paralogisms*. As already pointed out, this involves the use of the term idealism in a much wider sense than that which was usually given to it in Kant's own day. In the development of his argument Kant also wavers between two very different definitions of this idealism, as being denial of *immediate* certainty and as denial of all certainty. The second interpretation, which would make it apply to Hume rather than to Descartes, is strengthened in the minds of his readers by his further distinction between dogmatic and sceptical idealism, and the identification of the idealism under consideration with the latter. The title problematic which Kant in the second edition applies to Descartes' position suffers from this same ambiguity. As a matter of fact, Kant's refutation applies equally well to either position. The teaching of Berkeley, which coincides with dogmatic idealism as here defined by Kant, namely, as consisting in the contention that the conception of matter is inherently contradictory, is not dwelt upon, and the appended promise of refutation is not fulfilled.

Descartes' position is stated as follows: only our own existence and inner states are immediately apprehended by us; all perceptions are modifications of inner sense; and the existence of external objects can therefore be asserted only by an inference from the inner perceptions viewed as effects. In criticism, Kant points out that since an effect may result from more than one cause, this inference to a quite determinate cause, viz. objects as bodies in space, is doubtfully legitimate. The cause of our inner states may lie within and not without us, and even if external, need not consist in spatial objects. Further, leaving aside the question of a possible alternative to the assumption of independent material bodies, the assertion of the existence of such objects would, on Descartes' view, be merely conjectural. It could never have certainty in any degree equivalent to that possessed by the experiences of inner sense.

"By an idealist, therefore, we must not understand one who denies the existence of outer objects of the senses, but only one who does not admit that their existence is known through immediate perception, and who therefore concludes that we can never, by way of any possible experience, be completely certain of their reality."

No sooner is the term idealist thus clearly defined than Kant, in keeping with the confused character of the entire section, proceeds to the assertion (*a*) that there are idealists of another type, namely, transcendental idealists, and (*b*) that the non-transcendental idealists sometimes also adopt a dogmatic position, not merely questioning the immediacy of our knowledge of matter, but asserting it to be inherently contradictory. All this points to the composite origin of the contents of this section.

Transcendental idealism is opposed to empirical idealism. It maintains that phenomena are representations merely, not things in themselves. Space and time are the sensuous forms of our intuitions. Empirical idealism, on the other hand, goes together with transcendental realism. It maintains that space and time are given as real in themselves, in independence of our sensibility. (Transcendental here, as in the phrase "transcendental ideality," is exactly equivalent to transcendent.) But such a contention is inconsistent with the other main tenet of empirical idealism. For if our inner representations have to be taken as entirely distinct from their objects, they cannot yield assurance *even of the existence* of these objects. To the transcendental idealist no such difficulty is presented. His position naturally combines with empirical realism, or, as it may also be entitled, empirical dualism. Material bodies in space, being merely subjective representations, are immediately apprehended. The existence of matter can be established "without our requiring to issue out beyond our bare self-consciousness or to assume anything

more than the certainty of the representations in us, *i.e.* of the *cogito ergo sum*." Though the objects thus apprehended are outside one another in space, space itself exists only in us.

"Outer objects (bodies) are mere appearances, and are therefore nothing but a species of my representations, the objects of which are something only through these representations. Apart from them they are nothing. Thus outer things exist as well as I myself, and both, indeed, upon the immediate witness of my self-consciousness...."

The only difference is that the representation of the self belongs only to inner, while extended bodies also belong to outer sense. There is thus a dualism, but one that falls entirely within the field of consciousness, and which is therefore empirical, not transcendental. There is indeed a transcendental object which "in the transcendental sense may be outside us," but it is unknown and is not in question. It ought not to be confused with our representations of matter and corporeal things.

From this point the argument becomes disjointed and repeats itself, and there is much to be said in support of the contention of Adickes that the remainder of the section is made up of a number of separate interpolations. First, Kant applies the conclusion established in the *Postulates of Empirical Thought*, viz. that reality is revealed only in sensation. As sensation is an element in all outer perception, perception affords immediate certainty of real existence, Kant next enters upon a eulogy of sceptical idealism as "a benefactor of human reason." It brings home to us the utter impossibility of proving the existence of matter on the assumption that spatial objects are things in themselves, and so constrains us to justify the assertions which we are at every moment making. And such justification is, Kant here claims, only possible if we recognise that outer objects as mere representations are immediately known. In the next paragraph we find a sentence which, together with the above eulogistic estimate of the merits of idealism, shows how very far Kant, at the time of writing, was from feeling the need of differentiating his position from that of subjectivism. The sentence is this:

"We cannot be sentient of what is outside ourselves, but only of what is in ourselves, and the whole of our self-consciousness therefore yields nothing save merely our own determinations."

It is probable, indeed, that the paragraph in which this occurs is of very early origin, prior to the development of the main body of the *Analytic*; for in the same paragraph we also find the assertion, utterly at variance with the teaching of the *Analytic* and with that of the first and third *Paralogisms*, that "the thinking ego" is known phenomenally as *substance*. We seem justified in concluding that the various manuscripts which have gone to form this section on the fourth *Paralogism* were written at an early date within the Critical period.

We may note, in passing, two sentences in which, as in that quoted above, a distinction between representations and their objects is recognised in wording if not in fact.

"All outer perception furnishes immediate proof of something actual in space, or rather is the actual itself. To this extent empirical realism is beyond question, *i.e.* there corresponds to our outer perceptions something actual in space."

Again in A 377 the assertion occurs that "our outer senses, as regards the data from which experience can arise, have their actual corresponding objects in space." Certainly these statements, when taken together with the other passages in this section, form a sufficiently strange combination of assertion and denial. Either there is a distinction between representation and its object or there is not; if the former, then objects in space are not merely representations; if the latter, then the "correspondence" is merely that of a thing with itself.

This refutation of idealism will not itself stand criticism. For two separate reasons it entirely fails to attain its professed end. In the first place, it refutes the position of Descartes only by virtually accepting the still more extreme position of Berkeley. Outer objects, Kant argues, are immediately known because they are ideas merely. There is no need for inference, because there is no transcendence of the domain of

our inner consciousness. In other words, Kant refutes the problematic idealism of Descartes by means of the more subjective idealism of Berkeley. The "dogmatic" idealism of Berkeley in the form in which Kant here defines it, namely, as consisting in the assertion that the notion of an independent spatial object involves inherent contradictions, is part of his own position. For that reason he was bound to fail in his promise to refute such dogmatic idealism. Fortunately he never even attempts to do so. In the second place, Kant ignores the fact that he has himself adopted an "idealist" view of inner experience. Inner experience is not for him, as it was for Descartes, the immediate apprehension of genuine reality. As it is only appearance, the incorporation of outer experience within it, so far from establishing the reality of the objects of outer sense, must rather prove the direct contrary. No more is really established than Descartes himself invariably assumes, namely, the actual existence of mental representations of a corporeal world in space. Descartes' further assertion that the world of things in themselves can be inferred to be material and spatial, Kant, of course, refuses to accept. On this latter point Kant is in essential agreement with Berkeley.

It is by no means surprising that Kant's first critics, puzzled and bewildered by the obscurer and more difficult portions of the *Critique*, should have based their interpretation of Kant's general position largely upon the above passages; and that in combining the extreme subjective idealism which Kant there advocates with his doctrine that the inner life of ever-changing experiences is itself merely ideal, should have come to the conclusion that Kant's position is an extension of that of Berkeley. Pistorius objected that in making outer appearances relative to an inner consciousness which is itself appearance, Kant is reducing everything to mere illusion. Hamann came to the somewhat similar conclusion, that Kant, notwithstanding his very different methods of argument, is "a Prussian Hume," in substantial agreement with his Scotch predecessor.

II. "Prolegomena," Section 13, Notes II and III. — In the *Prolegomena* Kant replies to the criticism which the first edition of the *Critique* had called forth, that his position is an extension of the idealism of Descartes, and even more thoroughgoing than that of Berkeley. Idealism he redefines in a much narrower sense, which makes it applicable only to Berkeley

"...as consisting in the assertion that there are none but thinking beings, and that all other things which we suppose ourselves to perceive in intuition are nothing but representations in the thinking beings, to which no object external to them corresponds in fact."

In reply Kant affirms his unwavering belief in the reality of *Dinge an sich*

"...which though quite unknown to us as to what they are in themselves, we yet know by the representations which their influence on our sensibility procures us.... Can this be termed idealism? It is the very contrary."

Kant adds that his position is akin to that of Locke, differing only in his assertion of the subjectivity of the primary as well as of the secondary qualities.

"I should be glad to know what my assertions ought to have been in order to avoid all idealism. I suppose I ought to have said, not only that the representation of space is perfectly conformable to the relation which our sensibility has to objects (for that I have said), but also that it is completely similar to them — an assertion in which I can find as little meaning as if I said that the sensation of red has a similarity to the property of cinnabar which excites this sensation in me."

Kant is here very evidently using the term idealism in the narrowest possible meaning, as representing only the position of Berkeley, and as excluding that of Descartes and Leibniz. Such employment of the term is at variance with his own previous usage. Though idealism here corresponds to the "dogmatic idealism" of A 377, it is now made to concern the assertion or denial of things in themselves, not as previously the problem of the reality of material objects and of space. Kant is also ignoring the fact, which he more than once points out in the *Critique*, that his philosophy cannot prove that the cause of our sensations is without and not within us. His use of "body" as a name for the thing in itself is likewise

without justification. This passage is mainly polemical; it is hardly more helpful than the criticism to which it was designed to reply.

In Section 13, Note iii., Kant meets the still more extreme criticism (made by Pistorius), that his system turns all the things of the world into mere illusion (*Schein*). He distinguishes transcendental idealism from "the mystical and visionary idealism of Berkeley" on the one hand, and on the other from the Cartesian idealism which would convert mere representations into things in themselves. To obviate the ambiguities of the term transcendental, he declares that his own idealism may perhaps more fitly be entitled Critical. This distinction between mystical and Critical idealism connects with the contents of the second part of the Appendix, treated below.

III. "Prolegomena," Section 49. — This is simply a repetition of the argument of the fourth *Paralogism*. The Cartesian idealism, now (as in B 274) named material idealism, is alone referred to. The Cartesian idealism does nothing, Kant says, but distinguish external experience from dreaming. There is here again the same confusing use of the term "corresponds."

"That something actual without us not only corresponds but must correspond to our external perceptions can likewise be proved...."

IV. "Prolegomena," Second Part of the Appendix. — Kant here returns to the distinction, drawn in Section 13, Note iii., between what he now calls "idealism proper (*eigentlicher*)," *i.e.* visionary or mystical idealism, and his own.

"The position of all genuine idealists from the Eleatics to Bishop Berkeley is contained in this formula: 'All cognition through the senses and experience is nothing but mere illusion, and only in the ideas of pure understanding and Reason is there truth.' The fundamental principle ruling all my idealism, on the contrary, is this: 'All cognition of things solely from pure understanding or pure Reason is nothing but mere illusion and only in experience is there truth.'"

This mode of defining idealism can, in this connection, cause nothing but confusion. Its inapplicability to Berkeley would seem to prove that Kant had no first-hand knowledge of Berkeley's writings. As Kant's Note to the Appendix to the *Prolegomena* shows, he also had Plato in mind. But the definition given of "the fundamental principle" of his own idealism is almost equally misleading. It omits the all-essential point, that for Kant experience itself yields truth only by conforming to *a priori* concepts. As it is, he proceeds to criticise Berkeley for failure to supply a sufficient criterion of distinction between truth and illusion. Such criterion, he insists, is necessarily *a priori*. The Critical idealism differs from that of Berkeley in maintaining that space and time, though sensuous, are *a priori*, and that in combination with the pure concepts of understanding they

"...prescribe *a priori* its law to all possible experience: the law which at the same time yields the sure criterion for distinguishing within experience truth from illusion. My so-called idealism — which properly speaking is Critical idealism — is thus quite peculiar in that it overthrows ordinary idealism, and that through it all *a priori* cognition, even that of geometry, now attains objective reality, a thing which even the keenest realist could not assert till I had proved the ideality of space and time."

V. Sections added in Second Edition at the Conclusion of the Aesthetic. (B 69 ff.) — Kant here again replies to the criticism of Pistorius that all existence has been reduced to the level of illusion (*Schein*). His defence is twofold: first, that in naming objects appearances he means to indicate that they are independently grounded, or, as he states it, are "something actually given." If we *mis*interpret them, the result is indeed illusion, but the fault then lies with ourselves and not with the appearances as presented. Secondly, he argues that the doctrine of the ideality of space and time is the only secure safeguard against scepticism. For otherwise the contradictions which result from regarding space and time as independently real will likewise hold of their contents, and everything, including even our own existence, will be rendered illusory. "The good Berkeley [observing these contradictions] cannot, indeed, be blamed for reducing bodies to mere illusion." This last sentence may perhaps be taken as supporting the view that

notwithstanding the increased popularity of Berkeley in Germany and the appearance of new translations in these very years, Kant has not been sufficiently interested to acquire first-hand knowledge of Berkeley's writings. The epithet employed is characteristic of the rather depreciatory attitude which Kant invariably adopts in speaking of Berkeley.

VI. "Refutation of Idealism" in Second Edition of the "Critique." (B 274-9, supplemented by note to B xxxix.). — The refutation opens by equating idealism with material idealism (so named in contradistinction to his own "formal or rather Critical" teaching). Within material idealism Kant distinguishes between the problematic idealism of Descartes, and the dogmatic idealism of Berkeley. The latter has, he says, been overthrown in the *Aesthetic*. The former alone is dealt with in this refutation. This is the first occurrence in the *Critique* of the expression "problematic idealism": it is nowhere employed in the first edition. Problematic idealism consists in the assertion that we are incapable of having experience of any existence save our own; only our inner states are immediately apprehended; all other existences are determined by inference from them. The refutation consists in the proof that we have experience, and not mere imagination of outer objects. This is proved by showing that inner experience, unquestioned by Descartes, is possible only on the assumption of outer experience, and that this latter is as immediate and direct as is the former.

Thesis. — The empirically determined consciousness of my own existence proves the existence of objects in space outside me.

Proof. — I am conscious of my own existence as determined in time. Time determination presupposes the perception of something permanent. But nothing permanent is intuitable in the empirical self. On the cognitive side (*i.e.* omitting feelings, etc., which in this connection are irrelevant), it consists solely of representations; and these demand a permanent, distinct from ourselves, in relation to which their changes, and so my own existence in the time wherein they change, may be determined. Thus perception of this permanent is only possible through a thing outside, and not through the mere representation of a thing outside. And the same must hold true of the determination of my existence in time, since this also depends upon the apprehension of the permanent. That is to say, the consciousness of my existence is at the same time an immediate awareness of the existence of other things outside me.

In the note to the *Preface* to the second edition occurs the following emphatic statement.

"Representation of something permanent in existence is not the same as permanent representation. For though the representation [of the permanent] may be very changing and variable like all our other representations, not excepting those of matter, it yet refers to something permanent. This latter must therefore be an external thing distinct from all my representations, and its existence must be included in the determination of my own existence, constituting with it but a single experience such as would not take place even internally if it were not also at the same time, in part, external. How this should be possible we are as little capable of explaining further as we are of accounting for our being able to think the abiding in time, the coexistence of which with the variable generates the conception of change."

The argument of this note varies from that of B 274 ff. only in its use of an ambiguous expression which is perhaps capable of being taken as referring to things in themselves, but which does not seem to have that meaning. "I am just as certainly conscious that there are things outside me which relate to my sense...."

In B 277-8 Kant refers to the empirical fact that determination of time can be made only by relation to outer happenings in space, such as the motion of the sun. This is a point which is further developed in another passage which Kant added in the second edition.

"...in order to understand the possibility of things in conformity with the categories, and so to demonstrate the objective reality of the latter, we need not merely intuitions, but intuitions that are in all cases outer intuitions. When, for instance, we take the pure concepts of relation, we find firstly that in order to obtain something *permanent* in intuition corresponding to the concept of substance, and so to

demonstrate the objective reality of this concept, we require an intuition in space (of matter). For space alone is determined as permanent, while time, and therefore everything that is in inner sense, is in constant flux. Secondly, in order to exhibit *change* as the intuition corresponding to the concept of *causality*, we must take as our example motion, *i.e.* change in space. Only in this way can we obtain the intuition of changes, the possibility of which can never be comprehended through any pure understanding. For change is combination of contradictorily opposed determinations in the existence of one and the same thing. Now how it is possible that from a given state of a thing an opposite state should follow, not only cannot be conceived by any reason without an example, but is actually incomprehensible to reason without intuition. The intuition required is the intuition of the movement of a point in space. The presence of the point in different spaces (as a sequence of opposite determinations) is what first yields to us an intuition of change. For in order that we may afterwards make inner changes likewise thinkable, we must represent time (the form of inner sense) figuratively as a line, and the inner change through the drawing of this line (motion), and so in this manner by means of outer intuition make comprehensible the successive existence of ourselves in different states. The reason of this is that all change, if it is indeed to be perceived as change, presupposes something permanent in intuition, and that in inner sense no permanent intuition is to be met with. Lastly, the possibility of the category of *community* cannot be comprehended through mere reason alone. Its objective reality is not to be understood without intuition and indeed outer intuition in space."

In this passage Kant is modifying the teaching of the first edition in two very essential respects. In the first place, he is now asserting that consciousness of both space and motion is necessary to consciousness of time; and in the second place, he is maintaining that the *categories* can acquire meaning only by reference to outer appearances. Had Kant made all the necessary alterations which these new positions involve, he would, as we shall find, have had entirely to recast the chapters on *Schematism* and on the *Principles of Understanding*. Kant was not, however, prepared to make such extensive alterations, and these chapters are therefore left practically unmodified. This is one of the many important points in which the reader is compelled to reinterpret passages of earlier date in the light of Kant's later utterances. There is also a further difficulty. Does Kant, in maintaining that the categories can *acquire* significance only in reference to outer perception, also mean to assert that their subsequent employment is limited to the mechanical world of the material sciences? This is a point in regard to which Kant makes no quite direct statement; but indirectly he would seem to indicate that that was not his intention. He frequently speaks of the states of inner sense as mechanically conditioned. Sensations, feelings, and desires, are, he would seem to assert, integral parts of the unitary system of phenomenal existence. Such a view is not, indeed, easily reconcilable with his equating of the principle of substance with the principle of the conservation of matter. There are here two conflicting positions which Kant has failed to reconcile: the traditional dualistic attitude of Cartesian physics and the quite opposite implications of his Critical phenomenalism. When the former is being held to, Kant has to maintain that psychology can never become a science; but his Critical teaching consistently developed seems rather to support the view that psychology, despite special difficulties peculiar to its subject matter, can be developed on lines strictly analogous to those of the material sciences.

We may now return to Kant's main argument. This new refutation of idealism in the second edition differs from that given in the fourth *Paralogism* of the first edition, not only in method of argument but also in the nature of the conclusion which it seeks to establish. Indeed it proves the *direct opposite* of what is asserted in the first edition. The earlier proof sought to show that, as regards immediacy of apprehension and subjectivity of existence, outer appearances stand on the same level as do our inner experiences. The proof of the second edition, on the other hand, argues that though outer appearances are immediately apprehended they must be existences distinct from the subjective states through which the mind represents them. The two arguments agree, indeed, in establishing immediacy, but as that which is

taken as immediately known is in the one case a subjective state and in the other is an independent existence, the immediacy calls in the two cases for entirely different methods of proof. The first method consisted in viewing outer experiences as a subdivision within our inner experiences. The new method views their relation as not that of including and included, but of conditioning and conditioned; and it is now to outer experience that the primary position is assigned. So far is outer experience from being possible only as part of inner experience, that on the contrary inner experience, consciousness of the flux of inner states, is only possible in and through experience of independent material bodies in space. A sentence from each proof will show how completely their conclusions are opposed.

"Outer objects (bodies) are mere appearances, and are therefore nothing but a species of my representations, the objects of which are something only through these representations. Apart from them they are nothing." "Perception of this permanent is possible only through a *thing* outside me, and not through the mere *representation* of a thing outside me."

The one sentence asserts that outer objects are representations; the other argues that they must be existences distinct from their representations. The one inculcates a subjectivism of a very extreme type; the other results in a realism, which though ultimately phenomenalist, is none the less genuinely objective in character. This difference is paralleled by the nature of the idealisms to which the two proofs are opposed and which they profess to refute. The argument of the *Paralogism* of the first edition is itself Berkeleian, and refutes only the problematic idealism of Descartes. The argument of the second edition, though formally directed only against Descartes, constitutes a no less complete refutation of the position of Berkeley. In its realism it has kinship with the positions of Arnauld and of Reid, while, in attempting to combine this realism with due recognition of the force and validity of Hume's sceptical philosophy, it breaks through all previous classifications, formulates a profoundly original substitute for the previously existing theories, and inaugurates a new era in the theory of knowledge.

As already pointed out, Kant restates the distinction between the subjective and the objective in a manner which places the problem of knowledge in an entirely new light. The subjective is not to be regarded as opposite in nature to the objective, but as a subspecies within it. It does not proceed parallel with the sequence of natural existences, but is itself part of the natural system which consciousness reveals. Sensations, in the form in which they are consciously apprehended by us, do not constitute our consciousness of nature, but are themselves events which are possible only under the conditions which the natural world itself supplies. The Cartesian dualism of the subjective and the objective is thus subordinated to the Critical distinction between appearance and reality. Kant's phenomenalism is a genuine alternative to the Berkeleian teaching, and not, as Schopenhauer and so many others have sought to maintain, merely a variant upon it.

The striking contradiction between Kant's various refutations of idealism has led some of Kant's most competent critics to give a different interpretation of the argument of the second edition from that given above. These critics take the independent and permanent objects which are distinguished from our subjective representations to be things in themselves. That is to say, they interpret this refutation as based upon Kant's semi-Critical doctrine of the transcendental object (in the form in which it is employed for the solution of the *Antinomies*), and so as agreeing with the refutation given in the *Prolegomena*. Kant is taken as rejecting idealism because of his belief in things in themselves. This is the view adopted by Benno Erdmann, Sidgwick, A. J. Balfour.

As Vaihinger, Caird, and Adamson have shown, such an interpretation is at complete variance with the actual text. This is, indeed, so obvious upon unbiassed examination that the only point which repays discussion is the question, why Benno Erdmann and those who follow him should have felt constrained to place so unnatural an interpretation upon Kant's words. The explanation seems to lie in Erdmann's convinced belief, plainly shown in all his writings upon Kant, that the *Critique* expounds a single consistent and uniform standpoint. If such belief be justified, there is no alternative save to interpret

Kant's refutation of idealism in the manner which Erdmann adopts. For as the subjectivism of much of Kant's teaching is beyond question, consistency can be obtained only by sacrifice of all that conflicts with it. Thus, and thus alone, can Erdmann's rendering of the refutation of the second edition be sustained; the actual wording, taken in and by itself, does not support it. Kant here departs from his own repeated assertion, in the second hardly less than in the first edition of the *Critique*, of the subjectivity of outer appearances. But, as Vaihinger justly contends, Kant was never greater than in this violation of self-consistency, "never more consistent than in this inconsistency." Tendencies, previously active but hitherto inarticulate, are at last liberated. If the chrysalis stage of the intense brooding of the twelve years of Critical thinking was completed in the writing of the first edition of the *Critique*, the philosophy which then emerged only attains to mature stature in those extensions of the *Critique*, scattered through it from *Preface* to *Paralogisms*, which embody this realistic theory of the independent existence of material nature. For this theory is no mere external accretion, and no mere reversal of subordinate tenets, but a ripening of germinal ideas to which, even in their more embryonic form, the earlier Critical teaching owed much of its inspiration, and which, when consciously adopted and maturely formulated, constitute such a deepening of its teaching as almost amounts to transformation. The individual self is no longer viewed as being the bearer of nature, but as its offspring and expression, and as being, like nature, interpretable in its twofold aspect, as appearance and as noumenally grounded. The bearer of appearance is not the individual subject, but those transcendental creative agencies upon which man and nature alike depend. Both man and nature transcend the forms in which they are apprehended; and nothing in experience justifies the giving of such priority to the individual mind as must be involved in any acceptance of subjectivist theory. Though man is cognisant of space and time, comprehending them within the limits of his consciousness, and though in all experience unities are involved which cannot originate within or be explained by experience, it is no less true that man is himself subject to the conditions of space and time, and that the synthetic unities which point beyond experience do not carry us to a merely individual subject. If man is not a part or product of nature, neither is nature the product of man. Kant's transcendentalism, in its maturest form, is genuinely phenomenalist in character. That is the view which has already been developed above, in the discussion of Kant's transcendental deduction. I shall strive to confirm it by comparison of the teaching of the two editions of the *Critique* in regard to the reality of outer appearances.

Schopenhauer, to whom this new development of the Critical teaching was altogether anathema, the cloven hoof of the Hegelian heresies, denounced it as a temporary and ill-judged distortion of the true Critical position, maintaining that it is incapable of combination with Kant's central teaching, and that it finds no support in the tenets, pure and unperverted, of the first edition. Kant, he holds, is here untrue to himself, and temporarily, under the stress of polemical discussion, lapses from the heights to which he had successfully made his way, and upon which he had securely established, in agreement with Plato and in extension of Berkeley, the doctrine of all genuine philosophical thinking, the doctrine of the *Welt als Vorstellung*.

We may agree with Schopenhauer in regarding those sections of the first edition of the *Critique* which were omitted in the second edition as being a permanently valuable expression of Kantian thought, and as containing much that finds no equally adequate expression in the passages which were substituted for them; and yet may challenge his interpretation of both editions alike. If, as we have already been arguing, we must regard Kant's thinking as in large degree tentative, that is, as progressing by the experimental following out of divergent tendencies, we may justly maintain that among the most characteristic features of his teaching are the readiness with which he makes changes to meet deeper insight, and the persistency with which he strives to attain a position in which there will be least sacrifice or blurring of any helpful distinction, and fullest acknowledgment of the manifold and diverse considerations that are really essential. Recognising these features, we shall be prepared to question the legitimacy of Schopenhauer's

opposition between the teaching of the two editions. We shall rather expect to find that the two editions agree in the alternating statement and retraction of conflicting positions, and that the later edition, however defective in this or that aspect as compared with the first edition, none the less expresses the maturer insight, and represents a further stage in the development of ideas that have been present from the start. It may perhaps for this very reason be more contradictory in its teaching; it will at least yield clearer and more adequate formulation of the diverse consequences and conflicting implications of the earlier tenets. It will be richer in content, more open-eyed in its adoption of mutually contradictory positions, freer therefore from unconscious assumptions, and better fitted to supply the data necessary for judgment upon its own defects. Only those critics who are blind to the stupendous difficulties of the tasks which Kant here sets himself, and credulous of their speedy and final completion, can complain of the result. Philosophical thinkers of the most diverse schools in Germany, France, and England, have throughout the nineteenth century received from the *Critique* much of their inspiration. The profound influence which Kant has thus exercised upon succeeding thought must surely be reckoned a greater achievement than any that could have resulted from the constructing of a system so consistent and unified, that the alternative would lie only between its acceptance and its rejection. Ultimately the value of a philosophy consists more in the richness of its content and the comprehensiveness of its dialectic, than in the logical perfection of its formal structure. The latter quality is especially unfitted to a philosophy which inaugurated a new era, and formulated the older problems in an altogether novel manner. Under such conditions fertility of suggestion and readiness to modify or even recast adopted positions, openness to fuller insight acquired through the very solutions that may at first have seemed to satisfy and close the issues, are more to be valued than the power to remove contradictions and attain consistency. This is the point of view which I shall endeavour to justify in reference to the matters now before us. In particular there are two points to be settled: first, whether and how far the argument of the second edition is prefigured in the first edition; and secondly, whether and to what extent it harmonises with, and gives expression to, all that is most central and genuinely Critical in both editions.

In the first place we must observe that the fourth *Paralogism* occurs in a section which bears all the signs of having been independently written and incorporated later into the main text. It is certainly of earlier origin than those sections which represent the third and fourth layers of the deduction of the first edition, and very possibly was composed in the middle ‘seventies. Indeed, apart from single paragraphs which may have been added in the process of adapting it to the main text, it could quite well, so far as its refutation of idealism is concerned, be of even earlier date. The question as to the consistency of the refutation of the second edition with the teaching of the first edition must therefore chiefly concern those parts of the *Analytic* which connect with the later forms of the transcendental deduction, that is to say, with the transcendental deduction itself, with the *Analogies* and *Postulates*, and with particular paragraphs that have been added in other sections. We have already noted how Kant from the very first uses terms which involve the drawing of a distinction between representations and their objects. Passages in which this distinction occurs can be cited from both the *Aesthetic* and the *Analytic*, and two such occur in the fourth *Paralogism* itself. Objects, he says, “correspond” to their representations. A variation in expression is found in such passages as the following:

“...the objects of outer perception also actually exist (*auch wirklich sind*) in that very form in which they are intuited in space....”

Such language is meaningless, and could never have been chosen, if Kant had not, even in the earlier stages of his thinking, postulated a difference between the existence of an object and the existence of its representation. He must at least have distinguished between the representations and their content. That, however, he could have done without advancing to the further assertion of their independent existence. Probably he was not at all clear in his own mind, and was too preoccupied with the other complexities of his problem, to have thought out his position to a definite decision. When, however, as in the fourth

Paralogism, he made any attempt so to do, he would seem to have felt constrained to adopt the extreme subjectivist position. Expressions to that effect are certainly very much more common than those above mentioned. This is what affords Schopenhauer such justification, certainly very strong, as he can cite for regarding subjectivism as the undoubted teaching of the first edition.

When, however, we also take account of the very different teaching which is contained in the important section on the *Postulates of Empirical Thought*, the balance of evidence is decisively altered. The counter-teaching, which is suggested by certain of the conflicting factors of the transcendental deduction and of the *Analogies*, here again receives clear and detailed expression. This is the more significant, as it is in this section that Kant sets himself formally to define what is to be understood by empirical reality. It thus contains his, so to speak, official declaration as to the mode of existence possessed by outer appearances. The passage chiefly relevant is as follows:

"If the existence of the thing is bound up with some perceptions according to the principles of their empirical connection (the Analogies), we can determine its existence antecedently to the perception of it, and consequently, to that extent, in an *a priori* manner. For as the existence of the thing is bound up with our perceptions in a possible experience, we are able in the series of possible perceptions, and under the guidance of the Analogies, to make the transition from our actual perception to the thing in question. Thus we discover the existence of a magnetic matter pervading all bodies from the perception of the attracted iron filings, although the constitution of our organs cuts us off from all immediate perception of that matter. For in accordance with the laws of sensibility and the connection of our perceptions in a single experience, we should, were our senses more refined, actually experience it in an immediate empirical intuition. The grossness of our senses does not in any way decide the form of possible experience in general."

Now it cannot, of course, be argued that the above passage is altogether unambiguous. We can, if we feel sufficiently constrained thereto, place upon it an interpretation which would harmonise it with Kant's more usual subjectivist teaching, namely as meaning that in the progressive construction of experience, or in the ideal completion which follows upon assumption of more refined sense-organs, possible empirical realities are made to become, or are assumed to become, real, but that until the possible experiences are thus realised in fact or in ideal hypothesis, they exist outwardly only in the form of their noumenal conditions. And as a matter of fact, this is how Kant himself interprets the teaching of this section in the process of applying it in solution of the antinomies.

"Accordingly, if I represent to myself the aggregate of all objects of the senses existing in all time and all places, I do not set them, antecedently to experience, in space and time. The representation is nothing but the thought of a possible experience in its absolute completeness. Since the objects are mere representations, only in such a possible experience are they given. To say that they exist prior to all my experience, can only be taken as meaning that they will be met with, if, starting from actual perception, I advance to that part of experience to which they belong. The cause of the empirical conditions of this advance (that which determines what members I shall meet with, or how far I can meet with any such in my regress) is transcendental, and is therefore necessarily unknown to me. We are not, however, concerned with this transcendental cause, but only with the rule of progression in that experience in which objects, that is to say, appearances, are given. Moreover, in outcome it is a matter of indifference whether I say that in the empirical progress in space I can meet with stars a hundred times farther removed than the outermost now perceptible to me, or whether I say that they are perhaps to be met with in cosmical space even though no human being has ever perceived or ever will perceive them. For though they might be given as things in themselves, without relation to possible experience, they are still nothing to me, and therefore are not objects, save in so far as they are contained in the series of the empirical regress."

But though this is a possible interpretation of the teaching of the *Postulates*, and though further it is

Kant's own interpretation in another portion of the *Critique*, it is not by any means thereby decided that this is what the section itself actually teaches. Unbiassed study of the section, in independence of the use to which it is elsewhere put, can find within it no such limitation to its assertion of the actual independent existence of non-perceived bodies. We have to remember that the doctrine and solution of the *Antinomies* was completed prior to the writing of the central portions of the *Critique*. The section treating of their *solution* seems, indeed, in certain parts to be later than the other main portions of the chapter on the *Antinomies*, and must have been at least recast after completion of the *Postulates*. But the subjectivist solution is so much simpler in statement, so much more fully worked out, and indeed so much more capable of definite formulation, and also so much more at one with the teaching developed in the preceding chapter on the *Paralogisms*, that even granting the doctrine expounded in the section on the *Postulates* to be genuinely phenomenalist, it is not surprising that Kant should have been unwilling to recast his older and simpler solution of the *Antinomies*. In any case we are not concerned to argue that Kant, even after formulating the phenomenalist view, yields to it an unwavering adherence. As I have already insisted, his attitude continues to the very last to be one of alternation between two opposed standpoints.

But the most significant feature of Kant's treatment of the argument of the *Postulates* still remains for consideration. It was in immediate succession to the paragraph above quoted that Kant, in the second edition, placed his "*Refutation of Idealism*" with the emphatic statement that this (not as in the first edition in connection with the *Paralogisms*) was its "correct location." It is required, he says, as a reply to an objection which the teaching of the *Postulates* must at once suggest. The argument of the second edition in proof of the independent reality of material bodies, and in disproof of subjectivism, is thus given by Kant as a necessary extension and natural supplement of the teaching of the first edition.

There is therefore reason for concluding that the same preconception which has led to such radical misinterpretation of Kant's *Refutation of Idealism* has been at work in inducing a false reading of Kant's argument in the *Postulates*, namely the belief that Kant's teaching proceeds on consistent lines, and that it must at all costs be harmonised with itself. Finding subjectivism to be emphatically and unambiguously inculcated in all the main sections of the *Critique*, and the phenomenalist views, on the other hand, to be stated in a much less definite and somewhat elusive manner, commentators have impoverished the Critical teaching by suppression of many of its most subtile and progressive doctrines. Kant's experimental, tentative development of divergent tendencies is surely preferable to this artificial product of high-handed and unsympathetic emendation.

INNER SENSE AND APPERCEPTION

We are now in position to complete our treatment of inner sense. When the inner world of feelings, volitions, and representations is placed on the same empirical level as the outer world of objects in space, when the two are correlated and yet also at the same time sharply distinguished, when, further, it is maintained that objects in space exist independently of their representations, and that in this independence they are necessary for the possibility of the latter, the whole aspect of the Critical teaching undergoes a genial and welcome transformation. Instead of the forbidding doctrine that the world in space is merely my representation, we have the very different teaching that only through consciousness of an independent world in space is consciousness of the inner subjective life possible at all, and that as each is "external" to the other, neither can be reduced to, or be absorbed within, the other. The inner representations do not produce or generate the spatial objects, do not even condition their existence, but are required only for the individual's empirical consciousness of them. Indeed the relations previously holding between them are now reversed. It is the outer world which renders the subjective representations possible. The former is prior to the latter; the latter exist in order to reveal the former. The outer world in space must, indeed, be

regarded as conditioned by, and relative to, the noumenal conditions of its possibility; but these, on Kant's doctrine of outer and inner sense, are distinct from all experienced contents and from all experienced mental processes. This will at once be recognised as holding of the noumenal conditions of the given manifold. But it is equally true, Kant maintains, in regard to the noumenal conditions of our mental life. We have no immediate knowledge of the transcendental syntheses that condition all consciousness, and in our complete ignorance of their specific nature they cannot legitimately be equated with any individual or personal agent. As the empirical self is only what it is known as, namely, appearance, it cannot be the bearer of appearance. This function falls to that which underlies both inner and outer appearances equally, and which within experience gains twofold expression for itself, in the conception of the thing in itself = *x* on the one hand, and in the correlative conception of a transcendental subject, likewise = *x*, on the other.

But with mention of the transcendental subject we are brought to a problem which in the second edition invariably accompanies Kant's discussion of inner sense. The 'I think' of apperception can find expression only in an empirical judgment, and yet, so far from being the outcome of inner sense, preconditions its possibility. What then is its relation to inner sense? Does not its recognition conflict with Kant's denial of the possibility of self-conscious reflection, of direct intuitive apprehension by the self of itself? The pure apperception, 'I think,' is equivalent, Kant declares, to the judgment 'I am,' and therefore involves the assertion of the subject's existence. Does not this conflict on the one hand with the Critical doctrine that knowledge of existence is only possible in terms of sense, and on the other with the Critical limitation of the categories to the realm of appearance? How are such assertions as that the 'I think' of pure apperception refers to a non-empirical reality, and that it predicates its existence, to be reconciled with the doctrine of inner sense as above stated?

As we have already observed, Kant's early doctrine of the transcendental object was developed in a more or less close parallelism with that of the transcendental unity of apperception. They were regarded as correlative opposites, the dual centres of noumenal reference for our merely subjective representations. Kant's further examination of the nature of apperception, as embodied in alterations in the second edition, was certainly, as we shall find, inspired by the criticisms which the first edition had called forth. His replies, however, are merely more explicit statements of the distinction which he had already developed in the first edition between the transcendental and the empirical self, and that distinction in turn was doubtless itself largely determined by his own independent recognition of the untenability of his early view of the transcendental object. Though it is much more difficult to differentiate between the empirical and the transcendental self than to distinguish between the empirical object and the thing in itself, both distinctions are from a genuinely Critical standpoint equally imperative, and rest upon considerations that are somewhat similar in the two cases.

One of the chief and most telling criticisms directed against the teaching of the first edition was that Kant's doctrine of a transcendental consciousness of the self's existence, *i.e.* of the existence of a noumenal being, "this I or he or it (the thing) which thinks," is inconsistent with the teaching of the *Postulates of Empirical Thought*. In that section, as also later in the section on the theological *Ideal*, Kant had declared most emphatically that existence is never discoverable in the content of any mere concept. It is revealed in perception, and in perception alone, in virtue of the element of sensation contained in the latter.

"...to know the *actuality* of things demands *perception*, and therefore sensation.... For that the concept precedes perception, signifies the concept's mere possibility; the perception which supplies the content [*Stoff*] to the concept, is the sole criterion [*Charakter*] of actuality."

Yet Kant had also maintained that the 'I think' is equivalent to 'I am,' and that in this form, as an intellectual consciousness of the self's existence, it precedes all experience. The teaching of the *Postulates* is, however, the teaching of the *Critique* as a whole, and such critics as Pistorius seemed therefore to be justified in maintaining that Kant, in reducing the experiences of inner sense to mere

appearance, destroys the possibility of establishing reality in any form. Appearance, in order to be appearance, presupposes the reality not only of that which appears, but also of the mental process whereby it is apprehended. But if reality is given only in sensation, and yet all experience that involves sensation is merely appearance, there is no self by which appearance can be conditioned; and only illusion (*Schein*), not appearance (*Erscheinung*), is left. To quote Pistorius' exact words:

"[If our inner representations are not things in themselves but only appearances] there will be nothing but illusion (*Schein*), for nothing remains to which anything can appear."

Kant evidently felt the force of this criticism, for in the second edition he replies to it on no less than seven different occasions. In three of these passages the term *Schein* is employed, and in the note to B xxxix the term *Erdichtung* appears. This shows very conclusively that it is such criticism as the above that Kant has in mind. The most explicit passage is B 428:

"The proposition, 'I think,' or 'I exist thinking,' is an empirical proposition. Such a judgment, however, is conditioned by empirical intuition, and the object that is thought therefore underlies it as appearance. It would consequently seem that on our theory the soul is completely transformed, even in thinking [*selbst im Denken*], into appearance, and that in this way our consciousness itself, as being a mere illusion [*Schein*], must refer in fact to nothing."

Kant, in his reply, is unyielding in the contention that the 'I think,' even though it involves an empirical judgment, is itself intellectual. "This representation is a thinking, not an intuiting," or as he adds, "The 'I think' expresses the *actus* whereby I determine my existence." Existence is therefore already given thereby. Kant also still maintains that the self thus revealed is not "appearance and still less illusion."

"I am conscious of myself ..., not as I appear to myself, nor as I am in myself, but only that I am." "I thereby represent myself to myself neither as I am nor as I appear to myself. I think myself only as I do any object in general from whose mode of intuition I abstract."

Kant's method of meeting the criticism, while still holding to these positions, is twofold. It consists in the first place in maintaining that the 'I think,' though intellectual, can find expression only in empirical judgments — in other words, that it is in and by itself formal only, and presupposes as the occasion of its employment a given manifold of inner sense; and secondly, by the statement that the 'existence' which is involved in the 'I think' is not the category of existence. Let us take in order each of these two points.

Kant's first method of reply itself appears in two forms, a stronger and a milder. The milder mode of statement is to the effect that though the representation 'I am' already immediately involves the *thought* of the existence of the subject, it yields no knowledge of it. Knowledge would involve intuition, namely, consciousness of inner determinations in time, which in turn would itself presuppose consciousness of outer objects. As a merely intellectual representation,

"...this 'I' has not the least predicate of intuition which, in its character of permanence, could, somewhat after the manner of impenetrability in the empirical intuition of matter, serve as correlate of time determination in inner sense."

The stronger and more definite mode of statement is that the 'I think' is an empirical proposition. Though it involves as one factor the intellectual representation, 'I think,' it is none the less empirical.

"Without some empirical representation supplying the material for thought, the *actus*, 'I think,' would not take place...."

The empirical is indeed "only the condition of the application or employment of the pure intellectual faculty," but as such is indispensable. This is repeated in even clearer terms in B 429.

"The proposition, 'I think,' in so far as it amounts to the assertion, 'I exist thinking,' is no mere logical function but determines the subject (which is then at the same time object) in respect of existence, and cannot take place without inner sense...."

This admission is the more significant in that it follows immediately upon a passage in which Kant has been arguing that thinking, taken in and by itself, is a merely logical function.

The real crux lies in the question as to the legitimacy of Kant's application of the predicate existence to the transcendental subject. Its employment in reference to the empirical self in time is part of the problem of the *Refutation of Idealism* in the second edition; and the answer there given is clear and definite. Consciousness of the empirical self as existing in time involves consciousness of outer objects in space. But as Kant recognises that a transcendental ego, not in time, is presupposed in all consciousness of the empirical self, the question whether the predicate of existence is also applicable to the transcendental self cannot be altogether avoided, and is indeed referred to in B 277. The attitude to be taken to this latter question is not, however, defined in that section.

In the first edition Kant has insisted that the categories as pure forms of the understanding, in isolation from space and time, are merely logical functions "without content." Interpreted literally, this would signify that they are devoid of meaning, and therefore are incapable of yielding the thought of any independent object or existence. As merely logical forms of relation, they presuppose a material, and that is supplied only through outer and inner sense. Such is not, however, the way in which Kant interprets his own statement. It is qualified so as to signify only that they are without *specific* or *determinate* content. They are taken as yielding the conception of object in general. Passages in plenty can be cited from the first edition — passages allowed to remain in the second edition — in which Kant teaches that the pure forms of understanding, as distinct from the schematised categories, yield the conception of things in themselves. This view is, indeed, a survival from his earlier doctrine of the transcendental object. In all passages added in the second edition the consequences of his argument are more rigorously drawn, and the doctrine of the transcendental object is entirely eliminated. It is now unambiguously asserted that the pure forms of understanding, the "*modes* of self-consciousness in thinking," are not intellectual concepts of *objects*. They "yield no object whatsoever." The only object is that given through sense. And since in thinking the transcendental subject we do, by Kant's own account, think an "object," he is led to the conclusion, also explicitly avowed, that the notion of existence involved in the 'I think' is not the category of the same name. So also of the categories of substance and causality.

"If I represent myself as *subject* of thoughts or as *ground* of thinking, these modes of representation do not signify the categories of substance or of cause...."

The notion of the self, like the notion of things in themselves, is a concept distinct from all the categories.

This conclusion is reinforced by means of an argument which is employed in the section of the first edition on *Paralogisms*. Apperception is the ground of the possibility of the categories, and these latter on their side represent only the synthetic unity which that apperception demands. Self-consciousness is therefore the representation of that which is the condition of all unity, and which yet is itself unconditioned.

"...it does not represent itself through the categories, but knows the categories and through them all objects in the absolute unity of apperception, and so through itself. Now it is, indeed, very evident that I cannot know as an object that which I must presuppose in order to know any object...."

This argument recurs in B 422.

"The subject of the categories cannot by thinking the categories acquire a conception of itself as an object of the categories. For, in order to think them, its pure self-consciousness, which is what was to be accounted for, must itself be presupposed."

It is extremely difficult to estimate the value and cogency of this argument. Many objections or rather qualifications must be made before it can be either accepted or rejected. If it be taken only as asserting that the unity of self-consciousness is not *adequately* expressible through any of the categories, it is undoubtedly valid. If, further, the categories be identified with the schemata, it is also true that they are not applicable in any degree or manner. The schemata are applicable only to natural existences in space and time. Self-consciousness can never be reduced to a natural existence of that type. On the other hand, if it is

not self-consciousness as such, but the self-conscious *subject*, which on Kant's view is always noumenal — "this I or he or it (the thing) which thinks" — that is referred to, and if we distinguish between the categories strictly so called, that is, the pure forms of understanding, and the schemata, it is not at all evident that the self-conscious subject may not be described as being an existence that is always a subject and never a predicate, and as being related to experience as a ground or condition. These indefinite assertions leave open alternative possibilities. They do not even decide whether the self is "I or he or it." In so far as they advance beyond the mere assertion that the self rests upon noumenal conditions they are, indeed, incapable of proof, but by no Critical principle can they be shown to be inapplicable. When, therefore, Kant may seem to extract a more definite conclusion from the above argument, he advances beyond what it can be made to support.

Kant is here influenced by the results of the ethical enquiries with which in the period subsequent to 1781 he was chiefly preoccupied. He believed himself to have proved that the self, as a self-conscious being, is a genuinely noumenal existence. That being so, he was bound to hold that the categories, even as pure logical forms, are inadequate to express its real determinate nature. But he confounds this position with the assertion that they are not only inadequate, but in and by themselves are likewise inapplicable. That is not a legitimate conclusion, for even if the self is more than mere subject or mere ground, it will at least be so much. When ethical considerations are left out of account, the only proper conclusion is that the applicability of the categories to the self-conscious subject is capable neither of proof nor of disproof, but that when the distinction between appearance and reality (which as we shall find is ultimately based upon the Ideas of Reason) has been drawn, the categories can be employed to define the possible difference between self-conscious experience and its unknown noumenal conditions. Any other conclusion conflicts with the teaching of the section on the *Paralogisms*.

It is important to observe — a point ignored by such critics as Caird and Watson — that in the sections under consideration Kant most explicitly declares self-consciousness to be merely "the *representation* of that which is the condition of all unity." He maintains that this representation, as standing for "the determining self (the thinking), is to be distinguished from the self which we are seeking to determine (the subject which thinks) as knowledge from its object," or in other words, that, without special proof, unattainable on theoretical grounds, "the unity of thought" may not be taken as equivalent to the unity of the thinking subject. They may be as diverse as unity of representation and unity of object represented are frequently found to be. We may never argue from simplicity in a representation to simplicity in its object.

But to return to the main thesis, it may be observed that these arguments, with the exception of that which we have just been considering from the nature of self-consciousness, lead to the conclusion that the categories are as little applicable to the thing in itself as to the transcendental subject. Even the argument from the necessary and invariable presence of self-consciousness in each and every act of judgment is itself valid only from a point of view which regards self-consciousness in the manner of Kant's early semi-Critical view of the transcendental subject as an ultimate. But if, as is maintained in the section in which this argument occurs, viz. that on the *Paralogisms*, self-consciousness may be complexly conditioned, and may indeed have conditions similar in nature to those which underlie outer experience, the categories may be just as applicable, or as inapplicable, to its noumenal nature as to the nature of the thing in itself. It is noticeable that in the second edition, doubtless under the influence of preoccupation with ethical problems, some of Kant's utterances betray a tendency to relax the rigour of his thinking, and to bring his theoretical teaching into closer agreement with his ethical results than the theoretical analysis in and by itself at all justifies. This tendency was, of course, reinforced by the persisting influence of that view of the transcendental subject which he had held in the middle 'seventies, and from which he never completely emancipated either his language or his thinking. Indeed in several of the passages added in the second edition Kant even goes so far as to adopt language which if taken quite literally would mean that the 'I think' is an immediate consciousness of the mind's purely intellectual activity — a view which, as

we have seen, is altogether alien to the Critical position. It would, as he argues so forcibly elsewhere, involve a kind of experience which does not conform to Critical requirements, and which would lie open to the attacks of sceptics such as Hume.

In B 157-8 the difficulties of Kant's position are again manifest. Speaking of the representation of the self, he declares that "I am conscious of myself ..., not as I appear to myself, nor as I am in myself, but only that I am." This may seem to imply that existence is predicable of the transcendental self. He adds that though the determination, *i.e.* specification in empirical form, of my existence (*mein eigenes Dasein*) is possible only in inner sensuous intuition, it is "not appearance and still less mere illusion." But in the appended note it is urged that my existence (*Dasein*) as self-active being is represented in purely indeterminate fashion. Only my existence *as sensuous*, and therefore as appearance, can be known, *i.e.* can be made determinate.

The problem is more directly and candidly faced in the note to B 422. That note is interesting for quite a number of reasons. It reveals Kant in the very act of recasting his position, and in the process of searching around for a mode of formulation which will enable him to hold to a transcendental consciousness of the self's existence and at the same time not to violate the definition of existence given in the *Postulates*, *i.e.* both to posit the transcendental self as actual and yet to deny the applicability to it of any of the categories. After stating that the 'I think' is an empirical proposition in which my existence is immediately involved, he proceeds further to describe it as expressing "an undetermined empirical intuition, *i.e.* perception," and so as showing that sensation underlies its assertion of existence. Kant does not, however, mean by these words that the existence asserted is merely that of the empirical self; for he proceeds:

"...existence is here not a category, which as such does not apply to an indeterminately-given object.... An indeterminate perception here signifies only something real that is given, given indeed to thought in general, and so not as appearance, nor as thing in itself (*Noumenon*), but as something which actually [*in der That*] exists, and which in the proposition, I think, is denoted [*bezeichnet*] as such."

The phrases here employed are open to criticism on every side. Kant completely departs from his usual terminology when he asserts that through an "indeterminate perception" the self is given, and "given to thought in general" as "something real." The contention, that the existence asserted is not a category, is also difficult to accept. It is equally surprising to read that its reality is given "neither as appearance nor as thing [*Sache*] in itself (*Noumenon*)"; for hitherto no such alternative form of real existence has been recognised.

But to press such criticisms is to ignore the spirit for the sake of the letter. Kant here breaks free from all his habitual modes of expression for the very good and sufficient reason that he is striving to develop a position more catholic and comprehensive than any previously adopted. He is seeking to formulate a position which, without in any way justifying or encouraging the transcendent employment of the categories, will yet retain for thought the capacity of self-limitation, that is, of forming concepts which will reveal the existence of things in themselves and so will enable the mind to apprehend the radical distinction between things in themselves and things experienced. But he has not yet discovered that in so doing he is committing himself to the thesis that the distinction is mediated, not by the understanding, but by Reason, not by categories, but by Ideas. As I have already indicated, this tendency is crossed by another derived from his preoccupation with moral problems, namely, the desire to defend, in a manner which his Critical teaching does not justify, the noumenal existence of the self as a *thinking* being.

THE TRANSCENDENTAL ANALYTIC

Book II

THE ANALYTIC OF PRINCIPLES

The distinction which Kant here introduces for the first time between understanding (now viewed as the faculty only of concepts) and the faculty of judgment (*Urtheilskraft*) is artificial and extremely arbitrary. As we have seen, his own real position involves a complete departure from the traditional distinction between conceiving, judging, and reasoning, as separate processes. All thinking without exception finds expression in judgment. Judgment is the fundamental activity of the understanding. It is “an act which contains all its other acts.” Kant is bent, however, upon forcing the contents of the *Critique* into the external framework supplied by the traditional logic, viewed as an architectonic; and we have therefore no option save to take account of his exposition in the actual form which he has chosen to give to it. Since general logic develops its teaching under three separate headings, as the logic of conception, the logic of judgment, and the logic of reasoning, the *Critique* has to be made to conform to this tripartite division. The preceding book is accordingly described as dealing with concepts, and this second book as dealing with judgments or principles; while understanding and the faculty of judgment, now viewed as independent, are redefined to meet the exigencies of this new arrangement, the former as being “the faculty of rules,” and the latter as being “the faculty of subsuming under rules, *i.e.* of distinguishing whether something does or does not stand under a given rule (*casus datae legis*).”

The reader need not strive to discover any deep-lying ground or justification for these definitions. Architectonic, that ‘open sesame’ for so many of the secrets of the *Critique,* is the all-sufficient spell to resolve the mystery. As a matter of fact, Kant is here taking advantage of the popular meaning of the term judgment in the sense in which we speak of a man of good judgment; and in order that judgment and understanding may be distinguished he then imposes an artificial limitation upon the meaning in which the latter term is to be employed.

As formal logic abstracts from all content, it cannot, Kant maintains, supply rules for the exercise of “judgment.” It is otherwise with transcendental logic, which in the pure forms of sensibility possesses a content enabling it to define in an *a priori* manner the specific cases to which concepts must be applicable. The *Analytic of Principles* is thus able to supply “a canon for the faculty of judgment, instructing it how to apply to appearances the concepts of understanding which contain the condition of *a priori* rules.” This will involve (1) the defining of the sensuous conditions under which the *a priori* rules may be applied — the problem of the chapter on schematism; and (2) the formulating of the rules in their sensuous, though *a priori,* concreteness — the problem of the chapter on “the system of all principles of pure understanding.”

Such is Kant’s own very misleading account of the purposes of these two chapters. There are other and sounder reasons why they should be introduced. In the *Analytic of Concepts*, as we have seen, the transcendental deduction only succeeds in proving that *a priori* forms of unity are required for the possibility of experience. No proof is given that the various categories are just the particular forms required, and that they are one and all indispensable. This omission can be made good only by a series of proofs, directed to showing, in reference to each separate category, its validity within experience and its indispensableness for the possibility of experience. These proofs are given in the second of the two chapters. The chapter on schematism is preparatory in character; it draws attention to the importance of the temporal aspect of human experience, and defines the categories in the form in which they present themselves in an experience thus conditioned by *a priori* intuition.

CHAPTER I

THE SCHEMATISM OF PURE CONCEPTS OF UNDERSTANDING

The more artificial aspect of Kant's argument again appears in the reason which he assigns for the existence of a problem of schematism, namely, that pure concepts, and the sensuous intuitions which have to be subsumed under them, are completely opposite in nature. No such explanation can be accepted. For if category and sensuous intuition are really heterogeneous, no subsumption is possible; and if they are not really heterogeneous, no such problem as Kant here refers to will exist. The heterogeneity which Kant here asserts is merely that difference of nature which follows from the diversity of their functions. The category is formal and determines structure; intuition yields the content which is thereby organised. Accordingly, the "third thing," which Kant postulates as required to bring category and intuition together, is not properly so describable; it is simply the two co-operating in the manner required for the possibility of experience. Kant's method of stating the problem of schematism is, however, so completely misleading, that before we can profitably proceed, the various strands in his highly artificial argument must be further disentangled. This is an ungrateful task, but has at least the compensating interest of admirably illustrating the kind of influence which Kant's logical architectonic is constantly exercising upon his statement of Critical principles.

The architectonic has in this connection two very unfortunate consequences. It leads Kant to describe schematism as a process of *subsumption*, and to speak of the transcendental schema as "a *third thing*." Neither assertion is legitimate. Schematism, properly understood, is not a process of subsumption, but, as Kant has already recognised in A 124, of synthetic interpretation. Creative synthesis, whereby contents are apprehended in terms of functional relations, not subsumption of particulars under universals that are homogeneous with them, is what Kant must ultimately mean by the schematism of the pure forms of understanding. A category, that is to say, may not be viewed as *a predicate* of a possible judgment, and as being applied to a subject independently apprehended; its function is to articulate the judgment as a whole. The category of substance and attribute, for instance, is the *form* of the categorical judgment, and may not be equated with any one of its single parts.

Thus the criticisms which we have already passed upon Kant's mode of formulating the distinction between formal and transcendental logic, are no less applicable to the sections now before us. The terminology which Kant is here employing is borrowed from the traditional logic, and is out of harmony with his Critical principles.

Kant's description of the schema as a third thing, additional to category and intuition, and intermediate between them, is also a result of his misleading mode of formulating his problem. What Kant professes to do is to interpret the relation of the categories to the intuitional material as analogous to that holding between a class concept and the particulars which can be subsumed under it. This is implied in his use of the plate and circle illustration. But as the relation holding between categories and the material of sense is that of form and matter, structure and content, the analogy is thoroughly misleading. As *all* content, strictly so called, falls on the side of the intuitional material, there is no content, *i.e.* no quality or attribute, which is common to both. And thus it happens that the *inappropriateness* of the analogy which Kant is seeking to enforce is ultimately the sole ground which he is able to offer in support of his description of the schema as "a third thing."

"Now it is clear [!] that there must be a third thing, which is homogeneous on the one hand with the category and on the other with the appearance, and which thus makes the application of the one to the other possible."

On the contrary, the true Critical teaching is that category and intuition, that is to say, form and content, mutually condition one another, and that the so-called schema is simply a name for the latter as apprehended in terms of the former.

But there is a further complication. Kant, as we have already observed, defines judgment as being

"...the faculty of subsuming under *rules*, *i.e.* of distinguishing whether something does or does not stand under a given rule (*casus datae legis*)."

Now this view of judgment really connects with the syllogism, not with the proposition. As Kant states in his *Logic*, there are

"...three essential elements in all inference: (1) a universal rule which is entitled the major premiss; (2) the proposition which subsumes a cognition under the condition of the universal rule, and which is entitled the minor premiss; and lastly, (3) the conclusion, the proposition which asserts or denies of the subsumed cognition the predicate of the rule."

Regarded in this way, as the application of a *rule*, subsumption is more broadly viewed and becomes a more appropriate analogy for the relation of category to content. And obviously it is this comparison that Kant has chiefly in mind in these introductory sections. For only when the subsumption is that of a particular instance under a universal *rule*, can the necessity of a *mediating* condition be allowed.

Such, then, are the straits to which Kant is reduced in the endeavour to hold loyally to his architectonic. He has to identify the two very different kinds of subsumption which find expression in the proposition and in the syllogism respectively; and when his analogy between logical subsumption, thus loosely interpreted, and synthetic interpretation, proves inapplicable, he uses the failure of the analogy as an argument to prove the necessity of "a third thing." On his own Critical teaching, as elsewhere expounded, no such third thing need be postulated. Even the definitions which he proceeds to give of the various schemata do not really support this description of them.

But though Kant's method of introducing and expounding the argument of this chapter is thus misleading, the contents themselves are of intrinsic value, and have a threefold bearing: (*a*) on the doctrine of productive imagination; (*b*) on the relation holding between image and concept; and (*c*) on the nature of the categories in their distinction from the pure forms of understanding.

(*a*) Kant gives definite and precise expression to the two chief characteristics of the productive imagination, namely, that it deals with an *a priori* manifold of pure intuition and that it exercises a "hidden art in the depths of the human soul." Kant's description of the schema as "a third thing," *at once intellectual and sensuous*, seems to be in large part due to the transference to it of predicates already applied to the faculty which is supposed to be its source. The distinction between the transcendental schema and the particularised image is also given as analogous to that between the pure and the empirical faculties of imagination. In A 141-2 = B 180-1, Kant speaks of the *empirical* faculty of *productive* imagination, and so is led, to the great confusion of his exposition, though also to the enrichment of his teaching, to allow of empirical as well as of transcendental schemata, and thus contrary to his own real position to recognise schemata of such empirical objects as dog or horse — a view which empirical psychology has since adopted in its doctrine of the schematic image. This passage was doubtless written at the time when he was inclining to the view that the empirical processes run parallel with the transcendental. Kant's final view is that empirical imagination is always reproductive. This brings us, however, to our second main point.

(*b*) Kant makes a statement which serves as a valuable corrective of his looser assertions in other parts of the *Critique*. Five points set after one another, thus,....., form an image of the number five. The schema of the number five is, however, of very different nature, and must not be identified with any such image. It is

"...rather *the representation of a method* whereby a multiplicity [in this case five] may be represented in an image in accordance with a certain concept, than this image itself...."

This becomes more evident in the case of large numbers, such as a thousand. The thought or schema of the number remains just as clear and definite as in the case of smaller numbers, but cannot be so adequately embodied and surveyed in a concrete image.

"This representation of a general procedure of imagination in providing its image for a concept, I name the schema to this concept."

But even in the simplest cases an image can never be completely adequate to the concept. The image of a triangle, for instance, is always some particular triangle, and therefore represents only a part of the total connotation. As the schema represents a universal rule of production in accordance with a concept, it resembles the concept in its incapacity to subsist in an objective form. Images become possible only through and in accordance with schemata, but can never themselves be identified with them. Schemata, therefore, and not images — such is the implied conclusion — form the true subject-matter of the mathematical sciences. Images are always particular; schemata are always universal. Images represent existences; schemata represent methods of construction.

There are three criticisms which must be passed upon this position. In the first place, the selection of the triangle as an illustration tends to obscure the main point of Kant's argument. As there are three very different species of triangle, the concept triangle is a class concept in a degree and manner which is not to be found in the concepts, say, of the circle or of the number five. So that while Kant may seem to be chiefly insisting upon the *inadequacy* of the image to represent more than a part of the connotation of the corresponding concept, his real intention is to emphasise that the schema expresses the conceptual rule whereby, even in images that cover the whole connotation, the true meaning of the image can alone be determined.

Secondly, the above definition of the schema as being "the representation of a general procedure of imagination in providing an image for a concept" is obviously bound up with Kant's view of it as "a third thing," additional to the concept, and as intermediate between it and the image. But as we have already found occasion to note, in discussing Kant's doctrine of the "construction" of mathematical concepts, this threefold distinction is out of harmony with his Critical principles. It results from his retention of the traditional view of the concept as in all cases a mere concept, *i.e.* an abstracted or class concept. In defining the schema Kant is defining the true nature of the concept as against the false interpretation of it in the traditional class-theory; he misrepresents the logic of his own standpoint when he interpolates a third kind of representation intermediate between the concept and the image. The concept 'triangle,' *as a concept*, is (to employ Kant's own not very satisfactory terms) the representation of the method of constructing a certain type of object; and the only other mode of representing this kind of object is the image. There may, indeed, as Kant has himself suggested, be a species of image that may be entitled schematic; but if that be identified with a blurred or indeterminate or merely symbolic form of representation, it can have nothing in common with the *transcendental* or *conceptual* schema, save the name.

Thirdly, the entire discussion of the nature of the schemata of "sensuous concepts" and of their relation to the sense image, is out of order in this chapter; and however valuable in itself, bewilders the reader who very properly assumes for it a relevancy which it does not possess. The pure concepts of the understanding, whose schemata Kant is endeavouring to define, are altogether different in nature from sensuous representations, and can never be reduced in any form or degree to an image. They are wholly transcendental, representing pure syntheses unified through categories in accordance with the form of inner sense. This, however, brings us to our last main point.

(*c*) Kant's manner of employing the term category is a typical example of his characteristic carelessness in the use of his technical terms. Sometimes it signifies the pure forms of understanding. But more frequently it stands for what he now, for the first time, entitles schemata, namely, the pure conceptual

forms as modified through relation to time. To take as examples the two chief categories of relation. The first category of relation, viewed as a form of the pure understanding, is the merely logical conception of that which is always a subject and never a predicate. The corresponding schema is the conception of that which has permanent existence in time; it is not the logical notion of *subject*, but the transcendental conception of *substance*. The pure logical conception of ground and consequence is similarly distinguished from the transcendental schema of cause and effect.

This contrast is of supreme importance in the Critical philosophy, and ought therefore to have been marked by a careful distinction of terms. Had Kant restricted the term category to denote the pure forms, and invariably employed the term schemata to signify their more concrete counterparts, many ambiguities and confusions would have been prevented. The table of categories, in its distinction from the table of logical forms, would then have been named the table of schemata, and the definitions given in this chapter would have been appended to it, as the proper supplement to the metaphysical deduction, completing it by a careful definition of each separate schema. For what Kant usually means when he speaks of the categories *are* the schemata; and the chapter before us therefore contains their delayed definitions. As Kant has constantly been insisting, and as he again so emphatically teaches in this chapter, the pure forms of understanding, taken in and by themselves, apart from the forms of intuition, have no relation to any object, and are mere logical functions without content or determinate meaning.

From this point of view the misleading influence of Kant's architectonic may again be noted. It forces him to preface his argument by introductory remarks which run entirely counter to the very point which he is chiefly concerned to illustrate and enforce, namely, the inseparability of conception and intuition in all experience and knowledge. He does, indeed, draw attention to the fact that the conditions which serve to realise the pure concepts of understanding also at the same time restrict them, but it is with their empirical employment that he is here chiefly concerned.

Caird's mode of expounding Kant's doctrine of schematism may serve as an example of the misleading influence of Kant's artificial method of introducing his argument. As Caird accepts Kant's initial statements at their face value, he is led to read the entire chapter in accordance with them, and so to interpret it as being a virtual recantation of the assumptions which underlie the statement of its problem. The truer view would rather seem to be that the introduction is demanded by the exigencies of Kant's architectonic, and therefore yields no true account either of the essential purpose of the chapter or of its actual contents. Cohen not unjustly remarks that

"...recent writers are guilty of a very strange misreading of Kant when they maintain, as if in opposition to him, a thought to which his doctrine of schematism gives profound expression, namely, that intuition and conception do not function independently, and that thought, and still more knowledge, is and must always be intuitive."

Cohen fails, however, to draw attention to the cause of the misunderstanding for which Kant must certainly share the blame. Riehl, while adopting a somewhat similar view to that here given, traces Kant's misleading mode of stating the problem to his holding a false view of the universality of the concept. Such criticism of Kant, like that passed by Caird, is in many respects justified, but the occasion upon which the admonition is made to follow would none the less seem to be ill-chosen.

It may be asked why Kant in this chapter so completely ignores space. No really satisfactory answer seems to present itself. It is true that time is the one universal form of all intuition, of outer as well as of inner experience. It is also true that, as Kant elsewhere shows, consciousness of time presupposes consciousness of space for its own possibility, and so to that extent may be regarded as including the latter form of consciousness within itself. Nevertheless Kant's concentration on the temporal aspect of experience is exceedingly arbitrary, and results in certain unfortunate consequences. Owing to the manner in which Kant envisages his problem he is bound, indeed, to lay the greater emphasis upon time, but that need not have involved so exclusive a recognition of its field and function. Possibly Kant's very natural

preoccupation with his new and revolutionary doctrines of inner sense and productive imagination has something to do with the matter.

Though the definitions given of the various schemata, especially of those of reality and existence, raise many difficulties, consideration of them must be deferred. They can be properly discussed only in connection with the principles which Kant bases upon them. Only one further point calls for present remark. Kant does not give a schema for each of the categories. In the first two groups of pure conceptual forms, those of quantity and of quality, he gives a schema only for the third category in each case. Number is strictly not the schema of quantity as such, but of *totality*. The schema of quality is a definition only of *limitation*. This departure from the demands of strict architectonic is made without comment or explanation of any kind. Kant delights to insist upon the confirmation given to his teaching by the fulfilment of architectonic requirements; he is for the most part silent when they fail to correspond. This architectonic was a hobby sufficiently serious to yield him keen pleasure in its elaboration, but was not so vital to his main purposes as to call for stronger measures when shortcomings occurred.

In concluding this chapter Kant draws attention to the fact that the sensuous conditions which serve to realise the pure concepts also at the same time restrict their meaning. Their wider meaning is, however, of merely logical character. Their function, as pure concepts, lies solely in establishing unity of representation; they do not therefore suffice to yield knowledge of any object. Objective application "comes to them solely from sensibility." In these statements Kant expounds one of his fundamental doctrines, but in a manner which does less than justice to the independent value of pure thought. As he elsewhere teaches, it is not sense that sets limits to understanding; it is the pure forms of thought that enable the mind to appreciate the limited and merely phenomenal character of the world experienced.

CHAPTER II

SYSTEM OF ALL PRINCIPLES OF PURE UNDERSTANDING

The introductory remarks to this important chapter are again dictated by Kant's architectonic, and set its actual contents in an extremely false light. Kant would seem to imply that as the *Analytic of Concepts* has determined all the various conceptual elements constitutive of experience, and has proved that they serve as predicates of possible judgments, it now remains to show in an *Analytic of Principles* what *a priori* synthetic judgments, or in other words what principles, can actually be based upon them. Though this is a quite misleading account of the relation holding between the two books of the *Analytic*, it has been accepted by many commentators. For several reasons it must be rejected. The pure forms of understanding are not predicates for possible judgments. They underlie judgment as a whole, expressing the relation through which its total contents are organised. Thus in the proposition "cinnabar is heavy" the category of substance and attribute is not in any sense the predicate; it articulates the entire judgment, interpreting the experienced contents in terms of the dual relation of substance and attribute. Judgment, its nature and conditions, is the real problem of the misnamed *Analytic of Concepts*. As already indicated, the two main divisions of the *Analytic* deal with one and the same problem. But while doing so, they differ in two respects. In the first place, as above noted, the *Analytic of Concepts* supplies no proof of the validity of particular categories, but only a quite general demonstration that forms of unity, such as are involved in all judgment, are demanded for the possibility of apperception. The proofs of the indispensableness of *specific* categories are first given in the *Analytic of Principles*. Secondly, in the *Analytic of Concepts* the temporal aspect of experience falls somewhat into the background, whereas in the *Analytic of Principles* it is emphasised.

From these two fundamental points of difference there arises a third distinguishing feature. When the categories, or rather schemata, are explicitly defined, and receive individual proof, they are found to be just those principles that are demanded for the possibility of the positive sciences. This is, from Kant's point of view, no mere coincidence. Scientific knowledge is possible only in so far as experience is grounded on *a priori* conditions; and the conditions of *sense*-experience are also the conditions of its conceptual interpretation. But while the *Analytic of Concepts* deals almost exclusively with ordinary experience, in the *Analytic of Principles* the physical sciences receive their due share of consideration.

First and Second Sections. The Highest Principles of Analytic and Synthetic Judgments. — These two sections contain nothing not already developed earlier in the *Critique*. Though the principle of non-contradiction is a merely negative test of truth, it can serve as a universal and completely adequate criterion in the case of all judgments that are analytic of given concepts. The principle of synthetic judgments, on the other hand, is the principle whereby we are enabled to advance beyond a given concept so as to attach a predicate which does not stand to it in the relation either of identity or of contradiction. This principle is the principle of the possibility of experience. Though *a priori* synthetic judgments cannot be *logically* demonstrated as following from higher and more universal propositions, they are capable of a *transcendental* proof, that is, as being conditions of sense-experience.

"The possibility of experience is what gives objective reality to all our *a priori* knowledge." "Although we know *a priori* in synthetic judgments a great deal regarding space in general and the figures which productive imagination describes in it, and can obtain such judgments without actually requiring any experience; yet even this knowledge would be nothing but a playing with a mere figment of the brain, were it not that space has to be regarded as a condition of the appearances which constitute the material for outer experience...."

In the first part of the last sentence, as in the page which precedes it, Kant would seem to be inculcating his doctrine of a pure *a priori* manifold, but the latter part of the statement would not be affected by the admission that space is not an independent intuition but only the form of outer sense.

Third Section. Systematic Representation of all the Synthetic Principles of Understanding. — Kant is not concerned in this section with the fundamental propositions of mathematical science, since, on his view, they rest upon the evidence of intuition. He claims, however, that their objective validity depends upon two principles, which, though not themselves mathematical in the strict sense, may conveniently be so described from the transcendental standpoint — the principle of the "axioms of intuition," and the principle of the "anticipations of experience." The physicist, who takes the legitimacy of applied mathematics for granted, has no occasion to formulate these principles. That he none the less presupposes them is shown, however, by his unquestioning assumption that nature conforms to the strict requirements of pure mathematics. And since the principles involve pure concepts, the one embodying the schema of number, and the other the schema of quality, they fall outside the scope of the *Transcendental Aesthetic*, and call for a deduction similar to that of the other categories.

As already indicated, Kant's procedure is extremely arbitrary, and is due to the perverting influence of his architectonic. Proof of the validity of applied mathematics has already been given in the *Aesthetic* of the first edition — a proof which is further developed in the *Prolegomena*, and recast in the second edition so as to constitute a separate "transcendental exposition." As Kant teaches in these passages, the objective validity of applied mathematics rests upon proof that space and time are the *a priori* forms of outer and inner sense. The new deductions of the schemata of number and quality, which he now proceeds to formulate, are quite unnecessary, and also are by no means conclusive in the manner of their proof. This, however, is more than compensated by the extremely valuable proofs of the schematised categories of relation which he gives in the section on the *Analogies of Experience*. The section on the *Postulates of Empirical Experience*, which deals with the principles of modality, also contains matter of very real importance.

The principles with which this chapter has to deal can thus be arranged according to the fourfold division of the table of categories: (1) *Axioms of Intuition*, (2) *Anticipations of Perception*, (3) *Analogies of Experience*, (4) *Postulates of Empirical Thought*. And following the distinction already drawn in the *Analytic of Concepts*, Kant distinguishes between the Axioms and Anticipations on the one hand, and the Analogies and Postulates on the other. The former determine the conditions of intuition in space and time, and may therefore be called mathematical and constitutive. They express what is necessarily involved in every intuition as such. The latter are dynamical. They are principles according to which we must think the existence of an object as determined in its relation to others. While, therefore, the first set of principles can be intuitively verified, the second set have only an indirect relation to the objects experienced. Whereas a relation of causality can never be intuited as holding between two events, but only thought into them, spatial and temporal relations are direct objects of the mind. Similarly, the relation of substance and attribute cannot be intuited; it can only be thought into what is intuited. The mathematical principles thus acquire an immediate (though, be it remembered, merely *de facto*) evidence; the *a priori* certainty, equally complete, of the dynamical principles can be verified only through the circuitous channel of transcendental proof.

The composite constitution of these sections finds striking illustration in the duplicated account of this distinction which precedes and follows the table of principles. The two accounts can hardly have been written in immediate succession to one another. The earlier in location is probably the later in date. It would seem to rest upon some such uncritical distinction as that drawn in the *Prolegomena* between judgments of perception and judgments of experience. The second and briefer account is not open to this objection.

In A 178-80 = B 220-3 Kant develops a further point of difference between the mathematical and the

dynamical principles, or rather explains what he means by his all too brief and consequently ambiguous reference in the first of the above accounts to “existence” (*Dasein*). The mathematical principles are *constitutive*; the dynamical are *regulative*. That is to say, the mathematical principles lay down the conditions for the generation or construction of appearances. The dynamical only specify rules whereby we can define the relation in which existences contingently given are connected. As existence can never be constructed *a priori*, we are limited to the determination of the interrelations between existences all of which must be given. Thus the principle of causality enables us to predict *a priori* that for every event there must exist some antecedent cause; but only through empirical investigation can we determine which of the particular given antecedents may be so described. That is to say, the principle defines conditions to which experience must conform, but does not enable us to construct it in advance. This distinction is inspired by the contrast between mathematical and physical science, and is valuable as defining the empirically regulative function of the *a priori* dynamical principles; but its somewhat forced character becomes apparent when we bear in mind Kant’s previous distinction between the principles of pure mathematical science and the transcendental principles which justify their application to experience. Those latter principles concern existence as apprehended through schematised categories, and are consequently, as regards certainty and method of proof, in exactly the same position as the dynamical principles. This is sufficiently evident from his own illustration of sunlight. There is as little possibility of “constructing” its intensity as of determining *a priori* the cause of an effect.

I. THE AXIOMS OF INTUITION

All appearances are in their intuition extensive magnitudes. Or as in the second edition: *All intuitions are extensive magnitudes*.

‘Extensive’ is here used in a very wide sense to include temporal as well as spatial magnitude. Kant bases this principle upon the schema of number, and the proof which he propounds in its support is therefore designed to show that apprehension of an object of perception, whether spatial or temporal, is only possible in so far as we bring that schema into play. But though this is the professed purpose of the argument, number is itself never even mentioned; and the reason for the omission is doubtless Kant’s consciousness of the obvious objections to any such position. That aspect of the argument is therefore, no doubt without explicit intention, kept in the background. But even as thus given, the argument must have left Kant with some feeling of dissatisfaction. Loyalty to his architectonic scheme prevents such doubt and disquietude from finding further expression.

The argument, in its first-edition statement, starts from the formulation of a view of space and time directly opposed to that of the *Aesthetic*:

“I entitle a magnitude extensive when the representation of the parts makes possible, and therefore necessarily precedes, the representation of the whole. I cannot represent to myself a line, however small, without drawing it in thought, *i.e.* generating from a point all its parts one after another, and thus for the first time recording this intuition.”

Similarly with even the smallest time. And as all appearances are intuited in space or time, every appearance, so far as intuited, is an extensive magnitude, that is to say, can be apprehended only through successive generation of its parts. All appearances are “aggregates, *i.e.* manifolds of antecedently given parts.”

This definition of extensive magnitude involves an assumption which Kant also employs elsewhere in the *Critique*, but which he nowhere attempts to establish by argument; namely, that it is impossible to apprehend a manifold save in succession. This assumption is, of course, entirely false (at least as applied to our empirical consciousness), as has since been amply demonstrated by experimental investigation.

Kant adopted it in the earlier subjectivist stage of his teaching, before he had come to recognise that consciousness of space is involved in consciousness of time. But even after he had done so, the earlier view still tended to gain the upper hand whenever the doctrines of inner sense and of productive imagination were under consideration. For in regard to the transcendental activities of productive imagination, which are essentially synthetic, Kant continued to treat time as more fundamental than space. But, as already noted, a directly opposite view of the interrelations of space and time is expounded in passages added in the second edition.

The two central paragraphs are very externally connected with the main argument, and are probably later interpolations. In the first of these two paragraphs Kant ascribes the synthetic activity involved in the "generation of figures" to the productive imagination, and maintains that geometry is rendered possible by this faculty. In the other paragraph Kant deals with arithmetic, but makes no reference to the productive imagination. Its argument is limited to the contention that propositions expressive of numerical relation, though synthetic, are not universal. They are not axioms, but numerical formulae. This distinction has no very obvious bearing on the present argument, and serves only to indicate Kant's recognition that no rigid parallelism can be established between geometry and arithmetic. There are, it would seem, no arithmetical axioms corresponding to the axioms of Euclid.

The concluding paragraph is a restatement of the argument of the *Aesthetic* and of § 13, *Note* i. of the *Prolegomena*. Appearances are not things in themselves. They are conditioned by the pure intuitional forms, and are therefore subject to pure mathematics "in all its precision." Were we compelled to regard the objects of the senses as things in themselves, an applied science of geometry (again taken, in Kant's habitual manner, as typically representing the mathematical disciplines) would not be possible. The only new element in the argument is the reference to synthesis as presupposed in all apprehension.

The additional proof with which in the second edition Kant prefaces the entire argument calls for no special comment. It may, however, be noted that though in the argument of the first edition the need of synthesis in all apprehension is clearly taught, the term synthesis is not itself employed except in the central and final paragraphs. In the proof given in the second edition both the term and what it stands for are allowed due prominence.

2. THE ANTICIPATIONS OF PERCEPTION

In all appearances sensation and the real which corresponds to it in the object (realitas phaenomenon) has an intensive magnitude or degree. Or as in the second edition: *In all appearances the real, which is an object of sensation, has intensive magnitude or degree.*

We may first analyse the total section. The first paragraph explains the term anticipation. The second and third paragraphs give a first proof of the principle. Paragraphs four to ten treat of continuity in space, time and change, and of the impossibility of empty space, and also afford Kant the opportunity to develop his dynamical theory of matter, and so to indicate the contribution which transcendental philosophy is able to make towards a more adequate understanding of the principles of physical science. The eleventh and twelfth paragraphs, evidently later interpolations, give a second proof of the principle which in one important respect varies from the first proof. In the second edition a third proof akin to this second proof, but carrying it a stage further, is added in the form of a new first paragraph.

Kant's reason for changing the formulation of the principle in the second edition is evidently the unsatisfactoriness of the phrase "sensation *and* the real." The principle, properly interpreted, applies not, as the first edition title and also the second proof would lead us to expect, to sensation itself, but to its object, *realitas phaenomenon*. It is phenomenalist in its teaching. The emphatic term "anticipation" is adopted by Kant to mark that in this principle we are able in *a priori* fashion to determine something in regard to what in itself is purely empirical. Sensation as such, being the matter of experience, can never

be known *a priori*. Its quality, as being a colour or a taste, depends upon factors which are for us, owing to the limitations of our knowledge, wholly contingent. None the less in one particular respect we can predetermine the object of all sensation, and so can *anticipate* experience, even in its material aspect.

The first proof is as follows. Apprehension, so far as it takes place through a sensation, occupies only a single moment; it does not involve any successive synthesis proceeding from parts to the complete representation. That which is apprehended cannot, therefore, possess extensive magnitude. But, as already stated in the chapter on *Schematism*, reality is that in appearance which corresponds to a sensation. It is *realitas phaenomenon*. The absence of it is negation = 0. Now every sensation is capable of diminution; between reality in the appearance and negation there is a continuous series of many possible intermediate sensations, the difference between any two of which is always smaller than the difference between the given sensation and zero. That is to say, the real in appearance has intensive magnitude or degree. The argument is from capability of variation in the intensity of sensation to existence of degree in its object or cause. For the most part this reality is spoken of as that which is apprehended in sensation, but Kant adds that if it be

"...viewed as cause either of sensation or of other reality in appearance, such as change, the degree of its reality ... is then entitled a moment, as for instance the moment of gravity."

The obscurity of what in itself is a very simple and direct argument would seem to be traceable to the lack of clearness in Kant's own mind as to what is to be signified by reality. The implied distinction between sensation and its object has not been clearly formulated. Definitions have, indeed, been given of reality in the chapter on *Schematism*; but they are extremely difficult to decipher. Kant never varies from the assertion that reality is "that which corresponds to sensation in general." Our difficulty is with the additional qualifications. This reality, he further declares, is

"...that, the concept of which in itself points to an existence [*Sein*] in time."

The words 'in time' would seem to show that what is referred to is reality *in the realm of appearance*, the *realitas phaenomenon* of the *Anticipations*. But immediately below we find the following sentence:

"As time is only the form of intuition, and consequently of objects as appearances, what corresponds in them to sensation is the transcendental matter of all objects *as things in themselves*, thinghood [*Sachheit*], reality."

The teaching of the first sentence is phenomenalist; that of the other is subjectivist.

Now in the section on *Anticipations of Perception* the phenomenalist tendencies of Kant's thought are decidedly the more prominent. The implied distinction is threefold, between sensation as subjective state possessing intensive magnitude, spatial realities that possess both intensive and extensive magnitude, and the thing in itself. Objects as appearances are regarded as causes of sensation and as producing changes in one another.

The explanation of the phenomenalist character of this section is not far to seek. Kant's chief purpose in it, as we shall find, is to develop the dynamical theory of matter to which he had long held, and which, as he was convinced, would ultimately be substituted for the mechanistic view to which almost all physicists then adhered. We can easily understand how in this endeavour the realist tendencies of his thinking should at once come to the surface, and why he should have been constrained to develop a position more precise and less ambiguous than that expressed in the definitions of reality and degree given in the chapter on *Schematism*. With these preliminary explanations we may pass to Kant's second proof of his principle.

A link of connection between the two proofs may be found in the reason which Kant in the first proof gives for his assertion that sensation cannot possess extensive magnitude — the reason, namely, that as its apprehension takes place in a single moment, it involves no element of synthesis. In his second proof Kant modifies this contention, and maintains that we can abstract from the extensive magnitude of the appearance, and yet can recognise a synthesis as being involved.

"The real which corresponds to sensations in general, as opposed to negation = 0, represents only something the very conception of which contains an existence [*ein Sein*], and signifies nothing but the synthesis in an empirical consciousness in general."

Kant adds that in a single moment we can represent to ourselves as involved in the bare sensation

"...a synthesis of the uniform progression from zero to the given empirical consciousness."

These statements are far from clear; but it is hardly necessary to criticise them in detail. Since Kant is endeavouring to prove that a schema, that of reality or limitation, is involved in the apprehension of sensation, he is bound in consistency to maintain, in accordance with the teaching of his deduction of the categories, that the application of the schema demands some species of synthesis.

The third proof, added in the second edition, is somewhat more explicit, and represents a further and last stage in Kant's vain endeavour to harmonise the teaching of this section with his general principles. In the empirical consciousness of sensation there is

"...a synthesis of the different quantities involved in the generation of a sensation from its beginning in pure intuition = 0 to its particular required magnitude."

Or again, apprehension of magnitude is apprehension

"...in which the empirical consciousness can in a certain time increase from zero up to its given measure."

Here, again, what Kant asserts as occurring in our awareness of sensation calls for much more rigorous demonstration. Like the argument of the second proof, it is not independently established; it is a mere corollary to the general principles of his deduction of the categories.

Thus Kant's thesis, that the apprehension of sense qualities as intensive magnitudes presupposes a synthesis according to an *a priori* schema, is both obscure in statement, and unconvincing in argument; and some of the assertions made, especially in reference to the occurrence of synthesis, would seem to be hardly less arbitrary than the connection which Kant professes to trace between logical "quality," as affirmation or negation, and the dynamical intensity of sensuous qualities. For, as already indicated, logical "quality" and intensive magnitude have nothing in common save the name.

Kant next proceeds to a discussion of the general problem of continuity. The connection is somewhat forced. But if we overlook the artificial ordering of the argument and are content to regard what is given as in the nature of parenthetical comment, we find in the middle paragraph of this section an excellent statement of his view of the nature of continuity and a very clear statement of his dynamical theory of matter.

Kant develops the conception of continuity (*a*) in reference to space and time, and (*b*) in its application to the intensity of sensations and of their causes.

(*a*) Kant's own words require no comment:

"Space and time are *quanta continua* because no part of them can be given, save as enclosed between limits (points or moments), and therefore as being itself a space or a time. Space therefore consists only of spaces, time only of times. Points and moments are only limits, i.e. mere positions that limit space and time. But positions always presuppose the intuitions which they limit or are intended to limit; and out of mere positions, viewed as constituents capable of being given prior to space and time, neither space nor time can be constructed. Such magnitudes may also be called *flowing*, since the synthesis of productive imagination involved in their production is a progression in time, and the continuity of time is ordinarily denoted by the expression *flowing*."

(*b*) When Kant proceeds to apply the principle of continuity to intensive magnitude, his conclusion rests upon a somewhat different basis. He argues that appearances must be continuous owing to the fact that they are apprehended in space and time. So far as they are extended in space and enduring in time that may perhaps be true; but Kant's assertion has a wider sweep. It implies that sensations and the physical

conditions of sensation, as for instance the sensation of red or the force of gravity, are capable of existing in every possible degree between zero and any given intensity. This affords the key to his method of formulating his second and third proofs of the principle of *Anticipations of Perception*, which, in the form in which he interprets it, contains this further implication of continuity. These proofs are inspired by the desire to make all apprehension, even that of simple sensation, a temporal process, and by that indirect means to establish for sensuous intensity and its objective conditions a continuity similar to that of space and time. The proof is, however, as we have seen, inconclusive. This application of continuity must be regarded as more in the nature of a mere hypothesis than Kant is willing to recognise. As regards sensations, it would seem to have been positively disproved by the results of experimental psychology.

From his supposed proof of the continuity of all intensive magnitudes Kant draws two further conclusions: first, that experience can never be made to yield proof of the void in either space or time. For if all reality can exist in innumerable degrees, and if each sense has a determinate degree of receptivity, the complete absence of reality can never be itself experienced. Inference to such absence is also impossible for a second reason, namely, that one and the same extensive magnitude may be completely occupied by an infinite number of different intensive degrees, indefinitely approximating to, and yet also indefinitely differing from, zero. Kant is here referring to the dynamical theory of matter which he had long held, and which he expounds in opposition to the current mechanistic view. The mechanistic theory rests, he contends, upon an assumption purely metaphysical and therefore wholly dogmatic, that the real in space has no internal differences, but is uniform like the empty space in which it exists. In accordance with this assumption physicists infer that all qualitative differences in our sensations must be due to merely quantitative differences in their material causes, and ultimately to differences in the number and distribution of the constituent parts of material bodies. If two bodies of the same volume differ in weight or in inertia, the variation must be traced to differences in the amount of matter, or, otherwise stated, to differences in the amount of unoccupied space, in the two bodies. To this view Kant opposes his own hypothesis — for it is in this more modest form that it is presented in these paragraphs — namely, that matter occupies space by intensity and not by mere bulk, and that it may therefore be diminished indefinitely in degree without for that reason ceasing completely to fill the same extensive area. Thus an expanded force such as heat, filling space without leaving the smallest part of it empty, may be indefinitely diminished in degree, and yet may still with these lesser degrees continue to occupy that space as completely as before. This may not, Kant admits, be the true explanation of physical differences, but it at least has the merit of freeing the understanding from metaphysical preconceptions, and of demonstrating the possibility of an alternative to the current view. If matter has intensity as well as extensity, and so can vary in quality as well as in quantity, physical science may perhaps be fruitfully developed on dynamical lines.

3. THE ANALOGIES OF EXPERIENCE

The principle of the *Analogies* is: *Experience is possible only through the representation of a necessary connection of perceptions.*

Kant introduces the three analogies with the statement of an underlying principle, which corresponds to the central thesis of the transcendental deduction. In the second edition this general principle is reformulated, and a new proof is added. These alterations do not seem, however, to be of any special significance. The two proofs repeat the main argument of the transcendental deduction, but with special emphasis upon the temporal aspect of experience. The categories of relation, as schematised, yield the *Analogies*, which acquire objective validity in so far as they render experience possible. The first proof (given in the second paragraph of the first edition) maintains that they are indispensable for apperception, and the second proof (that of the second edition) that they are indispensable for knowledge of objects. The

references to time in the second proof are too condensed to be intelligible save in the light of the more explicit arguments given in support of the three *Analogies*.

The first paragraph in the first edition must be a later interpolation, as its assertion that simultaneity is a mode of time conflicts with the proof given of the first *Analogy*, but agrees with what must be regarded as a later interpolated passage introductory to that proof. This paragraph is also peculiar in another respect. Hitherto Kant has traced the existence of the three analogies to the three categories of relation, each of which conditions a separate schema. But in this paragraph he bases their threefold form on the fact that time has three modes, duration, sequence, and coexistence, and that there is therefore a threefold problem: first, what is involved in consciousness of duration; secondly, what is involved in consciousness of succession; and thirdly, what is involved in consciousness of coexistence. This is not, however, a satisfactory mode of stating the matter, for it might seem to imply that the three aspects of time can be separately apprehended, and that each has its own independent conditions. What Kant really proves is that all three involve one another. We can only be conscious of duration in contrast to succession, and of succession in contrast to the permanent, while both involve consciousness of coexistence. The three analogies thus treat of three aspects of the same problem, the first connecting with the category of substance, the second with that of causality, and the third with that of reciprocity.

The only point that calls for further comment concerns Kant's adoption of the term *Analogy* as a title for the three principles of "relation." The term is employed in contra-distinction to constitutive principle or axiom; and Kant points out that this usage of the term must be carefully distinguished from the other or mathematical. "In philosophy analogy is not the likeness of two quantitative but of two qualitative relations." In mathematical analogy a fourth term can be discovered from three given terms; but in an 'analogy of experience' we possess a rule that suffices only for the determination of the *relation* to a term not given, never for knowledge of this term itself. Thus if we are informed that 15 is to x as 5 is to 10, the value of x can be determined as 30. But if it be stated that a given event stands to an antecedent event as effect to cause, only the relation holding between the events can be specified, not the actual cause itself. The principle of causality thus serves only as a regulative principle, directing us to search for the cause of an event among its antecedents.

Riehl has suggested a very different explanation of the term, namely, as signifying that the categories of relation are employed only on the analogy of the corresponding, pure logical forms.

"In so far as I know matter in terms of its empirical properties as the substance of outer experiences, I do not gain knowledge of the nature of matter but only of its relation to my thinking. In all judgments upon outer things I employ matter as the *subject*. That knowledge is therefore nothing but an *analogy* to the conceptual relation of a subject to its predicates. Matter is related to its properties and effects in the realm of appearance as the subject of a categorical judgment is related to its predicates. In so far as an antecedent is entitled the cause of an event, we do not gain knowledge of its nature but only of the analogy of the relation of cause and effect with that of antecedent and consequent in a hypothetical proposition; the connection of the changes is analogous to the conceptual relation of ground and consequence; the principle of the sufficient ground of changes is an *analogy of experience*."

This explanation may at first sight seem to be supported by Kant's own statement in the concluding paragraph of the section before us.

"Through these principles we are justified in combining appearances only according to an analogy with the logical and general unity of concepts ..."

This assertion is, however, incidental to Kant's explanation that the analogies are not principles of "transcendental" (*i.e.* transcendent), but only of empirical application — an explanation itself in turn occasioned by his desire to connect his present argument with the chapter on *Schematism*. This interpretation of the term analogy is probably, therefore, of the nature of an afterthought. Having adopted the term on the grounds above stated in A 179-80 = B 222, he finds in it an opportunity to reinforce his

previous assertion of the restricting character of the time condition through which categories are transformed into schemata. The entire paragraph is probably, as Adickes remarks, a later interpolation. But there are further reasons why we cannot accept this passage as representing the real origin of the term analogy. It would involve adoption of the subjectivist standpoint from which Riehl, despite his otherwise realistic reading of Kant, interprets Kant's phenomenalist doctrines. For it implies that it is only in the noumenal, and not also in the phenomenal sphere, that substantial existences and genuinely dynamical activities are to be found. It would also seem to imply, what is by no means Kant's invariable position, the absolute validity of the logical forms. And lastly, it would involve the priority of the logical to the real use of the categories, a violation of Critical principles of which Kant is himself occasionally guilty, but never, as it would seem, in this exaggerated form.

A. First Analogy. — *All appearances contain the permanent (substance) as the object itself, and the changeable as its mere determination, i.e. as a mode in which the object exists.* Or as in the second edition: *In all change of appearances substance is permanent; its quantum in Nature neither increases nor diminishes.*

The second paragraph is of composite character. Its first part (consisting of the first three sentences) and its second part give separate proofs, involving assertions directly contradictory of one another. The one asserts change and simultaneity to be modes of time; the other denies this. They cannot, therefore, be of the same date. The first would seem to be the later; it connects with the first paragraph of the preceding section.

In the first edition the principle is defined as expressing the schema of the dual category of substance and attribute. In the second edition it is reformulated in much less satisfactory form, as being the scientific principle of the conservation (*i.e.* indestructibility) of matter. This second formulation emphasises the weaker side of the argument of the first edition, and is largely due to the perverting influence of Kant's method of distinguishing between the *Analytic of Concepts* and the *Analytic of Judgments*. It reveals Kant's growing tendency to contrast the two divisions of the *Analytic*, as dealing, the one with ordinary experience, and the other with its scientific reorganisation.

The first proof in the first edition gives explicit expression to a presupposition underlying this entire section, namely, that all apprehension is necessarily successive, or in other words that it is impossible to apprehend a manifold save in succession. From this assumption it follows that if such succession is not only to occur but is to be apprehended as occurring, and if we are to be able to distinguish between the successive order of all our apprehensions and the order of coexisting independent existences, a permanent must be thought into the succession, that is to say, the successive experiences must be interpreted into an objective order in terms of the category of abiding substance and changing attributes. Kant neither here nor elsewhere makes any attempt to explain how this position is to be reconciled with his doctrine that space can be intuited as well as time; and there is equal difficulty in reconciling it with the doctrine developed in his second proof (in the second division of this same paragraph) that time itself does not change but only the appearances in it.

As above shown, there are two tendencies in Kant's treatment of time, each of which carries with it its own set of connected consequences. There is the view that consciousness of time *as a whole* preconditions consciousness of any part of it. This tends to recognition of simultaneity as a mode of time and of the simultaneous as apprehended in a single non-successive act of apprehension. On the other hand, there is the counter-view that consciousness of time is only possible through the successive combination of its parts. This leads to the assertion that simultaneity is not a mode of time, and that time itself cannot be apprehended save as the result of synthesis in accordance with unifying categories. Through the categories there arises consciousness of objectivity, and so for the first time consciousness of a distinction between the subjective which exists invariably and exclusively in succession, and the objective which may exist either as successive or as permanent, and in whose existence both elements

are, indeed, inseparably involved.

To turn now to Kant's second proof of the principle; it is as follows. All our perceptions are in time, and in time are represented as either coexistent or successive. Time itself cannot change, for only as in it can change be represented. Time, however, cannot by itself be apprehended. As such, it is the mere empty form of our perceptions. There must be found in the objects of perception some abiding substrate or substance which will represent the permanence of time in consciousness, and through relation to which coexistence and succession of events may be perceived. And since only in relation to this substrate can time relations be apprehended, it must be altogether unchangeable, and may therefore be called substance. And being unchangeable it can neither increase nor diminish in quantity. Kant, without further argument, at once identifies this substance with matter.

This proof may be restated in briefer fashion. The consciousness of events in time involves the dating of them in time. But that is only possible in so far as we have a representation of the time in which they are to be dated. Time, however, not being by itself experienced, must be represented in consciousness by an abiding substrate in which all change takes place, and since, as the substrate of *all* change, it will necessarily be unchangeable, it may be called substance.

The argument, in both proofs, is needlessly abstract, and as already remarked, the reason of this abstractness is that Kant here, as in the chapter on *Schematism*, unduly ignores space, limiting his analysis to inner sense. He defines the schema of substance as the permanence of the real in time, *i.e.* as the representation of the real which persists while all else changes. As the second edition of the *Critique* shows, Kant himself came to recognise the inadequacy of this definition, and therefore of the proof of the first *Analogy*. Consciousness is only possible through the representation of objects in *space*. Only in outer sense is a permanent given in contrast to which change may be perceived. The proof ought therefore to have proceeded in the following manner. Time can be conceived only as motion, and motion is perceivable only against a permanent background in space. Consciousness of time therefore involves consciousness of a permanent in space. He might have added that consciousness of relative time involves consciousness of change in relation to something relatively permanent, and that the scientific conception of all changes as taking place in a single absolute time involves the determining of change through relation to something absolutely permanent, this ultimate standard being found in the heavenly bodies. By the permanent is not meant the immovable, but only that which is uniform and unchanging in its motions. The uniform motions of the heavenly bodies constitute our ultimate standard of time. The degree of their uniformity is the measure of our approximation to an absolute standard. A marginal note upon this *Analogy* in Kant's private copy of the *Critique* reveals Kant's late awakened recognition of the necessity of this mode of restating the argument.

"Here the proof must be so developed as to apply only to substances as phenomena of outer sense, and must therefore be drawn from space, which with its determinations exists at all times. In space all change is motion...."

That the new argument of the second edition still proceeds on the same lines as the second argument of the first edition is probably due, as Erdmann remarks, to Kant's unwillingness to make the extensive alterations which would have been called for in the chapter on *Schematism* as well as in the statement of this *Analogy*.

A second serious objection to Kant's treatment of the first *Analogy* follows at once from the above. Kant identifies the permanent which represents time in consciousness with matter, and seeks to prove by means of this identification the principle of the conservation of matter. That principle is not really capable of transcendental proof. It is not a presupposition of possible experience, but merely a generalisation empirically grounded. Kant is here confounding a particular theory as to the manner in which the element of permanence, necessary to possible experience, is realised, with the much more general conclusion which alone can be established by transcendental methods. His argument also conflicts with his own

repeated assertion that the notion of change, in so far as it is distinct from that of temporal succession or of motion in space, is empirical, and consequently falls outside the scope of transcendental enquiry. By the conservation of matter we mean the constancy of the weight of matter throughout all changes. But the only permanent which can be postulated as necessary to render our actual consciousness of time possible, consists of spatial objects sufficiently constant to act as a standard by comparison with which motions may be measured against one another. And as this first *Analogy*, properly understood, thus deals solely with spatial changes of bodies, the principle of the conservation of matter has no real connection with it.

Then thirdly, and lastly, Kant takes this first *Analogy* as showing the indispensable function performed in experience by the category of substance and attribute. Substance, he argues, corresponds to the time in which events happen, and its attributes correspond to the changing events. Just as all events are only to be conceived as happening in time, so too all changes are only to be conceived as changes in an abiding substance. These, he would seem to hold, are simply two ways of making one and the same assertion. Now Kant may perhaps be right in insisting that all change is change in, and not of, time. Unity of consciousness would seem to demand consciousness of a single time in which all events happen. But this relation of time to its events does not justify the same assertion being made of substance. Substance may be what corresponds to time in general, and may represent it in consciousness, but we cannot for that reason say that changes are also only in and not of it. To regard the changes in this way as attributes inhering in substance directly contradicts the view developed in the second *Analogy*. For the notion of substance is there treated as an implication of the principle of causality. Substance, Kant there insists, is not a bare static existence in which changes take place, but a dynamic energy which from its very nature is in perpetual necessitated change. Change is not change in, but change of, substance.

Even in the passage in which Kant identifies the notion of the permanent in change with that of substance and attribute, he shows consciousness of this difficulty. We must not, he says, separate the substance from its accidents, treating it as a separate existence. The accidents are merely the special forms of its existence. But all the same, he adds, withdrawing the words which he has just uttered, such a separation of the changing accidents from the abiding substance is "*unavoidable, owing to the conditions of the logical employment of our understanding*." Kant is here so hard pressed to account for the use of the category of substance and attribute in experience, and to explain the contradictions to which it gives rise, that the only way he sees out of the difficulty is to refer the contradictions involved in the category to the constitution of our understanding in its *logical* employment. Yet as such employment of understanding is, according to his own showing, secondary to, and dependent upon, its "real" employment, the category of substance and attribute can hardly have originated in this way.

We must, then, conclude that Kant offers no sufficient deduction or explanation of the category of substance and attribute, and as he does so nowhere else, we are driven to the further conclusion that he is unable to account for its use in experience, or at least to reconcile it in any adequate fashion with the principle of causality.

B. Second Analogy. — *Everything that happens, i.e. begins to be, presupposes something on which it follows according to a rule*. Or as in the second edition: *All changes take place in conformity with the law of the connection of cause and effect*.

This section, as Kant very rightly felt, contains one of the most important and fundamental arguments of the entire *Critique*; and this would seem to be the reason why he has so multiplied the proofs which he gives of the *Analogy*. Within the limits of the section no less than five distinct proofs are to be found, and still another was added in the second edition. As Adickes argues, it is extremely unlikely that Kant should have written five very similar proofs in immediate succession. The probability is that they are of independent origin and were later combined to constitute this section; or, if we hold with Adickes that Kant first composed a "brief outline," we may conclude that he combined the one or more proofs, which that outline contained, with others of earlier or of later origin. The first to the fourth paragraphs of the first

edition contain a first proof; the fifth to the seventh a second proof (a repetition of the first proof but in indirect form); the eighth to the tenth a third proof (almost identical with the first); the eleventh to the thirteenth a fourth proof (different in character from all the others); the fourteenth a fifth proof (probably the latest in time of writing; an anticipation of the argument in the second edition). The paragraph added in the second edition (the second paragraph in the text of the second edition) gives a sixth and last proof.

We may first state the central argument, deferring treatment of such additional points as arise in connection with Kant's varying formulations of it in his successive proofs. The second *Analogy*, though crabbedly, diffusely, and even confusedly stated, is one of the finest and most far-reaching pieces of argument in the whole *Critique*. It is of special historical importance as being Kant's answer to Hume's denial of the validity of the causal principle. Hume had maintained that we can never be conscious of anything but mere succession. Kant in reply seeks to prove that consciousness of succession is only possible through consciousness of a necessity that determines the order of the successive events.

Kant, we must bear in mind, accepts much of Hume's criticism of the category of causality. The general principle that every event must have an antecedent cause is, Kant recognises, neither intuitively certain nor demonstrable by general reasoning from more ultimate truths. It is not to be accounted for by analytic thought, but like all synthetic judgments *a priori* can only be proved by reference to the contingent fact of actual experience. Secondly, Kant makes no attempt, either in this *Analogy* or elsewhere in the *Critique*, to explain the nature and possibility of causal connection, that is, to show how one event, the cause, is able to give rise to another and different event, the effect. We can never by analysis of an effect discover any reason why it must necessarily be preceded by a cause. Thirdly, the principle of causality, as deduced by Kant and shown to be necessarily involved in all consciousness of time, is the quite general principle that every event must have *some* cause in what immediately precedes it. What in each special case the cause may be, can only be empirically discovered; and that any selected event is really the cause can never be absolutely certain. The particular causal laws are discovered from experience, not by means of the general principle but only in accordance with it, and are therefore neither purely empirical nor wholly *a priori*. As even J. S. Mill teaches, the general principle is assumed in every inference to a causal law, and save by thus assuming the general principle the particular inference to causal connection cannot be proved. But at the same time, since the proof of causal connection depends upon satisfaction of those empirical tests which Mill formulates in his inductive methods, such special causal laws can be gathered only from experience.

The starting-point of Kant's analysis is our consciousness of an *objective* order in time. This is for Kant a legitimate starting-point since he has proved in the *Transcendental Deduction* that only through consciousness of the objective is consciousness of the subjective in any form possible. The independent argument by which it is here supported is merely a particular application of the general principle of that deduction. When we apprehend any very large object, such as a house, though we do so by successively perceiving the different parts of it, we never think of regarding these successive perceptions as representing anything successive in the house. On the other hand, when we apprehend successive events in time, such as the successive positions of a ship sailing down stream, we do regard the succession of our experiences as representing objective succession in what is apprehended. Kant therefore feels justified in taking as fact, that we have the power of distinguishing between subjective and objective succession, *i.e.* between sequences which are determined by the order of our attentive experience and sequences which are given as such. It is this fact which affords Kant a precise method of formulating the problem of the second *Analogy*, viz. *how consciousness of objective change, as distinguished from subjective succession, is possible*?

Schopenhauer, owing to the prominence in his system of the principle of sufficient reason, has commented upon this second *Analogy* in considerable detail; and we may here employ one of his chief criticisms to define more precisely the general intention of Kant's argument. The succession in our

experiences of the parts of a house and of the positions of a ship is, Schopenhauer maintains, in both cases of genuinely objective character. In both instances the changes are due to the position of two bodies relatively to one another. In the first example one of these bodies is the body of the observer, or rather one of his bodily organs, namely the eye, and the other is the house, in relation to the parts of which the position of the eye is successively altered. In the second example the ship changes its position relatively to the stream. The motion of the eye from roof to cellar is one event; its motion from cellar to roof is a second event; and both are events of the same nature as the sailing of the ship. Had we the same power of dragging the ship upstream that we have of moving the eye in a direction opposite to that of its first movement, the positions of the ship could be reversed in a manner exactly analogous to our reversal of the perceptions of the house.

This criticism is a typical illustration of Schopenhauer's entire failure to comprehend the central thesis of Kant's Critical idealism. The *Analytic*, so far as the main argument of its objective deduction is concerned, was to him a closed book; and as this second analogy is little else than a special application of the results of the deduction, he was equally at a loss in its interpretation. Kant was himself, of course, in large part responsible for the misunderstanding. The distinction which would seem to be implied by Kant's language between sequence that is objective and sequence that is *merely* subjective is completely inconsistent with Critical principles, and is as thoroughly misleading as that other distinction which he so frequently employs between the *a priori* and the merely empirical. Schopenhauer, however, regarded these distinctions as valid, and accordingly applies them in the interpretation of Kant's method of argument. If inner and outer experience are to be contrasted as two kinds of experience, there is, as Schopenhauer rightly insists, no sufficient ground for regarding changes due to movements of the eye as being subjective and those that are due to movements of a ship as being objective. That is not, however, Kant's intention in the employment of these illustrations. He uses them only to make clear the fairly obvious fact that while in certain cases the order of our perceptions is subjectively initiated, in other cases we apprehend the subjective order of our experiences as corresponding to, and explicable only through, the objective sequence of events. In holding to this distinction Kant is not concerned to deny that even in the order which is determined by the subject's purposes or caprice objective factors are likewise involved. The fact that the foundations of a house support its roof, and will therefore determine what it is that we shall apprehend when we turn the eye upwards, does not render the order of our apprehensions any the less subjective in character. But that this order is *purely* subjective, Kant could never have asserted. His Critical principles definitely commit him to the view that even sensations and desires are integral parts of the unitary system of natural law. Kant, as we shall find, is maintaining that some such distinction between subjective and objective sequence as is illustrated in the above contrasted instances must be present from the very start of our experience — must, indeed, be constitutive of experience as such. Out of a consciousness of the purely subjective the notion of the objective can never arise. Or otherwise stated, consciousness of a time order, even though subjective, must ultimately involve the application of some non-subjective standard.

"I shall be obliged ... to derive the subjective sequence of apprehension from the objective sequence of appearances, because otherwise the former is entirely undetermined, and does not distinguish any one appearance from any other."

We interpret the subjective order in terms of an objective system; consciousness of the latter is the necessary presupposition of all awareness. It is as necessary to the interpretation of what is apprehended through the rotating eyeballs as to the apprehension of a moving ship. So far from refusing to recognise that the subjective order of our experiences is objectively conditioned, Kant is prepared to advance to the further assertion that it is only apprehensible when so conceived.

In the third *Analogy* Kant proceeds to the connected problem, how we can apprehend the parts of a house as simultaneous notwithstanding the sequent relation of our perceptions of them, and what

justification we have for thus interpreting the subjectively sequent experiences as representing objective coexistence. Just as Kant in this second *Analogy* does not argue that irreversibility is by itself proof of causal relation, but only that the consciousness of such irreversibility demands the employment of the conception of causality, so in the third *Analogy* he does not attempt to reduce the consciousness of coexistence to the consciousness of reversibility, but to prove that only through the application of the conception of reciprocity can the reversibility be properly interpreted. In each case the category conditions the empirical consciousness; the latter is an apprehension of determinate order only in so far as it presupposes the category. Though Kant's treatment of the third *Analogy* has less historical importance, and perhaps less intrinsic interest, than the proof of the second *Analogy*, it is even more significant of the kind of position which he is endeavouring to establish, and I may therefore forewarn the reader that he must not spare himself the labour of mastering its difficult, and somewhat illusive, argument. The doctrines which it expounds at once reinforce and extend the results of the second *Analogy*, while the further difficulties which it brings to view, but which it is not itself capable of meeting, indicate that the problems of the *Analytic* call for reconsideration in the light of certain wider issues first broached in the *Dialectic*.

We may now return to Kant's main argument. His problem, as we have found, is how consciousness of objective change, as distinguished from subjective succession, is possible. The problem, being formulated in this particular way, demands, Kant felt, careful definition of what is meant by the term 'objective,' upon which so much depends. To apply the illustration above used, the house as apprehended is not a thing in itself but only an appearance to the mind. What, then, do we mean by the house, as distinguished from our subjective representations of it, when that house is nothing but a complex (*Inbegriff*) of representations? The question and Kant's answer to it are stated in subjectivist fashion, in terms of his earlier doctrine of the transcendental object. To contrast an object with the representations through which we apprehend it, is only possible if these representations stand under a rule which renders necessary their combination in some one particular way, and so distinguishes this one particular mode of representation as the only true mode from all others. The origin, therefore, of our distinction between the subjectively successive and the succession which is also objective must be due in the one case to the presence of a rule compelling us to combine the events in some particular successive order, and in the other to the absence of such a rule. Our apprehension of the house, for instance, may proceed in any order, from the roof downwards or *vice versa*, and as the order may always be reversed there is no compulsion upon the mind to regard the order of its apprehension as representing objective sequence. But since in our apprehension of an event B in time, the apprehension of B follows upon the apprehension of a previous event A, and we cannot reverse the order, the mind is compelled to view the order of succession, in terms of the category of causality, as necessitated, and therefore as objective. The order is a necessary order not in the sense that A must always precede B, that A is the cause of B, but that the order, if we are to apprehend it correctly, must in this particular case be conceived as necessary. The succession, that is, need not be conceived as a causal one, but in order to be conceived as objective succession it must be conceived as rendered necessary by connections that are causal.

Having, in this general fashion, shown the bearing of his previous analysis of objective experience upon the problem in hand, Kant proceeds to develop from it his proof of the special principle of causality. The schema of causality is necessary succession in time, and it is through this, its time aspect, that Kant approaches the principle. It has to do with the special case of *change*. To be conscious of change we must be conscious of an *event*, that is, of something as happening at a particular point in time. The change, in other words, requires to be dated, and as we are not conscious of time in general, it must be dated by reference to other events, and obviously in this case in relation to the preceding events, in contrast to which it is apprehended *as change*. But according to the results of our analysis of what constitutes objective experience, it can be fixed in its position in objective time only if it be conceived as related to

the preceding events according to a necessary law; and the law of necessary connection in time is the law of causality. In order, then, that something which has taken place may be apprehended as having occurred, that is, as being an objective change, it must be apprehended as necessarily following upon that which immediately precedes it in time, *i.e.* as causally necessary.

The principle of causality thus conditions consciousness of objective succession, and Hume, in asserting that we are conscious of the succession of *events*, therefore admits all that need be assumed in order to prove the principle. The reason why Hume failed to recognise this, is that he ignored the distinction between consciousness of the subjective order of our apprehensions and consciousness of the objective sequence of events. Yet that is a distinction upon which his own position rested. For he teaches that determination of causal laws, sufficiently certain to serve the purposes alike of practical life and of natural science, can be obtained through observation of those sequences which remain constant. Such is also the position of all empiricists. They hold that causal relation is discovered by comparison of *given* sequences. Kant's contention is that the apprehension of change as change, and therefore ultimately the apprehension even of an arbitrarily determined order of subjective succession, presupposes, and is only possible through, an application of the category of causality. The primary function of the understanding does not consist in the clarification of our representation of an event, but in making such representation possible at all. The primary field of exercise for the understanding lies not in the realm of reflective comparison, but in the more fundamental sphere of creative synthesis. In determining the nature of the given it predetermines the principles to which all reflection upon the given must conform. The discursive activities of scientific reflection are secondary to, and conditioned by, the transcendental processes which generate the experience of ordinary consciousness. Only an experience which conforms to the causal principle can serve as foundation either for the empirical judgments of sense experience, or for that ever-increasing body of scientific knowledge into which their content is progressively translated. The principle of causality is applicable to everything experienced, for the sufficient reason that experience is itself possible only in terms of it. This conclusion finds its most emphatic and adequate statement in the *Methodology*.

"...through concepts of understanding pure reason establishes secure principles, not however directly from concepts, but always only indirectly through relation of these concepts to something altogether contingent, namely, *possible experience*. For when such experience (*i.e.* something as object of possible experience) is presupposed, the principles are apodictically certain, though by themselves (directly) *a priori* they cannot even be recognised at all. Thus no one can acquire insight into the proposition that everything which happens has its cause, merely from the concepts involved. It is not, therefore, a dogma, although from another point of view, namely, from that of the sole field of its possible employment, *i.e.* experience, it can be proved with complete apodictic certainty. But though it needs proof, it should be entitled a *principle,* not a *theorem,* because *it has the peculiar character that it makes possible the very experience which is its own ground of proof, and in this experience must always itself be presupposed*."

Before making further comment upon Kant's central argument, it is advisable to consider the varying statements which Kant has given of it. We may take his successive proofs in the order in which they occur in the first edition.

First Proof. — The argument is developed in terms of Kant's early doctrine of the transcendental object. The only points specially characteristic of the statement here given of that doctrine consist (*a*) in the emphasis with which it is asserted that representations can be experienced only in succession to one another, and that they can never stand in the relation of coexistence, and (*b*) in the almost complete ignoring of the transcendental object as source or ground of the rule in terms of which the successive representations are organised. (*a*) This is a point common to the arguments of all three *Analogies*. In the first and third the problem is how, from representations merely successive, permanence and coexistence

can be determined. In the second *Analogy* the problem is how from representations invariably successive a distinction can be drawn between the subjectively determined order of our apprehensions and the objective sequence of events. Or in other words: how under such conditions we can recognise an order as given, and so as prescribing the order in which it must be apprehended. Or to state the same point in still another manner: how we can distinguish between an arbitrary or reversible order and an imposed or fixed order, and so come to apprehend the subjective order of our apprehensions as in certain cases controlled by, and explicable only through, the objective sequence of events.

(*b*) The reason why the transcendental object, as source of the determinate and prescribed order of the given events, falls into the background in this passage is that Kant is concerned only with the general principle or category by means of which the order is apprehended as necessary. That principle has a subjective origin even though the particular sequences of concrete events have by means of that concept to be conceived as inexorably determined by their noumenal conditions. The principle accounts for the *comprehension* of the order as objective, and that is the only point with which Kant is here immediately concerned. That the assertion of the subjective origin of the category is not inconsistent with recognition of the imposed order of the given has already been shown above. Kant's own illustration, in this section, of the ship sailing down stream shows that he was prepared to assume without question that they are compatible. His argument is, however, obscure, owing to his failure to distinguish between the two senses in which the term 'rule' may be employed. The term may signify either the universal and merely formal principle that every event must have a cause, or it may be used to denote the fixed order in which concrete events are presented to sense-perception. The latter order need not represent a series the members of which are causally connected *with one another*, but only one that is due to causal necessities. Thus the successive positions of a ship sailing down stream are not interrelated as cause and effect, and yet in order to be apprehended as objectively successive must be conceived as causally conditioned. The term 'rule' has very different meanings in the two cases. 'Rule' in the first sense is of subjective origin. It is *formal*, and can never be given. It is read into the given. 'Rule' in the second sense is given merely, and being due to noumenal conditions constitutes the *material* element in natural science, the empirical content of some particular causal law. Owing to Kant's failure explicitly to distinguish between these two very different connotations of the term, such a sentence as the following is ambiguous: "That in appearance which contains the condition of this necessary rule of apprehension is the object." Kant may mean that the prescribed order of the concrete events is due to the transcendental object; but in that case it is not given as *necessary*. Necessity, as he constantly insists, is the one thing that can never be given. The sentence is also misleading through its use of the term 'appearance.' That term has no legitimate place in a passage inspired by the doctrine of the transcendental object; there can be no such middle term between subjective representations and the thing in itself. As Kant himself states, appearance defined in terms of that doctrine is "nothing save a complex of representations."

There is a very essential difference in the view which Kant takes of the causal relation according as he is proceeding upon subjectivist or upon phenomenalist lines. From the one point of view appearances are representations merely, and accordingly are entirely devoid of causal efficacy. They are not causes and effects of one another. They have not the independence or self-persistence necessary for the exercise of dynamical energy or even for the reception of modifications. Being "states of the identical self," all causal relation, dynamically conceived, must lie solely in their noumenal conditions. Causality reduces to the thought of necessitated (not necessitating) sequence. It is, as Kant has suggested in A 181 = B 224, a mere 'analogy' in terms of which we apply the logical relation of ground and consequence to the interpretation of our subjective representations, and so view them as grounded not in one another but exclusively in the thing in itself. Causality in the strict sense, *i.e.* dynamical agency, can be looked for only in the noumenal sphere.

Caird, while adopting this explanation of the term 'analogy,' is, as might be expected from his Hegelian

standpoint, extremely indefinite and non-committal as to whether or not empirical objects can be genuine causes. Riehl, notwithstanding his professedly realistic interpretation of Kant, adopts the above subjectivist view of natural causation. So also do Benno Erdmann and Paulsen. The latter speaks with no uncertain voice.

"Causality in the phenomenal world signifies for Kant, as for Hume, nothing but regularity in the sequence of phenomena. Real causal efficiency cannot of course occur here, for phenomena are ideational products. As such they can no more produce an effect than concepts can."

The corresponding phenomenalist view of the causal relation receives no quite definite formulation either in this section or elsewhere in the *Critique*, but may be gathered from the general trend of Kant's phenomenalist teaching. It is somewhat as follows. The term 'analogy' is viewed as having a meaning very different from that above suggested. The causal relation is not a mere analogy from the logical relation of ground and consequence; it is the representation of genuinely dynamical activities in the objects apprehended. Those objects are not mere states of the self, subjective representations. They are part of an independent order which in the form known to us is a phenomenalist transcript of a deeper reality. If the causal relation is the analogy of anything distinguishable from itself, it is an analogon or interpretation of dynamical powers exercised by things in themselves, not of the merely logical relation between premisses and conclusion. The objects of representation may exercise powers which representations as such can never be conceived as possessing. Between the individual's subjective states and things in themselves stands the phenomenal world of the natural sciences. Its function, whether as directly experienced through sense-perception or as conceptually reconstructed through scientific hypothesis, is to stand as the representative in human consciousness of that noumenal realm in which all existence is ultimately rooted. The causal interactions of material bodies in space are as essentially constitutive of those bodies as are any of their quantitative properties. Causal relation, even in the phenomenal sphere, must not be identified with mere conformity to law. The true and complete purpose of the natural sciences is not to be found in the Berkeleian or sceptical ideal of simplification, but in the older and sounder conception of causal explanation. That, at least, is the view which Kant invariably defends whenever he has occasion to discuss the principles of physical science.

Second Proof. — The argument of the first proof is here developed in indirect fashion. In the *absence* of any rule prescribing necessary sequence, no distinction can be made between subjective and objective succession. The justification for such a rule lies therefore, not in an inductive inference from repeated experience, but in its necessity for the possibility of experience. It is an expression of the synthetic unity in which experience consists.

Third Proof. — This is for the most part merely a restatement of the first proof. It differs from it in making rather more explicit that the objective reference involved in the notion of the transcendental object is one that carries the mind beyond all representations to the thought of something which determines their order according to a rule. Otherwise the ambiguities of the terms employed are identical with those of the first proof. Its concluding paragraph, however, is a much clearer statement of the difficult argument of A 192-3 = B 238-9.

Fourth Proof. — This proof differs from all the others. It argues from the characteristics of pure time to the properties necessary to the empirical representation of the time-series. As time cannot be experienced in and by itself, all its essential characteristics must be capable of being represented in terms of appearance. "Only in appearances can we empirically recognise continuity in the connection of times." The primary function of the understanding is to make such recognition possible, and it does so by "transferring the time order to the appearances and their existence." It is a necessary law of time that we can only advance to the succeeding through the preceding. Each moment of time is the indispensable condition of the existence of that which follows it. We can pass to the year 1915 only by way of the preceding year 1914. And since, as just noted, time is not cognisable by itself but only as the form of our

perceptions, this law must be applicable to them. We can only be conscious of all times as successively conditioning one another in one single time, and that means in one single *objective* time, if we are conscious of all the phenomena perceived as conditioning one another in their order in time.

It is somewhat difficult to understand how Kant came to formulate the argument in this form. The explanation may perhaps be found in his preoccupation with the doctrine of a transcendental activity of the productive imagination and with the connected doctrine of a pure *a priori* manifold. For this proof would seem to rest upon the assumption that the characteristics of time are known purely *a priori* and therefore with complete certainty, independently of sense experience. The unusual and somewhat scholastic character of the proof also appears in Kant's substitution of the principle of sufficient reason for the principle of causality. But despite the artificial character of the standpoint, the argument serves to bring prominently forward Kant's central thesis, viz. that the principle of causality is presupposed in all consciousness of time, even of the subjectively successive. Also, by emphasising that time in and by itself can never be "an object of perception," and that the relating of appearances to "absolute time" is possible only through the determining of them in their relations to one another, it supplies the data for correction of its own starting-point.

Fifth Proof. — This proof is probably later than the preceding proofs. Though its essential content coincides with that of the opening proof, its formulation would seem to be a first attempt at statement of the sixth proof, *i.e.* of the argument which Kant added in the second edition. Adickes considers this proof to be earlier in date than the first four proofs, but the reason which he assigns for so regarding it, viz. that Kant here postulates a synthesis of the imagination independent of the categories as preceding a synthesis of apprehension in terms of the categories, seems to be based upon a much too literal reading of Kant's loose mode of statement. The argument rather appears to be, as in the sixth proof, that synthesis of the imagination may be either subjective or objective; and the term "apprehension" would seem to be used as signifying that the manifold synthesised is *given* to the imagination through actual sense experience, and that as thus given it has a determinate order of its own. The argument concludes with the statement (more definite than any to be found in the preceding arguments), that the proof of the principle of causality consists in its indispensableness as a condition of all empirical judgments, and so of experience as such. As a ground of the possibility of experience it must be valid of all the objects of experience.

Sixth Proof. — The argument of the fifth proof is here more clearly stated. All synthesis is due to "the faculty of imagination which determines inner sense in respect of the time relation." Such synthesis may, however, yield the consciousness either of subjective succession or of succession "in the object." In the latter form it presupposes the employment of a pure concept of the understanding, that of the relation of cause and effect. And the conclusion reached is again that only so is empirical knowledge possible. This mode of stating the argument is far from satisfactory. It tends to obscure Kant's central thesis, that only through consciousness of an objective order is consciousness of subjective sequence possible, and that the principle of causality is therefore a conditioning factor of all consciousness. The misleading distinction drawn in the *Prolegomena* between judgments of perception and judgments of experience also crops out in Kant's use of the phrase "mere perception."

We may again return to Kant's central argument. For we have still to consider certain objections to which it may seem to lie open, and also to comment upon Kant's further explanations in the remaining paragraphs of the section. Kant's imperfect statement of his position has suggested to Hutchison Stirling and others a problem which is largely artificial, namely, how the mind is enabled to recognise the proper occasions upon which to apply the category of causality. On the one hand sequence as such cannot be the criterion, since many sequences are not causal, and on the other hand the absence of sequence does not appear to debar its application, since cause and effect would frequently seem to be co-existent. This difficulty arises from failure to appreciate the central thesis upon which Kant's proof of the principle of

causality ultimately rests. Kant's diffuse and varying mode of statement may conceal but never conflicts with that thesis, which consists in the contention that the category of causality is a necessary and invariable factor in all consciousness. Nothing can be apprehended save in terms of it. It prescribes an interpretation which the mind has no option save to apply in the consciousness of each and every event, of the coexistent no less than of the sequent. Whether two changes are coexistent or are successive, each must be conceived as possessing an antecedent cause. The only difference is that in the case of sequent events one of them (*i.e.* the antecedent change) may, upon empirical investigation, be found to be itself the cause of the second and subsequent event, whereas with coexistent events this can never be possible. As the principle of causality is that every event must have an antecedent cause, it follows that where there is no sequence there can be no causation. But when Kant states that sequence is "the sole empirical criterion" of the causal relation, he does less than justice to the position he is defending. The empirical criteria are manifold in number, and are such as John Stuart Mill has attempted to formulate in his inductive methods.

Schopenhauer has objected that Kant's argument proves too much, since it would involve that all objective sequences, such as that of night and day or of the notes in a piece of music, are themselves causal sequences. This criticism has been replied to by Stadler in the following terms:

"When Schopenhauer adduces the sequence of musical notes or of day and night, as objective sequences which can be known without the causal law, we need only meet him with the question, Where in these cases is the substance that changes? So soon as he is forced to put his objection into the form required to bring it into relation to the question of the possibility of knowledge, his error becomes obvious. His instances must then be expressed thus: — The instrument passes from one state of sound into another; the earth changes from the measure of enlightenment which makes day, to that which makes night. Of such changes no one will say that they are not referred to a cause. And we may quote in this reference the appropriate saying of Kant himself, 'Days are, as it were, the children of Time, since the following day with that which it contains is the product of the previous day.'"

Night and day, in so far as they are sequent events, must be conceived in terms of causality, not in the sense that night causes day, but as being determined by causes that account not only for each separately, but also for the alternating sequence of the one upon the other. Such causes are found by the astronomer to lie in the changing positions of the earth relatively to the sun.

Schopenhauer adds a further objection of a more subtle nature, which has again been excellently stated and answered by Stadler:

"Schopenhauer points out that what we call chance is just a sequence of events which do not stand in causal connexion. 'I come out of the house and a tile falls from the roof which strikes me; in such a case there is no causal connexion between the falling of the tile and my coming out of the house, yet the succession of these two events is objectively determined in my apprehension of them.' How have we to criticise this case from the transcendental point of view? We know that successions become necessary, *i.e.* objective, for our consciousness, when we regard them as changes of a substance which are determined by a cause. But it is shown here that there are successions in which the single members are changes of different substances. If substance S changes its state A into B on account of the cause X, and substance S´ changes its state A´ into B´ on account of the cause X´, and if I call the first change V and the second V´, the question arises how the objectivity of the succession V V´ is related to the law of causality. Sequences such as V V´ are very frequent, and our consciousness of the objectivity is certain. Do we owe this consciousness to the same rule as holds good in other cases? Certainly. The distinction is not qualitative, but rests only on the greater complication of the change in question. The sequence V V´ can become objective only if I think it as a necessary connexion. It must be so determined that V can only follow V´ in 'consciousness in general'; there must be a U, the introduction of which is the cause that V´ follows V. To be convinced of this, I do not need actually to know U. I know that on every occasion U

causes the succession V V´. Of course, this presupposes that all data of the states considered, A and A´, remain identical. But whether these data are very simple or endlessly complex, whether they are likely to combine to the given result frequently or seldom, is indifferent for the objectifying of the event; it is not the perception of U, but the presupposition of it, which makes the change necessary and so objective for us."

To turn now to the other difficulty which Kant himself raises in A 202-3 = B 247-8, viz. that cause and effect would frequently seem to be coexistent, and the "sole empirical criterion" to be therefore absent. It may from this point of view be maintained that the great majority of causes occur simultaneously with their effects, and that such time sequence as occurs is due solely to the fact that the cause cannot execute itself in one single instant. Kant has little difficulty in disposing of this objection. Causality concerns only the *order*, not the *lapse*, of time; and the sequence relation must remain even though there is no interval between the two events. If a leaden ball lies upon a cushion it makes a depression in it. The ball and the depression are coexistent. None the less, when viewed in their dynamical relation, the latter must be regarded as sequent upon the former. If the leaden ball is placed upon a smooth cushion a hollow is at once made, but if a hollow exists in a cushion a ball need not appear. In other words, the criteria for the determination of specific causal relations are neither the presence nor the absence of sequence, but are empirical considerations verifiable only upon special investigation. The observer is called upon to disentangle the complicated web of given appearances under the guidance of the quite general and formal principle that every event is due to some antecedent cause. He must do so as best he can through the application of his acquired insight, and, when necessary, by means of the requisite experimental variation of conditions.

In the two following paragraphs (A 204-5 = B 249-51) Kant raises points which he later discussed more fully in the *Metaphysical First Principles of Natural Science*. As adequate explanation of the argument would be a very lengthy matter, and not of any very real importance for the understanding of the general Critical position, we may omit all treatment of it. In the sections of the *Metaphysical First Principles* just cited, the reader will find the necessary comment and explanation. Such bearing as these two paragraphs have upon Kant's view of the nature of the causal relation has been noted above.

In the section on *Anticipations of Perception* Kant has stated that the principle of the continuity of change involves empirical factors, and therefore falls outside the limits of transcendental philosophy. To this more correct attitude Kant, unfortunately, did not hold. In A 207-11 = B 252-6 he professes to establish the principle in *a priori* transcendental fashion as a necessary consequence of the nature of time. This proof is indeed thrice repeated with unessential variations, thereby clearly showing that these paragraphs also are of composite origin. The argument in all three cases consists in inferring from the continuity of time the continuity of all changes in time. As the parts of time are themselves times, of which no one is the smallest, so in all generation in time, the cause must in its action pass through all the degrees of quantity from zero to that of the final effect.

"Every change has a cause which evinces its causality in the whole time in which the change takes place. This cause, therefore, does not engender the change suddenly (at once or in one moment), but in a time, so that, as the time increases from its initial moment *a* to its completion in *b*, the quantity of the reality (*b*-*a*) is in like manner generated through all lesser degrees which are contained between the first and the last."

This argument is inconclusive. As Kant himself recognises in regard to space, we may not without special proof assume that what is true of time must be true of the contents of time. If time, change, and causation can be equated, what is true of one will be true of all three. But the assumption upon which the argument thus rests has not itself been substantiated.

In the third proof the argument is stated in extreme subjectivist terms which involve the further assumption that what is true of apprehension is *ipso facto* true of everything apprehended. The possibility

of establishing the law of dynamical continuity follows, Kant declares, as a consequence of its being a law of our subjective apprehension.

"We anticipate only our own apprehension, the formal condition of which, inasmuch as it inheres in the mind prior to all given appearances, must certainly be capable of being known *a priori*."

Kant's attitude towards the physical principle of continuity underwent considerable change. In his *New Doctrine of Motion and Rest* (1758) he maintains that it cannot be proved, and that physicists may rightly refuse to recognise it even as an hypothesis. It is in the Essay on *Negative Quantity* (1763) that Kant first adopts the attitude of the *Critique*, and rejects the "speculative" objections raised against the mathematical conception of the infinitely small. In the *Metaphysical First Principles of Natural Science* the principle of continuity is defended and developed, but only in its application to material existence, not in its relation to the causal process.

C. Third Analogy. — *All substances, in so far as they are coexistent, stand in thoroughgoing communion, i.e. in reciprocity with one another.* Or, as in the second edition: *All substances, so far as they can be perceived to coexist in space, are in thoroughgoing reciprocity.*

This section contains four separate proofs. The first three paragraphs in the text of the first edition contain the first proof. The fourth paragraph supplies a second proof, and the fifth paragraph a third. In the second edition Kant adds a fourth proof (the first paragraph of the text of the second edition).

We may lead up to these proofs by first formulating (*a*) the fundamental assumption upon which they proceed, and (*b*) the thesis which they profess to establish. (*a*) The argument involves the same initial assumption as the preceding *Analogies*, viz. that representations exist exclusively in succession, or stated in phenomenalist terms, that the objectively coexistent can be apprehended only in and through representations that are sequent to one another in time. Upon this assumption the problem of the third *Analogy* is to explain how from representations all of which are in succession we can determine the objectively coexistent. (*b*) In the *Dissertation* Kant had maintained that though the possibility of dynamical communion of substances is not necessarily involved in their mere existence, such interaction may be assumed as a consequence of their common origin in, and dependence upon, a Divine Being. In the *Critique* no such metaphysical speculations are any longer in order, and Kant recognises that as regards things in themselves it is not possible to decide whether dynamical interaction is, or is not, necessarily involved in coexistence. The problem of this third *Analogy* concerns only appearances, which as such must be subject to the conditions of unitary experience; and one such condition is that they be apprehended as belonging to a single objective order of nature, and therefore as standing in reciprocal relations of interaction. *The apprehension of substances as reciprocally determining one another is,* Kant contends, *an indispensable condition of their being known even as coexistent*. Such is Kant's thesis. The proof may first be stated in what may be called its typical or generic form. Kant's four successive proofs can then be related to it as to a common standard.

Two things, A and B, can be apprehended as coexistent only in so far as we can experience them in either order, *i.e.* when the order of our perceptions of them is reversible. If they existed in succession, this could never be possible. The earlier member of a time series is past when the succeeding member is present, and what belongs to the past can never be an object of perception. The fact that the order in which things can be perceived is reversible would thus seem to prove that they do not exist successively to one another in time. That, however, is not the case. By itself such experience does not really suffice to yield consciousness of coexistence. It can yield only consciousness of an alternating succession. A further factor, namely, interpretation of the reversibility of our perceptions as due to their being conditioned by objects which stand in the relation of reciprocal determination, must first be postulated. If these objects mutually determine one another to be what they are, no one of them can be antecedent to or subsequent upon the others; and by their mutual reference each will date the others as simultaneous with itself. In other words, the perception of the coexistence of objects involves the conception of them as mutually

determining one another. The principle of communion or reciprocity conditions the experience of coexistence, and is therefore valid for objects apprehended in that manner.

Kant also maintains, more by implication than by explicit statement, that as A and B need not stand in any direct relation, the apprehension of them as coexistent involves the conception of an all-embracing order of nature within which they fall and which determines them to be what they are. If any one of them, even the most minute and insignificant, were conceived as altered, corresponding simultaneous variations would have to be postulated for all the others. The unity of the phenomenal world is the counterpart of the unity of apperception. Unity of experience involves principles which prescribe a corresponding unity in the natural realm. Dynamical *communion* is the sufficient and necessary fulfilment of this demand. It carries to completion the unity demanded by the preceding *Analogies* of *substance* and *causality*. Kant sums up his position in a note to A 218 = B 265.

"The unity of the world-whole, in which all appearances have to be connected, is evidently a mere consequence of the tacitly assumed principle of the communion of all substances which are coexistent. For if they were isolated, they would not as parts constitute a whole. And if their coexistence alone did not necessitate their connection (the reciprocal action of the manifold) we could not argue from the former, which is a merely ideal relation, to the latter, which is a real relation. We have, however, in the proper context, shown that communion is really the ground of the possibility of an empirical knowledge of coexistence, and that therefore the actual inference is merely from this empirical knowledge to communion as its condition."

To turn now to Kant's successive proofs. The first calls for no special comment. It coincides with the above. The second proof is an incompletely stated argument, which differs from the first only in its more concrete statement of the main thesis and in its limitation of the argument to spatial existences. Dynamical community is the indispensable condition of our apprehension of any merely spatial side-by-sideness. Kant now adds that it is the dynamical continuity of the *spatial* world which enables us to apprehend the coexistence of its constituents. The important bearing of this argument we shall consider in its connection with the proof which Kant added in the second edition.

The third proof is probably the earliest in date of writing. It draws a misleading distinction between subjective and objective coexistence, and seems to argue that only the latter form of coexistence need presuppose the employment of the category of reciprocity. That runs directly counter to the central thesis of the other proofs, that only in terms of dynamical relation is coexistence at all apprehensible. That the above distinction indicates an early date of writing would seem to be confirmed by the obscure phrase "community of apperception" which is reminiscent of the prominence given to apperception in Kant's earlier views, and by the concluding sentence in which Kant employs terms — inherence, consequence, and composition — that are also characteristic of the earlier stages of his Critical enquiries.

It is significant that in the new argument of the second edition the space factor, emphasised in the second proof of the first edition, is again made prominent. The principle is, indeed, reformulated in such manner as to suggest its limitation to spatial existences. "All substances, so far as they can be perceived to coexist *in space*, are in thoroughgoing reciprocity." Now it is decidedly doubtful whether Kant means to limit the category of reciprocity to spatial existences. As we have already noted, he would seem to hold that though the category of causality can *acquire* meaning only in its application to events in space, it may in its subsequent employment be extended to the states of inner sense. The latter are effects dynamically caused, and among their causal conditions are mechanical processes in space. The extension of the category of reciprocity to include sensations and desires undoubtedly gives rise to much greater difficulties than those involved in the universal application of the causal principle. On the other hand, its limitation to material bodies must render the co-ordination of mental states and mechanical processes highly doubtful, and would carry with it all the difficulties of an epiphenomenal view of psychical existences. The truth probably is that in this matter Kant had not thought out his position in any quite

definite manner; and that owing to the influence, on the one hand of the dualistic teaching of the traditional Cartesian physics, and on the other of his increasing appreciation of the part which space must play in the definition and proof of the principles of understanding, he limited the category of reciprocity to spatial existences, without considering how far such procedure is capable of being reconciled with his determinist view of the empirical self. His procedure is also open to a second objection, namely, that while thus reformulating the principle, he fails to remodel his proof in a sufficiently thoroughgoing fashion. The chief stress is still laid upon the temporal element; and in order to obtain a proof of the principle that will harmonise with the prominence given to the space-factor, we are thrown back upon such supplementary suggestions as we can extract from the second argument of the first edition. It is there stated that "without dynamical communion even spatial community (*communio spatii*) could never be known empirically." That is an assertion which, if true, will yield a proof of the principle of reciprocity analogous to that which has been given of the principle of causality; for it will show that just as the conception of causality is involved in, and makes possible, the awareness of time, so the conception of reciprocity is involved in, and makes possible, the awareness of space.

The proof will be as follows. The parts of space have to be conceived as spatially interrelated. Space is not a collection of independent spaces; particular spaces exist only in and through the spaces which enclose them. In other words, the parts of space mutually condition one another. Each part exists only in and through its relations, direct or indirect, to all the others; the awareness of their coexistence involves the awareness of this reciprocal determination. But space cannot, any more than time, be known in and by itself; and what is true of space must therefore hold of the contents, in terms of the interrelations of which space can alone be experienced. How, then, can the reciprocal determination of substances in space be apprehended by a consciousness which is subject in all its experiences to the conditions of time? As Kant has pointed out in A 211 = B 258, objective coexistence is distinguished from objective sequence by reversibility of the perceptions through which it is apprehended. When A and B coexist, our perceptions can begin with A and pass to B, or start from B and proceed to A. There is also, as Kant observes in the second proof, a further condition, namely, that the transition is in each case made through a *continuous* series of changing perceptions.

"Only the continuous influences in all parts of space can lead our senses from one object to another. The light, which plays between our eye and the celestial bodies, produces a mediate communion between us and them, and thereby establishes the coexistence of the latter. We cannot empirically change our position (perceive such a change), unless matter in all parts of space makes the perception of our position possible to us. Only by means of its reciprocal influence can matter establish the simultaneous existence of its parts, and thereby, though only mediately, their coexistence with even the most remote objects. Without communion, every perception of an appearance in space is broken off from every other, and the chain of empirical representations, *i.e.* experience, would have to begin entirely anew with every new object, without the least connection with preceding representations, and without standing to them in any relation of time."

But even such reversibility of *continuous* series does not by itself establish coexistence. For in the imagination we can represent such series, without thereby acquiring the right to assert that they exist not as series but as simultaneous wholes. And as Kant might also have pointed out, even in sense-perception we can experience reversible continuous series that do not in any way justify the inference to coexistence. We may, for instance, produce on a musical instrument a series of continuously changing sounds, and then in immediate succession produce the same series in reverse order. An additional factor is therefore required, namely, the interpretation of the reversibility of our perceptions as being grounded in objects which, because spatially extended, and spatially continuous with one another, can yield continuous series of perceptions, and which, because of their thoroughgoing reciprocity, make possible the reversing of these series. To summarise the argument in a sentence: as the objectively coexistent, if it is to be known at

all, can only be known through sequent representations, the condition of its apprehension is the possibility of interpreting reversible continuous series as due to the reciprocal interaction of spatially ordered substances.

This argument has a twofold bearing. Its most obvious consequence is that all things apprehended as coexistent must be conceived as standing in relations of reciprocal interaction; but by implication this involves the further consequence that the conceptual principle of reciprocity is an integral factor in all apprehension of space. Space, though intuitive in character, has a meaning that demands this concept for its articulation. Just as consciousness of temporal sequence is only possible in terms of causation, so consciousness of spatial coexistence is only possible through application of the category of reciprocity. And since, on Kant's view, awareness of space conditions awareness of time, these conclusions carry the Critical analysis of our consciousness of time a stage further. In confirmation of the more general argument of the objective deduction, reciprocity is added to the already large sum-total of the indispensable conditions of our time-consciousness; while in regard to time itself it is shown that, owing to its space-reference, coexistence may be counted among its possible modes.

I have made occasional reference to the positions adopted by Stout in his *Manual of Psychology*, and may here indicate their relation to the present argument. Stout cites four "categories" or ultimate principles of unity which "belong even to rudimentary perceptual consciousness as a condition of its further development," namely, spatial unity, temporal unity, causal unity, and the unity of different attributes as belonging to the same thing. The criticism which, from the standpoint of the *Analogies*, has to be passed upon this list, is that it ignores the category of reciprocity, *i.e.* of systematic interconnection, and that it fails to recognise the close relation in which the various principles stand to one another. The temporal unity must not be isolated from causal unity, nor either of them from the spatial unity, with which the category of reciprocity is inseparably bound up. Further, Kant maintains that these principles are demanded, not merely for the *development* of perceptual consciousness, but for its very existence.

But Kant's argument suggests many difficulties which we have not yet considered, and we may again employ Schopenhauer's criticisms to define the issues involved.

"The conception of reciprocity ought to be banished from metaphysics. For I now intend, quite seriously, to prove that there is no reciprocity in the strict sense, and this conception, which people are so fond of using, just on account of the indefiniteness of the thought, is seen, if more closely considered, to be empty, false, and invalid.... It implies that both the states A and B are cause and that both are effect of each other; but this really amounts to saying that each of the two is the earlier and also the later; thus it is an absurdity."

This criticism proceeds on the assumption that the category of reciprocity reduces to a dual application of the category of causality. If that were the case, there would, of course, be no separate category of reciprocity, and further it would, as Schopenhauer maintains, be impossible to regard A and B as being at one and the same time both cause and effect of one another. Causality determines the order of the states of substances in the time series; reciprocity must be distinct from causality if it is to be capable of defining the order of their coexistent states in space. A deduction from the dual application of the conception of causality has, therefore, no bearing upon the question of the possibility of this further category. Kant has laid himself open to this criticism by a passage which occurs in the first proof, and which shows that he was not quite clear in his own mind as to how reciprocity ought to be conceived.

"That alone can determine the position of anything else in time, which is its cause or the cause of its determinations. Every substance (inasmuch as only in its determinations can it be an effect) must therefore contain in itself the causality of certain determinations in the other substance, and at the same time the effects of the causality of that other, *i.e.* they must stand in dynamical communion (immediately or mediately), if their coexistence is to be known in any possible experience."

It should be noted that in the new proof in the second edition Kant is careful to employ the terms ground

and influence in place of the terms cause and causality.

Secondly, Schopenhauer argues that if the two states necessarily belong to each other and exist at one and the same time, they will not be simultaneous, but will constitute only *one* state. Schopenhauer is again refusing to recognise the conditions under which alone a special category of reciprocity is called for. We can speak of simultaneity only if a *multiplicity* be given; and if it be given, its nature as *simultaneous plurality* cannot be comprehended through a causal law, which, as such, applies only to sequent order.

Lastly, Schopenhauer endeavours to confirm his position by examination of the supposed instances of reciprocity.

"[In the continuous burning of a fire] the combination of oxygen with the combustible body is the cause of heat, and heat, again, is the cause of the renewed occurrence of the chemical combination. But this is nothing more than a chain of causes and effects, the links of which have alternately *the same name*.... We see before us only an application of the single and simple law of causality which gives the rule to the sequence of states, but never anything which must be comprehended by means of a new and special function of the understanding."

Schopenhauer is again misled by his equating of reciprocity with causal action. Combustion is quite obviously a case of sequent processes. Instead of proving that coexistence does not involve reciprocity, Schopenhauer is only showing that cause and effect may sometimes, as Kant himself observes, seem to be simultaneous. Action *followed* by reaction is not equivalent to what Kant means by reciprocal determination. Schopenhauer also cites the instance of a pair of scales brought to rest by equal weights.

"Here there is no effect produced, for there is no change; it is a state of rest; gravity acts, equally divided, as in every body which is supported at its centre of gravity, but it cannot show its force by any effect."

This example is more in line with what Kant would seem to have in view, but is still defined in reference to the problem of causation, and not in reference to that of coexistence. Kant is not enquiring whether coexistent bodies are related as causes and effects, though, as we have already observed, his language betrays considerable lack of clearness on this very point. He is endeavouring to define the conditions under which we are enabled to recognise that bodies, external to one another in space and apprehensible only through sequent perceptions, are none the less coexistent. And the answer which he gives is that coexistence can only be determined by reference of each existence to the totality of systematic relations within which it is found, its particular spatial location being one of the factors which condition this reference. Causal explanation in the most usual meaning of that highly ambiguous phrase, namely, as explanation of an artificially isolated event by reference to antecedents similarly isolated from their context, may partially account for this event being of one kind rather than another, but will not explain why it is to be found at this particular time in this particular place. That is to say, it will not answer the question which is asked when we are enquiring as to what events are coexistent with it.

But the considerations which thus enable us to dispose of Schopenhauer's criticisms have the effect of involving us in new, and much more formidable, difficulties. Indeed they disclose the incomplete, and quite inadequate, character of Kant's proof of the third *Analogy*. For must not spatial co-existence be independently known if it is to serve as one of the factors determinant of reciprocity? Can the apprehension of extended bodies wait upon a prior knowledge of the system of nature to which they belong?

The mere propounding of these questions does not, however, suffice to overthrow Kant's contention. For he is prepared — that is indeed the reason why the *Critique* came to be written — to answer them in a manner that had never before been suggested, save perhaps in the philosophies of Plato and Aristotle. This answer first emerges in the *Dialectic*, in the course of its treatment of the wider problem, of which the above difficulties are only special instances, how if conditioned parts can only be known in terms of an unconditioned whole, any knowledge whatsoever can be acquired by us. But though Kant in the

Dialectic gives due prominence to this fundamental problem, the hard and fast divisions of his architectonic — and doubtless other influences which would be difficult to define — intervene to prevent him from recognising its full implications. For the problem is viewed in the *Dialectic* as involving considerations altogether different from those dwelt upon in the *Analogies*, and as being without application to the matters of which they treat.

The situation thus created is very similar to that which is occasioned by Kant's unfortunate separation of the problems of space and time in the *Aesthetic* from the treatment of the categories in the *Analytic*. In the *Aesthetic* space and time are asserted to be intuitive, not conceptual, in nature; and yet in the *Analytic* we find Kant demonstrating that the principles of causality and reciprocity are indispensably involved in their apprehension. But even more misleading is the separation of the problems of the *Aesthetic* and *Analytic* from those of the *Dialectic*. Kant's primary and prevailing interest is in the metaphysics, not in the mere methodology, of experience; and it is in the *Dialectic* that the metaphysical principles which underlie and inspire all his other tenets first find adequate statement. Since the third *Analogy* defines the criterion of coexistence in entire independence of all reference to the Ideas of Reason, Kant is thereby precluded from even so much as indicating the true grounds upon which his position, if it is to be really tenable, must be made to rest. For as he ultimately came to recognise, the intuition of space not only involves the conceptual category of reciprocal determination, but likewise demands for its possibility an Idea of Reason. In space the wider whole is always prior in thought to the parts which go to constitute it. But though Kant states that this characteristic of space justifies its being entitled an Idea of Reason, he nowhere takes notice of the obvious and very important bearing which this must have upon the problem, how we are to formulate the criterion of coexistence.

The general character of time is analogous to that of space, and our formulation of the criterion of causal sequence is therefore similarly affected. The system of nature is not the outcome of natural laws which are independently valid; natural laws are the expression of what this system prescribes; they are the modes in which it defines and embodies its inherent necessities.

The situation which these considerations would seem to disclose may, therefore, be stated as follows. If the empirical criteria of truth are independent of the Ideas of Reason, the *Analytic* may be adequate to their discussion, but will be unable to justify the assertion that there is a category of reciprocal or systematic connection distinct from that of causality. If, however, it should be found that these criteria are merely special applications of standards *metaphysical in character* — and that would seem to be Kant's final conclusion, — only in the light of the wider considerations first broached in the *Dialectic*, can we hope to define their nature and implications with any approach to completeness.

4. THE POSTULATES OF EMPIRICAL THOUGHT IN GENERAL

First Postulate. — *That which agrees, in intuition and in concepts, with the formal conditions of experience is possible.*

Second Postulate. — *That which is connected with the material conditions of experience (that is, with sensation) is actual.*

Third Postulate. — *That which is determined, in its connection with the actual, according to universal conditions of experience is (that is, exists as) necessary.*

In this section Kant maintains that when the Critical standpoint is accepted, possibility, actuality and necessity can only be defined in terms of the conditions which render sense-experience possible. In other words, the Critical position, that all truth, even that of *a priori* principles, is merely *de facto*, involves acceptance of the view that the actual reduces to the experienced, and that only by reference to the actual as thus given can possibility and necessity be defined. The Leibnizian view that possibility is capable of being defined independently of the actual, and antecedently to all knowledge of it, must be rejected.

An analysis of the text can be profitably made only after a detailed examination of Kant's general argument; and to that task we may at once apply ourselves. The section affords further illustration of the perverting influence of Kant's architectonic, as well as of the insidious manner in which the older rationalism continued to pervert his thinking in his less watchful moments.

First Postulate. — In the opening paragraphs Kant uses (as it would seem without consciousness of so doing) the term possibility in two very different senses. When the possible is distinguished from the actual and the necessary, it acquires the meaning defined in this first *Postulate*; it is "that which agrees with the *formal* conditions of experience." But it is also employed in a much narrower sense to signify that which can have "objective reality, *i.e.* transcendental truth." The possibility of the objectively real rests upon fulfilment of a threefold condition: (1) that it agree with the formal conditions of experience; (2) that it stand in connection with the material of the sensuous conditions of experience; and (3) that it follow with necessity upon some preceding state in accordance with the principle of causality, and so form part of a necessitated order of nature. In other words, it must be causally necessitated in order to be empirically actual; and only the empirically actual is genuinely possible. Such is also the meaning that usually attaches to the term possible in the other sections of the *Critique*. A 'possible experience' is one that can become actual when the specific conditions, all of which must themselves be possible, are fulfilled. An experience which is not capable of being actual has no right to be described even as possible. As a term applicable to the objectively real, the possible is not wider than the actual, but coextensive with it. As Kant himself remarks, those terms refer exclusively to differences in the subjective attitude of the apprehending mind.

This ambiguity in the term 'possibility' has caused a corresponding ambiguity in Kant's employment of the term 'actuality.' It leads him to endeavour to define the actual, not in its connection with the conditions of possibility, but in distinction from them. The possible having been defined (in the first *Postulate*) solely in terms of the *formal* factors of experience, he proceeds to characterise the actual in a similarly one-sided fashion, exclusively in terms of the *material* element of given sensation. Doubtless the element of sensation must play a prominent part in enabling us to decide what is or is not actually existent, but no definition which omits to take account of relational factors can be an adequate expression of Critical teaching. Indeed, we only require to substitute the words 'sensuously given' for 'actual' in Kant's definition of the third *Postulate* (*i.e.* of the necessary) in order to obtain a correct statement of the true Critical view of actual existence: it is "that which is determined in its connection with the sensuously given according to universal conditions of experience." For Kant the actual and the necessary, objectively viewed, coincide. Necessity is for the human mind always merely *de facto*; and nothing can be objectively actual that is not causally determined. As the empirically possible cannot, in its objective reference, be wider than the empirically necessary, one and the same definition adequately covers all three terms alike. While the distinctions between them will, of course, remain, they will be applicable, not to objects, but only to the subjective conditions of experience in so far as these may vary from one individual to another. Experiences capable of being actual for one individual may be merely possible for another. And what is merely actual to one observer may by others be comprehended in its necessitating connections. The terms will not denote differences in the real, but only variations in the cognitive attitude of the individual.

Thus in professing to show that the three *Postulates* are transcendental *principles*, Kant does less than justice to his own teaching. For though both here and in the opening sections of the chapter he speaks of them in this manner, *i.e.* as being conditions alike of ordinary and of scientific experience, he has himself admitted in so many words the inappropriateness of such a description.

"The principles of modality are nothing more than explanations [not, it may be noted, proofs] of the concepts of possibility, actuality and necessity, in their empirical use, and are therefore at the same time restrictions of all the categories to this merely empirical use, ruling out and forbidding their

transcendental [= transcendent] employment.”

That is to say, these so-called principles are not really principles; they merely embody explanatory statements designed to render the preceding results more definite, and especially to guard against the illegitimate meanings which the Leibnizian metaphysics had attached to certain of the terms involved.

These considerations bring us to the real source of Kant’s perverse argumentation, namely, the artificial (but none the less imperious) demands of his architectonic. He is constrained to provide a set of *principles* corresponding to the categories of modality. The definitions of the modal categories have therefore to be called by that inappropriate name. But that is not the end of the matter. In order to meet the needs of his logical framework, Kant proceeds even further than he had ventured to do in the sections on the *Axioms of Intuition* and *Anticipations of Perception*. There he fell so far short as to provide only a single principle in each case. In dealing, however, with the categories of relation he has been able to define each of the three categories separately, and to derive from each a separate principle. Many of the defects in his argument are, indeed, traceable to this source. The close interrelations of the three principles are, as we have had occasion to note, seriously obscured. But still, in the main, separate treatment of each has proved feasible. Kant, encouraged, as we may believe, by this successful fulfilment of architectonic requirements, now sets himself to develop, in similar fashion, a separate principle for each modal category. But for any such enterprise the conditions are less favourable than in the case of the categories of relation. For, as just indicated, no one of the three can, on Critical principles, possess any genuine meaning save in its relation to the others. Before following out this line of criticism, we must however note some further points in Kant’s argument.

In A 219 = B 266, and again in A 225 = B 272, Kant makes the statement that a concept can be complete prior to any decision as to its possibility, actuality, or necessity. This contention is capable of being interpreted in two quite independent ways, and in only one of those ways is it tenable. He may mean that the distinction between the possible, the actual, and the necessary, does not concern the objectively real, which as such is always both actual and necessary, but only the subjective attitude of the individual towards the objects of his thought and experience. From the Critical standpoint, as we have been arguing, such a contention is entirely just. But Kant would seem in the above statement to be chiefly concerned to maintain that a conception may be complete and determinate, even while we remain in doubt whether the existence for which it stands is even possible. Such a view is merely a relic of the Leibnizian rationalism from which he is striving to break away. All existences have their place in a systematic order of experience, and no conception of them can be either complete or determinate which fails to specify the causal context to which they belong. The process of specifying the detail of a concept is the only process whereby we can define its possibility, actuality, or necessity. Were it capable of complete statement without determination of its modal character, it could never form part of a unified experience. The examples of “fictitious” concepts, which Kant cites, are either so determinate as to be demonstrably inconsistent with experience, and therefore empirically impossible, or so indeterminate as to afford no sufficient means of deciding even as to their possibility.

There is a further objection to the definition given of possibility in the first *Postulate*. After stating that the possible is what *agrees* with the formal conditions of experience, Kant proceeds, on the one hand, to argue that the forms of intuition and the categories of understanding may, in accordance with this criterion, be viewed as possible, and, on the other hand, to maintain that no other concepts can be so regarded. That is to say, the possible, as thus interpreted, does not consist in something additional to, and in harmony with, the conditions of experience, but reduces without remainder to those very forms. Now Kant is not betrayed merely by inadvertence into thus narrowing the sphere of the possible; such limitation is an almost inevitable consequence of the one-sided manner in which he has treated the concept of the possible in this first *Postulate*. He professes to be proceeding in the light of the results obtained in the transcendental deduction, and to be defining the possible in terms of the conditions which make sense-

experience possible. But the deduction has shown that experience is possible only in so far as the material factors co-operate with the formal. And when this is recognised, it becomes obvious that a definition of the possible in terms of sensation, — namely, as that which is capable of being presented in sense-perception, — is equally legitimate, and is indeed required in order to correct the deficiencies of the definition which Kant has himself given. As both factors are indispensable in all possible experience, both must be reckoned with in defining the possible.

Kant's argument in the fifth paragraph is somewhat obscured by its context. He is contending that fictitious (*gedichtete*) concepts, elaborated from the contents presented in perception, cannot be determined as possible. As they involve sensuous contents, the formal elements of experience do not suffice for proof of their possibility; and since the contents are supposed to have been recombined in ways not supported by experience, an empirical criterion is equally inapplicable. Obviously Kant is here using the term 'possible' not in the meaning of the first *Postulate*, but in its narrower connotation as signifying that which is capable of objective reality. Such fictitious concepts may completely fulfil all the demands prescribed by space, time, and the categories, and yet, as he here insists, be none the less incapable of objective existence.

The argument is still further obscured by the character of the concrete examples which Kant cites. They involve modes of action or of intuition which contradict the very conditions of human experience, and so for that reason alone fall outside the realm of the empirically possible. That would not, however, seem to be Kant's meaning in employing them. Assumed powers of anticipating the future or of telepathic communication with other minds are, he says, concepts

"...the possibility of which is altogether groundless, as they cannot be based on experience and its known laws, and without such confirmation are arbitrary combinations of thoughts, which, although indeed free from contradiction, can make no claim to objective reality and so to the possibility of an object such as we here profess to think."

The mathematical examples which Kant gives in A 223 = B 271 are no less misleading. The concept of a triangle can, it is implied, be determined as possible in terms of the first *Postulate*, since it harmonises with a formal condition of experience, namely, space. This is true only if it be granted that construction in space can be executed absolutely *a priori*, in independence of all sense-experience. Such is, of course, Kant's most usual view; and to that extent the argument is consistent. Mathematical concepts will from this point of view represent the only possible exception to the general statement that the formal conditions of experience constitute a criterion of possibility for no concepts save themselves. Kant's final conclusion is clearly and explicitly stated in the following terms:

"I leave aside everything the possibility of which can be derived only from its reality in experience, and have here in view only the possibility of things through *a priori* concepts; and I maintain the thesis that the possibility of such things can never be established from such concepts taken in and by themselves, but only when they are viewed as formal and objective conditions of experience in general."

We are now in a position to appreciate the reasons which have induced Adickes to regard the text as of composite origin. Adickes argues that Kant's original intention was to treat the three concepts together, showing that they can be defined only in empirical terms, and that their significance is consequently limited to the world of appearance. Such is the content of the first, second, fourth (excepting the first sentence), and fifth paragraphs. No attempt is made to separate the three *Postulates*, and the term possibility is throughout employed exclusively as referring to objective reality. (In the third paragraph it is used in both senses.) The other paragraphs were, according to Adickes' theory, added later, when Kant unfortunately resolved to fulfil more exactly the requirements of his architectonic. That involved the formulation of three separate *Postulates*, with all the many evil consequences which that attempt carried in its train. He must then have interpolated the third paragraph, added the first sentence to the fourth paragraph, corrected the too extensive sweep of the older paragraphs through the introduction of the sixth

paragraph, further supplemented the exposition of the first *Postulate* by the seventh paragraph, and added independent treatments of the postulates of actuality and necessity. This may seem a very complicated and hazardous hypothesis; but careful examination of the text, with due recognition of the confused character of the argument as it stands, will probably convince the reader that Adickes is in the right.

Second Postulate. — Perception is necessary to all determination of actuality. The actual is either itself given in perception or can be shown, in accordance with the *Analogies*, to stand within the unity of objective experience, in connection with what is thus given. So long as Kant expresses himself in these terms his statements are entirely valid. Nothing which cannot be shown to be bound up with the contingent material of sense-experience can be admitted as actual. He proceeds, however, to give a definition of actuality which entirely omits all reference to the *Analogies*, and which is open to the same fundamental criticism as his characterisation of possibility in the first *Postulate*. Though the earlier statements give due recognition both to the material content and to the relational forms constitutive of complete experience, Kant now contrasts the mere or bare (*blosser*) concept and the given perception in a manner which suggests the unfortunate distinction drawn in the *Prolegomena*, and repeated in the second edition of the *Critique*, between judgments of perception and judgments of experience. Kant's reference to "the mere concept of a thing" is on the same lines as the opening paragraph of the section. However complete the concept may be, it yields not the least ground for deciding as to the existence of its object.

Kant's thinking, as I have already pointed out, is here perverted by the continuing influence of the Leibnizian rationalism. He is forgetting that, on Critical principles, even the categories are meaningless except in their reference to the contingently given. If that be true of the strictly *a priori*, it must hold with even greater force of empirical concepts with sensuous content. As the sole legitimate function of concepts, whether *a priori* or empirical, is to organise and unify the material of sense, there can be no such thing as the mere or bare concept. Such a combination of words is without Critical significance. A concept as such must refer to, and embody insight into, the real. Only in proportion to its incompleteness, that is, to its indefiniteness, can it remain without specific and quite determinate location within the context of unified experience. It may, indeed, be found convenient to retain the phrase "mere concept" notwithstanding its misleading character and rationalistic origin. It must, however, be used only to mark the indefiniteness, indeterminateness, or incompleteness which prevents it from adequately revealing the denotation to which through the nature of its content it necessarily refers. Meaning and existence, connotation and denotation, are complementary the one to the other, and though not, perhaps, coextensive (if that term has itself meaning in this connection), are none the less inseparably conjoined. When Kant's utterances, as frequently happens, imply the contrary, they may be taken as revealing the strength and insidious tenacity of the influences from which he was sufficiently courageous, but not always sufficiently watchful, to break away.

The doctrine of the "mere concept" finds its natural supplement in the equally un-Critical assertion that

"...perception [evidently employed in the less pregnant sense, as signifying 'sensation accompanied by consciousness'], which supplies the material to the concept, is *the sole character of actuality*."

This same position is expressed equally strongly by Kant in his *Reflexionen* (ii. 1095).

"Possibility is thought without being given; actuality is given without being thought; necessity is given through being thought."

Such statements are entirely out of harmony with Kant's central teaching. There is no lack of passages in the *Critique* which inculcate the direct contrary. Though the element of sensation is a *sine qua non* of all experience of the actual, the formal elements are no less indispensable. In their absence the merely given would reduce to less than a dream; for even in dreams images are interpreted and are referred to some connected context. The given, merely as such, cannot enter the field of consciousness, and is therefore "for us as good as nothing." As Caird has pointed out, we find in Kant

"...two apparently contradictory forms of expression — (1) that the understanding by means of its conceptions refers our preceptions to objects, and (2) that conceptions are referred to objects only indirectly through perceptions. The former mode of expression is preferred whenever Kant has to show that 'perceptions without conceptions are blind'; the latter when he has to show that 'conceptions without perceptions are empty.'" "We can understand the possibility of Kant's looking at the subject in these two opposite ways, only if we remember the reciprocal presupposition of perception and conception in the judgment of knowledge, and the way in which Kant tries to explain it, now from the point of view of perception, and now from the point of view of conception. The effect of this is, no doubt, a formal contradiction which Kant himself never disentangles, but which *we* must endeavour to disentangle, if we would do justice to him."

The one-sidedness of Kant's definition of actuality is certainly due to the cause suggested by Caird. The definition, notwithstanding its misleading character, serves to enforce against the older rationalism, with which Kant throughout this section is almost exclusively concerned, the central tenet through which the Critical teaching is distinguished from that of Leibniz, namely, that neither existence, possibility, nor necessity, can be established save by reference to the contingent nature of the sensuously given. Proof by reference to the possibility of experience can establish only those conditions which can be shown to be *de facto* necessary in order that consciousness of time may be accounted for. The formal conditions of experience, which in and by themselves are determinable neither as actual nor as possible, are established as actual, and so as necessary, by reference to the merely given; they are necessary only in this merely relative fashion, as being indispensable to what can never itself be viewed as other than contingent.

"Our knowledge of the existence of things reaches, then, only so far as perception and its continuation according to laws of nature can extend. If we do not start from experience, or do not proceed according to laws of the empirical connection of appearances, our guessing or enquiring into the existence of anything will only be an idle pretence."

Polemically, therefore, Kant's formulation of the second *Postulate* is not without its advantages, though from the inner standpoint of Critical teaching it is altogether inadequate.

For comment upon A 226 = B 273, and upon the general teaching of this *Postulate* in its important bearing upon Kant's phenomenalism, cf. above, p-19.

B 274-9. — *Refutation of Idealism*, cf. above, ff.

Third Postulate. — In the opening sentence Kant draws the distinction which was lacking in his treatment of the first *Postulate* between 'material' and 'formal' modality. (No distinction, however, is drawn between the 'formal' possibility of the first *Postulate* and logical possibility, which consists in absence of contradiction.) It is with the former alone that we have to deal. As existence cannot be determined completely *a priori*, necessity can never be known from concepts, but only by reference to the actually given, in accordance with the universal principles that condition experience. Further, since such empirical necessity does not concern the existence of substances, but only the existence of their states, viewed as dynamically caused, the criterion of empirical necessity reduces to the second *Analogy*, viz. that everything which happens is determined by an antecedent empirical cause. This criterion does not extend beyond the field of possible experience, and even within that field applies only to those existences which can be viewed as effects, *i.e.* as *events* which come into existence in time, and of which therefore the causes are of the same temporal and conditioned character. The necessity is a hypothetical necessity; given an empirical event, it can always be legitimately viewed as necessitated by an antecedent empirical cause.

Kant introduces, reinterprets, and in this altered form professes to justify, four of the central principles of the Leibnizian metaphysics. *In mundo non datur casus* gives expression to the above empirical

principle. *Non datur fatum* may be taken as meaning that natural (*i.e.* empirical) necessity is a conditioned and therefore comprehensible necessity, and is consequently not rightly described as blind. The other two principles, *non datur saltus*, and *non datur hiatus* connect with the principle of continuity already established in the *Anticipations of Perception* and in the second *Analogy*.

Kant's further remarks reveal an uneasy feeling that he is neglecting to assign these principles to the pigeon-holes provided in his architectonic. The reader, he states, may easily do so for himself. That may be so, but only if the reader be permitted the same high-handed methods of adjustment that are here illustrated in Kant's location of *non datur fatum* with the principles of modality.

In the next paragraph (A 230 = B 282) Kant suddenly, without warning or explanation, attaches to the term possibility a meaning altogether different from any yet assigned to it. He now takes it as equivalent to the absolutely or metaphysically possible. Combining this with the meanings previously given to it by Kant we obtain the following table: —

Possibility–

Logical: equivalent to absence of contradiction.

Empirical: in the wider sense, equivalent to agreement with the formal conditions of experience; in the narrower or stricter sense, involving in addition the capacity of being presented in sense-experience.

Metaphysical: equivalent to absolute possibility, a conception not of understanding but of Reason.

When this last meaning is given to the term, an entirely new set of problems arises, to the confusion of the reader who very properly continues to employ the term possibility in the empirical sense which, as Kant has been insisting, is alone legitimate. Kant has temporarily changed over to the standpoint of the metaphysical view which he has been criticising, and accordingly uses the term 'possibility' in the Leibnizian sense. Is Leibniz, he asks, justified in maintaining that the field of the possible is wider than the realm of the actual, and the latter in turn wider in extent than the necessary? In reply Kant accepts the metaphysical meaning assigned to the term 'possibility,' but restates the problem in Critical fashion. Do all things belong as appearances to the context of a single experience, or are other types of experience possible? Do other forms of intuition besides space and time, other forms of understanding besides the discursive through concepts, come within the range of the possible? These are questions which fall to be answered, not by the mere understanding, the sole function of which is empirical, but by Reason, which transcends the world of appearance.

Kant introduces these questions, as he is careful to state, only because they are currently believed to be within the competence of the understanding; and he now for the first time points out that possibility, in this sense, means absolute possibility, that which is independent of all limiting conditions, a meaning ruled out by the preceding treatment of the modal categories. Like all other absolute conceptions, it belongs to Reason, and must therefore await treatment in the *Dialectic*. These admissions come, however, only after the discussion has been completed. Had Kant reversed the order of the two paragraphs which constitute this digression, and marked them off as being a digression, he would have greatly assisted the reader in following the argument.

Kant adds a refutation of the merely logical arguments by which Leibniz had professed to establish the priority and greater scope of the possible. From the proposition, everything actual is possible, we can infer by immediate inference that some possible things are actual. That, however, would seem to imply that part of the possible is not actual, and that something must be added to the possible in order to constitute the actual. But this, Kant replies, is obviously an untenable view. The something additional to the possible, not being itself possible, we should be constrained to regard as impossible. *For our*

understanding, the possible is that which connects with some perception in agreement with the formal conditions of experience. (Kant here gives the correct Critical definition of the possible, by combining the two first postulates.) Whether, and how far, other existences beyond the field of sense experience are possible, we have no means of deciding.

B 288-294. — This second edition section emphasises the fact that possibility cannot be determined through the categories alone, but only through the categories in their relation to intuition, and indeed to outer intuition. Possibility is throughout taken as referring to objective reality. The section is chiefly important in connection with the problems bearing on the relation of inner and outer sense and on the nature of our consciousness of time.

In B 289-91 Kant criticises those rationalistic arguments which rest upon the equating of necessity of thought with necessity of existence. When it is sought by mere analysis of concepts to prove that all accidental existence has a cause, the most that can be shown is that the existence of the accidental cannot be *comprehended* by us, unless the existence of a cause be assumed. But we may not argue that a condition of possible understanding is likewise a condition of possible existence. What is or is not possible for thought is, without special proof, no sufficient criterion of what is or is not possible in the real. If, again, the term accidental be taken as meaning that which can exist only as a consequence of some other existence, the general principle becomes merely analytic, and must not be taken as establishing the synthetic principle of causality. The latter demands transcendental proof by reference to the possibility of contingent experience.

CHAPTER III

ON THE GROUND OF THE DISTINCTION OF ALL OBJECTS WHATEVER INTO PHENOMENA AND NOUMENA

THIS chapter, as Kant himself states, can yield no new results. It will serve merely to summarise those already established in the *Analytic*, showing how they one and all converge upon a conclusion of supreme importance for understanding the nature and scope of human experience — the conclusion, that though the objective employment of the categories can be justified only within the realm of sense-experiences, they have a wider significance whereby they define a distinction between appearances and things in themselves. This is the conclusion which Kant now sets himself to illustrate and enforce in somewhat greater detail. It may be observed that the title of the chapter makes mention only of grounds for *distinguishing* between phenomena and noumena. That things in themselves really exist, Kant, as we shall find, never seriously thought of questioning.

Kant begins by recalling a main point in the preceding argument. The categories apart from the manifold of sensibility are merely logical functions without content. Though *a priori*, they require to be supplemented through empirical intuition.

“Apart from this relation to possible experience they have no objective validity of any sort, but are a mere play of the imagination or the understanding with their respective representations.”

As evidence of the truth of this conclusion Kant now adds a further argument, namely, the impossibility of defining the categories except in terms that involve reference to the conditions of sensibility. When these conditions are omitted, the categories are without relation to any object and consequently without meaning. They are no longer concepts of possible empirical employment, but only of “things in general.” When, for instance, the permanence of existence in time, which is the condition of the empirical application of the concept of substance, is omitted, the category reduces merely to the notion of something that is always a subject and never a predicate.

“But not only am I ignorant of all conditions under which this logical pre-eminence may belong to anything, I can neither put such a concept to any use nor draw the least inference from it. For under these conditions no object is determined for its employment, and consequently we do not at all know whether it signifies anything whatsoever.”

In abstraction from sense-data, the categories still remain as concepts or *thoughts*, logically possible; but that is not to be taken as signifying that they still continue to possess meaning, *i.e.* reference to an object. And in the absence of ascertainable meaning they cannot, of course, be defined.

In A 244 Kant states his position in somewhat different fashion. In abstraction from sense the categories have meaning, but not determinate meaning; they relate not to any specific object, but only to things in general. In this latter reference, however, they possess no objective validity, since in the absence of intuition there is no means of deciding whether or not any real existence actually corresponds to them.

But whichever mode of statement be adopted, the same conclusion follows.

“Accordingly, the transcendental *Analytic* has this important result, that the most the understanding can achieve *a priori* is to anticipate the form of a possible experience in general. And since that which is not appearance cannot be an object of experience, the understanding can never transcend those limits of sensibility within which alone objects are given to us. Its principles are merely rules for the exposition of appearances; and the proud title of an Ontology, which presumptuously claims to supply, in systematic doctrinal form, synthetic *a priori* knowledge of things in general (*e.g.* the principle of causality), must therefore give place to the modest claims of a mere Analytic of pure understanding.”

A 248-9 opens a new line of argument which starts from the results obtained in the *Aesthetic*. The proof that space and time are subjective forms establishes the merely phenomenal character of everything which can be apprehended in and through them, and is meaningless except on the assumption that things in themselves exist. This assumption, Kant argues, is already involved in the very word 'appearance,' and unless it be granted, our thinking will revolve in a perpetual circle. But, he proceeds, this conclusion may easily be misinterpreted. It might be taken as proving the objective reality of noumena, and as justifying us in maintaining a distinction between the sensible and the intelligible worlds, and therefore in asserting that whereas the former is the object of intuition, the latter is apprehended by the understanding in pure thought. We should then be arguing that though in experience things are known only as they appear, through pure understanding a nobler world than that of sense, "*eine Welt im Geiste gedacht*," is opened to our view.

But any such interpretation, Kant insists, runs directly counter to the teaching of the *Analytic*, and is ruled out by the conclusions to which it has led. Categories yield only "rules for the exposition of appearances," and cannot be extended beyond the field of possible experience. It is true that all our sense-representations are related by the understanding to an object that is "transcendental." But that object, in its transcendental aspect, signifies only a something = *x*. It cannot be thought apart from the sense-data which are referred to it. When we attempt to isolate it, and so to conceive it in its independent nature, nothing remains through which it can be thought.

"It is not in itself an object of knowledge, but only the representation of appearances under the concept of an object in general, viewed as determinable through the manifold of those appearances."

Kant is here again expounding his early doctrine of the transcendental object. Evidently, at the time at which this passage was written, he had not yet come to realise that such teaching is not in harmony with his Critical principles. It is, as we have seen above, a combination of subjectivism and of dogmatic rationalism. The very point which he here chiefly stresses was bound, however, when consistently followed out, to reveal the untenableness of the doctrine of the transcendental object; and in the second edition Kant so recast this chapter on phenomena and noumena as to eliminate all passages in which the transcendental object is referred to.

But to return to Kant's own argument: the reason why the mind is "not satisfied with this substrate of sensibility," and therefore proceeds to duplicate the phenomenal world by a second world of noumena, lies in the character of the agency whereby sensibility is limited. Sensibility is limited by the understanding; and the understanding, overestimating its powers and prerogatives, proceeds to transform the notion of the transcendental object = *x* into the concept of a noumenon, viewed in a manner conformable to its etymological significance, as something apprehended by reason or pure intuition, *i.e.* as intuited in some non-sensuous fashion. For only by postulating the possibility of a non-sensuous species of intuition, can the notion of a noumenon, thus positively conceived, be saved from self-contradiction. Otherwise we should be asserting the apprehension of an object independently of appearances, and yet at the same time denying the only means through which such apprehension is possible. Statement of the postulate suffices, however, to reveal its unsupported character. We have no such power of non-sensuous, intuitive apprehension; nor can we in any way prove that such a power is possible even in a Divine Being. Though, therefore, the concept of noumena is not self-contradictory, it involves more than we have the right to assert; the process whereby the empty notion of a transcendental object = *x* is transformed into the positive concept of a noumenon is easily comprehensible, but it is none the less illegitimate. We must, Kant insists, keep strict hold of the central doctrine of Critical teaching, namely, that the categories are applicable only to the data of sense. We can still employ them as pure logical functions, yielding the notion of objects in general (of the transcendental object = *x*). But this does not widen the sphere of *known* existences. It only enables us to comprehend the limited and merely

phenomenal character of the world experienced.

At this point Kant's argument takes a strange and misleading turn. The concept of object in general (the transcendental object = *x*) has been proved to be involved in the apprehension of appearances as appearances, and in this capacity to be a limiting concept (*Grenzbegriff*), which, though negative in function, is indispensably involved in the constitution of human experience. Now, however, Kant proceeds to ascribe this function to *the concept of the noumenon*. That concept is, he repeats, purely problematic. Even the mere possibility of its object, presupposing as it does the possibility of an understanding capable through non-sensuous intuition of apprehending it, we have no right to assert. That the concept is not self-contradictory is the most that we can say of it. None the less, it is to this concept that Kant here ascribes the indispensable limiting function.

"The concept of a noumenon is a merely limiting concept, the function of which is to curb the pretensions of sensibility; and it is therefore only of negative employment. At the same time it is no arbitrary invention, and it is bound up with the limitation of sensibility, though it cannot affirm anything positive beyond the field of sensibility."

This confusion, between the concept of a noumenon and the less definite concept of object in general, which is probably due to the combining of manuscripts of different dates, is corrected in the second edition by means of a new distinction which Kant introduces, evidently for this very purpose. The term noumenon may, he there says, be used either positively or negatively. Taken positively, it signifies "an object of a non-sensuous intuition"; regarded negatively, it means only "a thing so far as it is not an object of our sensuous intuition." Only in its negative employment, he states, is it required as a limiting concept; and it is then, as he recognises, indistinguishable from the notion of the unknown thing in itself.

But despite this variation in mode of expression, in the main Kant holds consistently to his fundamental teaching.

"...understanding is not limited through sensibility; on the contrary, it itself limits sensibility by applying the term noumena to things in themselves (things not regarded as appearances). But in so doing it at the same time sets limits to itself, recognising that it cannot know these noumena through any of the categories, and that it must therefore think them only under the title of an unknown something."

Or as Kant adds in the concluding sentence of this chapter:

"...the problematic thought which leaves open a place for [intelligible objects], serves only, like an empty space, for the limitation of empirical principles, without itself containing or revealing any other object of knowledge beyond their sphere."

A sentence in A 258 = B 314 deserves special notice.

"...we can never know whether such a transcendental or exceptional knowledge is possible under any conditions, least of all if it is to be regarded as of the sort that stands under our ordinary categories."

This sentence clearly shows that Kant was willing to recognise that the categories may be inapplicable, not merely owing to lack of data for their specification, but because of their inherent character. They may be intrinsically inapplicable, expressing only the *modi* of our self-consciousness. They may be merely the instruments of our human thinking, not forms necessary to knowledge as such.

RELEVANT PASSAGES IN THE SECTION ON AMPHIBOLY

Before passing to consideration of the extensive alterations made in this chapter in the second edition, it is advisable to take account of the two passages dealing with this problem in the first edition section on *Amphiboly*: namely, A 277-280 = B 333-6, and A 285-9 = B 342-6. The first of these passages is of great interest in other connections; its chief importance in reference to the present problem lies in its concluding paragraph. Kant there declares that the representation of an object "as thing in general" is not only, in the absence of specific data, insufficient for the determination of an object, but is self-contradictory. For we

must either abstract from all reference to an object, and so be left with a merely logical representation; or, in assuming an object, we must postulate a special form of intuition which we do not ourselves possess, and which therefore we cannot employ in forming our concept of the object. *Here again Kant is substituting the concept of a noumenon for the less definite concept of the thing in itself*. This is still more explicitly done in the second passage. The pure categories are, Kant there declares, incapable of yielding the concept of an object. Apart from the data of sense they have no relation to any object. As purely logical functions, they are altogether lacking in content or meaning. By objects as things in themselves we must therefore mean objects of a non-sensuous intuition. Kant still, indeed, continues to maintain that to them the categories do not apply, and that we cannot, therefore, have any knowledge of them, either intuitional or conceptual.

"Even if we assume a non-sensuous form of intuition, our functions of thought would still have no meaning in reference to it."

But Kant now insists that the notion of noumena, viewed in the above manner, differs from the notion of "objects in general" (transcendental = *x*) in being a legitimate non-contradictory conception; and he also insists that though more positive in content, it is for that very reason less open to misunderstanding. Its function is not to extend our knowledge, but merely to limit it.

"For it merely says that our species of intuition does not extend to all things, but only to objects of our senses; that its objective validity is consequently limited; and that a place therefore remains open for some other species of intuition, and so for things as its objects."

The concept of a noumenon, as thus employed to signify the objects of a non-sensuous intuition, is, Kant proceeds, merely problematic. As we have neither intuition nor (it may be) categories fitted for its apprehension, it represents something upon the possibility or impossibility of which we are quite unable to pronounce.

"...as the problematic concept of an object for a quite different intuition and a quite different understanding than ours, it is itself a problem."

We may not therefore assert the existence of noumena, but we must none the less form to ourselves the concept of them. This concept is indispensably involved in the constitution of our empirical knowledge, and is demanded for its proper interpretation. Only when viewed as a self-sufficient representation of an absolute existence does it become dogmatic and therefore illegitimate. In its Critical aspects it stands for a problem which human reason is constrained by its very nature to propound.

"The concept of the noumenon is, therefore, not the concept of an object, but is a problem unavoidably bound up with the limitation of our sensibility — the problem, namely, as to whether there may not be objects entirely disengaged from our sensuous species of intuition. This is a question which can only be answered in an indeterminate manner, by saying that, as sense intuition does not extend to all things without distinction, a place remains open for other different objects; and consequently that these latter must not be absolutely denied, though — since we are without a determinate concept of them (inasmuch as no category can serve that purpose) — neither can they be asserted as objects for our understanding."

The fact that these fundamental concepts have not yet been quite definitely and precisely formulated in Kant's own mind, appears very clearly from the immediately following paragraph. For he there again introduces the concept of the transcendental object, and adds that if "we are pleased to name it noumenon for the reason that its representation is not sensuous, we are free so to do." The characterisation given in this paragraph of the transcendental object deserves special notice, for in it Kant goes further in the sceptical expression of his position, though not indeed in the modification of it, than in any other passage.

"[The understanding in limiting sensibility] thinks for itself an object in itself, but only as transcendental object which is the cause of appearance and therefore not itself appearance, and which can

be thought neither as quantity nor as reality nor as substance, etc.... We are completely ignorant whether it is to be met with in us or outside us, whether it would be at once removed with the cessation of sensibility, or whether in the absence of sensibility it would still remain."

This sentence reveals Kant as at once holding unquestioningly to the existence of things in themselves, and yet at the same time as teaching that they must not be conceived in terms of the categories, not even of the categories of reality and existence.

ALTERATIONS IN SECOND EDITION

In the second edition certain paragraphs of the chapter on *Phenomena and Noumena* are omitted, and new paragraphs are inserted to take their place. Though these alterations do not give adequate expression to the Critical teaching in its maturest form, there are three important respects in which they indicate departures from the teaching of the first edition. In the first place, those paragraphs in which the doctrine of the transcendental object finds expression are entirely eliminated, and the phrase 'transcendental object' is no longer employed. This, as we have already noted, is in harmony with the changes similarly made in the second edition *Transcendental Deduction and Paralogisms*.

Secondly, Kant is even more emphatic than in the first edition, that the categories must not be employed save in reference to sense intuitions. In the first edition he still allows that their application to things in themselves is logically possible, though without objective validity. In the second edition he goes much further. Save in their empirical employment the categories "mean nothing whatsoever."

"[In the absence of sensibility] their whole employment, and indeed all their meaning entirely ceases; for we have then no means of determining whether things in harmony with the categories are even possible...."

In the third place, Kant, as already noted, distinguishes between a negative and a positive meaning of the term noumenon. Noumenon in its negative sense is defined as being merely that which is not an object of sensuous intuition. By noumenon in the positive sense, on the other hand, is meant an object of non-sensuous intuition. Kant now claims that it is the concept of noumenon in the negative sense, as equivalent therefore simply to the thing in itself, that alone is involved, as a *Grenzbegriff*, in the "doctrine of sensibility." For its determination the categories cannot be employed; that would demand a faculty of non-sensuous intuition, which we do not possess, and would amount to the illegitimate assertion of noumena in the positive sense. The limiting concept, indispensably presupposed in human experience, is therefore the bare notion of things in themselves. And accordingly, in modification of the conclusion arrived at in the first edition, viz. that "the division of objects into phenomena and noumena ... is not in any way admissible," Kant now adds to the term noumena the qualifying phrase "in the positive sense." In this way the assumption that things in themselves actually exist becomes quite explicit, despite Kant's greater insistence upon the impossibility of applying any of the categories to them.

But beyond thus placing in still bolder contrast the two counter assertions, on the one hand that the categories must not be taken by us as other than merely subjective thought-functions, and on the other that a limiting concept is indispensably necessary, Kant makes no attempt in these new passages to meet the difficulties involved. With the assertion that the categories as such, and therefore by implication those of reality and existence, are inapplicable to things in themselves, he combines, without any apparent consciousness of conflict, the contention that things in themselves must none the less be postulated as actually existing.

The teaching of this chapter must be regarded as only semi-Critical. The fact that it is formulated in terms of the doctrine of the transcendental object, itself suffices to determine the date at which it must

have been composed as comparatively early; and such changes as Kant could make in the second edition were necessarily of a minor character. More extensive alterations would have involved complete reconstruction of the entire chapter, and indeed anticipation of the central teaching of the *Dialectic*.

Kant is also hampered by the unfortunate location to which he has assigned this chapter. At this point in the development of his argument, namely, within the limits of the *Analytic*, Kant could really do no more than recapitulate the *negative* consequences which follow from the teaching of the transcendental deduction. For though these might justify him in asserting that it is understanding that limits sensibility, he was not in a position to explain that the term understanding, as thus employed, has a very wide meaning, and that within this faculty he is prepared to distinguish between understanding in the strict sense as the source of the categories, and a higher power to which he gives the title Reason, and which he regards as originating a unique concept, that of the unconditioned. Yet only when these distinctions, and the considerations in view of which they are drawn, have been duly reckoned with, can the problem before us be discussed in its full significance.

This placing of the chapter within the *Analytic*, and therefore prior to the discussions first broached in the *Dialectic*, has indeed the unfortunate consequence of concealing not only from the reader, but also, as it would seem, to some extent from Kant himself, the ultimate grounds upon which, from the genuinely Critical standpoint, the distinction between phenomena and noumena must be based. For neither in this chapter, nor in any other passage in the *Critique*, has Kant sought to indicate, in any quite explicit manner, the bearing which the important conclusions arrived at in the *Dialectic* may have in regard to it. Like so many of the most important and fruitful of his tenets, these consequences are suggested merely by implication; or rather remain to be discovered by the reader's own independent efforts, in proportion as he thinks himself into the distinctions upon which, in other connections, Kant has himself insisted. They are never actually formulated in and by themselves.

In seeking, therefore, to decide upon what basis the distinction between appearance and reality ought to be regarded as resting, we are attempting to determine how the argument of this chapter would have proceeded had it been located at the close of the *Dialectic*. The task is by no means easy, but the difficulties are hardly as formidable as may at first sight appear. The general outlines of the argument are fairly definitely prescribed by Kant's treatment of kindred questions, and may perhaps, with reasonable correctness, be hypothetically constructed in view of the following considerations.

Just as Kant started from the natural assumption that reference of representations to objects must be their reference to things in themselves, so he similarly adopted the current Cartesian view that it is by an inference, in terms of the category of causality, that we advance from a representation to its external ground. It was very gradually, in the process of developing his own Critical teaching, and especially his phenomenalist view of the empirical world in space, that he came to realise the very different position to which he stood committed. When the doctrine of the transcendental object is eliminated from his teaching, and when the categories, including that of causality, are pre-empted for the *empirical* object, and that object is regarded as directly apprehended, the function of mediating the reference of phenomenal nature to a noumenal basis falls to the Ideas of Reason. For the distinction is no longer between representations and their noumenal causes, but between the limited and relative character of the entire world in space and time, and the unconditioned reality which Reason demands for its own satisfaction. To regard the world in space as merely phenomenal, because failing to satisfy our standards of genuine reality, is to adopt an entirely different attitude from any to be found in Descartes or Locke. The position may be outlined in the following manner, in anticipation of its more adequate statement in connection with the problems of the *Dialectic*.

The concept, whereby Reason limits sensibility, is not properly describable as being that of the thing in itself; it is the unique concept of the unconditioned. Our awareness of the conditioned as being conditioned presupposes, over and above the categories, an antecedent awareness of Ideal standards; and

to that latter more fundamental form of consciousness all our criteria of truth and reality are ultimately due. The criteria by means of which we empirically distinguish sense-appearance from sense-illusion, when rigorously applied, lead us to detect deficiencies in the empirical as such. We have then no alternative save to conceive absolute reality in terms of the rational Ideals, of which the empirical criteria are merely specialised forms.

There are thus two distinct, but none the less interdependent, elements involved in Kant's more mature teaching, phenomenalism, and what may be called the Idealist, or absolutist, interpretation of the function of Reason. Each demands the other for its own establishment. There must be a genuinely objective world, by reflection upon which we may come to consciousness of the standards which are involved in our judgments upon it; and we must possess a faculty through which our consciousness of these standards may be accounted for. The standards of judgment cannot be acquired by means of judgments which do not already presuppose them; the processes by which they are brought to clear consciousness cannot be the processes in which they originate. They must be part of the *a priori* conditions of experience and combine with space, time and the categories to render experience of the kind which we possess — self-transcending and self-limiting — actually possible.

From this point of view the distinction between appearance and reality is not a contrast between experience and the non-experienced, but a distinguishing of factors, which are essential to all experience, and through which we come to consciousness of an irresolvable conflict between the Ideals which inspire us in the acquisition of experience, and the limiting conditions under which alone experience is attainable by us. In the higher field of Reason, as in the lower field of understanding, it is not through the given, but only through the given as interpreted by conditioning forms of an Ideal nature, that a meaningful reality can disclose itself to the mind. The ultimate meaning of experience lies in its significance when tested by the standards which are indispensably involved in its own possibility. That meaning is essentially metaphysical; more is implied in experience than the experienced can ever itself be found to be.

Such is the central thesis of the Critical philosophy, when the teaching of the *Analytic* is supplemented by that of the *Dialectic*. Though the *Critique* is, indeed, the record of the manifold ways in which Kant diverged from this position, not a systematic exposition of its implications and consequences, the above thesis represents the goal upon which his various lines of thought tend to converge. It is the guiding motive of his devious and complex argument in the three main divisions of the *Dialectic*. On no other interpretation can the detail of his exposition be satisfactorily explained.

There are two chief reasons why Kant failed to draw the above conclusions in any quite explicit manner. One reason has already been sufficiently emphasised, namely, that the thesis, which I have just formulated, rests upon a phenomenalist view of the natural world, whereas the *Dialectic* is inspired by the earlier, subjectivist doctrine of the transcendental object. Upon the other main reason I shall have frequent occasion to insist. As we shall find, Kant was unable to arrive at any quite definitive decision as to the nature of the Ideals of Reason. He alternates between the sceptical and the absolutist view of their origin and function, and in the process of seeking a comprehensive mid-way position which would do justice to all that is valid in the opposing arguments, the further question as to the bearing of his conclusions upon the problem of the distinction between appearance and reality was driven into the background. But we are anticipating matters the discussion of which must meantime be deferred.

APPENDIX

THE AMPHIBOLY OF THE CONCEPTS OF REFLECTION

IN this appendix Kant gives a criticism of the Leibnizian rationalism — a criticism already partially

stated in the section on the *Postulates* — and he does this in a manner which very clearly reveals the influence which that rationalism continued to exercise upon his own thinking. Thus Kant speaks of the "mere concept," and in doing so evidently means to imply that it exists in its own right, with a nature determined solely by intrinsic factors of a strictly *a priori* character, in complete independence of the specific material of sense-experience. He denies, it is true, the objective validity of such concepts, and maintains that in their empirical employment they are completely transformed through the addition of new factors. None the less he allows to the concepts an intrinsic nature, and practically maintains that from the point of view of the pure concept, and therefore from the point of view of a logic based upon it, the Leibnizian rationalism is the one true system of metaphysics. For pure thought, Leibniz's system is the ultimate and only possible philosophy; and were thought capable of determining the nature of things in themselves, we should be constrained to adopt it as metaphysically valid. This is the standpoint which underlies much of Kant's argument in the *Dialectic*. It leads him to maintain that the self must necessarily, in virtue of an unavoidable transcendental illusion, believe in its own independent substantial reality, that the mind is constrained to conceive reality as an unconditioned unity, and that the notions of God, freedom, and immortality are Ideas necessarily involved in the very constitution of human thought.

But we must not regard Kant's doctrine of the pure concept merely as a survival from a standpoint which the Critical teaching is destined to displace and supersede. For Kant is not led through inconsistency, or through any mere lack of thoroughness in the development of his Critical principles, to retain this rationalistic doctrine. To understand the really operative grounds of Kant's argumentation, and so to place the contents of this section in proper focus, we must recall the fundamental antithesis, developed in my introduction, between the alternative positions, which are represented for Kant by the philosophies of Hume and Leibniz. Kant, as already observed, is profoundly convinced of the essential truth of the Leibnizian position. He holds to the Leibnizian view of reason. Human reason is essentially metaphysical; its ultimate function is to emancipate us from the limiting conditions of animal existence; it reveals its nature in those Ideas of the unconditioned, the discussion of which Kant reserves for the *Dialectic*.

The chief defect in Kant's criticism of Leibniz, as developed in this section, is that the deeper issues, which determine the extent of his agreement with Leibniz, are not raised or even indicated. Consequently, his references to pure thought, and his assertion that from the point of view of pure thought Leibniz is entirely justified in his teaching, bewilder the reader, who has been made to adopt a Critical standpoint, and therefore to believe that thought can function only in connection with the data of sense-experience. Kant would seem, indeed, to have lapsed into the dogmatic standpoint of the *Dissertation*, distinguishing between a sensible and an intelligible world, and maintaining that pure thought is capable of determining the nature of the latter. The only difference between his teaching here and in the *Dissertation* consists in the admission that all knowledge is limited to sense-experience, and that we are therefore unable to determine whether this intelligible world which we must *think*, and *think in the precise manner defined by Leibniz*, does or does not exist.

This section is, indeed, like the chapter on *Phenomena and Noumena*, wrongly located. Giving, as it does, Kant's criticism of the Leibnizian ontology, it discusses problems of metaphysics; and ought therefore to have found its place in the *Dialectic*, in natural connection with the corresponding examination of the metaphysical sciences of rational psychology, cosmology, and theology. Architectonic, that ever-present source of so many of Kant's idiosyncrasies, has again interposed its despotic mandate. As there are only three forms of syllogism, only three main divisions can be recognised in the *Dialectic*; and the criticism of ontology, to its great detriment, must therefore be located, where it does not in the least belong, in the concluding section of the *Analytic*.

But we must follow Kant's argument as here given. Leibniz views thought as capable of prescribing, antecedently to all experience, the fundamental conditions to which reality must conform. The possible is

prior to, and independent of, the actual; and can be adequately determined by pure reason from its own inherent resources. Kant does not here question this assertion of the independence and priority of pure thought. He is content to maintain that what is valid for thought need not hold of those appearances which are the only possible objects of human knowledge, since in sense-experience conditions, unforeseen by pure thought, partly limitative and partly extensive of its concepts, intervene to modify the conclusions which from its own point of view are logically valid. Leibniz, through failure to realise the dual character of thought and sense, overlooked this all-important fact; and, in asserting that what is true for pure thought is valid of the sensuously real, fell victim to the fallacy which Kant entitles transcendental amphiboly.

Kant's clearest statement of the fallacy is in A 280 = B 336. It reduces, formally stated, to the fallacy of denying the antecedent. In accordance with the *dictum de omni et nullo*, we can validly assert that what belongs to or contradicts a universal concept, belongs to or contradicts the particulars which fall under that concept. Leibniz employs the principle in a negative and invalid form. He argues that what is *not* contained in a universal concept is also not contained in the particulars to which it applies. "The entire intellectualist system of Leibniz is reared upon this latter principle." And as Kant points out, the reason why so acute and powerful a thinker succumbed to this obvious fallacy is to be found in his view of sense as merely confused thought; or, to state the same point in another way, in his interpretation of appearances as being the confused representations of things in themselves. All differences between appearance and reality are, on this view, due merely to lack of clearness in our apprehension of the given. Sense, when completely clarified, reduces without remainder to pure thought; and in the concepts, which thought develops from within itself, lie the whole content alike of knowledge and of real existence. Owing to a metaphysical theory of the nature of the real, itself due to a false interpretation of the nature and function of pure thought, and ultimately traceable to an excessive preoccupation with knowledge of the strictly mathematical type, Leibniz failed to do justice to the fundamental characteristics of our human experience, and in especial to the actual given nature of space, time, and dynamical causality. His rationalistic metaphysics has its roots in the Cartesian philosophy, and is, in Kant's view, the perfected product of philosophical thinking, when developed on dogmatic, *i.e.* non-Critical, lines. It is the opposite counterpart of the empirical or sceptical type of philosophy which in modern times found its first great supporter in Locke, and which, as Kant held, obtained its perfected expression in the philosophy of Hume. While Descartes and Leibniz intellectualise appearances, Locke and Hume regard the *a priori* concepts of understanding as merely empirical products of discursive reflection. Both commit the same fundamental error of failing to recognise that understanding and sensibility are two distinct sources of representations. Both consequently strive, in equally one-sided fashion, to reduce the complexity of experience to one alone of its constituent elements. This section of the *Critique* ought to have developed the Critical teaching in its opposition to both these alternative attitudes; Kant arbitrarily limits it to criticism of the Leibnizian rationalism.

Kant's method of introducing and arranging his criticism is artificial, and need be no more than mentioned. Critical reflection upon the sources of our knowledge, which Kant, in order to distinguish it from reflection of the ordinary type, entitles *transcendental* reflection, is, he states, a duty imposed upon all who would profess to pass *a priori* judgments upon the real. It will trace the concepts employed to their corresponding faculties, intellectual and sensuous, and will reveal the independence and disparity of sensibility and understanding, and so will effectually prevent that false locating of concepts to which transcendental amphiboly is due. Such reflection, he further argues, consists in a *comparison* of the representations with the faculty to which they are due, and like ordinary comparison will determine the relations of (1) *identity and difference*, (2) *agreement and opposition*, (3) *inner and outer*, (4) *determinable and determining* (matter and form). In this arbitrary but ingenious fashion Kant contrives to obtain the four main headings required for his criticism of the Leibnizian ontology.

(1) Under the first heading he deals with the principle of the identity of indiscernibles. It is, Kant

maintains, a typical example of the fallacy of transcendental amphiboly. Leibniz argues that if no difference is discoverable in the concept of things, there can be none in the things themselves; things which are identical in conception must be identical in all respects. But this, Kant replies, is true only so long as the concepts abstract from the sensuous conditions of existence. Thus no two cubic feet of space are alike. They are distinguishable from one another by their spatial location; and that is a difference which concerns the conditions of intuition; it is not to be discovered in the pure concept. Spaces, alike for thought, are distinguishable for sense. To take another of Kant's illustrations: two drops of water, if indistinguishable in all their internal properties of quality or quantity, are conceptually identical. Through differences of location in space, irrelevant to their conception, they can none the less be intuited as numerically different. The principle of indiscernibles is not a law of nature, but only an analytic rule for the comparison of things through mere concepts.

(2) A second principle of the Leibnizian metaphysics is that realities can never conflict with one another. This is supposed to follow from the fact that in pure thought the only form of opposition is logical negation. Realities, being pure affirmations, must necessarily harmonise with one another. This principle ignores the altogether different conditions of sense-existence. Space, time, and the resulting possibility of dynamical causality supply the conditions for real opposition. Two existences, though equally real and positive, may annul one another. Two forces acting upon a body may neutralise one another. From the above logical principle Leibniz's successors profess to obtain the far-reaching metaphysical conclusions, that all realities agree with one another, that evil is merely negative, consisting exclusively in limitation of existence, and that God, without detriment to the unity of his being, can be constituted of all possible realities.

(3) Viewing space and time, which condition external relation, as merely confused forms of apprehension, Leibniz further concluded that the reality of substance is purely internal. And ruling out position, shape, contact and motion, all of which involve external relations, he felt justified in endowing the monads with the sole remaining form of known existence, namely consciousness. The assertion that the monads are incapable of external relation leads to the further conclusion that they are incapable of interaction, and stand in systematic relation to one another, solely in virtue of a pre-established harmony.

(4) From the point of view of pure thought matter must precede form. The universal must precede the particular which is a specification of it. Unlimited reality is taken as being the matter of all possibility, and its limitation or form as being due to negation. Substances must antecedently exist in order that external relations may have something upon which to ground themselves. Space and time must be interpreted as confused apprehensions of purely intellectual orders, space representing a certain order in the reciprocal (pre-established) correspondence of substances, and time the dynamical sequence of their states. On the other hand, from the standpoint of sense and its intuitional forms the reverse holds. The world of appearance is conditioned by the forms of space and time; the objectively possible coincides with the actual; and the *substantia phaenomenon* has no independent essence, but reduces without remainder to external relations. For pure thought this world of given appearance is an utterly paradoxical form of existence; it is the direct opposite of everything that genuine reality ought to be. In this strange conclusion the problems of the *Dialectic*, in one of their most suggestive forms, at once loom up before us. As stated above, this entire discussion is an anticipation of questions which cannot be adequately treated within the limits of the *Analytic*.

The text of this section is highly composite. The entire content of the *Appendix* is twice reintroduced and restated at full length in the accompanying *Note*. These successive expositions of one and the same argument were doubtless independently written, and then later pieced together in this external fashion. A 277-8 = B 333-4, on the nature of the *substantia phaenomenon*, would by its references to the transcendental object seem to be of early origin. It has already been commented upon. A 285-9 = B 342-6, on the other hand, which supplements the chapter on *Phenomena and Noumena*, would seem to be of late

origin. It is so dated by Adickes, owing to the reference to schemata in its opening sentence.

A 289-91 = B 346-9. Table of the division of the conception of nothing. — This curious and ingenious classification of the various meanings of the term ‘nothing’ is chiefly of interest through its first division: “empty conception without object, *ens rationis*.” The *ens rationis* can best be defined in its distinction from the fourth division: “empty object without conception, *nihil negativum*.” The former is a *Gedankending*; the latter is an *Unding*. The former indeed, though not contradictory, is mere fiction (*bloss Erdichtung*), and consequently must not be taken as falling within the field of the possible. The latter is a concept which destroys itself, and which therefore stands in direct conflict with the possible. The *ens rationis* includes, Kant explicitly states, the conception of noumena, “which must not be reckoned among the possibilities, although they must not for that reason be declared to be also impossible.” Kant must here be taking noumena in the positive sense. As usual Kant’s attempt to obtain parallels for the four classes of category breaks down. The so-called *nihil privativum* and the *ens imaginarium* do not properly come within the denotation of the term ‘nothing.’ This is very evident in the examples which Kant cites. Cold is as real as the opposite with which it is contrasted, while pure space and pure time are not negative even in a conventional sense.

TRANSCENDENTAL LOGIC

DIVISION II. THE TRANSCENDENTAL DIALECTIC

INTRODUCTORY COMMENT UPON THE COMPOSITE ORIGIN AND CONFLICTING TENDENCIES OF THE DIALECTIC.

We have had constant occasion to observe the composite origin and conflicting tendencies of the *Analytic*. The *Dialectic* is hardly less composite in character, and is certainly not more uniform in its fundamental teaching.

The composite nature of the text, though bewildering to the unsophisticated reader, is not, however, without its compensations. The text, as it stands, preserves the record of the manifold influences which presided over its first inception, and of the devious paths by which Kant travelled to his later conclusions. It thus enables us to determine, with considerable accuracy, the successive stages through which it has passed in the process of settling into its present form. As we shall find, the sections on the antinomies contain the original argument, out of which by varied processes of supplementation and modification the other parts have arisen.

The conflict of doctrine has also its counter-advantages. The problems are impartially discussed from opposed standpoints; the difficulties peculiar to each of the competing possible solutions are frankly recognised, and indeed insisted upon; and the internal dialectic of Kant's own personal thinking obtains dramatic expression. We are thus the better enabled to appreciate the open-minded pertinacity with which Kant set himself to do justice to every significant aspect of his many-sided problems, and are consequently in less danger of simplifying his argument in any arbitrary manner, or of ignoring the tentative character of the solutions at which he arrives.

I shall first define the main lines of conflict, and shall then attempt to trace those conflicts to the considerations in which they have their source. The two chief lines of thought traceable throughout the *Dialectic* are represented by its negative and by its positive tendencies respectively. From one point of view, Reason is merely the understanding in its self-limiting, self-regulative employment, and the main purpose of the *Dialectic* is to guard against the delusive power of fictitious principles. From the other point of view, Reason is a faculty distinct from understanding, and its problems run parallel with those of the *Analytic*, forming no less important a subject of philosophical reflection, and no less fruitful a source of positive teaching. The one line of argument connects with Kant's more sceptical tendencies, the other with his deep-rooted belief in the ultimate validity of the absolute claims of pure thought.

When we approach the *Dialectic* from the standpoint of the *Analytic*, it is the negative aspect that is naturally most prominent. In the *Analytic* Kant has proved that all knowledge is limited to sense-experience, and that a metaphysical interpretation of reality is altogether impossible. But as the human mind would seem to be possessed by an inborn need of metaphysical construction, this conclusion cannot obtain its due influence until the sources of the metaphysical tendency have been detected and laid bare. The *Dialectic* must yield *a psychology of metaphysics* as well as a *logic of illusion*.

But when, on the other hand, the problems of the *Dialectic* are viewed in their *distinction* from those of the *Analytic*, and their independent character is recognised, they appear in a perspective which sets them in a very different light. Reason is a faculty co-ordinate with understanding, and yields *a priori* concepts distinct in function, no less than in nature, from the categories. To mark this distinction Kant entitles the concepts of Reason Ideas. They demand both a metaphysical and a transcendental deduction. These requirements are fulfilled through their derivation from the three forms of syllogism, and by the proof that they exercise an indispensable function, at once limiting and directing the understanding. As limiting concepts, they condition the consciousness of those Ideal standards through which the human mind is

enabled to distinguish between appearance and things in themselves. As regulative, they prescribe the problems which the understanding in its search for knowledge is called upon to solve.

These two tendencies, sceptical and constructive, are never, indeed, in complete opposition. Common to both, rendering possible the psychological explanation of the metaphysical impulse, which even the negative standpoint demands, is the doctrine of the regulative function of Ideal principles. This doctrine, which already appears in the *Dissertation* of 1770, was later developed into the Critical theory of transcendental illusion; and by means of that theory Kant succeeded in bringing the two standpoints into a very real and vital connection with one another. At first sight it may seem to achieve their complete reconciliation, accounting for their distinction while rendering them mutually complementary; and Kant's teaching may perhaps be so restated as to bear out that impression. But the harmony is never completely attained by Kant. Here, as in the *Analytic*, there is an equipoise of tendencies that persist in opposition.

Kant's mediating doctrine of transcendental illusion may first be stated. It rests upon a distinction between appearance and illusion. Appearance (*Erscheinung*) is a transcript in phenomenal terms of some independent reality; and of such appearances we can acquire what from the human point of view is genuine knowledge. On the other hand, all professed insight into the nature of the transcendent or non-empirical is sheer illusion (*Schein*), and purely subjective. There are three species of illusion, logical, empirical and transcendental. Logical illusion stands apart by itself. It is due merely to inattention or ignorance; and vanishes immediately the attention is aroused. Empirical and transcendental illusion, on the other hand, have a twofold point of agreement, first, in being unavoidable, and secondly, in that they originate in our practical needs. We may know that the moon at its rising is no larger than in mid-heavens, that the ocean is no higher in the distance than at the shore; this makes not the least difference in the perceptions as they continue to present themselves. That the illusions are adapted to our practical needs, and are consequently beneficial, is less often observed. Changes in the colour, form, and size of objects as they recede from us, the seeing of the parallel sides of a street as converging, enable us to achieve what would not otherwise be possible. By their means we acquire the power of compressing a wide extent of landscape into a single visual field, of determining distance, and the like. Their practical usefulness is in almost exact proportion to the freedom with which they depart from the standards of the independently real. Kant argues that, in these respects, transcendental illusion is analogous to the empirical. Just as the illusory characteristics of our perceptions are to be understood only in terms of their practical function, so the Ideas of pure Reason have always a practical bearing, and can only be explained and justified in terms of the needs which they satisfy. As theoretical enquirers, we accept all that affords us orientation in the attainment of knowledge; as moral agents, we postulate the conditions which are necessary for the realisation of the moral imperative. And as the Ideals of natural science are found (such is Kant's contention) to be in general form akin to those of the moral consciousness, they thus acquire a twofold footing in the mental life, maintaining their place there quite independently of theoretical proof. Though illusory, they are unavoidable; and though theoretically false, they are from a practical point of view both legitimate and indispensable.

Kant, in developing this thesis, might profitably have pointed to still another respect in which the analogy holds between sense-experience and transcendental beliefs. The illusions of sense-perception come in the ordinary processes of experience to be detected as such by the mind. From the theoretical standpoint of the outside observer who compares the situation of one percipient with that of another, and so is enabled to cancel the differences which variety of situation carries with it, the useful illusions of ordinary experience are reduced to the level of mere appearance. In contradicting one another they reveal their subjective character, and also at the same time afford data for determining the objective conditions to which their subjectively necessary existence is causally due. In similar fashion the transcendental illusions result in contradictions, which compel the mind to recognise that the Ideals to which it is committed by its practical needs are of a merely subjective character, and may never be legitimately

interpreted as representing the actual nature of the independently real.

The chief transcendental illusion, and ultimately the cause of all the others, consists in the belief that the Ideals of explanation which satisfy Reason must in general outline represent the nature of ultimate reality. What the individual seeks to discover he naturally believes to exist prior to the discovery. As practical beings, we regard the objects of sense-experience as absolute realities — they are the realities of practical life, and we are practical rather than theoretical beings — and the existing empirical sciences, conceived as Ideally completed, are therefore viewed as yielding an adequate representation of ultimate reality. But such a belief involves us in contradictions. The world of phenomena in space and time is endlessly relative. It can have no outer bounds or first beginning, and no smallest parts; and in the series of causal antecedents there can be no member that is not effect as well as cause. Viewed as representing a pre-existent goal, the Ideas of Reason are imaginary completions of the intrinsically and merely relative, and are in their very notion self-contradictory. All that is definite in their content conflicts with their absoluteness; and yet, as it would seem, only in their empirical reference can they hope for objective verification.

Such are the problems of the *Dialectic*, so far as they can be formulated in terms common to the two opposed standpoints. Their deeper significance, and the grounds of Kant's alternating treatment of them, only appear when he raises the further questions, what those Ideals of explanation which Reason prescribes really are, and how, if they conflict with the content of experience, it is possible that they should be conceived at all. To these questions Kant propounds both a sceptical and an Idealist answer. The former, in bare outline, may be stated as follows. The so-called Ideas are based upon experience and are derived from it. The understanding removes the limitations to which its pure concepts are subject in sense-experience, and proceeds to use them in their widest possible application, *i.e.* to things in general. As thus employed, they are without real significance, and are indeed self-contradictory. To form the Idea of the unconditioned, we have to omit all those conditions through which alone anything can be apprehended, even as possible. To construct the concept of absolute or unconditioned necessity, we have similarly to leave aside the conditions upon which necessity, as revealed in experience, in all cases depends; in eliminating conditions, we eliminate necessity in the only forms in which it is conceivable by us. Such Ideas are, indeed, simply *schematic forms*, whereby we body forth to ourselves, in more or less metaphorical terms, the concept of a *maximum*. They are imaginary extensions, in Ideal form, of the unity and system which understanding has discovered in actual experience, and which, under the inspiration of such Ideals, it seeks to realise in ever-increasing degree. If the understanding, as thus insisting upon Ideal satisfaction, be entitled Reason, the Ideas must be taken as expressing a subjective interest, and as exhausting their legitimate employment in the regulation of the understanding. Their transcendental deduction will consist in the proof that they are necessary to the understanding for the *perfecting* of its experience. They do not justify us in attempting to decide, in anticipation of actual experience, how far the contingent collocations and the inexhaustible complexities of brute experience are really reducible to a completely unified system; but they quite legitimately demand that through all discouragements we persist in the endeavour towards their realisation. In any case, it is by experience that the degree of their reality has to be decided. We judge of things by the standard of that for which they exist, and not *vice versa*. As the sole legitimate function of the Ideas is that of inspiring the understanding in its empirical employment, they must never be interpreted as having metaphysical significance. As the Ideas exist solely for the sake of experience, it is they that must be condemned, if the two really diverge. We do not say "that a man is too long for his coat, but that the coat is too short for the man." It is experience, not Ideas, which forms the criterion alike of truth and of reality.

Kant's teaching, when on Idealist lines, is of a very different character. Reason is distinct from understanding, and yet is no less indispensably involved in the conditioning of experience. All consciousness is consciousness of a whole which precedes and conditions its parts. Such consciousness

cannot be accounted for by assuming that we are first conscious of the conditioned, and then proceed through omission of its limitations to form to ourselves, by means of the more positive factors involved in this antecedent consciousness, an Idea of an unconditioned whole. The Idea of the unconditioned is distinct in nature from all other concepts, and cannot be derived from them. It must be a pure *a priori* product of what may be named the faculty of Reason. Its uniqueness is what causes its apparent meaninglessness. As it is involved in all consciousness, it conditions all other concepts; and cannot, therefore, be defined in terms of them. Its significance must not be looked for save in that Ideal, to which no experience, and no concept other than itself, can ever be adequate. That in this Ideal form it has a very real and genuine meaning is proved by our capacity to distinguish between appearance and reality. For upon it this distinction, in ultimate analysis, is found to rest. Consciousness of limitation presupposes a consciousness of what is beyond the limit; consciousness of the unconditioned is prior to, and renders possible, our consciousness of the contingently given. The Idea of the unconditioned must therefore be counted as being, like the categories, though in a somewhat different manner, a condition of the possibility of experience. With it our standards both of truth and of reality are inextricably bound up. The Ideas in which it specifies itself, so far from depending upon empirical verification, are the touchstone by which we detect the unreality of the sensible world, and by which a truer reality, such as would be adequate to the Ideal demands of pure Reason, is prefigured to the mind.

These two standpoints are extremely divergent in their consequences. Each leads to a very different interpretation of the content of the Ideas, of their function in experience, and of their objective validity. On the one view, their content is merely empirical, and sense-experience is our sole criterion of truth and reality; on the other, they have to be recognised as containing a pure *a priori* concept, and are themselves the standards by which even empirical truth can alone be determined. In the one case, they are Ideals projected by experience for its own empirical guidance; they are built upon contingent experience, and depend upon it alike for the content which makes them conceivable and for their validity. In the other, they are presuppositions of experience, at once conditioning its possibility and revealing its merely phenomenal character. According to the sceptical view, Reason is concerned only with itself and its own subjective demands; on the Idealist view, it is a metaphysical faculty, and outlines possibilities that may perhaps be established by practical Reason.

Such, in broad outline, are the central doctrines of the *Dialectic*. They constitute an extraordinarily stimulating and suggestive body of Critical teaching. In no other division of the *Critique* do the power and originality of Kant’s thinking gain such abundant, forceful and illuminating expression. The accumulated results of the painstaking analyses of the earlier sections contribute a solidity and fulness of meaning, which render the argument extremely impressive, even to those who are out of sympathy with Kant’s ultimate purposes. Its persistent influence, on sceptical no less than on Idealist lines, and often conveyed by very devious channels, can frequently be detected even in thinkers — Herbert Spencer is an instance — who would indignantly repudiate the charge of being indebted to such a source.

THE HISTORY AND DEVELOPMENT OF KANT’S VIEWS IN REGARD TO THE PROBLEMS OF THE DIALECTIC

We may now proceed to consider the evidence in support of the early origin of the central portions of the *Dialectic* — the sections on the antinomies. As Benno Erdmann has very conclusively shown, preoccupation with the problem of antinomy was the chief cause of the revolution which took place in Kant’s views in 1769, and which found expression in his *Dissertation* of 1770. It was the existence of antinomy which led Kant to recognise the subjectivity of space and time. That is to say, it led him to develop that doctrine of transcendental idealism which reappears in the concluding sections of the *Aesthetic*, and which was recast and developed in the *Analytic*. Already in the *Dissertation* it supplies

the key for the solution of the problems concerning infinity. The impossibility of completing the space, time, and causal series, and the consequent impossibility of satisfying the demands of the mind for totality, simplicity and unconditionedness, do not, it is there maintained, discredit reason, but only serve to establish the subjectivity of the sensuous forms to which the element of infinitude is in all cases due.

Kant's thinking was, of course, diverted into an entirely new channel (as his letter to Herz of February 21, 1772, shows), when he came to realise that the metaphysical validity or invalidity of thought must be decided prior to any attempt to discover a positive solution of such problems as are presented by the antinomies. And when, owing to the renewed influence of Hume, at some time subsequent to the date of the letter to Herz, this new problem was recognised as being the problem of *a priori synthesis*, all questions regarding the nature of the absolutely real were made to take secondary rank, yielding precedence to those of logical theory. When the antinomy problems re-emerge, their discussion assumes Critical form.

In three fundamental respects Kant's treatment of the antinomies in the *Dissertation* differs from that of the *Critique*. In the first place, the demand for totality or absoluteness is not in the *Dissertation* ascribed to a separate faculty. Indeed Kant's words would seem to show that at times he had inclined to ascribe it merely to the free-ranging fancy or imagination. Secondly, as the various antinomies were traced exclusively to the influence of space and time upon pure thought, they were treated together, and no classification of them was attempted. And lastly, though Kant's utterances are somewhat ambiguous, the illusory character of the antinomies was in the main viewed as being of a more or less *logical* nature. That is to say, it was regarded as entirely preventable and as "vanishing like smoke" upon adoption of a true philosophical standpoint.

A number of the *Reflexionen* reveal the various tentative schemes, by trial of which Kant worked his way toward a more genuinely Critical treatment of the problems of infinity. The intellectual factors receive fuller recognition, and as a consequence a definite classification results. At some time prior to the discovery of the table of categories, Kant adopted a threefold division of what he names first principles or presuppositions — principles of substance-accident, of ground-consequence, and of whole-part. *Reflexion* ii. 578 is typical.

"Three *principia*: (1) in the field of the actual there is the relation of substance to accident (*inhaerentia*): (2) of ground to consequence (*dependentia*): (3) of parts and of composition (*compositio*). There are three presuppositions: of the subject, of the ground, and of the parts; of insition [Kant's own term], of subordination, and of composition; therefore also three first *principia*: (1) subject, which is never a predicate; (2) ground, which is never a consequence; (3) unity, which is not itself composite."

There are numerous other *Reflexionen* to the same effect. The resulting conceptions are defined both as limits and as absolute totalities, and in *Reflexion* ii. 1252 are enumerated as follows:

"The first subject; the first ground; the first part. The subject which holds everything in itself; the ground which takes everything under itself; the whole which comprehends everything. The *totalitas absoluta* of reality, of series, of co-ordination."

The introduction of the terms 'absolute' and 'totality' indicate that Kant has also come to recognise the presence of a unique notion (equivalent to the "unconditioned" of the *Critique*), distinct in content from any of the three enumerated *principia*, but common to them all. From the very first Kant would seem to have appropriated for it the title Idea. *Reflexionen* ii. 1243, 1244, and 124 may be quoted:

"The Idea is single (*individuum*), self-sufficient, and eternal. The divinity of our soul is its capacity to form the Idea. The senses give only copies or rather *apparentia*." "Idea is the representation of the whole in so far as it necessarily precedes the determination of the parts. It can never be empirically represented, for the reason that in experience we proceed from the parts through successive syntheses to the whole. It is the archetype (*Urbild*) of things, for certain objects are only possible through an Idea. Transcendental Ideas are those in which the absolute whole determines the parts in an aggregate or as series."

“Metaphysics proper is the application of transcendental philosophy to concepts supplied by Reason and necessary to it, to which, however, no corresponding objects can be given in experience. The concepts must therefore refer to the supersensible. That, however, can be nothing but the unconditioned, *for that is the sole theoretical Idea of reason*. [Not italicised in the original.] Metaphysics thus relates: (1) to that of which only the whole can be represented as absolutely unconditioned: (2) to things so far as they are in themselves sensuously unconditioned. The first part is cosmology, the second rational doctrine of the soul, pneumatology and theology.”

At this stage, therefore, Kant would seem to have held that there is but one Idea strictly so called, and that the above three *principia* are merely specifications of it in terms of the concepts of substance-accident, ground-consequence, and whole-part. The classification thus obtained is in certain respects more satisfactory than that which is adopted in the *Critique*. It locates the cosmological argument with the causal category, and so would enable the conceptions of freedom or *causa sui*, and of Divine Existence, to be dealt with in their natural connection with one another. It also supplies, in the category of whole and part, a more fitting heading for those antinomy problems which deal with the unlimited and the limited, the divisible and the indivisible, the complex and the simple. The classification would, however, in separating the problem of the simple from that of substance, remain open to the same criticism as that of the *Critique*.

This classification must, as we have stated, be of a date prior to Kant’s discovery of the table of categories. That is quite clear from its ignoring the category of reciprocity, and from its combination of the other two categories of relation with the merely quantitative category of whole and part. For though the last is also entitled composition and co-ordination, it is conceived in these particular *Reflexionen* in exclusively quantitative terms. When Kant formulated the “metaphysical” deduction of the categories he was, of course, compelled to recast the classification, and did so in the only possible manner, consistent with his architectonic, by substituting the category of reciprocity for that of whole and part, and by taking the new heading, obtained through combination of reciprocity with the Idea of the unconditioned, as equivalent to the Idea of Divine Existence. But this could not be done without dislocating the entire scheme. The category of ground and consequence is deprived of its chief application, that expressed in the cosmological argument; and in order to provide a new content for it, Kant is compelled to force upon it the problems previously classified under the displaced category of whole and part. Even so, the problem of the *causa sui* cannot be eliminated, and reappears, partly as the problem of freedom, and partly as the modal problem of necessary existence.

The identification of the theological Idea with the category of reciprocity has a further consequence. It carries the problem of Divine Existence outside the sphere of the problems of infinity, and necessitates a very different treatment from that which it would naturally have received at Kant’s hands, if developed in its connection with his own Critical teaching. He is driven to expound it in the extreme rationalistic form in which it had been formulated by Leibniz and Wolff, as a doctrine of the *Ens realissimum*.

Prior to the rearrangement, necessitated by recognition of the category of reciprocity, Kant would seem to have expected to bring the entire body of Wolffian metaphysics within the scope of a general doctrine of antinomy. The problems of the divisible and the indivisible, of the simple and the complex, leading as they do to discussion of the presuppositions underlying the Leibnizian monadology, concern spiritual as well as material substance. Similarly, the main problems of theology would have been treated in connection with the cosmological inference to a first cause, and with the discussion of the possibility of first beginnings in space and time.

The sections in the *Critique* devoted to the antinomies reveal, in many ways, Kant’s original design. It is especially noticeable in his discussion of the third and fourth antinomies. The problems of freedom and of necessary existence are by no means treated in merely cosmological fashion. Indeed Kant makes no pretence of concealing their psychological and theological implications. Even the first and second

antinomies have obvious bearings of a similar character. But it is in the section entitled *The Interest of Reason in this Self-conflict* that the broader significance of the antinomies finds its fullest expression. In its suggestive contrast of the two possible types of philosophy, Epicurean and Platonic, the argument entirely transcends the bounds prescribed to it by its cosmological setting. As we follow the comprehensive sweep of its argument, we can hardly avoid regretting that Kant failed to keep to his original plan, as here unfolded, of expounding the self-conflict of Reason in the form of a broad judicial statement of the grounds and claims of the two opposing authorities which divide the allegiance of the human spirit, namely, the intellectual and the moral, science with its cognitive demands on the one hand, the consciousness of duty with its no less imperious prescriptions on the other. The materialist philosophies would then have been presented as inevitably arising when intellectual values are made supreme; and the Idealist philosophies as equally cogent when moral values are taken as primary and are allowed to determine speculative tenets. Against this background of conflicting dogmatisms the comprehensive and satisfying character of the Critical standpoint would have stood out the more clearly; and its historical affiliations, its debt to the sceptics and materialists, no less than to the Idealists, would have been depicted in more adequate terms. As it is, in the chapters on the *Paralogisms* and the *Ideal of Pure Reason* there is almost entire failure to recognise the possibility of a naturalistic solution of the problems with which they deal, and Kant so far succumbs to the outworn influences of his day and generation — the very influences from which the Critical philosophy, consistently developed, is a final breaking away — as to maintain, almost in the manner of the English Deists, of Voltaire and Rousseau, that God, Freedom, and Immortality are conceptions which the mind must necessarily form, and in the validity of which it must spontaneously believe. Kant is here, indeed, interpreting "natural reason" in the light of his own personal history. The Christian beliefs, in which he had been nurtured from childhood, and their rationalist counterparts in the Wolffian philosophy, had become, as it were, a second nature to him; and the resistance, which in his own person they had offered to the development of Critical teaching, he not unnaturally interpreted as evidence of their being imposed by the very structure of reason. He transforms the metaphysical sciences in their Wolffian form into inevitable illusions of the human mind.

There is evidence that the theological problems were the first to be withdrawn from the sphere of the "sceptical method," peculiar to the antinomies. Thus *Reflexion* ii. 125 states that "metaphysics proper consists of *cosmologia rationalis* and *theologia naturalis*" — rational psychology being, as it would seem, still included within cosmology. What the considerations were which induced Kant to claim similarly independent treatment for rational psychology, we can only conjecture. For a time, while still holding to the bipartite division, he would seem to have made the further change of also separating psychology from cosmology, classing psychology and theology together as subdivisions of the rational science of soul.

"[Metaphysics has two parts]: the first is cosmology, the second rational doctrine of soul, pneumatology and theology."

A main factor deciding Kant in favour of a dogmatic, non-sceptical treatment of rational psychology may have been the greater opportunity which it seemed to afford him of connecting its doctrines with the teaching of the *Analytic*, and especially with his central doctrine of apperception. But to whatever cause the decision was due, it resulted in the impoverishment of the second antinomy, through withdrawal of the more important half of its natural content. This antinomy could no longer be made to comprehend a discussion of the logical bases of monadology, and of its professed proofs of the simplicity and immortality of the soul. Nothing is left to it save the discussion of the monadistic theory of matter (*somatologia pura*). This change has also, as already noted, the unfortunate effect of precluding Kant from recognition of the physical application of the category of substance. By the simple he means the substantial, and yet he may not say so; his architectonic forbids.

I may hazard the further suggestion that Kant's interpretation of rational psychology in terms of the

Critical doctrine of apperception is of earlier date than his doctrine of transcendental illusion. For the chapter on the *Paralogisms* seems in its first form to have contained no reference to that latter doctrine. The few passages which take account of it, all bear evidence of being later intercalations. This is the more remarkable in that the Paralogisms can easily be shown to be typical examples of transcendental illusion. Indeed, neither the antinomies nor the theological Ideal conform to its definition in the same strict fashion.

The problem as to whether the doctrine of transcendental illusion and the deduction of the Ideas from the three species of syllogism originated early or late, is largely bound up with the question as to when Kant finally adopted the terms *Analytic* and *Dialectic* as titles for the two main divisions of his *Transcendental Logic*. That Kant was at first very uncertain as to what the main divisions of his system ought to be, appears very clearly from the *Reflexionen*. To his teaching as a whole he usually applies the title *Transcendental Philosophy*, and in *Reflexion* ii. 123 he enumerates the following subdivisions within it: *Aesthetic*, *Logic*, *Critique*, and *Architectonic*. By *Critique* Kant must here mean what in other *Reflexionen* he names *Discipline*, and which he finally named *Dialectic*. As thus identified with the *Discipline*, the *Dialectic* is at times viewed as a division of a *Methodology* or *Organon*, whose other divisions are entitled *Canon* and *Architectonic*. This earlier scheme may therefore be represented as follows:

Transcendental
Philosophy–

Doctrine of Elements

Aesthetic.
Logic.

Critique = Discipline [corresponding to the Dialectic of the *Critique*].

Doctrine of Methods
(Methodology)

Canon.
Architectonic.

The terms *Analytic* and *Dialectic* do not occur in these *Reflexionen*, and their adoption may therefore be inferred to synchronise with Kant's later decision to include the treatment of the metaphysical sciences within his *Logic*; and that decision was probably an immediate result of his having developed meantime a doctrine of transcendental illusion. The new scheme in its final form is therefore as follows:

Transcendental
Philosophy
or Critique of
Pure Reason

Doctrine of
Elements

Aesthetic.
Logic.

Analytic

of Concepts.
of Judgement.

Dialectic — of Reason.

Doctrine of
Methods
(Methodology)

Discipline (retained but given a new
and more general content).

Canon.
Architectonic.
History.

In thus transferring *Dialectic* from the *Methodology* to the *Doctrine of Elements*, Kant stands committed to the view that it contains positive teaching of a character analogous to that of the *Analytic*, with which it is now co-ordinated. As we have already noted, the fundamental opposition which runs through the entire *Dialectic* is due to the conflict between the older view of Reason as merely understanding in its transcendent employment, and this later view of it as a distinct faculty, yielding concepts with a positive and indispensable function, different from, and yet also analogous to, that exercised by the categories of the understanding.

Adickes, to whom students of Kant are indebted for a convincing demonstration of the constant influence of Kant's logical architectonic upon the content of the Critical teaching, would seem at this point to rely too exclusively upon that method of explanation. He contends that Kant's deduction of the Ideas of Reason from the three species of syllogism is entirely traceable to this source, and is without real philosophical significance. That is perhaps in the main true. But it need not prevent us from appreciating the importance of the doctrines which Kant contrives to expound under guise of this logical machinery. We have already observed that prior to the discovery of this deduction Kant had recognised the connection between the concept of the unconditioned and the three Ideas through which it finds expression. As the forms of syllogism are differentiated in terms of the three categories of relation, the deduction does not interfere with Kant's retention of this classification of Ideas; while in connecting Reason as a faculty with reasoning as a logical process, an excellent opportunity is found for explaining the grounds and significance of the demand for unconditionedness, i.e. for completeness of explanation. This demand, as he has also come to recognise, lies open to question, and therefore calls for more precise definition.

The artificial character of the metaphysical deduction lies not so much in this derivation of the three Ideas of the unconditioned — unconditioned substance, unconditioned causality, unconditioned system — from the categorical, hypothetical, and disjunctive forms of syllogism respectively, as in the further equating of them with the Ideas of the Self, the World, and God. The Idea of unconditioned substance has many possible applications besides the use to which it is put in rational psychology. The Idea of an unconditioned causality may be conceived in psychological and theological as well as in cosmological terms; and as a matter of fact Kant himself frequently identifies it with the concept of freedom, as in the third and fourth antinomies, or when he enumerates the Ideas as being those of God, Freedom, and Immortality. Similarly, the Idea of system is the inspiring principle of materialism, and also finds in such philosophies as that of Spinoza much more adequate expression than in the *Ens realissimum* of the Wolffian School. But further comment is not, at this stage, really profitable. These are questions which can best be discussed as they emerge in the course of the argument.

Kant carried his logical architectonic one stage further. Not satisfied with connecting the three Ideas of Reason with the categories that underlie the three species of syllogism, he also attempted to organise the various particular applications of each Idea in terms of the fourfold division of the table of categories. By the use of his usual high-handed methods he succeeded in doing so in the case of the psychological and cosmological Ideas. There are four paralogisms and four antinomies. But when the attempt failed in regard to the theological Idea, he very wisely abstained from either apology or explanation. That the failure was not due to lack of desire or perseverance appears from *Reflexion* ii. 1573, which would seem to be the record of an unavailing attempt to obtain a satisfactory articulation of the theological Ideal. Doubtless, had he been sufficiently bent upon it, he could have worked out some sort of fourfold division; but there were limits even to Kant's devotion to the architectonic scheme. It is difficult to see how any such arrangement could have been followed without serious perversion of the argument.

Adickes has suggested that the distinction between the faculty of understanding and the faculty of judgment is subsequent to, and suggested by, Kant's successful tracing of the Ideas to a separate faculty of Reason. Some such distinction was demanded in order that the parallelism of transcendental and formal logic might be complete. This conjecture of Adickes is probably correct. It would seem to be supported by the internal evidence of the *Analytic of Principles*. As we have had occasion to note, the doctrine of schematism, in terms of which the distinction between understanding and judgment is formulated, is late in date of origin. This distinction is of the same artificial character as that between understanding and Reason; and though, like the latter distinction, it supplies Kant with a convenient framework for the arrangement of genuine Critical material, it also tends to conceal the simpler and more inward bonds of true relationship.

TRANSCENDENTAL DIALECTIC

INTRODUCTION

I. Transcendental Illusion

Dialectic is a Logic of Illusion. — The meaning which Kant attaches to the term dialectic has already been considered. The passage above quoted from his *Logic* shows the meaning which he supposed the term historically to possess, namely, as being a sophistical art of disputation, presenting false principles in the guise of truth by means of a seeming fulfilment of the demands of strict logical proof. The incorrectness of this historical derivation hardly needs to be pointed out. Kant professes to be following his contemporaries in thus using the term as a title for the treatment of false reasoning. But even this statement must be challenged. Adickes, after examination of a large number of eighteenth-century text-books, reports that in the six passages in which alone he has found it to occur it is never so employed. In Meier it is used as a title for the theory of probable reasoning, and in Baumgarten it occurs only in adjectival form as equivalent to sophistical. This last is the nearest approach to Kant's definition. All historical considerations may therefore be swept aside. We are concerned only with the specific meaning which Kant thought good to attach to the term. He adapts it in the freest manner to the needs of his system. In A 61 = B 85, as in his *Logic*, he has defined it in merely negative fashion. He is now careful to specify the more positive aspects of the problems with which it deals. Though definable as the logic of illusion, the deceptive inferences with which it concerns itself are of a quite unique and supremely significant character. They must, as above noted, be distinguished alike from logical and from empirical illusion. They have their roots in the fundamental needs of the human mind, and the recognition of their illusory character does not render unnecessary either a positive explanation of their occurrence or a Critical valuation of their practical function as regulative ideals.

A 293 = B 349. — Regarding the connection between illusion and error cf. B 69, and above, p-53.

A 295 = B 352. — Logical, empirical, and transcendental illusion. Cf. above, p, 427-9, 437.

A 296 = B 352. — Kant here defines the terms transcendental and transcendent in a very unusual manner. The two terms are not, he states, synonymous. The principles of pure understanding are of merely empirical validity, and *consequently* are not of *transcendental* employment beyond the limits of experience. A principle is *transcendent* when it not only removes these limits, but prescribes the overstepping of them.

II. Pure Reason as the Seat of Transcendental Illusion

(*a*) *Reason in General*

Reason, like understanding, is employed in two ways, formal or logical and real. The logical use of Reason consists in mediate inference, the real in the generation of concepts and principles. Reason is thus both a logical and a transcendental faculty, and we may therefore expect that its logical functions will serve as a clue to those that are transcendental. The argument which follows is extremely obscure. It is a foreshadowing in logical terms of a distinction which, as Kant himself indicates, cannot at this stage be adequately stated. The distinction may be extended and paraphrased as follows. Reason, generically taken as including both activities, is the faculty of principles, in distinction from understanding which is the faculty of rules. Principles, properly so-called, are absolutely *a priori*. Universals which imply the element of intuition must not, therefore, be ranked as principles in the strict sense. They are more properly to be entitled rules. A true principle is one that affords knowledge of the particulars which come under it,

and which does so from its own internal resources, that is to say, through pure concepts. In other words, it yields *a priori* synthetic knowledge, and yet does so independently of all given experience. Now, as the *Analytic* has proved, knowledge obtained through understanding, whether in mathematical or in physical science, is never of this character. Its principles, even though originating in pure intuition or in the pure understanding, are valid only as conditions of possible experience, and are applicable only to such objects as can occur in the context of a sense-perception. That is to say, the understanding can never obtain synthetic knowledge through pure concepts. Though, for instance, it prescribes the principle that everything which happens must have a cause, that principle does not establish itself by means of the concepts which it contains, but only as being a presupposition necessary to the possibility of sense-experience. If, then, principles in the strict sense actually exist, they must be due to a faculty distinct from understanding, and will call for a deduction of a different character from that of the categories.

In the last paragraph but one of the section Kant indicates the doctrine which he is foreshadowing. The rules of understanding apply to appearances, prescribing the conditions under which the unity necessary to any and every experience can alone be attained. The principles of Reason do not apply directly to appearances, but only to the understanding, defining the standards to which its activities must conform, if a completely unified experience is to be achieved. Whereas the rules of understanding are the conditions of objective existence in space and time, principles in the strict sense are criteria for the attainment of such absoluteness and totality as will harmonise Reason with itself. Reason, determined by principles which issue from its own inherent nature, prescribes what the actual ought to be; understanding, proceeding from rules which express the conditions of possible experience, can yield knowledge only of what is found to exist in the course of sense-experience. The unity of Reason is Ideal; the unity of understanding is empirical. Principles are due to the *self*-determination of reason; the rules of understanding express the necessitated determinations of sense. The former demand a more perfect and complete unity than is ever attainable by means of the latter. Two passages from the *Lose Blätter* will help to define the distinction.

"There is a synthesis prototypon and a synthesis ectypon. The one ... *simpliciter, a termino a priori*, ... the other *secundum quid, a termino a posteriori*.... Reason advances from the universal to the particular, the understanding from the particular to the universal.... The first is absolute and belongs to the free or metaphysical, and also to the moral, employment of Reason." "The principles of the synthesis of pure Reason are all metaphysical.... [They] are principles of the subjective unity of knowledge through Reason, *i.e.* of the agreement of Reason with itself."

The chief interest of this section lies in its clear indication of the dual standpoint to which Kant is committing himself by the manner in which he formulates this distinction between rules and principles. The indispensableness of the latter, upon which Kant is prepared to insist, points to the Idealist interpretation of their grounds and validity; their derivation from mere concepts, without reference to or basis in experience, must, on the other hand, in view of the teaching of the *Analytic*, commit Kant to a sceptical treatment of their objective validity. In the above account, suggestions of the Idealist point of view are not entirely absent; but, on the whole, it is the sceptical view that is dominant. The Ideas of Reason can be justified as necessary only for the perfecting of experience, not as conditions of experience as such. They express a subjective interest in the attainment of unity, not conditions of the possibility of objective existence.

"[Civil Laws] are only limitations imposed upon our freedom in order that such freedom may completely harmonise with itself; hence they are directed to something which is entirely our own work, and of which we ourselves, through these concepts, can be the cause. But that objects in themselves, the very nature of things, should stand under principles, and should be determined according to mere concepts, is a demand which, if not impossible, is at least quite contrary to common sense [*Widersinnisches*]."

(*b*) *The Logical Use of Reason*

In this subsection Kant introduces the distinction between understanding and judgment which he has sought to justify in A 130 ff. = B 169 ff. By showing that inference determines the *relation* between a major premiss (due to the understanding) and the condition defined in the minor premiss (due to the faculty of judgment), he professes to obtain justification for classifying the possible forms of reasoning according to the three categories of relation. The general remark is added that the purpose of Reason, in its logical employment as inference, is to obtain the highest possible unity, through subsumption of all multiplicity under the smallest possible number of universals.

(*c*) *The Pure Use of Reason*

Kant here states the alternatives between which the *Dialectic* has to decide. Is Reason merely formal, arranging given material according to given forms of unity, or is it a source of principles which prescribe higher forms of unity than any revealed by actual experience? Further examination of its formal and logical procedure constrains us, Kant asserts, to adopt the latter position; and at the same time indicates how those principles must be interpreted, namely, as subjective laws that apply not to objects but only to the activities of the understanding.

In the first place, a syllogism is not directly concerned with intuitions, but only with concepts and judgments. This may be taken as indicating that pure Reason relates to objects only mediately *by way* of understanding and its judgments. The unity which it seeks is higher than that of any possible experience; it is a unity which must be constructed and cannot be given.

Secondly, Reason in its logical use seeks the *universal* condition of its judgment; and when such is not found in the major premiss proceeds to its discovery through a regressive series of prosyllogisms. In so doing it is obviously determined by a principle expressive of the peculiar function of Reason in its logical employment, namely, that for the conditioned knowledge of understanding the *unconditioned* unity in which that knowledge may find completion must be discovered. Such a principle is synthetic, since from analysis of the conception of the conditioned we can discover its relation to a condition, but never its relation to the *unconditioned*. That is a notion which falls entirely outside the sphere of the understanding, and which therefore demands a separate enquiry. How is the above *a priori* synthetic principle to be accounted for, if it cannot be traced to understanding? Has it objective, or has it merely subjective validity? And lastly, what further synthetic principles can be based upon it? Such are the questions to which Critical *Dialectic* must supply an answer. This *Dialectic* will be composed of two main divisions, the doctrine of “the transcendent concepts of pure Reason” and the doctrine of “transcendent and dialectical inferences of Reason.”

BOOK I

THE CONCEPTS OF PURE REASON

The distinction here drawn between concepts obtained by reflection and concepts gained by inference is a somewhat misleading mode of stating the fact that, whereas the categories of understanding condition experience and so make possible the unity of consciousness necessary to all reflection, or, in other words, are conditions of the material supplied for inference, the concepts of Reason are Ideal constructions which though in a certain sense resting upon experience none the less transcend it. The function of the Ideas is to organise experience in its totality; that of the categories is to render possible the sense-perceptions constitutive of its content. The former refer to the unconditioned, and though that is a conception under which everything experienced is conceived to fall, it represents a type of knowledge to which no actual experience can ever be adequate.

Conceptus ratiocinati — conceptus ratiocinantes. When such transcendent concepts possess “objective validity,” they are correctly inferred, and may be entitled *conceptus ratiocinati*. If, on the other hand, they are due to merely sophistical reasoning, they are purely fictitious, *conceptus ratiocinantes*. This distinction raises many difficulties. Kant’s intention cannot be to deny that the *conceptus ratiocinati* are “mere Ideas” (*entia rationis*) — for such is his avowed and constant contention — or that the inference to them is dialectical and is based upon a transcendental illusion. Two alternatives are open. He may mean that they are only valid when the results of such inference are Critically reinterpreted, and when the function of the Ideas is realised to be merely regulative; or his intention may be to mark off the Ideas, strictly so-called, which are inevitable and beneficial products of Reason, from the many idle and superfluous inventions of speculative thought. Kant’s concluding remark, that the questions at issue can be adequately discussed only at a later stage, may be taken as in the nature of an apology for the looseness of these preliminary statements, and as a warning to the reader not to insist upon them too absolutely. The participles *ratiocinati* and *ratiocinantes* are of doubtful latinity. The distinction of meaning here imposed upon them has not been traced in any other writer, and is perhaps Kant’s own invention.

SECTION I

IDEAS IN GENERAL

Kant connects his use of the term Idea with the meaning in which it is employed by Plato. He urges upon all true lovers of philosophy the imperative need of rescuing from misuse a term so indispensable to mark a distinction more vital than any other to the very existence of the philosophical disciplines.

“[For Plato] Ideas are the archetypes of the things themselves, and not, like the categories, merely keys to possible experiences. In his view they issued from the Supreme Reason, and from that source have come to be shared in by human Reason.... He very well realised that our faculty of knowledge feels a much higher need than merely to spell out appearances according to a synthetic unity, in order to read them as experience. He knew that our Reason naturally exalts itself to forms of knowledge which so far transcend the bounds of experience that no given empirical object can ever coincide with them, but which must none the less be recognised as having their own reality and which are by no means mere fictions of the brain.”

Plato found these ideas chiefly, though not exclusively, in the practical sphere. When moral standards are in question, experience is the mother of illusion.

“For nothing can be more injurious or more unworthy of a philosopher than the vulgar appeal to so-called adverse experience. Such experience would never have existed at all, if those institutions had been established at the proper time in accordance with Ideas, and if Ideas had not been displaced by crude conceptions which, just because they have been derived from experience, have nullified all good intentions.”

Even in the natural sphere Ideas which are never themselves adequately embodied in the actual must be postulated in order to account for the actual. Certain forms of existences “are possible only according to Ideas.”

“A plant, an animal, the orderly arrangement of the cosmos — probably, therefore, the entire natural world — clearly show that they are possible only according to Ideas, and that though no single creature in the conditions of its individual existence coincides with the Idea of what is most perfect in its kind — just as little as does any individual man exactly conform to the Idea of humanity, which he actually carries in his soul as the archetype of his actions — yet these Ideas are none the less completely determined in the

Supreme Understanding, each as an individual and each as unchangeable, and are the original causes of things. But only the totality of things, in their interconnection as constituting the universe, is completely adequate to the Idea."

Though Kant avows the intention of adapting the term Idea freely to the needs of his more Critical standpoint, all these considerations contribute to the rich and varied meanings in which he employs it.

Reflexionen and passages from the *Lectures on Metaphysics* may be quoted to show the thoroughly Platonic character of Kant's early use of the term, and to illustrate its gradual adjustment to Critical demands.

"The Idea is the unity of knowledge, through which the manifold either of knowledge or of the object is possible. In the former, the whole of knowledge precedes its parts, the universal precedes the particular; in the latter, knowledge of the objects precedes their possibility, as *e.g.* in [objects that possess] order and perfection." "That an object is possible only through a form of knowledge is a surprising statement; but all teleological relations are possible only through a form of knowledge [*i.e.* a concept]." "The Idea is single (*individuum*), self-sufficient, and eternal. The divinity of our soul is its capacity to form the Idea. The senses give only copies or rather *apparentia*." "As the Understanding of God is the ground of all possibility, archetypes, Ideas, are in God.... The divine *Intuitus* contains Ideas according to which we ourselves are possible; *cognitio divina est cognitio archetypa*, and His Ideas are archetypes of things. The [corresponding] forms of knowledge possessed by the human understanding we may also entitle (in a comparative sense) archetypes or Ideas. They are those representations of our understanding which serve for judgment upon things." "Idea is the representation of the whole in so far as it necessarily precedes the determination of the parts. It can never be empirically represented, because in experience we proceed from the parts through successive synthesis to the whole. It is the archetype of things, for certain objects are only possible through an Idea. Transcendental Ideas are those in which the absolute whole determines the parts in an aggregate or as series." "The pure concepts of Reason have no *exemplaria*; they are themselves archetypes. But the concepts of our pure Reason have as their archetypes this Reason itself and are therefore subjective, not objective." "The transcendental Ideas serve to limit the principles of experience, forbidding their extension to things in themselves, and showing that what is never an object of possible experience is not therefore a non-entity [*Unding*], and that experience is not adequate either to itself or to Reason, but always refers us further to what is beyond itself." "The employment of the concept of understanding was immanent, that of the Ideas as concepts of objects is transcendent. But as regulative principles alike of the completion and of the limitation of our knowledge, they are Critically immanent." "The difficulties of metaphysics all arise in connection with the reconciling of empirical principles with Ideas. The possibility of the latter cannot be denied, but neither can they be made empirically intelligible. The Idea is never a *conceptus dabilis*; it is not an empirically possible conception."

Kant appends the following 'Stufenleiter' (ladder-like) arrangement of titles for the various kinds of representation. Representation (*Vorstellung*) is the term which he substitutes for the Cartesian and Lockian employment of the term idea, now reserved for use in its true Platonic meaning. To entitle such a representation as that of red colour an idea is, in Kant's view, an intolerable and barbaric procedure; that representation is not even a concept of the understanding.

SECTION II

This section completes the metaphysical deduction of the Ideas. In the preceding sections on the logical and on the pure use of Reason, Kant has pointed out that Reason proceeds in accordance with the principle, that for the conditioned knowledge of understanding the unconditioned, in which it finds completion, must be discovered. This principle is synthetic, involving a concept which transcends the understanding; and as Reason in its logical use is merely formal, that concept must be due to Reason in its creative or transcendental activity. In the section before us Kant deduces from the three kinds of syllogism the three possible forms in which such an Idea of Reason can present itself. The deduction is, as already noted, wholly artificial, and masks Kant's real method of obtaining the Ideas, namely, through combination of the unique concept of the unconditioned with the three categories of relation. The deduction is based upon an extremely ingenious analogy between the logical function of Reason in deductive inference and its transcendental procedure in prescribing the Ideal of unconditioned totality. In the syllogism the predicate of the conclusion is shown to be connected with its subject in accordance with a condition which is stated in its universality in the major premiss. Thus if the conclusion be: Caius is mortal, in constructing the syllogism, required to establish it, we seek for a conception which contains the condition under which the predicate is given — in this case the conception "man" — and we state that condition in its universality: All men are mortal. Under this major premiss is then subsumed Caius, the object dealt with: Caius is a man. And so indirectly, by reference to the universal condition, we obtain the knowledge that Caius is mortal. Universality, antecedently stated, is restricted in the conclusion to a specific object. Now what corresponds in the synthesis of intuition to the *universality* (*universalitas*) of a logical premiss is *allness* (*universitas*) or *totality* of conditions. The transcendental concept of Reason, to which the logical procedure is to serve as clue, can therefore be no other than that of the totality of conditions for any given conditioned. And as totality of conditions is equivalent to the *unconditioned*, this latter must be taken as the fundamental concept of Reason; the unconditioned is conceived as being the ground of the synthesis of everything conditioned. But there are three species of relation, and consequently there are three forms in which the concept of Reason seeks to realise its demand for the unconditioned: (1) through categorical synthesis in one subject, (2) through hypothetical synthesis of the members of a series, and (3) through disjunctive synthesis of the parts in one system. To these three correspond the three species of syllogism, categorical, hypothetical, and disjunctive, in each of which thought passes through a regressive series of prosyllogisms back to an unconditioned: the first to a concept which stands for what is always a subject and never a predicate; the second to a presupposition which itself presupposes nothing further; and the third to such an aggregate of the members of the division as will make that division complete. It may be observed that in this proof the threefold specification of the concept of the unconditioned is really obtained directly from the categories of relation, or at least from the judgments of relation, and not from the corresponding species of syllogism.

Totality and unconditionedness, when taken as equivalent, become synonymous with the *absolute*. This last term, however, especially when taken as defining possibility and necessity, is ambiguous. The absolutely possible may signify either that which in itself, *i.e.* so far as regards its internal content, is possible; or else that which is in every respect and in all relations possible. The two meanings have come to be connected largely owing to the fact that the internally impossible is impossible in every respect. Otherwise, however, the two meanings fall completely apart. Absolute necessity and inner necessity are quite diverse in character. We must not, for instance, argue that the opposite of what is absolutely necessary must be inwardly impossible, nor consequently that absolute necessity must in the end reduce to an inner necessity. Examination will show that, in certain types of cases, not the slightest meaning can be attached to the phrase 'inner necessity.' As we possess the terms inner and logical to denote the first form of necessity, there is no excuse for employing the term absolute in any but the wider sense. That, Kant

holds, is its original and proper meaning. The *absolute* totality to which the concept of Reason refers is that form of completeness which is in every respect unconditioned.

In A 326 = B 383 Kant’s mode of statement emphasises the connection of the Ideas with the categories of relation. Reason, he claims, “seeks to extend the synthetic unity, which is thought in the category, to the absolutely unconditioned.” Such positive content as the Ideas can possess lies in the experience which they profess to unify; in so far as they transcend experience and point to an Ideal completion that is not empirically attainable, they refer to things of which the understanding can have no concept. It is necessary, however, that they should present themselves in this absolute and transcendent form, since otherwise the understanding would be without stimulus and without guidance. Though mere Ideas, they are neither arbitrary nor superfluous. They regulate the understanding in its empirical pursuit of that systematic unity which it requires for its own satisfaction.

In A 327-8 = B 383-4 one and the same ground is assigned for entitling the Ideas transcendental and also transcendent, namely, that, as they surpass experience, no object capable of being given through the senses corresponds to them. But a difference would none the less seem to be implied in the connotation of the two terms. In being prescribed by the very nature of Reason, they are transcendental; as overstepping the limits of experience, they are transcendent. Kant’s use of the terms subject and object in this passage is also somewhat puzzling. ‘Object’ is employed in the metaphysical sense proper only from the pre-Critical standpoint of the *Dissertation*, as meaning an existence apprehended through pure thought. The term ‘subject’ receives a correspondingly un-Critical connotation. The further phrase “the merely speculative use of Reason” is somewhat misleading, even though we recognise that for Kant speculative and theoretical are synonymous terms; we should rather expect “Reason in its legitimate or Critical or directive function.” Kant’s intended meaning, however, is sufficiently clear. When we say that a concept of Reason is an Idea merely, we have in mind the degree to which it can be *empirically* verified. We are asserting that it prescribes an Ideal to which experience may be made to approach, but which it can never attain. It defines “a problem to which there is no solution.” In the practical sphere of morals, on the other hand, the Ideal of Reason must never be so described. Though only partially realisable, it is genuinely actual. Even those actions which imperfectly embody it none the less presuppose it as their indispensable condition. In two respects, therefore, as Kant points out, the statement that the transcendental concepts of Reason are merely Ideas calls for qualification. In the first place they are by no means “superfluous and void.” They supply a canon for the fruitful employment of understanding. And secondly, they may perhaps be found to make possible a transition from natural to moral concepts, and so to bring the Ideas of practical Reason into connection with the principles of speculative thought. The reader may again note the genuinely Platonic character of Kant’s use of the term Idea.

In A 330-1 = B 386-7 Kant returns to the problem of the metaphysical deduction, and analyses the nature of syllogistic reasoning. The analysis differs from that of A 321 ff. = C 377 ff. only in emphasising that when a conclusion is given as valid the totality of the premisses required for its establishment can be postulated as likewise given, and that when completely stated in the implied prosyllogisms the premisses form a regressive series. In this way Kant contrives to bring the logical process into closer connection with the transcendental principle, which he now definitively formulates as follows: When the conditioned is given, the series of conditions up to the unconditioned is likewise given. The series of antecedent conditions may either have a first term or may be incapable of such. In either case it has to be viewed as unconditioned, in the one case in virtue of its unconditioned beginning, in the other in its character as an unending and therefore unlimited series. In one or other form Reason demands that the unconditioned be recognised as underlying and determining everything conditioned.

class=“chead”SECTION III

SYSTEM OF THE TRANSCENDENTAL IDEAS

The three Ideas of Reason, as derived from the three kinds of syllogism, are now brought into connection with the three possible relations in which representations are found to stand: first, to the thinking subject; secondly, to objects as appearances; thirdly, to objects of thought in general. Kant argues that the completed totalities towards which Reason strives are likewise three in number. Reason seeks: (1) in regard to the subject known, as constituting the fact of inner experience, a representation of the self or soul that will render completely intelligible what is peculiar to the inner life; (2) in regard to the object known, a conception of the completed totality of the world of phenomena, the cosmos; (3) in regard to the ultimate synthesis of the subject known and the object known, such a conception of all existing things as will render intelligible the co-operation of mind and external nature in one experience. In this way Kant professes to obtain transcendental justification for the threefold division of metaphysical science into rational psychology, rational cosmology, and rational theology. The absolute unity of the thinking subject is dealt with by psychology, the totality of all appearances by cosmology, and the Being, which contains the condition of the possibility of all that can be thought, by theology.

In thus proceeding, Kant is assuming that the concepts of unconditioned substance and of unconditioned necessity can be interpreted only in spiritualist and theological terms. This assumption stands in direct conflict with what the history of philosophy records. The Absolute has frequently been materialistically defined, and, as Kant himself admits, we cannot prove that the thinking subject may not be naturalistically conditioned. Architectonic is again exercising its baleful influence. That the argument is lacking in cogency is indeed so evident that Kant takes notice of the deficiency, and promises that it will be remedied in the sequel. This promise he is unable to fulfil. Such further reasons as he is able to offer are of the same external character.

"Of these transcendental Ideas, *strictly speaking, no objective deduction, such as we were able to give of the categories, is possible*." As Kant indicates by use of the phrase 'strictly speaking,' this statement is subject to modification. He himself formulates a transcendental deduction of the Ideas, as principles regulative of experience. The deduction from the three forms of syllogism, which Kant here entitles subjective, ought properly to be named 'metaphysical.'

BOOK II

THE DIALECTICAL INFERENCES OF PURE REASON

CHAPTER I

THE PARALOGISMS OF PURE REASON

As rational psychology fails to distinguish between appearances and things in themselves, it identifies mere apperception with inner sense; the self in experiencing the succession of its inner states is supposed to acquire knowledge of its own essential nature. "I, as thinking, am an object of inner sense, and am entitled soul," in contrast to the body which is an object of outer sense. Empirical psychology deals with the concrete detail of inner experience; rational psychology abstracts from all such special experiences, indeed from everything empirical, professing to establish its doctrine upon the single judgment, "I think." That judgment has already been investigated in its connection with the problem of the possibility, within the field of experience, of synthetic *a priori* judgments. It has now to be considered as a possible basis for knowledge of the self as a thinking being (*ein denkend Wesen*) or soul (*Seele*).

Following the guiding thread of the table of categories, but placing them in what he regards as being, in this connection, the most convenient order, Kant obtains a "topic" or classification of the possible rubrics for the doctrines of a rational psychology: (1) the soul is *substance*; (2) is *simple*; (3) is *numerically identical*; (4) stands in relation to *possible* objects in space. Now all those four doctrines are, Kant holds, incapable of demonstration. The proofs propounded by rational psychology are logically imperfect, committing the logical fallacy which is technically named paralogism. The fallacy is not, however, of merely logical character. Had that been the case, it could never have gained such general currency. Certainly no metaphysical science, widely accepted by profound thinkers, could ever have come to be based upon it. The paralogism is transcendental in character, resting upon a transcendental ground. It represents an illusion which from any non-Critical standpoint is altogether unavoidable. Its dialectic is a natural dialectic, wrongly interpreted by the Schools, but not capriciously invented by them. The key to its proper treatment is first supplied by the results of the transcendental deduction. We are now called upon to apply these results in explanation of the occurrence of the paralogisms, and in judgment upon their false claims. Little that is really new is to be found in this chapter; but many of the established results of the *Analytic* receive interesting illustration, and are thereby set in a clearer light.

In rational psychology the "I think" is taken in its universal, or to use Kant's somewhat misleading term, problematic aspect, that is to say, not as a judgment expressive of the self's own existence but "in its mere possibility," as representing the self-consciousness of all possible thinking beings. As we cannot gain a representation of thinking beings through outer experience, we are constrained to think them in terms of our own self-consciousness. The "I think" is thus taken as a universal judgment, expressing what belongs to the conception of thinking being in general. The judgment is so interpreted by rational psychology, "in order to see what predicates applicable to its subject (be that subject actually existent or not) may flow from so simple a judgment."

In summarising what is directly relevant in the argument of the transcendental deduction, Kant emphasises that the I, as representation, is altogether empty of content.

"We cannot even say that it is a conception, but only that it is a bare (*blosses*) consciousness which accompanies all conceptions. Through this I or he or it (the thing) which thinks, nothing further is represented than a transcendental subject of the thoughts = *x*...."

It is apprehended only in its relation to the thoughts which are its predicates; apart from them we cannot form any conception whatever of it, but can only revolve in a perpetual circle, since any judgment upon it has already made use of its representation.

The patchwork character of the *Critique*, the artificial nature of the connections between its various

parts, is nowhere more evident than in this section on the *Paralogisms*. According to the definition given of transcendental illusion, we naturally expect Kant's argument to show that the *Paralogisms* rest upon a failure to distinguish between appearance and reality. As a matter of fact, the cause of their fallacy is traced in the first three *Paralogisms* solely to a failure to distinguish between the logical and the real application of the categories. The argument can indeed be restated so as to agree with the introductory sections of the *Dialectic*. But Kant's manner of expounding the *Paralogisms* shows that this chapter must originally have been written independently of any intention to develop such teaching as that of the sections which in the ultimate arrangement of the *Critique* are made to lead up to it.

First Paralogism: of Substantiality. — Save for the phrase 'subject in itself,' there is, in Kant's comment upon this *Paralogism*, not a word regarding the necessity of a distinction between appearance and reality, but only an insistence that the "I think" yields no knowledge of the thinking self. Consciousness of the self and knowledge of its underlying substance are by no means identical. The self, so far as it enters into consciousness, is a merely logical subject; the underlying substrate is that to which this self-consciousness and all other thoughts are due. It is in the light of this distinction that Kant discusses the substantiality of the subject. As expressive of the "I think," the category of substance and attribute can be employed only to define the relation in which consciousness stands to its thoughts; it expresses the merely logical relation of a subject to its predicates. It tells us nothing regarding the nature of the "I," save only that it is the invariable centre of reference for all thoughts. In order to know the self as substance, and so as capable of persisting throughout all change, and as surviving even the death of the body, we should require to have an intuition of it, and of such intuition there is not the slightest trace in the "I think." It "signifies a substance only in Idea, not in reality." As Kant adds later, the permanence and self-identity of the representation of the self justifies no argument to the permanence and self-identity of its underlying conditions. Inference from the nature of representation to the nature of the object represented is entirely illegitimate. In the equating of the two, and not, as the introduction to the *Dialectic* would lead us to expect, in a failure to distinguish appearance from reality, consists the paralogistic fallacy of this first syllogism.

Second Paralogism: of Simplicity. — We may follow Adickes in his analysis of A 351-62. (*a*) The original criticism, parallel to that of the first *Paralogism*, would seem to be contained in paragraphs five to nine. (*b*) The opening paragraphs, and (*c*) the concluding paragraphs, would seem, for reasons stated below, to be independent and later additions.

(*a*) The argument of the central paragraphs runs almost exactly parallel with the criticism of the first *Paralogism*, applying the same line of thought, in disproof of the assumed argument for the simplicity of the soul. It may be noted, in passing, that Kant here departs from his table of categories. There is no category of simplicity. The connection which he seeks to establish between the concept of simplicity and the categories of quality is arbitrary. It more naturally connects with the category of unity; but the category of unity is required for the third *Paralogism*. For explanation of the way in which he equates the concept of simplicity with the category of reality Kant is satisfied to refer the reader to the section on the second antinomy in which this same identification occurs. Indeed the simplicity here dwelt upon seems hardly distinguishable from substantiality, and therefore it is not surprising that Kant's criticism of the second *Paralogism* should be practically identical with that of the first. Since the "I," as logical subject of thought, signifies only a something in general, and embodies no insight into the constitution of this something, it is for that reason empty of all content, and consequently simple. "The simplicity of the *representation* of a subject is not *eo ipso* a knowledge of the simplicity of the subject itself...." The second *Paralogism* thus, in Kant's view, falsely argues from the merely logical unity of the subject *in representation* to the actual simplicity of the subject *in itself*.

(*b*) One reason for regarding the first four paragraphs as a later addition is their opening reference to the introductory sections of the *Dialectic*, of which this chapter otherwise takes little or no account. This

Paralogism is, Kant declares, "the Achilles of all the dialectical inferences in the pure doctrine of the soul," meaning that it may well seem a quite invulnerable argument.

"It is no mere sophistical play contrived by a dogmatist in order to impart to his assertions a superficial plausibility (*Schein*), but an inference which appears to withstand even the keenest scrutiny and the most scrupulously exact investigation."

The second paragraph is a very pointed restatement of a main supporting argument of this second *Paralogism*. This argument well deserves the eulogy with which Kant has ushered it in. It is as follows. The unity of consciousness can not be explained as due to the co-operative action of independent substances. Such a merely external effect as that of motion in a material body may be the resultant of the united motions of its parts. But it is otherwise with thought. For should that which thinks be viewed as composite, and the different representations, as, for instance, of the single words of a verse, be conceived as distributed among the several parts, a multiplicity of separate consciousnesses would result, and the single complex consciousness, that of the verse as a whole, would be rendered impossible. Consciousness cannot therefore — such is the argument — inhere in the composite. The soul must be a simple substance.

As there is no reference in this argument to the "I think," the criticism cannot be that of the first *Paralogism*, nor that of the central paragraphs of this second *Paralogism*. Kant's reply — as given in the third and fourth paragraphs — is in effect to refer the reader to the results of the *Analytic*, and is formulated in the manner of his *Introduction* to the *Critique*. The principle that multiplicity of representation presupposes absolute unity in the thinking subject can neither be demonstrated analytically from mere concepts, nor derived from experience. Being a synthetic *a priori* judgment, it can be established only by means of a transcendental deduction. But in that form it will define only a condition required for the possibility of consciousness; it can tell us nothing in regard to the noumenal nature of the thinking being. And, as Kant argues in the third *Paralogism*, there may be a possible analogy between thought and motion, though of a different kind from that above suggested.

The entire absence of all connection between the argument of these paragraphs and the argument of those which immediately follow upon them, at least suffices to show that this second *Paralogism* has not been written as a continuous whole; and taken together with the fact that the problem is here formulated in terms of the *Introduction* to the *Critique*, would seem to show that this part of the section is of comparatively late origin.

(*c*) The concluding paragraphs, which are of considerable intrinsic interest, also reflect an independent line of criticism. As the phrase "the above proposition" seems to indicate, they were not originally composed in this present connection. They give expression to Kant's partial agreement with the line of argument followed by the rationalists, but also seek to show that, despite such partial validity, the argument does not lend support to any metaphysical extension of our empirical knowledge. In A 358 we have what may be a reference to the argument of the introductory sections of the *Dialectic*. The argument under criticism is praised as being "natural and popular," "occurring even to the least sophisticated understanding," and as leading it to view the soul as an altogether different existence from the body. The argument is as follows. None of the qualities proper to material existence, such as impenetrability or motion, are to be discovered in our inner experience. Nor can feelings, desires, thoughts, etc., be externally intuited. In view of these differences, we seem justified in asserting that the soul cannot be an appearance in space, and cannot therefore be corporeal. Kant replies by drawing attention to the fundamental Critical distinction between appearances and things in themselves. If material bodies, as apprehended, were things in themselves, the argument would certainly justify us in refusing to regard the soul and its states as of similar nature. But since, as the *Aesthetic* has shown, bodies, as known, are mere appearances of outer sense, the real question at issue is not that of the distinction between the soul and

bodies in space, but of the distinction between the soul and that something which conditions all outer appearances.

"...this something which underlies the outer appearances and which so affects our sense that it obtains the representations of space, matter, shape, etc., this something, viewed as noumenon (or better, as transcendental object), might yet also at the same time serve as the subject of our thoughts...."

Thus the argument criticised serves only to enforce the very genuine distinction between inner and outer appearances; it justifies no assertion, either positive or negative, as to the nature of the soul or as to its relation to body in its noumenal aspect. The monadistic, spiritualist theory of material existence remains an open possibility, though only as an hypothesis incapable either of proof or of disproof. We cannot obtain, by way of inference from the character of our apperceptive consciousness, any genuine addition to our speculative insight.

Third Paralogism: of Personality. — Kant's criticism again runs parallel with that of the preceding *Paralogisms*. The fallacy involved is traced to a confusion between the numerical identity of the self *in representation* and the numerical identity of the subject *in itself*. The logical subject of knowledge must, as the transcendental deduction has proved, think itself as self-identical throughout all its experiences. This is indeed all that the judgment "I think" expresses. It is mere identity, "I am I." But from the identity of representation we must not argue to identity of the underlying self. So far as the unity of self-consciousness is concerned, there is nothing to prevent the noumenal conditions of the self from undergoing transformation so complete as to involve the loss of identity, while yet supporting the representation of an identical self.

"Although the dictum of certain ancient Schools, that everything in the world is in a flux and nothing permanent and abiding, cannot be reconciled with the admission of substances, it is not refuted by the unity of self-consciousness. For we are unable from our own consciousness to determine whether, as souls, we are permanent or not. Since we reckon as belonging to our identical self only that of which we are conscious, we must necessarily judge that we are one and the same throughout the whole time of which we are conscious. We cannot, however, claim that such a judgment would be valid from the standpoint of an outside observer. As the only permanent appearance which we meet with in the soul is the representation 'I' that accompanies and connects them all, we are unable to prove that this 'I,' a mere thought, may not be in the same state of flux as the other thoughts which are connected together by its means."

And Kant adds an interesting illustration.

"An elastic ball which impinges on another similar ball in a straight line communicates to the latter its whole motion, and therefore its whole state (*i.e.* if we take account only of the positions in space). If, then, in analogy with such bodies, we postulate substances such that the one communicates to the other representations together with the consciousness of them, we can conceive a whole series of substances of which the first transmits its state together with its consciousness to the second, the second its own state with that of the preceding substance to the third, and this in turn the states of all the preceding substances together with its own consciousness and with their consciousness to another. The last substance would then be conscious of all the states of the substances, which had undergone change before its own change, as being its own states, because they would have been transferred to it together with the consciousness of them. And yet it would not have been one and the same person in all these states."

The perversely Hegelian character of Caird's and Watson's manner of interpreting the *Critique* is especially evident in their treatment of the *Paralogisms*. They make not the least mention of this part of Kant's teaching.

Kant employs a further argument which would seem to show that at the time when these paragraphs were written the general tendency of his thought was predominantly subjectivist in character. There are, he implies, as many different times as there are selves that represent time. The argument is as follows. As

the “I think” is equivalent to “I am I,” we may say either that all time of which I am conscious is in me, or that I am conscious of myself as numerically identical in each and every part of it. In my individual consciousness, therefore, identity of my person is unfailingly present. But an observer, viewing me from the outside, represents me in the time of his own consciousness; and as the time in which he thus sets me is not that of my own thinking, the self-identity of my consciousness, even if he recognises its existence, does not justify him in inferring the objective permanence of my self.

The two concluding paragraphs seem to have been independently composed. They contribute nothing of importance.

Fourth Paralogism: of Ideality. — The main argument of this *Paralogism*, which contains the first edition refutation of idealism, has already been considered above. We require, therefore, only to treat of it in its connection with the other *Paralogisms*, and to note some few minor points that remain for consideration. Its argument differs from that of the other *Paralogisms* in that the fallacy involved is traced, in agreement with the requirements of the introductory sections of the *Dialectic*, to a failure to distinguish between appearances and things in themselves. Its connection with the table of categories is extremely artificial. In A 344 = B 402 the category employed is that of possibility, in A 404 and A 344 *n*. that of existence. Kant’s attempt to combine the problem here treated with that of the other *Paralogisms* can only be explained as due to the requirements of his architectonic. This *Paralogism* does not concern itself with the nature of the soul. It refers exclusively to the mode of existence to be ascribed to objective appearances. None the less, Kant contrives to bring it within the range of rational psychology in the following manner. He argues that rational psychologists are one and all adherents of empirical idealism. They confound appearances in space with things in themselves, and therefore assert that our knowledge of their existence is inferential and consequently uncertain. The errors of empirical idealism are thus bound up with the dogmatic assumptions of the rationalist position. They are traceable to its failure to distinguish between appearances and things in themselves. Such dogmatism may take the form of materialism or of ontological dualism, as well as of spiritualism. All three, in professing to possess knowledge of things in themselves, violate Critical principles. If the chief function of rational psychology consists in securing the conception of the soul against the onslaughts of materialism, that can be much more effectively attained through transcendental idealism.

“For, on [Critical] teaching, so completely are we freed from the fear that on the removal of matter all thought, and even the very existence of thinking beings, would be destroyed, that on the contrary it is clearly shown that if I remove the thinking subject the whole corporeal world must at once vanish, since it is nothing save appearance in the sensibility of our subject and a species of its representations.”

We do not, indeed, succeed in proving that the thinking self is in its existence independent of the “transcendental substrate” of outer appearances. But as both possibilities remain open, the admission of our ignorance leaves us free to look to other than speculative sources for proof of the independent and abiding existence of the self.

Reflection on the Whole of Pure Psychology. — This section affords Kant the opportunity of discussing certain problems which he desires to deal with, but is unable to introduce under the recognised rubrics of his logical architectonic. There are, Kant says, three other dialectical questions, essential to the purposes of rational psychology, grounded upon the same transcendental illusion (confusion of appearances with things in themselves), and soluble in similar fashion: (1) as to the possibility of the communion of soul and body, *i.e.* of the state of the soul during the life of the body; (2) as to the beginning of this association, *i.e.* of the soul in and before birth; (3) as to the termination of this association, *i.e.* of the soul in and after the death of the body. Kant treats these three problems from the extreme subjectivist standpoint, inner and outer sense being distinguished and related in the manner peculiar to the first edition. The contrast between mind and body is a difference solely between the appearances of inner and those of outer sense. Both alike exist only in and through the thinking subject, though the latter

“...have this deceptive property that, representing objects in space, they as it were detach themselves from the soul and appear to hover outside it.”

The problem, therefore, of the association of soul and body, properly understood, is not that of the interaction of the soul with other known substances of an opposite nature, but only

“...how in a thinking subject outer intuition, namely, that of space, with its filling in of figure and motion, is possible. And that is a question which no human being can possibly answer. The gap in our knowledge ... can only be indicated through the ascription of outer appearances to that transcendental object which is the cause of this species of representations, but of which we can have no knowledge whatsoever and of which we shall never acquire any conception.”

The familiar problem of the association of mind and body is thus due to a transcendental illusion which leads the mind to hypostatise representations, viewing them as independent existences that act upon the senses and generate our subjective states. The motions in space, which are merely the expression in terms of appearance of the influence of the transcendental object upon “our senses,” are thus wrongly regarded as the causes of our sensations. They themselves are mere representations, and, as Kant implies, are for that reason incapable of acting as causes. In this section, it may be noted in passing, there is not the least trace of the phenomenalist teaching, according to which spatial objects are viewed as acting upon the bodily sense-organs. Kant here denies all interaction of mind and body, and recognises only the interaction of their noumenal conditions. Appearances as such can never have causal efficacy. The position represented is pure subjectivism, and very significantly goes along with Kant’s earlier doctrine of the transcendental object.

The dogmatic character of the interaction theory appears very clearly, as Kant proceeds to point out, in the objections which have been made to it, whether by those who substitute for it the theories of pre-established harmony and occasionalism, or by those who adopt a sceptical non-committal attitude. Their objections rest upon exactly the same presupposition as the theory which they are attacking. To demonstrate the impossibility of interaction, they must be able to show that the transcendental object is not the cause of outer appearances; and owing to the limitations of our knowledge that is entirely beyond our powers. Failing, however, to draw a distinction between appearances and things in themselves, they have not realised the actual nature of the situation, and accordingly have directed their objections merely to showing that mind and body, taken as independent existences, must not be viewed as capable of interaction.

The Critical standpoint also supplies the proper formulation for the other two problems — a formulation which in itself decides the degree and manner of our possible insight in regard to them. The view that the thinking subject may be capable of thought prior to all association with the body should be stated as asserting

“...that prior to the beginning of that species of sensibility in virtue of which something appears to us in space, those transcendental objects, which in our present state appear to us as bodies, could have been intuited in an entirely different manner.”

The view that the soul, upon the cessation of all association with the corporeal world, may still continue to think, will similarly consist in the contention

“...that if that species of sensibility, in virtue of which transcendental objects (which in our present state are entirely unknown) appear to us as a material world, should cease, all intuition of them would not for that reason be removed; but that it would still be possible that those same unknown objects should continue to be known [sic] by the thinking subject, though no longer, indeed, in the quality of bodies.”

Not the least ground, Kant claims, can be discovered by means of speculation in support of such assertions. Even their bare possibility cannot be demonstrated. But it is equally impossible to establish any valid objection to them. Since we cannot pretend to knowledge of things in themselves, a modest acquiescence in the limitations of experience alone becomes us.

The remaining paragraphs (A 396-405) contain nothing that is new. They merely repeat points already more adequately stated. A 401-2, which deals with the nature of apperception and its relation to the categories, has been considered above. The argument that, as the self must presuppose the thought of itself in knowing anything, it cannot know itself as object, is also commented upon above.

The statement that the determining self (the thinking, *das Denken*) is to be distinguished from the determinable self (the thinking subject) as knowledge from its object, should be interpreted in the light of Kant's argument in the second and third *Paralogisms*, that the simplicity and self-identity of the representation of an object must not be taken as knowledge of simplicity or numerical identity in the object represented.

The analysis given in A 402-3 of the fallacy involved in the *Paralogisms* is, as Adickes has pointed out, confused and misleading. Kant here declares that in the major premiss of each syllogism the assertion is intended in the merely logical sense, and therefore as applicable only to the subject *in representation*, but in the minor premiss and conclusion is asserted of the subject as bearer of consciousness, *i.e. in itself*. But were that so, the minor premiss would be a false assertion, and the false conclusion would not be traceable to logical fallacy. Kant gives the correct statement of his position in B 410-11. The attempted justification of the fourfold arrangement of the *Paralogisms* with which the section concludes suffers from the artificiality of Kant's logical architectonic.

SECOND EDITION STATEMENT OF THE PARALOGISMS

Except for the introductory paragraphs, which remain unaltered, the chapter is completely recast in the second edition. The treatment of the four *Paralogisms* which in the first edition occupied thirty-three pages is reduced to five. The problems of the mutual interaction of mind and body, of its prenatal character and of its immortality, the discussion of which in the first edition required some ten pages, are now disposed of in a single paragraph (B 426-7). The remaining twenty-two pages of the new chapter are almost entirely devoted to more or less polemical discussion of criticisms which had been passed upon the first edition. These had been in great part directed against Kant's doctrine of apperception and of inner sense, and so could fittingly be dealt with in connection with the problems of rational psychology. As Benno Erdmann has suggested, B 409-14 and 419-21 would seem to be directed against Ulrichs' Leibnizian position and especially against his metaphysical interpretation of apperception. B 428-30 treats of the difficulties raised by Pistorius in regard to the existence of the self. B 414-15 is similarly polemical, but in this case Kant cites his opponent, Mendelssohn, by name. Throughout, as in the alterations made in the chapter on *Phenomena and Noumena*, Kant insists more strongly than in the first edition upon the unknowableness of the self, and on the difference between thought and knowledge. The pure forms of thought are not, Kant now declares, concepts of objects, that is, are not categories, but "merely logical functions." Though this involves no essential doctrinal change, it indicates the altered standpoint from which Kant now regards his problem. Its significance has already been dwelt upon.

In formulating the several arguments of the four *Paralogisms*, Kant develops and places in the forefront a statement which receives only passing mention in A 352-3, 362, 366-7, 381-2, namely, that the truths contained in the judgments of rational psychology find expression in merely identical (*i.e.* analytic) propositions. This enables Kant to formulate both the *Paralogisms* and his criticisms thereof in much briefer and more pointed fashion. In each case the *Paralogism*, as he shows, substitutes a synthetic *a priori* judgment, involving an extension of our knowledge and a reference to the noumenal self, for the given judgment which, in so far as it is valid, is always a merely analytic restatement of the purely formal "I think." From the very start also, Kant introduces the distinctions of his own Critical teaching, especially that between thinking and intuiting, and that between the determining and the determinable self.

First Paralogism. — That the I which thinks must always *in thought* be viewed as subject and not as

mere predicate, is an identical proposition. It must not be taken as meaning that the subject which underlies thought is an abiding substance. This latter proposition is of much wider scope, and would involve such data (in this case entirely lacking) as are required for the establishment of a synthetic *a priori* judgment.

Second Paralogism. — That the I of *apperception* and so of all *thought* is single and cannot be resolved into a multiplicity of subjects, is involved in the very conception of thought, and is therefore an analytic proposition. It must not be interpreted as signifying that the self is a simple substance. For the latter assertion is again a synthetic proposition, and presupposes for its possibility an intuition by the self of its own essential nature. As all our intuitions are merely sensuous, that cannot be looked for in the "I think."

"It would, indeed, be surprising if what in other cases requires so much labour to discover — namely, what it is, of all that is presented by intuition, that is substance, and further, whether this substance is simple (*e.g.* in the parts of matter) — should be thus directly given me, as if by revelation, in the poorest of all representations."

We may here observe how the practice, adopted by Caird, of translating *Anschauung* by 'perception' has misled him into serious misunderstanding of Kant's teaching. It has caused him to interpret Kant as arguing that we have no knowledge of the self because we can have no *sensuous* perception of it. Kant's argument rather is that as all human "intuition" is sensuous, we are cut off from all possibility of determining our noumenal nature. We are thrown back upon mere concepts which, as yielding only analytic propositions, cannot extend our insight beyond the limits of sense-experience. The term 'intuition' is much broader in meaning than the term 'perception'; it can also be employed as equivalent to the phrase '*immediate* apprehension.' The grounds for Kant's contention that we have no intuition or immediate knowledge of the self are embodied in, and inspire, his doctrine of inner sense. It may also be noted that in B 412 Kant, speaking of the necessity of intuition for knowledge of the self, uses the unusual phrase 'a permanent intuition' — a phrase which, so far as I have observed, he nowhere employs in dealing with the intuition that conditions the sense perception of material bodies. Its employment here may perhaps be due to the fact that its implied reference is not to a given sensuous manifold but to some form of immediate apprehension, capable of revealing the permanent nature of the noumenal self.

Third Paralogism. — That I am identical with myself throughout the consciousness of my manifold experiences, is likewise an analytic proposition obtainable by mere analysis of the "I think." And since that form of consciousness, as stated in the criticism of the preceding *Paralogism*, is purely conceptual, containing no element of intuition, no judgment based solely upon it can ever be taken as equivalent to the synthetic proposition that the self, as thinking being, is an identical substance.

Fourth Paralogism. — This *Paralogism* is somewhat altered. As noted above, the problem dealt with in the first edition concerns the outer world, and only quite indirectly the nature of the self. In the second edition that argument is restated, and is more properly located within the *Analytic*. The argument which now takes its place runs parallel with that of the three preceding *Paralogisms*. The assertion that I distinguish my own existence as a thinking being from other things outside me, including thereunder my own body, is an analytic proposition, since by *other* things is meant things which I think as different from myself.

"But I do not thereby learn whether this consciousness of myself would be at all possible apart from things outside me through which representations are given to me, and whether, therefore, I can exist merely as thinking being (*i.e.* without existing in human form)."

In B 417-18 Kant points out that rational psychology, in asserting that the self can be conscious apart from all consciousness of outer things, commits itself to the acceptance of problematic idealism. If consciousness of outer objects is not necessary to consciousness of self, there can be no valid method of proving their existence. In the fourth *Paralogism* of the first edition, the inter-dependence of rational

psychology and empirical idealism is also dwelt upon, but is there traced to a confusion of appearances with things in themselves.

B 410-11. — The correct formulation is here given of what in the first edition is quite incorrectly stated. A paralogism is a syllogism which errs in logical form (as contrasted with a syllogism erring in matter, *i.e.* the premisses of which are false). In the paralogisms of Rational Psychology, the logical fallacy committed is that of ambiguous middle, or as Kant names it, the *sophisma figurae dictionis*. In the major premiss the middle term is used as referring to real existence, in the minor only as expressive of the unity of consciousness.

Refutation of Mendelssohn's Proof of the Permanence of the Soul. — Mendelssohn's argument is that the soul, as it does not consist of parts, cannot disappear *gradually* by disintegration into its constituent elements. If, therefore, it perishes, it must pass out of existence *suddenly*; at one moment it will exist, at the next moment it will be non-existent. But, Mendelssohn maintains, for three closely connected reasons this would seem to be impossible. In the first place, the immediate juxtaposition of directly opposed states is never to be met with in the material world. Complete opposites, such as day and night, waking and sleeping, never follow upon one another abruptly, but only through a series of intermediate states. Secondly, among the opposites which material processes thus bridge over, the opposition of being and not-being is never to be found. Only by a miracle can a material existence be annihilated. If, therefore, empirical evidence is to be allowed as relevant, we must not assert of the invisible soul what is never known to befall the material existences of the visible world. Thirdly — the only part of Mendelssohn's argument which Kant mentions — the sudden cessation of the soul's existence would also violate the law of the continuity of time. Between any two moments there is always an intermediate time in which the one moment passes continuously into the other.

Kant's reply to this third part of Mendelssohn's argument is that though the soul must not be conceived as perishing suddenly, it may pass out of existence by a continuous diminution through an infinite number of smaller degrees of intensive reality; and in support of this view he maintains the very doubtful position that clearness and obscurity of representation are not features of the contents apprehended, but only of the intensity of the consciousness directed upon them.

B 417-22. — Kant here points out that rational psychology, as above expounded, proceeds synthetically, starting from the assertion of the substantiality of the soul and proceeding to the proof that its existence is independent of outer things. But it may proceed in the reverse fashion, analytically developing the implications supposed to be involved in the "I think," viewed as an existential judgment, *i.e.* as signifying "I exist thinking." Kant restates the argument in this analytic form in order, as it would seem, to secure the opportunity of replying to those criticisms of his teaching in the first edition which concern his doctrine of apperception and his employment of the categories, especially of the category of existence, in relation to the self. What is new and important in these pages, and also in the connected passages in B 428-30, has been discussed above.

B 419-20. — After remarking that simplicity or unity is involved in the very possibility of apperception, Kant proceeds to argue that it can never be explained from a strictly materialist standpoint, since nothing that is real in space is ever simple. Points are merely limits, and are not therefore themselves anything that can form part of space. The passage as a whole would seem to be directed against the Leibnizian teaching of Ulrichs.

B 426-7. — Kant makes a remark to which nothing in his argument yields any real support, namely, that the dialectical illusion in rational psychology is due to the substitution of an Idea of reason for the quite indeterminate concept of a thinking being in general. As is argued below, the assumption which he is here making that the concept of the self is an *a priori* and ultimate Idea of pure Reason, cannot be regarded as a genuine part of his Critical teaching.

B 427-8 touches quite briefly upon questions more fully and adequately treated in the first edition. The

scanty treatment here accorded to them would seem to indicate, as Benno Erdmann remarks, that the problem of the interaction of mind and body which so occupied Kant's mind from 1747 to 1770 has meantime almost entirely lost interest for him. The problem of immortality remains central, but it is now approached from the ethical side.

In B 421 and B 423-6 Kant draws from his criticism of the *Paralogisms* the final conclusion that the metaphysical problems as to the nature and destiny of the self are essentially *practical* problems. When approached from a theoretical standpoint, as curious questions to be settled by logical dialectic, their speculative proof

"...so stands upon the point of a hair, that even the schools preserve it from falling only so long as they keep it unceasingly spinning round like a top; even in their own eyes it yields no abiding foundation upon which anything could be built." "Rational psychology exists not as *doctrine*, ... but only as *discipline*. It sets impassable limits to speculative reason in this field, and thus keeps us, on the one hand, from throwing ourselves into the arms of soulless materialism, or, on the other hand, from losing ourselves in an unsubstantial spiritualism which can have no real meaning for us in this present life. But though it furnishes no positive doctrine, it reminds us that we should regard this refusal of Reason to give satisfying response to our inquisitive probings into what is beyond the limits of this present life as a hint from Reason to divert our self-knowledge from fruitless and extravagant speculation to its fruitful practical employment." "The proofs which are serviceable for the world at large preserve their entire value undiminished, and indeed, upon the surrender of these dogmatic pretensions, gain in clearness and in natural force. For Reason is then located in its own peculiar sphere, namely the order of ends, which is also at the same time an order of nature; and since it is in itself a practical faculty which is not bound down to natural conditions, it is justified in extending the order of ends, and therewith our own existence, beyond the limits of experience and of life."

Then follows brief indication of the central teaching of the *Metaphysics of Ethics* and of the two later *Critiques*. Through moral values that outweigh all considerations of utility and happiness, we become conscious of an inner vocation which inspires feelings of sublimity similar to those which are aroused by contemplation of the starry firmament; and to the verities thus disclosed we can add the less certain but none the less valuable confirmation yielded by natural beauty and design, and by the conformity of nature to our intellectual demands.

"Man's natural endowments — not merely his talents and the impulses to employ them, but above all else the Moral Law within him — go so far beyond all utility and advantage which he may derive from them in this present life, that he learns thereby to prize the mere consciousness of a righteous will as being, apart from all advantageous consequences, apart even from the shadowy reward of posthumous fame, supreme over all other values; and so feels an inner call to fit himself, by his conduct in this world, and by the sacrifice of many of its advantages, for being a citizen of a better world upon which he lays hold in Idea. This powerful and incontrovertible proof is reinforced by our ever-increasing knowledge of purposiveness in all that we see around us, and by a glimpse of the immensity of creation, and therefore also by the consciousness of a certain illimitableness in the possible extension of our knowledge and of a striving commensurate therewith. All this still remains to us, though we must renounce the hope of ever comprehending, from the mere theoretical knowledge of ourselves, the necessary continuance of our existence."

IS THE NOTION OF THE SELF A NECESSARY IDEA OF REASON?

One point of great importance must be dwelt upon before we pass from the *Paralogisms*. Though the negative consequences which follow from the teaching of the objective deduction are here developed in the most explicit manner, Kant does not within the limits of this chapter, in either edition, make any further

reference to the doctrine expounded in the introductory sections of the *Dialectic*, viz. that the notion of the self as an immortal being is a necessary Idea of human Reason. The reader is therefore left under the impression that that doctrine is unaffected by the destructive criticism passed upon rational psychology, and that it still survives as an essential tenet of the Critical philosophy. And he is confirmed in this view when he finds the doctrine reappearing in the *Appendix* to the *Dialectic* and in the *Methodology*. The Idea of the self is there represented as performing a quite indispensable, regulative function in the development of the empirical science of psychology. Now it is one thing to maintain the existence of Ideal demands of Reason for unity, system and unconditionedness, and to assert that it is in virtue of these demands that we are led, in the face of immense discouragement and seeming contradictions, to reduce the chance collocations and bewildering complexities of ordinary experience to something more nearly approximating to what Reason prescribes. But it is a very different matter when Kant claims that in any one sphere, such as that of psychology, the unity and the unconditionedness must necessarily be of one predetermined type. He is then injecting into the Ideals that *specific* guidance which only the detail of experience is really capable of supplying. He is proving false to his own Critical empiricism, in which no function is ascribed to Reason that need in any way conflict with the autonomy of specialist research; and he is also violating his fundamental principle that the *a priori* can never be other than purely formal. Indeed, when Kant discloses somewhat more in detail what he means by the regulative function of the Idea of the self, the ambiguity of his statements reveals the unconsidered character of this part of his teaching. It is the expression only of a preconception, and has eluded the scrutiny of his Critical method largely because of the protective colouring which its admirable adaptation to the needs of his architectonic confers upon it. If, for instance, we compare the three passages in which it is expounded in the *Appendix* to the *Dialectic*, we find that Kant himself alternates between the authoritative prescription to psychology of a spiritualist hypothesis and what in ultimate analysis, when ambiguities of language are discounted, amounts simply to the demand for the greatest possible simplification of its complex phenomena. The passages are as follows.

"In conformity with these Ideas as principles we shall first, in psychology, connect in inner experience all appearances, all actions and receptivity of our mind, as if (*als ob*) the mind were a simple substance which persists with personal identity (in this life at least), while its states, to which those of the body belong only as outer conditions, are in continual change."

"...in the human mind we have sensation, consciousness, imagination, memory, wit, power of discrimination, pleasure, desire, etc. Now, to begin with, a logical maxim requires that we should reduce, so far as may be possible, this seeming diversity, by comparing these with one another and detecting their hidden identity. We have to enquire whether imagination combined with consciousness may not be the same thing as memory, wit, power of discrimination, and perhaps even identical with understanding and Reason. Though logic is not capable of deciding whether a *fundamental power* actually exists, the Idea of such a power is the problem involved in a systematic representation of the multiplicity of powers. The logical principle of Reason calls upon us to bring about such unity as completely as possible; and the more appearances of this or that power are found to be identical with one another, the more probable it becomes that they are simply different manifestations of one and the same power, which may be entitled, relatively speaking, their *fundamental power*. The same is done with the other powers. The relatively fundamental powers must in turn be compared with one another, with a view to discovering their harmony, and so bringing them nearer to a single radical, *i.e.* absolutely fundamental, power. But this unity of Reason is purely hypothetical. We do not assert that such a power must necessarily be met with, but that we must seek it in the interest of Reason, that is, of establishing certain principles for the manifold rules which experience may supply to us. We must endeavour, wherever possible, to bring in this way systematic unity into our knowledge."

In the third of the *Appendix* passages these two views are confusedly combined. Kant is insisting that

an Idea never asserts, even as an hypothesis, the existence of a real thing.

"[An Idea] is only the schema of the regulative principle by which Reason, so far as lies in its power, extends systematic unity over the whole field of experience. The first object of such an Idea is the 'I' itself, viewed simply as thinking nature or soul. If I am to investigate the properties with which a thinking being exists in itself, I must interrogate experience. I cannot even apply any one of the categories to this object, except in so far as its schema is given in sense intuition. But I never thereby attain to a systematic unity of all appearances of inner sense. Instead, then, of the empirical concept (of that which the soul actually is), which cannot carry us far, Reason takes the concept of the empirical unity of all thought; and by thinking this unity as unconditioned and original, it forms from it a concept of Reason, *i.e.* the Idea of a simple substance, which, unchangeable in itself (personally identical), stands in association with other real things outside it; in a word, the Idea of a simple self-subsisting intelligence. Yet in so doing it has nothing in view save principles of systematic unity in the explanation of the appearances of the soul. It is endeavouring to represent all determinations as existing in a single subject, all powers, so far as possible, as derived from a single fundamental power, all change as belonging to the states of one and the same permanent being, and all appearances in space as completely different from the actions of thought. The simplicity and other properties of substance are intended to be only the schema of this regulative principle, and are not presupposed as the real ground of the properties of the soul. For these may rest on altogether different grounds of which we can know nothing. The soul in itself could not be known through these assumed predicates, not even if we regarded them as absolutely valid in regard to it. For they constitute a mere Idea which cannot be represented *in concreto*. Nothing but advantage can result from the psychological Idea thus conceived, if only we take heed that it is not viewed as more than a mere Idea, and that it is therefore taken as valid only in its bearing on the systematic employment of Reason in determining the appearances of our soul. For no empirical laws of bodily appearances, which are of a totally different kind, will then intervene in the explanation of what belongs exclusively to inner sense. No windy hypotheses of generation, extinction, and palingenesis of souls will be permitted. The consideration of this object of inner sense will thus be kept completely pure and unmixed, without employing heterogeneous properties. Also, Reason's investigations will be directed to reducing the grounds of explanation in this field, so far as may be possible, to a single principle. All this will be best obtained (indeed is obtainable in no other way) through such a schema, viewed as if (*als ob*) it were a real being. The psychological Idea, moreover, can signify nothing but the schema of a regulative principle. For were I to enquire whether *the soul in itself* is of spiritual nature, the question would have no meaning. In employing such a concept I not only abstract from corporeal nature, but from nature in general, *i.e.* from all predicates of a possible experience, and therefore from all conditions for thinking an object for such a concept: yet only as related to an object can it be said to have a meaning."

The last passage would seem to indicate that Kant has still another and only partially avowed reason for insisting upon a *special* and *spiritualist* Idea, as regulative of empirical psychology. It is necessary, he would seem to argue, in order to mark off the peculiar nature of its subject matter, and to warn us against attempting to explain its phenomena in the mechanistic manner of physical science. But if that is Kant's intention, he has failed to formulate the position in any really tenable way. It is impossible to maintain, as he here does, that "no empirical laws of bodily appearances [can] intervene in the explanation of what belongs exclusively to inner sense." Indeed, in the immediately following sentences, he very clearly indicates how completely such a position conflicts with his own real teaching. To think away the corporeal is to think away all experience. Experience is not dualistically divided into separate worlds. It is one and single, and the principle of causality rules universally throughout, connecting inner experiences of sense, feeling, and desire, with their outer conditions, organic and physical. Thus Kant's retention of the Idea of the self is chiefly of interest as revealing the strength and tenacity of his spiritualist leanings. We may judge of the disinterestedness and courage of his thinking by the contrary character of his pre-

conceptions. For even when they have been shown to be theoretically indemonstrable, they continue to retain by honorific title the dignity from which they have been deposed. The full force of the objections is none the less recognised.

"The simplicity of substance ... is not presupposed as the real ground of the properties of the soul. For these may rest on altogether different grounds of which we can know nothing."

That, however, is only Kant's unbiassed estimate of the theoretical evidence; it is not an expression of his own personal belief.

CHAPTER II

THE ANTINOMY OF PURE REASON

This introduction summarises the preceding argument, and distinguishes the new problems of *Antinomy* from those of the *Paralogisms*. In rational psychology pure Reason attains, as it were, euthanasia; in the antinomies an entirely different situation is disclosed. For though rational cosmology is able to expound itself in a series of demonstrated theses, its teaching stands in irreconcilable conflict with the actual nature of appearances, as expressed through a series of antitheses which are demonstrable in an equally cogent manner.

SECTION I

SYSTEM OF THE COSMOLOGICAL IDEAS

The first eight paragraphs of this section are of great textual interest. They must have been written at a time when Kant still intended to expound his entire criticism of metaphysical science in the form of a doctrine of antinomy. For they define the Ideas of Reason as exclusively cosmological, and give a very different explanation of their origin from that which has been expounded in the preceding chapters. Evidently, therefore, this part of the section must have been written prior to Kant's formulation of the metaphysical deduction from the three species of syllogism. This is supported by the fact that the argument begins anew, just as if the matter had not previously been discussed; and that, though a new view of the nature of Reason is propounded, there is not the least mention of the more Idealist view which it displaces. Reason, Kant here teaches, is not a faculty separate from the understanding, and does not therefore produce any concept peculiar to itself. Reason is simply a name for the understanding in so far as it acts independently of sensibility, and seeks, by means of its pure forms, in abstraction from all empirical limitations, to grasp the unconditioned. "The transcendental Ideas are in reality nothing but categories extended to the unconditioned." The intelligible, as thus conceived by the understanding, expresses itself, as he later shows, in a series of theses; while the sensuous expresses its opposite and conflicting character in a series of antitheses.

Yet not all categories yield a concept of the unconditioned. That is possible only to those which concern themselves with a series of members conditioning and conditioned, and in reference to which, therefore, the postulate of an unconditioned would seem to be legitimate, viz.: (1) unconditioned quantity in space and time; (2) unconditioned quality (indivisibility and simplicity) of reality in space (matter); (3) unconditioned causality of appearances; (4) unconditioned necessity of appearances. As this arrangement is determined by the needs of Kant's architectonic, no detailed comment is here called for. Its consequences we shall have ample opportunity to consider later. As already noted, Kant's statement in A 414 = B 441, that "the category of substance and accident does not lend itself to a transcendental Idea," shows very clearly that, at the time when he composed this passage, he had not yet bethought himself of placing a separate and independent Idea at the basis of rational psychology. But as Kant here strives to follow the fourfold arrangement of the categories, the content of these paragraphs must either have been later recast or have been composed in the interval between his discovery of the metaphysical deduction of the categories and his formulation of the corresponding deduction of the Ideas from the three forms of syllogism. It may also be observed that the derivation of the cosmological Idea from the hypothetical

syllogism, which embodies only the category of causality, clashes with the above specification of it in terms of all four rubrics of category.

The remaining paragraphs (ninth to thirteenth) of this section must be of later date, as they are developed in view of the independent treatment of the theological Ideal. (Adickes, in dating the ninth and tenth paragraphs with the preceding instead of with the concluding paragraphs, would seem to have overlooked this fact.) In order to justify the treatment of the Ideas of a first cause and of unconditioned necessity, as *cosmological*, Kant now asserts that the antinomies concern only appearances— "our [cosmical] Ideas being directed only to what is unconditioned *among the appearances*," *and not to noumena*. His explanation of the nature of transcendental illusion, and of the antinomies in particular, as being due to a failure to distinguish between appearance and things in themselves, is thus ruthlessly sacrificed to considerations of architectonic. Kant could not, of course, consistently hold to the position here adopted; but it causes him from time to time, especially in dealing with the third and fourth antinomies, to make statements which tend seriously to obscure the argument and to bewilder the careful reader.

Kant is far from clear as to the relation in which the concepts of the totality of conditions and of the unconditioned stand to one another. In A 322 = B 379 they would seem to be taken as exactly equivalent concepts. In A 416-17 = B 443-5 they are apparently regarded as distinct, the former only leading up to the latter. But discussion of this important point must meantime be deferred.

SECTION II

ANTITHETIC OF PURE REASON

"[Antithetic] is the conflict between two apparently dogmatic judgments [*Erkenntnisse*] to neither of which can we ascribe any superior claim to acceptance over the other, *i.e.* by Antithetic I mean a *thesis*, together with an *antithesis*." "Transcendental Antithetic is an investigation of the antinomy of pure Reason, its causes and outcome."

The very existence of such antinomy presupposes a twofold condition: first, that it does not refer to a gratuitous but to an inevitable problem of human Reason, "one which it must necessarily encounter in its natural progress"; and secondly, that the thesis and the antithesis together generate a "natural and inevitable illusion," which continues to persist even after its deceptive power has been clearly disclosed. Such conflict is caused by the fact that Reason seeks a unity which transcends the understanding, and which nevertheless is meant to conform to the conditions of the understanding. If the unity is adequate to the demands of Reason, it is too great for the understanding; if it is commensurate with the understanding, it is too small for Reason. The theses express the higher unity at which Reason aims; the antitheses are the judgments to which the understanding is constrained by the nature of the appearances with which both it and Reason profess to deal. If we hold to Reason, we make assertions contradictory of the appearances; while if we place reliance on the understanding, Reason condemns our conclusions.

This conflict is limited to those few problems above enumerated in which we are called upon to complete a given series. Since totality, whether in the form of a first beginning of the series or as an actual infinity of the whole series, can never itself be experienced, these are problems in regard to which experience can be of no assistance to us. It can neither confirm nor refute any particular solution. The only possible method of deciding between the competing claims is to watch or even to provoke the conflict, in the hope that we may finally be able to detect some misunderstanding, and so to resolve the conflict to the satisfaction of both the litigants. Such is Kant's description of what he entitles his "sceptical method."

Without here attempting a full discussion of the subject, it seems advisable to point out at the very start

what Kant's exposition seriously obscures, namely, the real character of the evidence upon which the theses and the antitheses respectively rest. The latter are not correctly stated as transcending experience, and as therefore incapable of confirmation by it. The proofs which Kant offers of them are, indeed, of a non-empirical *a priori* character. They are formulated in terms of the dogmatic rationalism of the Leibnizian position, with a constant appeal to abstract principles. But, as a matter of fact, they can be much more adequately established — in so far as they can be established at all — through analysis of the spatial and temporal conditions of material existence. As space and time are continuous and homogeneous, any assertion which is true of a space or time however small is likewise true of a space or time however large. Any space consists of spaces, and must be regarded as itself part of a larger whole. Any time consists of parts which are themselves times, and is apprehensible only as following upon preceding times. It is by such considerations as these that we are led to regard the material world as unlimited, as infinitely divisible, and as having no first state.

Kant's method of demonstrating the theses — that the world is limited, is finitely divisible, and has a first state — is no less misleading. Here again his rationalistic arguments conceal the basis upon which the various theses really rest. Their true determining ground is the demand of Reason for some more satisfactory form of unconditionedness than that which is found in the actual infinite. It is this demand which has led philosophers to look around for proofs in support of the theses, and to elaborate those rationalistic arguments which Kant here reproduces. Thus the grounds of the antitheses are altogether different from those of the theses; and in neither case are they properly represented by the arguments which Kant employs.

The reasons why Kant in his detailed statement of the antinomies has omitted, or at least subordinated, the above considerations, are complex and various. In the first place, this doctrine of antinomy was in several of its main features already formulated prior to his development of the Critical philosophy. It forms part of his *Dissertation* of 1770; and at that time Kant was still largely in fundamental sympathy with the Leibnizian ontology. Secondly, Kant is here professing to criticise the science of rational cosmology, and is therefore bound to expound it in more or less current form. And in the third place, he teaches that *the antinomies exist as antinomies only when viewed from the false standpoint of dogmatic rationalism*. Had he eliminated the rationalistic proofs, the conflict of the antinomies, in its strictly logical form, as the conflict of direct contradictories, would at once have vanished. The general framework of this division of the *Dialectic* demanded a rationalistic treatment of both theses and antitheses, and Kant believed that the rationalistic proofs which he propounds in their support are unanswerable, so long as the dogmatic standpoint of ordinary consciousness and of Leibnizian ontology is preserved. But even when that important limitation is kept in view, Kant fails to justify this interpretation of the conflict, and we must therefore be prepared to find that his proofs, *whether of theses or of antitheses*, are in all cases inconclusive. I shall append to each of his arguments a statement of the reasons which constrain us to reject them as unsound. We shall then be in a position to consider his whole doctrine of antinomy in its broader aspects, and in its connection with the teaching of the other main divisions of the *Dialectic*.

FIRST ANTINOMY

Thesis. — (*a*) The world has a beginning in time, and (*b*) is also limited in regard to space.

Thesis *a*. Proof. — If we assume the opposite, namely, that the world has no beginning in time, and if we define the infinite as that which can never be completed by means of a successive synthesis, we must conclude that the world-series can never complete itself. But the entire series of past events *elapses*, *i.e.* completes itself at each moment. It cannot therefore be infinite.

Criticism. — This argument gains its plausibility from the illegitimate use of the term 'elapse' (*verfliessen*) as equivalent to 'complete itself.' If it be really correct to define the infinite as that which can never be completed, the conclusion to be drawn is that the temporal series is always actually infinite,

and that no point or event in it is nearer to or further from either its beginning or its end. We may select any point in the series as that from which we propose to begin a regress to the earlier members of the series, but if the series is actually infinite, it will be a regress without possibility of completion, and one therefore which removes all justification for asserting that at the point chosen a series has completed itself. It has no beginning, and has no completion. What it has done at each moment of the past it is still doing at each present moment, namely, coming out of an inexhaustible past and passing into an equally inexhaustible future. Time is by its given nature capable of being interpreted only as actually infinite, alike in its past and in its future. It cannot complete itself any more than it can begin itself. The one would be as gross a violation of its nature as would the other. The present exists only as a species of transition, unique in itself, but analogous in nature to the innumerable other times that constitute time past. It is a transition from the infinite through the infinite to the infinite. That we cannot comprehend how, from an infinitude that has no beginning, the present should ever have been reached, is no sufficient reason for denying what by the very nature of time we are compelled to accept as a correct description of the situation which is being analysed. The actual nature of time is such as to rule out from among the possibilities the thesis which Kant is here professing to be able to establish; time, being such as it actually is, can have no beginning.

What thus holds of time may likewise hold of events in time. If time is actually infinite, no proof can be derived from it in support of the assumption that the world has had a beginning in time.

The phrase “by means of a successive synthesis” gives a needlessly subjectivist colouring to Kant’s method of proof. The antinomy is professedly being stated from the realist standpoint, and ought not therefore to be complicated by any such reference. This objection applies, as we shall find, still more strongly to Kant’s proof of the second part of the thesis. The latter proof depends upon this subjectivist reference; the present proof does not.

Kant limits his problem to the past infinitude of time. The reason for this lies, of course, in the fact that he is concerned with the problem of creation. The limitation is, however, misleading.

Thesis *b*. — The world is limited in regard to space.

Proof. — Assume the opposite, namely, that the world is an infinite, given whole of coexisting parts. A magnitude not given within the determinate limits of an intuition can only be thought through the synthesis of its parts, and its totality through their completed synthesis. In order, therefore, that we may be able to think as a single whole the world which fills all space, the successive synthesis of the parts of an infinite world must be regarded as completed, *i.e.* an infinite must be regarded as having elapsed in the enumeration of all coexisting things. This, however, is impossible. An infinite aggregate of actual things cannot therefore be viewed as a given whole, nor as being given as coexistent. Consequently the world of spatial existences must be regarded as finite.

Criticism. — From the impossibility of traversing infinite space in thought by the successive addition of part to part, Kant here argues that “an infinite aggregate of actual things cannot be viewed as a given whole,” and consequently that the world cannot be infinitely extended in space. That is, from a *subjective impossibility of apprehension* he infers an *objective impossibility of existence*. But Kant has himself defined the infinite as involving this subjective impossibility; for in the proof of thesis a he has stated that the infinitude of a series consists in the very fact that it can never be completed through successive synthesis. Kant is therefore propounding against the *existence* of the infinite the very feature which by definition constitutes its infinitude. The implication would seem to be that the concept of the infinite is the concept of that which *ex definitione* cannot exist, and that there is therefore a contradiction in the very idea of the actual infinite.

Deferring for a moment the further objections to which such procedure lies open, we may observe that Kant, in arguing from a subjective to an objective impossibility, commits the fallacy of *ignoratio elenchi*. For when the conditions of objective existence are recognised in their distinction from those of mental

apprehension, the supposed contradiction vanishes, and the argument ceases to have any cogency. The use of the words ‘given’ and ‘whole’ is misleading. If space is infinite, it is without bounds, and cannot therefore exist as a whole in any usual meaning of that term. For the same reason it must be incapable of being given as a whole. Its infinitude is a presupposition which analysis of actually given portions of it constrains us to postulate, and has to be conceived in terms of the definition employed in thesis *a*. The given must always be conceived as involving what is not itself given and what is not even capable of complete construction. In terms of this presupposition an actual infinite, not given and not capable of construction, can be represented with entire consistency.

But to return to the main assumption upon which Kant’s proof would seem to rest: it is all-important to observe that Kant does not, either in the *Critique* or in any other of his writings, assert that the concept of the actual infinite is inherently self-contradictory. This is a matter in regard to which many of Kant’s critics have misrepresented his teaching. Kant’s argument may, as we have just maintained, be found on examination to involve the above assertion; but this, if clearly established, so far from commending the argument to Kant, would have led him to reject it as invalid. The passage in the *Dissertation* of 1770, which contains his most definite utterance on this point, represents the view from which he never afterwards departed. It may be quoted in full.

“Those who reject the actual mathematical infinite do so in a very casual manner. For they so construct their definition of the *infinite* that they are able to extract a contradiction from it. The infinite is described by them as *a quantity than which none greater is possible*, and the mathematical infinite as a multiplicity — of an assignable unit — than which none greater is possible. Since they thus substitute *maximum* for *infinitum*, and a greatest multiplicity is impossible, they easily conclude against this infinite which they have themselves invented. Or, it may be, they entitle an infinite multiplicity an *infinite number*, and point out that such a phrase is meaningless, as is, indeed, perfectly evident. But again they have fought and overthrown only the figments of their own minds. If, however, they had conceived the mathematical infinite as a quantity which, when related to measure, as its unity, is *a multiplicity greater than all number*; and if furthermore, they had observed that *measurability* here denotes only the relation [of the infinite] to the standards of the human intellect, which is not permitted to attain to a *definite conception of multiplicity* save by the successive addition of unit to unit, nor to the *sum-total* (which is called *number*) save by completing this progress in a finite time; they would have perceived clearly that what does not conform to the established law of some subject need not on that account exceed all intellection. An intellect may exist, though not indeed a human intellect, which perceives a multiplicity distinctly in one intuition [*uno obtutu*] without the successive application of a measure.”

The concluding sentences of this *Dissertation* passage may be taken as Kant’s own better and abiding judgment in regard to the question before us. We must not argue from the impossibility of mentally traversing the infinite to the impossibility of its existence. Indeed the essentials of the above passage are restated in the ‘Observation’ on this thesis. Thus the concept of the actual infinite is not only, as a concept, perfectly self-consistent, it is also one which, in view of the nature of time and of space, we are constrained to accept as a correct representation of the actually given. The thesis of this first antinomy runs directly counter to admitted facts. That Kant is here arguing in respect to the world, and not merely in respect to space and time, does not essentially alter the situation. For if space and time are necessarily to be viewed as infinite, there can be no *a priori* proof — none, at least, of the kind here attempted — that the world-series may not be so likewise.

Antithesis. — (*a*) The world has no beginning in time; (*b*) has no limits in space. In both these respects the world is infinite.

In these antitheses Kant assumes that space and time are actually infinite, and from that assumption advances to the proof that this is likewise true of the world in its spatial and temporal aspects. This, by itself, ought to be sufficient evidence that Kant does not regard the actual infinite as an inherently

impossible conception. As the antinomies are avowedly formulated from the realist, dogmatic standpoint of ordinary consciousness, Kant is also enabled to assume that if the world begins to be, it must have an antecedent cause determining it to exist at that moment rather than at another.

Antithesis *a*. Proof. — Let us assume the opposite, namely, that the world has a beginning. It will then be preceded by an empty time in which it was not. But in an empty time no becoming is possible, since in such a time no part possesses over any other any distinguishing condition of existence rather than of non-existence. The world must therefore be infinite as regards past time.

Criticism. — In this argument everything depends upon what is to be meant by the term 'world.' If Kant means by it merely the material world, the assumption of its non-existence does not leave only empty time and space. Other kinds of existence may be possible, and in these a sufficient cause of its first beginning may be found. The nature of creative action will remain mysterious and incomprehensible, but that is no sufficient reason for denying its possibility. If, on the other hand, Kant means by the world 'all that is,' the assumption of its non-existence is likewise the assumption of the non-existence of all its possible causes. That, however, is for ordinary consciousness a quite impossible assumption, since it runs counter to the causal principle which is taken as universally valid. From this point of view the argument consists in making an impossible assumption, and in then pointing out the impossible consequence which must follow. By such a mode of argument no conclusion can be reached. Kant's decision ought rather to have been that, as time is actually infinite, the world may be so likewise, but that though *reality* must in some form be eternally existent, the *material world* cannot be proved to be so by any *a priori* proof of the kind here given.

Antithesis *b*. Proof. — Let us assume the opposite, namely, that the world is finite, existing in an empty limitless space. There will then be not only a relation of things *in space*, but also of things *to space*. But as the world is a totality outside of which no object of intuition can be found, the relation of the world to empty space is a relation to *no object*. Such a relation is nothing. Consequently the opposite holds; the world must be infinitely extended.

Criticism. — That Kant himself felt the inadequacy of this argument, when taken from the dogmatic standpoint, is indicated by the lengthy note which he has appended to it, and which develops his own Critical view of space as not a real independent object, but merely the form of external intuition. From the standpoint of ordinary consciousness space is a self-existent entity, and there is no insuperable difficulty in conceiving a relation as holding between it and its contents. The introduction of the opposed standpoint of the *Aesthetic* therefore runs directly counter to Kant's own intention of expounding the antinomies from the dogmatic standpoint which involves this realist view of space, and of showing that they afford, in independence of the arguments of the *Aesthetic*, an indirect proof of the untenableness of that belief. The conclusion which ought to have been drawn is analogous to that above suggested for thesis *a*. As space is actually infinite, the material world may be so likewise; but that it actually is so, cannot be established by an *a priori* argument of the kind here attempted.

SECOND ANTINOMY

Thesis. — Every composite substance in the world consists of simple parts, and nothing anywhere exists save the simple or what is composed of it.

Proof. — Let us assume the opposite, namely, that substances do not consist of simple parts. If all composition be then removed in thought, no composite part, and (as there are no simple parts) also no simple part, and therefore nothing whatsoever, will remain. Consequently no substance will be given. Either, therefore, it is impossible to remove in thought all composition, or after its removal something that exists without composition, *i.e.* the simple, must remain. In the former case the composite would not itself consist of substances (with them composition is a merely accidental relation, and they must, as self-persisting beings, be able to exist independently of it). As this contradicts our assumption, only the latter alternative remains, namely, that the substantial compounds in the world consist of simple parts.

Criticism. — Kant here assumes, by his definition of terms, the point which he professes to establish by argument. The substance referred to, though never itself mentioned by name, is extended matter. Kant identifies it with 'composite substance.' Substance, he further dogmatically decides, is that which is capable of independent existence, and to which all relations of composition are therefore merely accidental. If these assumptions be granted, it at once follows that composition cannot be essential to matter, and that when all composition is thought away, its reality will be disclosed as consisting in simple parts. Kant, however, makes no attempt to prove that extended matter can be defined in any such terms. From the dogmatic point of view of ordinary consciousness, though not from the sophisticated standpoint of Leibniz, extension is of the very essence of matter; and, as Kant himself believed, the continuity of extension is such as to exclude all possibility of elimination of the composite. For he maintains that, however far division be carried, the parts remain no less composite than the whole from which the regress has started. On any such view the extended and the composite are not equivalent terms. The opposite of the composite is the simple; the opposite of the extended is the non-extended. Kant is here surreptitiously substituting a Leibnizian metaphysics in place of the empirical reality which is supposed to necessitate the argument.

In the *Observation* on this thesis Kant shows consciousness of the defects of his argument. It does not apply to space, time, or change.

"We ought not to call space a *compositum* but a *totum*, because its parts are possible only in the whole, not the whole through the parts."

As Kant further states, he is speaking only of the simples of the Leibnizian system. This thesis is "the dialectical principle of monadology." Again in the *Observation* on the antithesis, in commenting on the mathematical proof of the infinite divisibility of matter, Kant even goes so far as to declare that the argument of the thesis is based on an illegitimate substitution of things in themselves, conceived by the pure understanding, for the appearances with which alone the antinomy is concerned.

"...it is quite futile to attempt to overthrow, by sophistical manipulation of purely discursive concepts, the manifest, demonstrated truth of mathematics."

Antithesis. — No composite thing in the world consists of simple parts, and there nowhere exists in the world anything simple.

Proof. — Let us assume the opposite, namely, that a composite thing (as substance) consists of simple parts. As all external relation, and therefore all composition of substances, is only possible in space, space must consist of as many parts as there are parts of the composite that occupies it. Space, however, does not consist of simple parts, but of spaces. The simple must therefore occupy a space. Now as everything real which occupies a space contains in itself a manifold of constituents external to one another, and therefore is composite, and as a real composite is not composed of accidents (for without substance accidents could not be outside one another), but of substances, the simple would be a substantial composite, which is self-contradictory.
